SUMMARY

We publish portraits of Mr. S. Z. de Ferranti, who has again been chosen as President of the Institution of Electrical Engineers, and of the new members proposed for the Council. (Page 219.)

A loud-speaking telephone is employed at the tramway centre on the North side of Blackfriars Bridge, in conjunction with the system of queues, to assist the regulation of passenger traffic during rush hours. (Page 220.)

We publish the first part of an article by Mr. G. W. Partridge (Engineer-in-Chief of the London Electric Supply Corporation), describing the single-phase plant supplying the L.B. & S.C. Railway. Specially designed three-phase generators are used, arranged so that they can be employed either for the single-phase supply to the line or for three-phase supply for the general power distribution. The pressure is kept absolutely constant by means of a Tirrill regulator, in spite of rapid variations in load from 3,000 kw. to zero, and a simple but effective arrangement of duplicate feeders prevents unnecessary interruptions of supply from momentary short circuits. Mr. Partridge also discusses some interesting points in connection with switchboard design. (Page 221.)

A letter from Willans & Robinson explains that the lawsuit, reported last week, in which they were unsuccessful, related to work done in 1906–1908 at their old Queensferry works, now closed, and not at their main works in Rugby. Mr. Haydn T. Harrison also writes regarding recent contracts for electric street lighting. (Page 224.)

In their report for 1910 the Light Railway Commissioners again call attention to the need of strengthening the Light Railways Act of 1896, if any permanent benefit is to be derived from it. At present the applications under the Act show a strong tendency to decline. (Page 224.)

A 10-mile section of the Stratford-on-Avon and Midland Junction Railway has been equipped by Railophones, Ltd., to demonstrate the possibilities of the company's system of inductive telephony to and from moving trains. (Page 225.)

Among the specifications published by the Patent Office on Thursday last was one by the Elektrochemische Werke Ges. for a new process for the manufacture of hard copper wire by the addition of calcium and molybdenum. A conductivity of 98 per cent. and a tensile strength of 52 kg. per sq. mm. are said to be obtained.—F. Harrison describes a method of exhausting lamp bulbs with the aid of phosphorus and a high-tension discharge, and a sealing-in machine is described by W. L. Pakenham, of the "Z" Electric Lamp Manufacturing Co.—Siemens Bros. & Co. cover the use of a layer of paper strip between the insulation and sheathing of metal-sheathed cable for wiring.—Opposition has been entered to the grant of a patent for an arc furnace for treating gases. (Page 226.)

At a meeting of the National Electrical Manufacturers' Association on Tuesday, a Paper was read by Mr. L. Joseph, in which he drew attention to the advantage which foreign industries have by reason of the assistance received from the banks. In the dis-

Hosted by Google

cussion, it was suggested that steps should be taken to form industrial banks in Great Britain in connection with the electrical industry. (Page 227.)

THE gas and electric lighting companies have been unable to send in separate tenders for street lighting in Holborn, and have presented a joint tender for lighting the borough partly by gas and partly by electricity. The matter has been sent to the Works Committee for report. (Page 227.)

IT is announced that a number of important Canadian electrical companies are to be amalgamated.—Malvern ratepayers support the railless electric traction proposals.—The company which proposes to run trolley omnibuses in Macclesfield are asking for sanction to equip further routes.—Mr. J. M. McElroy, General Manager of the Manchester tramways, has been retained to advise the Swansea Corporation in connection with the proposed purchase of the tramways.—A sum of £51,000 has been transferred to relief of rates from the Leeds tramway profits for last year. (Page 227.)

A 1,500-K.W. turbine driving a D.C. generator and an A.C. alternator is required at South Shields; a feed-water heating plant at Barnes; distributing switchboard, feeder, cable, &c., at Ilford; and electrically-driven centrifugal pumping plant at Mirfield.—The Auckland (N.Z.) Council require complete boiler-house and engine-room equipments; additional generating plant is to be installed at Greenock and Alloa, and a large quantity of telephone and telegraph material is required at Brisbane. (Page 228.)

AFTER meeting all charges and wiping out the deficit for 1909, the British Westinghouse Co. carry forward a net profit of £5,117 for 1910.—A scheme for dealing with the arrears of preference dividends is under consideration by Edmundsons' Electricity Corporation. (Page 229.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, APRIL 27TH.

Imperial Education Conference.

At the Foreign Office. (1) "Engineering Education," by J. A. Ewing, F.R.S., (2) "Higher Technical Instruction," by J. H. Reynolds.

Institution of Electrical Engineers.

8 p.m. At Victoria Embankment. "Battery Economics and Battery Discharge Arrangements," by A. M. Taylor.

SATURDAY, APRIL 29TH.

Association of Mining Electrical Engineers.

3.30 p.m. *Notts and Derbyshire Branch.* At University College, Nottingham. (1) Discussion on the Revised Rules for the Use of Electricity in Mines. (2) "Considerations Specially Relative to Small Colliery Installations," by T. Thomson.

5.30 p.m. *Warwickshire and S. Staffs Branch.* At Imperial Hotel, Birmingham. (1) "Three-phase Motors for Haulage in Mines," by J. Simpson. (2) "Oil for Transformers and Switches," by G. Humphrey.

Old Ferrantians.

7 for 7.30 p.m. Dinner at Trocadero Restaurant, London.

TUESDAY, MAY 2ND.

Batti-Wallahs' Society.

7.45 p.m. Smoking Concert at Holborn Restaurant.

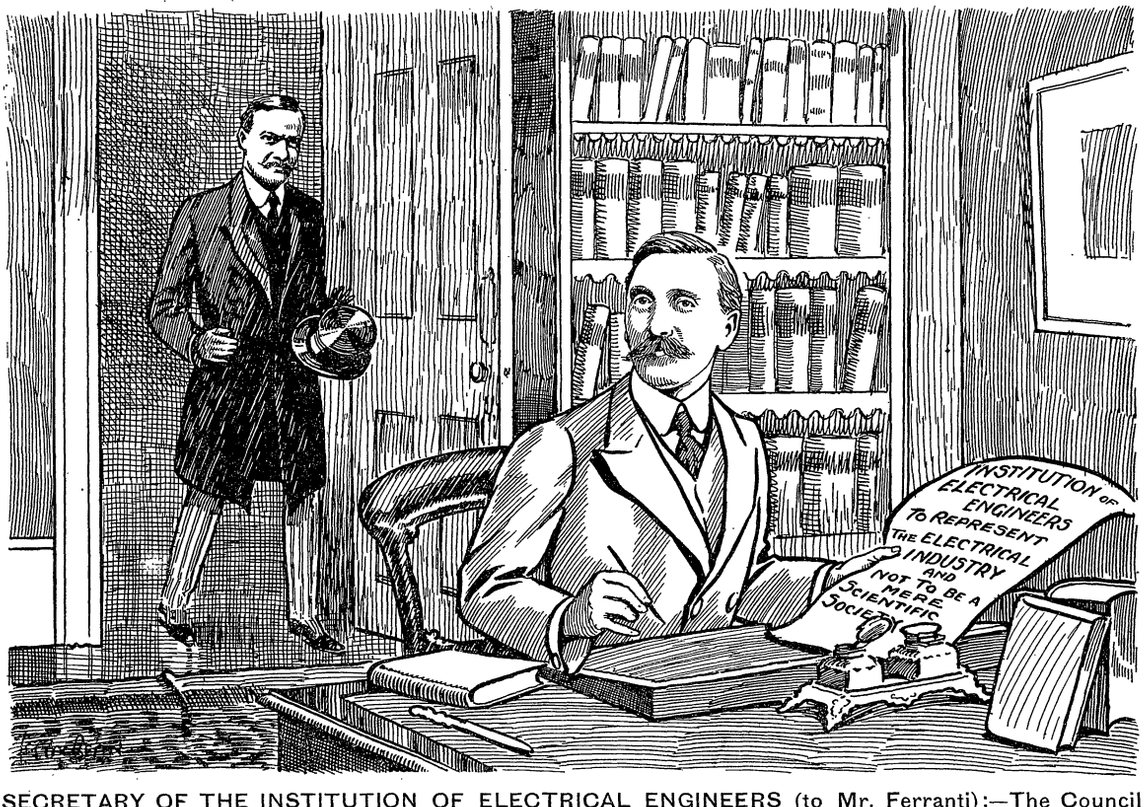
Faraday Society.

8 p.m. At Institution of Electrical Engineers, Victoria Embankment, E.C. (1) "Hydro-Electric Plants in Norway and their Application to the Electrochemical Industry," by A. Scott-Hansen. (2) "Electrometallurgy in the Steel Foundry," by Verdon Cutts.

WEDNESDAY, MAY 3RD.

Institution of Electrical Engineers: Students' Section.

7.30 p.m. At Victoria Embankment. Annual General Meeting.



Royal Society of Arts.

8 p.m. "Improvements in the Transport and Distribution of Goods in London," by A. W. Gattie.

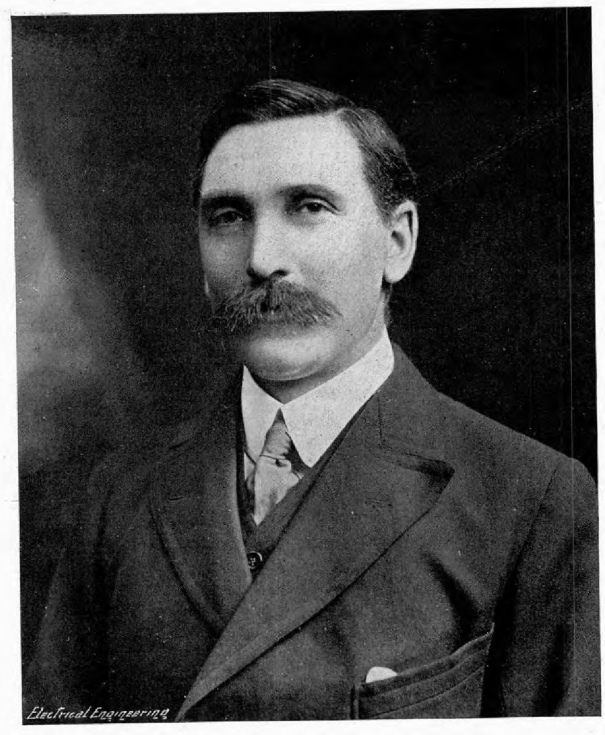
THURSDAY, MAY 4TH.

National Electrical Manufacturers' Association.

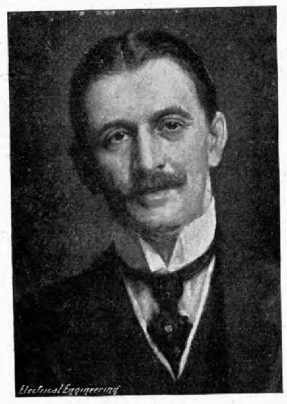
2.30 p.m. Council Meeting at Balfour House, Finsbury Pavement, E.C.

SECRETARY OF THE INSTITUTION OF ELECTRICAL ENGINEERS (to Mr. Ferranti):—The Council hope that you will continue President for another year, Sir, to develop the new policy, and I am sure that the member is universally in favour of it.

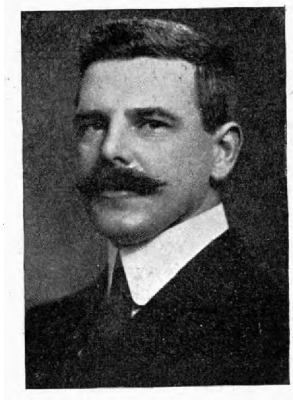
Hosted by Google



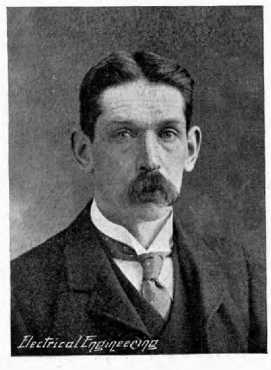
NEW COUNCIL OF THE INSTITUTION OF ELECTRICAL ENGINEERS



Major W. O'Meara, C.M.G.
(*Nominated Vice-President.*)

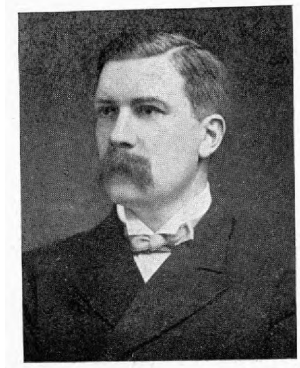


J. F. C. Snell.
(*Nominated Vice-President.*)



S. Z. de Ferranti.
(*President.*)

Hugo Hirst.



J. S. Highfield.

B. M. Jenkin.

J. E. Kingsbury.

C. P. Sparks.

THE Council of the Institution of Electrical Engineers have nominated Mr. S. Z. de Ferranti to serve as President for a second year of office; this will meet with the approval of every member of the Institution. In all probability the Council, having noted the cordial reception given to Mr. Ferranti's views that the Institution should represent the electrical engineering industry itself and not only the scientific and purely technical side of electrical engineering, have finally adopted this policy and have recognised that they could not do better than to ask Mr. Ferranti to remain another year in office in order to develop it.

Major O'Meara (Engineer-in-Chief to the Post Office) and J. F. C. Snell (Consulting Engineer) are proposed as Vice-Presidents to replace J. H. Rider and Sydney Evershed, who retire by rotation. Both have been on the Council for the last three years.

The other new members of Council nominated are J. S. Highfield, Hugo Hirst, Bernard M. Jenkin, J. E. Kingsbury, and C. P. Sparks, in place of Major O'Meara and Mr. Snell (who are nominated as Vice-Presidents as already mentioned), and G. Stoney, A. H. Walton, and Prof. Mather, who retire by rotation after three years' service; and Mr. H. E. Wimperis succeeds Mr. J. E. Taylor as Associate Member of Council.

Mr. Highfield is Engineer and Manager of the Metropolitan Electric Supply Co. He has been Engineer-in-Chief since the beginning of 1903, and was appointed Manager on Mr. Connacher's retirement early last year. Mr. Highfield has been on the Council before (from 1904 to 1907).

Mr. Hirst is the Chairman of the General Electric Co., Ltd., and we are glad to see the head of one of the large electrical manufacturing firms once more invited to sit on the Council. We may take this as a sign of the new policy. Mr. Hirst has already served twice on the Council from 1900 to 1903, and from 1904 to 1907, and did valuable work there, especially in connection with financial and business matters.

Mr. Jenkin is in partnership with Sir Alexander B. W. Kennedy, and the firm of Kennedy & Jenkin has been consulting engineers to some of the largest electrical undertakings of the country, including the Westminster Electricity Supply Co., the

Hosted by Google

Edinburgh Corporation Electricity Works, the Waterloo and City Railway, and the electrification of the suburban section of the Great Western Railway.

Mr. Kingsbury was Manager of the London branch of the Western Electric Co. from 1883 until the end of 1909, when he retired from the active management and took a seat on the Board. He has served three five-year periods on the Council, once as Vice-President.

Mr. Sparks has been Engineer-in-Chief to the County of London Electric Supply Co. since 1899, and from the early days until that date was associated with Mr. Ferranti in his pioneer work, and with the firm of Ferranti, Ltd. He has been on the Council twice before, from 1900 to 1903, and from 1904 to 1909 (from 1906 to 1909 as Vice-President).

Mr. Wimperis is Deputy Chief Inspecting Engineer to the Crown Agents for the Colonies. He is author of a book on Internal Combustion Engines, and is a member of the Gaseous Explosions Committee. Recently he has been engaged on experiments on the acceleration of trains around London.

The following members remain on the Council: *Vice-Presidents*: W. Duddell and W. H. Patchell. *Members*: W. W. Cook, H. Dickinson, G. K. B. Elphinstone, W. Judd, P. V. McMahon, R. K. Morcom, W. M. Morrison, S. L. Pearce, H. Faraday Proctor, and C. H. Wordingham. *Associate Members*: E. Russell Clarke and Sydney Morse.

Mr. Robert Hammond (*Honorary Treasurer*) and Messrs. H. Alabaster and Sidney Sharp (*Honorary Auditors*) retire, and are nominated for re-election.

LOUD-SPEAKING TELEPHONES AT THE L.C.C. TRAMWAY STOPPING-PLACE AT BLACKFRIARS

MUCH public interest has been aroused by the loud-speaking telephones adopted by Mr. A. L. C. Fell, Chief Officer of the L.C.C. tramways, for facilitating the handling of traffic during rush hours at Blackfriars Bridge. At the stopping place on the north side of the bridge there are immense crowds every evening, waiting for the cars going southwards. A shelter has recently been completed, upon which the queues form. This is roofed in, and consists of a central part about 26 yards long, in front of which the cars stop, and two approaches, one on either side, each divided by low galvanised iron partitions into four passages, 1 ft. 10½ ins. wide. These approaches are about 17 yards long, and the names of the routes for which the eight queues form in them are displayed in illuminated signs at the end of each. As each car approaches the official who is called the "regulator" allows only as many people to pass from the corresponding queue to what may be called the "landing stage," as there is room for in the cars. This avoids any struggling for precedence on the arrival of the cars, as the passengers know that there is enough room for all. The arrangement is made clearer by the sketch diagram above.

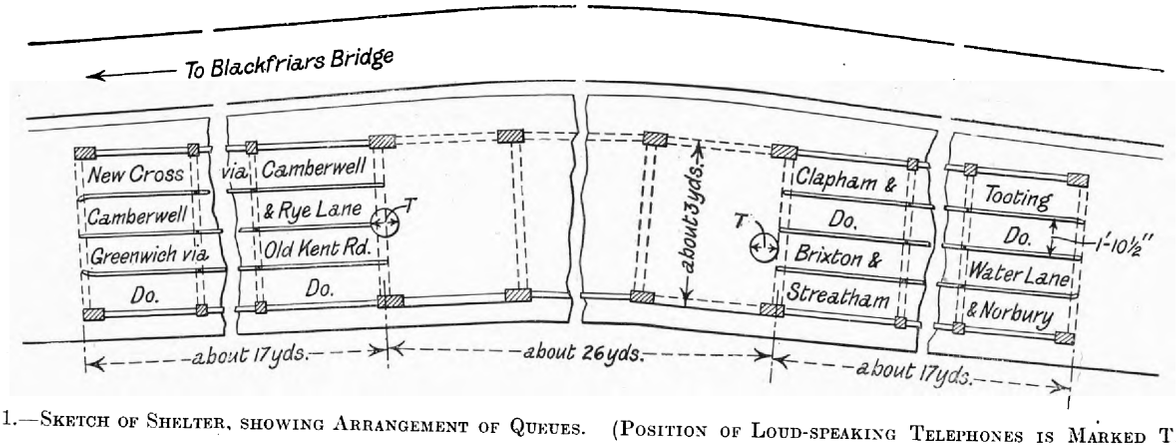


Fig. 1.—Sketch of Shelter, showing Arrangement of Queues. (Position of Loud-speaking Telephones is Marked T.)

It is to save time when the car arrives at the stopping place that the loud-speaking telephones have been installed. A transmitter is fixed on an electric light standard at a stopping place about 100 yards before the shelter, and is connected to two receivers in the shelter just above the heads of the two "regulators" there. The instruments have been supplied by Messrs. Alfred Graham & Co. (St. Andrew's Works, Crofton Park, S.E.), and are of a similar pattern to that used for ship telephones, being enclosed in painted gun-metal cases. The transmitter is a carbon-granule instrument with carbon diaphragm, and the set is direct-working, no induction coil being employed. When the transmitter is to be used, a switch handle is pulled down, which, in addition to connecting up the circuit, removes a protecting cap from the diaphragm, and moves the microphone to shake up any packed granules. Eight six-block agglomerate Leclanché cells are employed. A twin 16 S.W.G. vulcanised rubber lead-covered cable, laid in the subway under the Embankment connects the transmitter with the two receivers. The receivers are of Messrs. Graham's standard loud-speaking pattern, fitted with a 12 in. sound amplifying trumpet, and they are connected in parallel.

Fig. 2.—Transmitter.

Fig. 3.—Receiver.

Fig. 2 shows the transmitter in use, and Fig. 3 one of the receivers. We are indebted to Messrs. Alfred Graham & Co. for the loan of the negatives.

The South London Single-phase Railway.—Acording to the *Times*, the London, Brighton, and South Coast Railway will, it is anticipated, start the single-phase electric train service from Victoria Station to the Crystal Palace on May 12th, the opening day of the Festival of Empire and Imperial Exhibition. It is stated that the work of electrification is practically completed. The Company in several ways have utilised the experience gained by the working of the South London electric line from Victoria to London Bridge. For instance, the trains will be composed of six coaches instead of three or four; and the corridor, not having served its purpose of inducing people to entrain quickly, will be abolished, the extra space being devoted to increased seating accommodation. Most of the cars have already been delivered, and are at the new workshops of the Company at Norwood Junction. The electrification of the London Bridge section from Peckham Rye, where a junction is made with the South London line through East and North Dulwich and Tulse Hill, to a junction with the line from Victoria at West Norwood, and thus to the Crystal Palace, will not be ready until after the opening day of the Festival.

I.E.E. Students' Tour.—Preliminary arrangements have been made for a tour to Sweden by the Institution of Electrical Engineers Students this year. Permission is being asked to visit, amongst others, the following works:—Trolhättan Water Power Station, Nydquist Turbine Works, Domnarfvet Iron and Steel Works, Power Station and Paper Mills, Fahlun Copper Mines, Amalgamated Electrical Company's Works, Grangesberg Iron Mines, and the Westeras Electrical Machinery Works and Metal Mills. It is proposed that the party shall leave Hull on Thursday, July 20th, arriving at Gothenburg on the following Saturday, remaining there until Monday, July 24th, afterwards setting out on a tour through Trolhättan, Fahlun, Berlauge, Ludvika, Grangesberg, Westeras, and possibly Stockholm. It is estimated that the tour should not cost more than £15. Full particulars can be obtained from Mr. Douglas Betts, Hon. Secretary of the Students' Section.

Hosted by Google

THE SINGLE-PHASE PLANT SUPPLYING THE LONDON BRIGHTON AND SOUTH COAST RAILWAY

By G. W. Partridge, M.Inst.C.E.

(Engineer-in-Chief to the London Electric Supply Corporation.)

PART I: THE ELECTRICAL PLANT.

NOW that the single-phase system has proved to be a success, both from an engineering and a commercial point of view, it may be of interest if I give some particulars of the present installation at the Deptford generating station for supplying the single-phase current to the South London Line of the Brighton Railway. A full description of the equipment of the line itself has been given by the Consulting Engineer, Mr. Philip Dawson.

Historical Notes.

The Deptford generating station of the London Electric Supply Corporation was first set to work in the year 1889, and was the first station in the world to generate and distribute extra-high tension alternating-current. The system was condemned by many engineers, and it is recorded that Mr. Edison, when he visited the station in October, 1889, stated that he did not believe in the system.

However, in spite of the uphill work which such an enterprise necessitated, including the expenditure of enormous sums of money on experimental work, as we had to manufacture our own H.T. mains and electric generators (some of which were made two or three times over before reaching perfection), the E.H.T. system was finally made a success, and has since been adopted by other engineers all over the world. Some of the 10,000-volt mains we manufactured over twenty years ago are still in constant use, in spite of the joints at every twenty feet, which was the method of manufacture and construction then adopted.

Large generating stations have lately been erected by engineers in this country and in America with complete success, but in the early days of the Deptford generating station the generation and transmission of current of 10,000 volts' pressure was unknown in any other country, and it speaks volumes for the enterprise of the directors and the perseverance of the then chief engineer of the company, Mr. Ferranti, as he had to design every detail of the system with no previous experience to guide him. It is a remarkable coincidence that the contract for the supply of single-phase current should be placed by the Brighton Company with the very company who some twenty years ago did all the pioneer work in the generation and transmission of this particular system.

The Brighton scheme has up to the present been a complete success, and the supply of energy to the railway has given every satisfaction to the officials since they first commenced to run electric trains in December, 1909. Extensions of a capacity of 14,000 E.H.P. are now in hand in order to supply that portion of the suburban lines of the Brighton Railway at present undergoing conversion to electric traction, but I propose now, however, only to describe the plant which has already been installed.

The engine room is divided into two bays, one containing the old lighting plant, some of which was installed in 1889 and is still running and supplying some of the original Ferranti mains at a pressure of 10,000 volts. The other bay contains the traction plant, which I propose to describe in detail.

The generators of the latter are three-phase star wound machines, four in number, and capable of giving 2,000 kw. single-phase and 2,500 kw. three-phase. Each generator is connected to a three-pole oil switch. The three conductors are then taken to three isolating plugs which can be thrown over into two positions. By putting the plugs into the top contacts, the machines are connected to the railway 'bus bars, *i.e.*, one pole is connected straight through to the earthed rails of the railway, the switch on that pole being short circuited, whilst the other two poles of the generators are controlled by the oil switch, and thence taken to the 'bus bars. As will be seen by reference to the diagram Fig. 1, the railway feeders are connected across the two phases of the generators. The third phase is merely connected to the 'bus bars to make the parallel running more stable and to enable us to supply three-phase current for rotary converters during certain hours of the day. When the plugs are

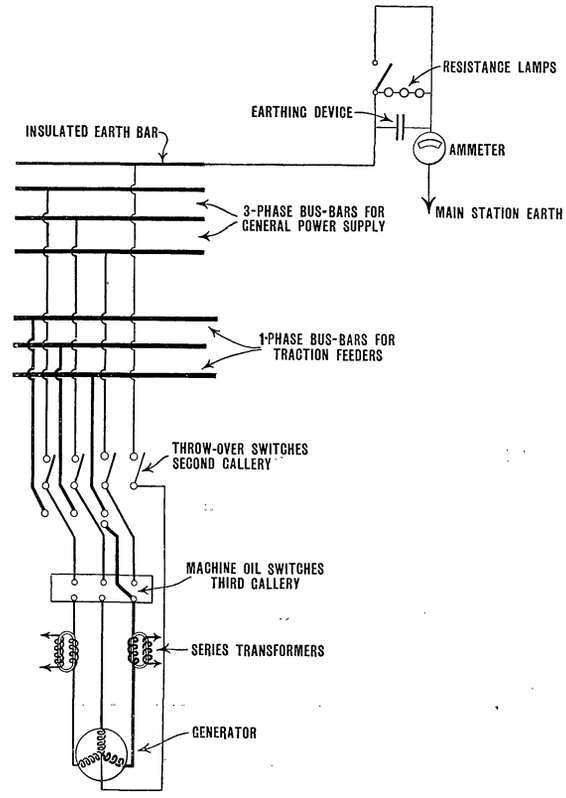

Fig. 1.—Diagram Showing Connection of Generator to Bus-bars.

placed in the bottom position the machines are connected to a three-phase 'bus bar, and all three poles are broken by the oil switch in the ordinary manner. By this means, any of the machines can give a single- or three-phase supply to either system.

Design of the Generators.

The four generators were manufactured by Messrs. Dick, Kerr & Co., and were designed to withstand the effect of heavy short circuits which sometimes take place. That is to say, they were made mechanically as strong as possible, and the regulation was not too close, the self-induction being high, thus reducing the momentary short-circuit current to as low a figure as possible. The special method of insulating the coils with pure mica has proved a complete success, and we have had no trouble with the coils of the machines since this method of insulation was adopted by the contractors. The ends of all the stator coils are securely clamped so as to prevent any movement due to the heavy currents which are taken from the machines. The mechanical stress on the ends of the coils varies as the square of the current, and as the current on short circuit may go up to 15 or 20 times the normal, the stress on the ends of the stator coils may be from 200 to 400 times normal. I am informed that tests have been made on a 6,000-kw. two-pole machine which showed that the stresses on the ends of the stator coils vary from five to ten tons at the time of short circuit.

Great care has also been taken to fit heavy damping coils on the rotors of these machines to overcome the difficulty of the pulsating current set up in the rotors when the machines are giving single-phase supply. The pulsating flux set up in the rotors of single-phase generators has caused so much trouble that perhaps it may be of interest if I refer more particularly to this part of the subject.

Hosted by Google

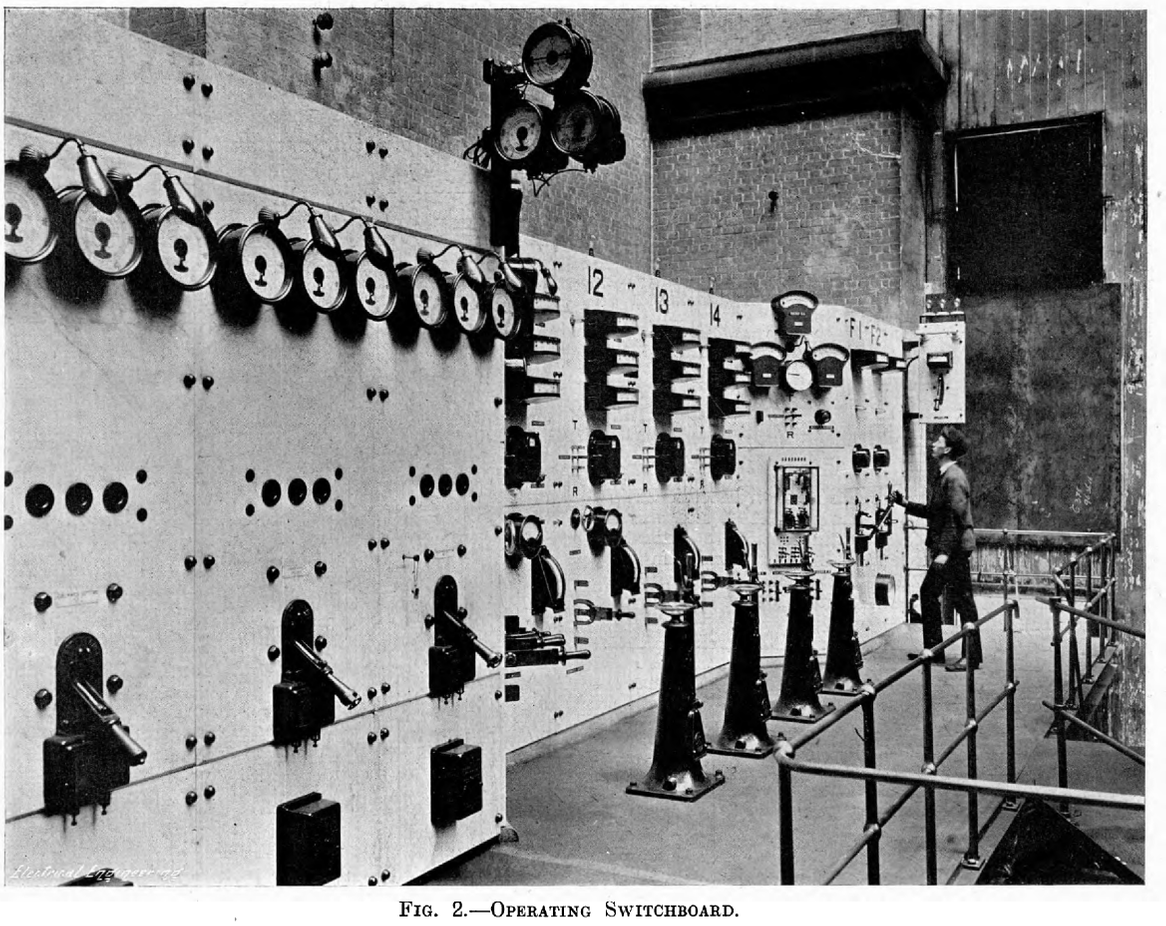

Fig. 2.—Operating Switchboard.

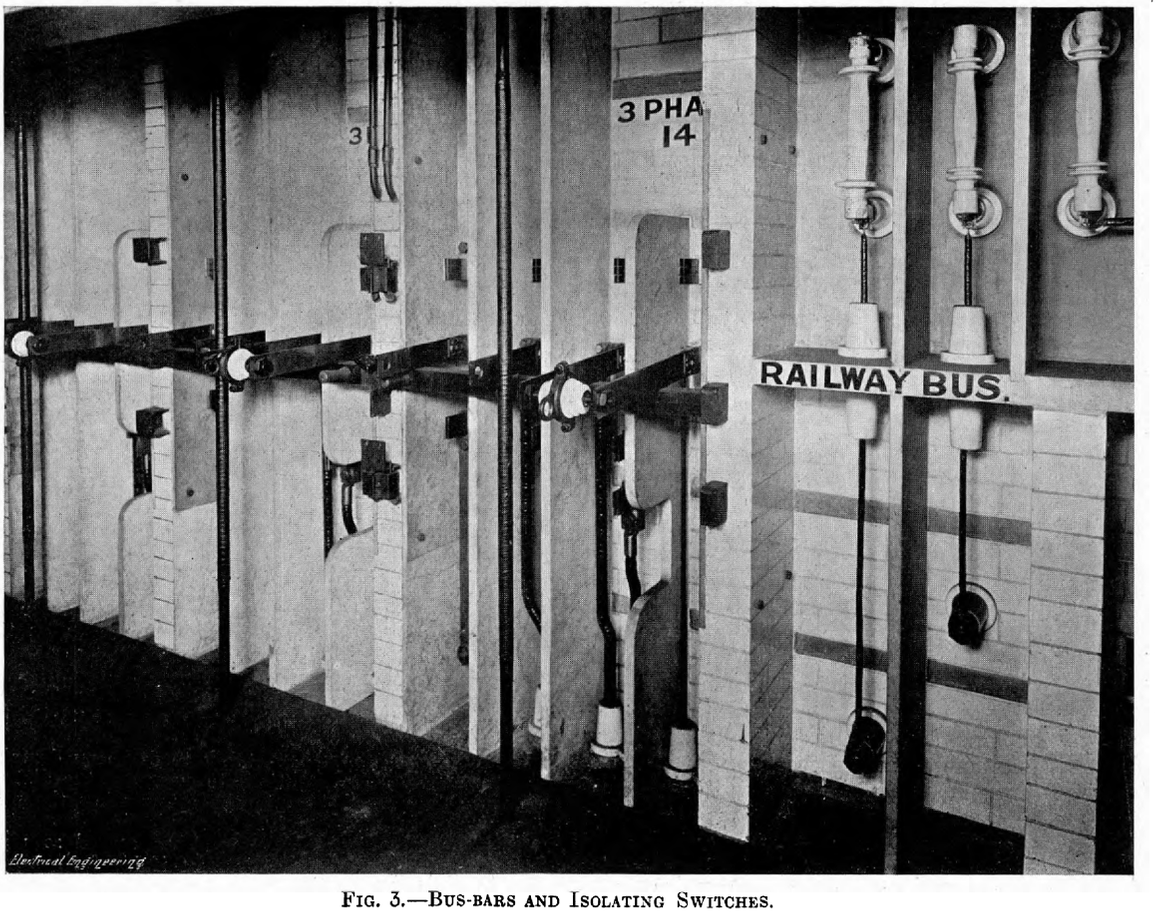

Fig. 3.—Bus-bars and Isolating Switches.

Hosted by Google

The behaviour of three-phase and single-phase generators are somewhat different in this respect. With a three-phase generator the magnetic flux rotates synchronously with the machine, and, being constant, it causes practically no loss in the rotor circuit. In the case of a single-phase generator, on the other hand, the armature current sets up a pulsating flux in the rotor, which does not rotate in the same manner as the three-phase generator, but is practically stationary. This flux causes hysteresis and eddy-current losses in the rotor, more especially in certain designs of generators running at low periodicity. The losses under certain conditions are considerable, and cause excessive heating and considerably reduce the efficiency of the generator. By placing heavy copper damping windings on the rotor, as near to the field of the pulsating flux as possible, all this trouble has been overcome. It means a very careful design of damping winding, and plenty of copper should be used so as to have the resistance of the circuit as low as possible. The best damping winding of all would be similar to a squirrel-cage winding of an induction motor, but all generator rotors are not designed to make such an arrangement possible.

A great deal of trouble has been experienced both in America and on the Continent with electric generators supplying single-phase current of low periodicity for traction purposes. Low periodicity, as a rule, means fewer stator coils and large pole pitch, which accentuates the trouble. In one particular case I have in mind on the Continent the trouble was so considerable that the whole of the generators had to be practically rebuilt, and the traction system was shut down for some weeks in consequence.

I think the manufacturers are to be congratulated on the satisfactory results they have obtained in their generators. No expense or trouble on their part has been spared to make the generators suit our special requirements. I am indebted to Mr. William Murray, chief engineer of the New York New Haven Railroad, for his experience in connection with this kind of work, which has been of assistance in settling the design of these generators.

The Switchboard.

The switchboard manufactured by the British Thomson-Houston Co. is divided into three galleries. The top gallery contains the operating board (see Fig. 2); on the second gallery are the high-tension 'bus-bars and isolating plugs, where the machines are connected to the railway, and also the three-phase 'bus-bars (see Fig. 3), and the third gallery contains the remote control oil switches.

Taking the control gallery first, each machine has its own instruments and excitation panel, together with a cast-iron pedestal from which the oil switch is mechanically operated, and the field resistance adjusted by means of a hand wheel and mechanical gearing to the resistance itself, which stands at the back of the board. The back of the board is almost as neat in appearance as the front; all the resistance contacts can be inspected, and every circuit can be easily traced and repaired if necessary. Two panels set at an angle on either side of the four generating panels contain the exciter switchboard, the Tirrill regulator, and the synchronising instruments. The Tirrill regulator takes care of the pressure on the traction system, and it does its duty so well that I think I cannot do better than give curves showing the variations in the traction load and the abnormally straight pressure curve.

The Railway Feeders.

The railway feeders are in duplicate, being connected at the railway switch cabins, where the current is measured. Each feeder has automatic trip gear. In practice we arrange that each pair of feeders is connected so that one trip acts instantaneously and the other has a considerable time lag. Thus if a short circuit takes place on any section of the line, one of the feeders to that section is cut out instantaneously, and the resistance between the station and the feeding point is doubled, as there is only one feeder in circuit. If the "short" does not clear itself at once, the time limit apparatus acts on the second feeder and cuts off the whole supply from that particular section. In practice, the "short" nearly always clears itself in time, so that the supply to the faulty section is never entirely cut off, although possibly there may be a heavy drop in pressure until the second feeder is switched on again. A certain time (30 seconds) is allowed to elapse before closing the second feeder switch, so that if the short circuit comes on again during this period there is an extra resistance or buffer between the fault and the generators.

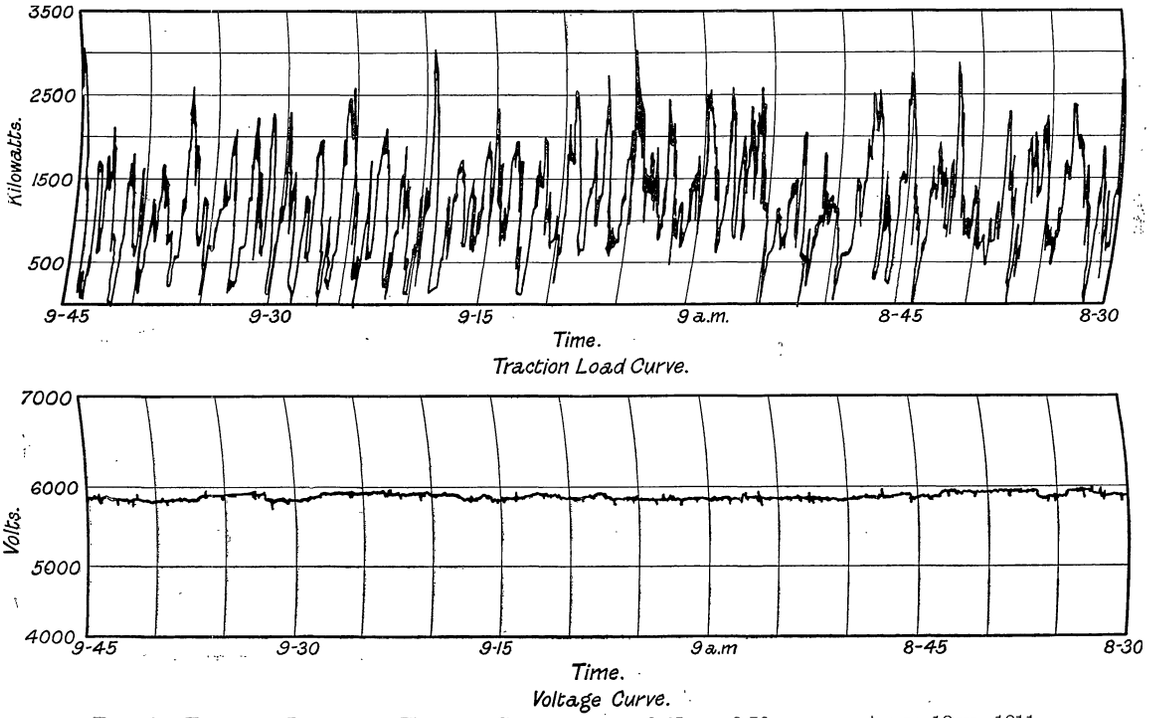

Fig. 4.—Traction Load and Voltage Curves from 9.45 to 8.30 a.m. on April 12th, 1911.

Arrangements have also been made to cut out a section of the Tirrill regulator automatically when the first feeder opens, so that the pressure on the whole system automatically drops when a short-circuit takes place, thereby reducing the strain on the electric generators as much as possible.

The generators are controlled by hand only, no automatic apparatus being used, as we find that automatic apparatus nearly always acts at times when not required. It has been our practice for the past 17 years to leave the switching in and out of the generators to the switchmen only; and many times we have been thankful that no automatic apparatus was in circuit.

The 'Bus Bars and Isolating Switches.

The 'bus bars (Fig. 3) consist of ordinary bare conductors supported on insulators with stone slabs dividing the phases. This system is, I believe, generally adopted in most generating stations; but, unless it is installed in a very rigid manner and entirely

Hosted by Google

covered up, I am not at all sure that it is the best system to adopt. The drawbacks to such a system are:

(1) The insulators break and conductors move when very heavy short circuits take place.
(2) It requires cleaning periodically, depending on whether the switchboard is in or outside the generating station. If it is inside, a bad leakage of steam is liable to cause all the insulators to leak, and probably make it impossible to start up again till they have all been dried.
(3) Animals, such as rats, mice, and crane fly (commonly known as "daddy-long-legs"), have before now short-circuited insulators or caused bare conductors to arc to the wall.

If such an arc as described in (3) does take place, it nearly always finds its way to other phases and practically short circuits the whole system. I have, unfortunately, had experience with all three kinds of animals, with very disastrous results both to ourselves and to the animals, especially to two mice, whose history is known to many engineers of the company. And lastly, there is always danger of somebody touching a live contact by accident.

The isolating switches also seen in Fig. 3 are all locked in such a manner that they cannot open accidentally when a short circuit takes place, a fault which is common to the old type of isolating switch and one that has caused serious troubles at many generating stations.

The insulated barriers seen in Fig. 3, besides preventing the isolating switches from being moved, are arranged to light up pilot lights automatically on the operating board, so that the attendant may know which way a generator is connected before it is started up. The front of this gallery is enclosed with a glass partition, the door of which is kept locked, and nobody can obtain access to the live terminals without first obtaining the key. An automatic arrangement is also in use which lights up the interior of the gallery as soon as the door is open, and draws the attention of the engineer in charge if anybody is at work inside. Signal lamps are also connected to each set of 'bus-bars showing whether they are alive or dead.

The lower gallery contains the three-phase oil switches, which are worked mechanically from the upper gallery. These switches have repeatedly opened short circuits direct across the generators during some experimental work which was carried out in connection with the railway equipment, without any injury to themselves, and without spilling any oil out of the oil tanks.

The second part of this article will deal with the engines, boilers, and condensing arrangements.

CORRESPONDENCE

CRUSE *v.* WILLANS & ROBINSON, LTD.

To the Editor of Electrical Engineering.

Sir,—Mention is made in your columns this week of this law suit, in which we, as defendants, have been unsuccessful. As inquiries have reached us regarding same, may we point out, to prevent misconception, that the action arose solely on account of work done as far back as 1906–1908 at the company's Queensferry Works, and is in no sense connected with the main works at Rugby. The Queensferry Works, it may be remembered, were built for the manufacture of boiler and kindred work, and were closed in 1908.

Victoria Works, Rugby. April 22nd, 1911.

Yours faithfully, For Willans & Robinson, Ltd., C. S. Essex, Secretary.

PRICE AND LIFE OF OSRAM LAMPS.

To the Editor of Electrical Engineering.

Sir,—In your journal of April 20th, under the heading of "The Price and Life of Osram Lamps," you mention several places where these lamps are being used for street lighting, and, as these are taken from information supplied by the General Electric Co., the impression may be created that they are solely responsible for the work. Perhaps, therefore, you will permit me to add that I have been responsible for nearly 75 per cent. of the places named. It might also interest you to know that I could name about eighty other places where I am either carrying out the same work or have already completed doing so.

Yours faithfully, Haydn T. Harrison.

11 Victoria Street, Westminster, S.W. April 20, 1911.

LIGHT RAILWAY COMMISSIONERS' REPORT

The report of the Light Railway Commissioners for 1910 shows that twelve Orders were submitted to and confirmed by the Board of Trade. These Orders authorised the construction of 13½ miles of light railway at an estimated cost of £76,680.

Once again the Commissioners draw attention to the necessity for amending the Light Railways Act of 1896. At the present time about 750 miles of line have been constructed under the Act, and nearly 1,200 miles have been authorised but not yet constructed. The main reason which accounts for failure to construct lines in country districts, and also for the notable reduction in the number of proposals for new lines, is to be found, says the report, in the fact that in its present form the Act does not adequately secure certain essential conditions, viz., cheap capital, cheap construction, and cheap work. When it is remembered that the chief difficulty in all light railway schemes has been to find capital, it will be seen, says the Commissioners, that the financial assistance of the State under the terms of the Act has not greatly contributed towards the construction of light railways for the reason that the extent of such assistance and the conditions under which it may be given have not been such as to enable the remainder of the capital to be raised on reasonable terms.

Reference is again made to a point mentioned in the last report, viz., lines on public roads mostly worked by electric power. It is provided in the Act of 1896 that special consideration shall be given by the Commissioners to the question whether proposals brought before them should in certain circumstances be submitted to Parliament, but no provision is made in the event of the Commissioners deciding to submit any scheme to Parliament, and no machinery is prescribed in the Act in this connection. The result is that proceedings taken under the Act in any such case become abortive, and the whole of the procedure becomes, to that extent, less effectual and less certain than it should be. In the opinion of the Commissioners this is one of the chief causes which is tending to bring applications for lines of this character (in many cases lines of much public usefulness) practically to an end.

The Commissioners have been asked to entertain applications for the installation of trolley omnibuses, but they are advised that, taken under the terms of the Light Railways Act, such applications cannot be dealt with.

Telephone Transfer.—It is stated that a Telephone Transfer Bill will be introduced into Parliament during the present session, dealing with the transfer of the National Telephone Company's undertaking to the Government.

Fire.—Owing to the boiling over of a can of varnish at the works of the London Electric Wiring Co., Leyton, on Thursday, considerable damage was done to the block of buildings known as the insulation and experimental works. Fortunately it was confined to this building, and did not spread to the other portion of the factory, which is a short distance away.

The Batti-Wallahs' Society.—The last smoking concert for this season will be held in the Council Chamber, Holborn Restaurant, at 7.45 p.m. on Tuesday, May 2nd. The chair will be taken by the new president, Mr. Slade Olver. An exceptionally strong programme has been arranged by the Entertainment Committee, and it is hoped that members will turn up in force.

Wireless Telegraph Notes.—The wireless telegraph station at Wick, Caithness, is now practically completed. The object in erecting a station at this spot is in order to obtain a more systematic control of the naval fleets operating in northern waters.

It has been decided to erect a wireless telegraph station at Spitzbergen, Norway.

Congress of Technology at Boston.—A congress, at which a number of Papers on applied science in relation to various branches of industry and public good, was held at Boston on April 10th and 11th, in commemoration of the jubilee of the Massachusetts Institute of Technology. Among the papers read was one by Mr. H. M. Hobart on "The Progress of Electric Propulsion in England." The president of the congress was Dr. Maclaurin, who, in his inaugural address, spoke of the progress of the Institute during the fifty years of its life and the influence of its work.

A Rapidly Completed Power Installation.—A notable illustration of the value of public electric power supply has just occurred at Messrs. Rennie & Company's Providence Mills, Stanningley, where, but for its aid, the machinery would now be standing idle. On Wednesday of last week the main engine gave way, and the machinery was brought to a standstill. Fortunately, the Yorkshire Electric Power Company's supply is available in Stanningley, and in twenty-four hours the supply was connected, and the first motor set to work. By Sunday night the whole of the machinery was converted to electrical driving, and now over 400 h.p. is taken from the public mains. This probably constitutes a record for this class of work.

TRAIN TELEPHONY

At the invitation of Mr. H. von Kramer we attended the opening at Stratford-on-Avon on Thursday last, of what is stated to be the first Railophone installation for wireless inductive signalling to and from moving trains. Some months ago experiments were made on a short section of the London, Brighton & South Coast Railway by Mr. Von Kramer, and a company was formed under the name of Railophones, Ltd., to develop the system. By the courtesy of Mr. Harry Willmott, chairman of the Stratford-on-Avon and Midland Junction Railway Co., Mr. Von Kramer has been able to equip a ten-mile section of this railway between Stratford and Kineton, for the purpose of showing the possibilities of the system, but this installation also appears to be of an experimental nature.

On Thursday a temporary telephone box was fitted up in a marquee adjacent to the railway station at Stratford, and Miss Marie Corelli spoke an inaugural message into the telephone, which was received and replied to by the Mayor of Stratford from a telephone box on the train. On account of the fact that the patents covering the system have not yet been taken out in all countries, the company are averse from the publication of complete technical details, but the following notes will indicate the principles upon which the system is worked.

Speech is transmitted by electro-magnetic induction between a large coil of wire on the coach, and a stationary wire along the track. Thus, current variations in either the train coil or the stationary track circuit produce a varying magnetic field which induces currents in the other circuit and operates the receiver. Thus the coil on the train and the wire along the track may be looked upon as the two coils of a transformer of rather loose coupling, although one is on the train and the other along the track. The movement of one relatively to the other is of no account.

On the experimental track at Stratford-on-Avon, the stationary wire in the railway stations and at crossings is buried in the railway embankment on one side of the track, and consists of a bare iron wire placed in a wooden trough filled with bitumen, but along the open line it is suspended on short wooden poles, one foot high, close to the track. This wire is joined up with the rails which form the return wire, and thus complete the circuit with the telephone instruments in the signal box or any other desired position. One coach of the train is fitted with two large coils of insulated wire, hung horizontally from the bottom of the coach. One of these is connected with a telephone transmitter, and the other with a receiver. The transmitters used both on the train and in the signal box differ from the ordinary pattern only in having a somewhat lower resistance. The current employed in transmitting is about three amperes, in order that a sufficiently strong magnetic field may be produced.

As there are two coils on the coach, one for receiving and one for transmitting, the operator speaks and listens as with an ordinary telephone. In the case of the stationary telephone box, however, it is necessary, in the present experimental installation, to switch over from the transmitter to the receiver when it is desired to receive, as there is only one stationary circuit. One circuit cannot be used for both transmitting and receiving, as the receiver will not carry the heavy current required for transmitting.

The chief difficulty in developing the system has been the elimination of mutual disturbances with the ordinary telegraph wires along the railway track. Originally the coils on the train were arranged vertically, and in a longitudinal plane, the lower side of the coil only being active, while the remaining part extended over the roof, and was enclosed in a tube of brass or other non-magnetic metal. This method, however, has been abandoned, and the difficulties are now overcome by a special method of winding the coils, which has not yet been disclosed.

An important development of the system foreshadowed by Mr. Kramer consists in tuning the signals to and from different trains, so that a train will only pick up the impulses to which its apparatus is tuned. Experiments are also being conducted with a relay which will enable speaking and hearing to be performed with one track circuit without the inconvenience of being obliged to switch over from the transmitter to the receiver, and *vice versa*, in the stationary telephone box.

It was announced some months ago that the company had contracted to instal the system on the London, Brighton & South Coast Railway, over a distance of 30 miles in the middle of the route between London and Brighton, and to equip the express train known as the "Southern Belle" with the necessary apparatus, thus enabling passengers to send or receive messages during the journey from London to Brighton, but it does not seem that the system is yet sufficiently developed to be applied commercially in this way.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

REVOLUTION INDICATORS.—An illustrated booklet from the Union Electric Co. (Park Street, Southwark, S.E.), describes a series of electrical revolution indicators for marine work. These are on the Hartmann Kempf system, and depend on the resonance of a graduated row of tuned reeds in the field of a magnet excited by a small permanent magnet 24-pole alternator, driven by a chain from the main shaft. The frequency is thus proportional to the speed of the main engines and the scale against the reeds can be calibrated direct in r.p.m. of the main engines. In most of the instruments the dial is also provided with an indicating pointer, worked by a voltmeter connected to the same alternator, which also gives an approximate indication of the speed. Several indicators can be driven by the same alternator.

METAL FILAMENT LAMPS.—The latest price list of Westinghouse Auriga metal filament lamps from the British Westinghouse Electric & Manufacturing Co. gives notice of reductions in the prices of these lamps in the larger sizes, ranging from 65 to 600 candle-power. These lamps are manufactured from 8 to 1,000 c.p. and for circuits from 25 to 260 volts, and are British made.

CONTROLLERS.—A comprehensive catalogue of controllers, fuses, &c., has been issued by Messrs. Allen, West & Co., Ltd., of Lewes Road, Brighton, in the form of a number of sheets in a convenient file. It embraces porcelain handle fuses of the West self-aligning pattern, and a considerable selection of drum type controllers for series, shunt, and compound motors with and without braking positions, and power notches for lowering. Similar controllers for two- and three-phase motors, resistance grids and frames, and special heavy service controllers for steel works, collieries, &c.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ELECTRIC FANS.—The British Westinghouse Electric & Manufacturing Co. (Trafford Park, Manchester), are giving considerable attention to the study of ventilation, and have just issued a new list of electric fans, and in addition to supplying these pieces of apparatus, they are willing to place their experience in their application at the disposal of purchasers. Electric fans are of the utmost use when applied to real ventilation, that is to say, changing and not mere stirring up of the air, and as much care should be exercised in their application as in their selection. The list deals with continuous and alternating current fans, and the patterns include cabin fans, ceiling fans, exhaust and ventilating fans of the two-blade type, as well as the familiar desk and bracket fans.

INSTALLATION MATERIAL, &c.—Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), have issued a new pocket edition of their catalogue. This contains the whole of the prices and particulars given in their full 400-page quarto list issued twelve months ago, with the exception that the fittings section has been curtailed slightly in view of a complete new fittings catalogue, which is now in course of preparation. But one or two new items have introduced. An idea of the completeness of the range can be obtained from the following list of the sections into which the catalogue is divided: Conduits, Flexible Wiring, Distribution Boards, Watertight Fittings, Wires and Cables, Accessories, Electric Bells, Porcelain Insulators, Lamps, Fans, Cooking, Heating, Signs, Meters, Instruments, Fixtures, Holophane, and Shades.

METAL FILAMENT LAMPS.—A leaflet from the Foster Engineering Co., Ltd., gives notice of reduction in the prices of the larger sizes of their metal filament lamps from 100 to 600 c.p. As is well known, these lamps are manufactured from start to finish at the Company's works at Wimbledon, and the Foster Co. are prepared to supply advertising literature overprinted with the names and addresses of contractors. We may mention that the Midland Railway has placed a twelve months' contract for Foster lamps.

The South African Institute of Electrical Engineers.—The report which was presented at the annual meeting on January 19th, 1911, records a total membership of 205, made up of 88 members, 79 associate members, 22 associates, and 16 students. A number of meetings have been held, the average attendance at which was 88. The following are the officers and council for the present year:—*President:* J. H. Rider. *Vice-Presidents:* Bernard Price, J. W. Kirkland. *Members of Council:* W. Elsdon-Dew, W. H. Perrow, L. B. Woodworth, A. G. F. Heather, F. H. Michell, W. C. Brown, F. W. Bentley, A. E. Gibbs, G. A. Webb. *Associate Members of Council:* J. S. Ross, G. H. B. Bernard, E. V. Perrow.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 20th, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

7,657/10. **Improving Electrical and Mechanical Properties of Hard Copper Wire.** Elektrochemische Werke Ges. (Berlin). Up to 1 per cent. of calcium or molybdenum or smaller percentages of each are added to electrolytic copper instead of aluminium and magnesium as is now usual to produce hard wires for overhead lines. Whereas a usual requirement for such wire is a conductivity of 95 per cent. with a tensile strength of 40 to 46 kg. per sq. mm., a wire with 0·35 per cent. of calcium is stated to give on test 98 per cent. conductivity and a tensile strength of 54 kg. per sq. mm. Similarly, a wire with 0·05 per cent. of molybdenum is stated to give 96·2 per cent. conductivity and a tensile strength of 52·9 kg. per sq. mm. By adding 0·35 per cent. of both calcium and molybdenum to pure copper, a conductivity of 98 per cent. and a tensile strength of 52 kg. per sq. mm. are said to be obtained.

8,019/10. **Heavy-current Telephone Transmitter.** C. E. Egner and J. G. Holmstrom (Stockholm). In transmitters provided with a box of soluble material, such as paraffin wax, which, in melting, cools the granule chamber, metal rods are placed in the box extending upward from the bottom adjacent to the granule chamber, in order to conduct the heat into the soluble body. Two figures.

10,870/10. **Exhausting Lamp Bulbs.** F. Harrison (London). In order to exhaust completely the bulbs of incandescent lamps, and particularly those for pressures below 30 volts, red phosphorus or arsenic is inserted in the bulb or on the stem, and the bulb is first exhausted by a pump in the usual way. It is then placed in the electrostatic field or between the terminals of an induction coil or H.T. transformer, so that a bluish glow appears. At the same time a current greater than the normal is passed through the filament, and the phosphorus is heated by a flame until the blue glow disappears, whereupon the lamp is sealed off. One figure.

12,754/10. **Sealing-in Machine.** W. L. Pakenham and The "Z" Electric Lamp Manufacturing Co., Ltd. (London). This apparatus consists of a revolvable table carrying the lamp bulb and filament pedestal to be sealed, mounted on a support, so that it can be slid into or out of the zone of flame produced by a number of gas jets. When the bulb is brought into the flame the table is immediately rotated by a friction drive. A lever for adjusting the height of the pedestal is also provided. Four figures.

13,672/10. **Wiring Cable.** Siemens Bros. & Co. and W. Dieselhorst. With wiring cable of the kind which is provided with a metallic sheathing outside the insulation, trouble is often experienced when stripping off portions of the sheathing by reason of the insulation adhering to it. To obviate this, a wrapping of thin, non-adhesive material, such as paper strip, is provided between the sheathing and the insulation. Two figures.

15,425/10. **Accumulator Boxes.** G. E. B. Pritchett (Pritchetts & Gold, Ltd., London). Boxes for accumulators used for train-lighting, &c., where they are subject to vibration and concussion are made much deeper than the plates, and a very thick plate of teak or lead is supported horizontally just above the level of the electrolyte, while a large space is provided between the top of this plate and the top of the box. The electrolyte may penetrate through the narrow passages between the plate and the sides of the box, but is not projected out of the box. Five figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Moul, 13,528/10.

Electric Ignition: Vickers, Sons, & Maxim, Ltd. (*Elia*) [Submarine mines] 2,706/11.

Electrochemistry and Electrometallurgy: FitzGerald [Electric furnaces] 15,166/10; Consortium für Elektrotechnische Industrie Ges. [Production of indoxyl] 17,143/10; Nogier [Sterilising liquids by ultra-violet rays] 26,783/10.

Heating and Cooking: Bell [Heat conserving and heating and cooking apparatus] 2,829/10.

Incandescent Lamps: Krause [Metal filament lamps] 24,548/10.

Instruments and Meters: Hardingham (*Hartmann & Braun A.-G.*) [Measuring instruments] 19,093/10.

Storage Batteries: Marino [Separators] 30,602/09; Boult (*Smith*), 2,017/11.

Switchgear, Fuses, and Fittings: Conradi [Fuses] 7,823/10; Barry and Clarke [Rheostats] 8,274/10; Tucker [Switches] 8,375/10; Adams Manufacturing Co. (*Cutler Hammer Mfg. Co., U.S.A.*) [Motor controllers] 9,097/10; Trier [Switches] 9,153/10; Martyn [Wall-plugs] 13,274/10; Winterhalder [Automatic circuit-breakers] 15,482/10; Gill [Sheath for lamps] 18,821/10; Scott [Switches] 19,125/10; Dorman, Smith and Baggs [Fuses] 27,712/10; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Resistance units] 252/11; Baldwin [Bell circuits] 2,572/11.

Telephony and Telegraphy: Zwicky, Schwartz and Denholm [Signalling by light] 7,928/10; Hurd [Transcription of telegraphic messages] 10,745/10; Fessenden [Telephone transmitters and relays] 11,602/10; Goldstein [Central battery signalling system] 16,333/10.

Traction: Rothwell [Rail joints] 23,259/09 and 2,669/11; Jenkins and Brook [Air-brakes] 10,925/10; Quibell and Coghlan [Tramway rails] 27,723/10; Schilowsky [Mono-rail system] 29,892/10.

Miscellaneous: Arledter [Process for sizing paper electrically] 132/10; Hall [Coal-cutter] 8,987/10; Fries [Flux for soldering aluminium] 10,790/10; Oliver [Galvanising machines] 14,959/10; Money [Electromagnetic clutches] 15,422/10; Galvanostegie Ges. [Cleaning tubes before galvanising] 19,496/10; Siemens-Schuckertwerke Ges. [Percussion tools] 19,540/10; Bigge and Butt [X-ray apparatus] 25,670/10; Siemens Bros. Dynamo Works, Kieffer and Vernon [Liquid piston explosion engines for pumping] 27,753/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Körting & Mathiesen A.-G. [A.-C. lamps] 6,336/11 and 6,783/11 Siemens-Schuckertwerke Ges., 7,501/11.

Electrometallurgy: Elektrostahl Ges. [Manufacture of iron and steel] 25,581/10.

Heating: Monnot, 8,023/11.

Incandescent Lamps: Weber, 1,210/11; Barollier [Sealing-in machine] 7,868/11.

Instruments: Strelow [Meters] 8,032/11, and [Measuring instruments] 8,033/11.

Switchgear: Allgemeine Elektricitäts Ges. [Voltage regulators] 7,668/11 and 8,150/11; Eilertsen [Rheostat for remote control] 8,156/11.

Telegraphy: Reisz and Strauss [Relay for undulatory currents] 2,111/11; De Bernochi [Transmitting pictures to a distance] 8,017/11.

Traction: T. Goldschmidt [Rail joints] 27,382/10; Schapire [Rail joints] 8,009/11.

Miscellaneous: Von Koch [Production of discharges in gases] 1,746/11; Goldstein [Temperature alarms] 7,670-1-2/11; Biermasz [Transmitting compass positions to a distance] 7,906/11; Rennert [Motor-controlled regulating devices for furnace dampers, valves, &c.] 8,151/11.

Opposition to Grant of Patent

5,934/10. **Arc Furnace for Treating Gases.** G. W. Johnson. (*Chemische Fabrik Griesheim-Elektron.*) Opposition has been entered to the grant of this patent. The specification describes a blowing device for directing the gases to be treated into the arc. Two streams of gas issue from longitudinal slits in two parallel tubes, and meet at an angle adjacent to the arc. It is claimed that the arc burns without any aureola, and that subsequent decomposition of the gases produced by the reaction is avoided.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. Bremer [Flame arc lamps with self-supporting carbons or carbons fed against metal stops] 420/00; F. W. E. Schuer [Enclosed lamp globe] 418/06.

Distribution Systems, &c.: Siemens Bros. & Co. (*Siemens-Schuckertwerke Ges.*) [Battery load-equalising plant] 376/06.

Dynamos, &c.: British Thomson-Houston Co. and B. Hopps [Control of generator in petrol-electric power transmission gear] 320/05.

Instruments, &c.: British Thomson-Houston Co. and F. Holden [Mercury meters] 515/06.

Storage Batteries: A. Müller [Casting grids with vulcanite or metallic backings] 273/03; C. Roderburg [Paste and grids] 415/03.

Switchgear, &c.: C. T. Briscoe, E. Jones, and T. S. Jones [Card-grips for lamp holders for preventing twisting of the conductors] 165/99; W. W. Lackie and W. T. Caldicwood [Fuses] 330/04.

Traction: C. Contal [Motor-suspension and gear of electric vehicles] 12,598/00; W. Griffiths and B. H. Bedell [Live stud detector for surface contact tramways] 351/04; Westinghouse Brake Co. [Air brakes] 307/05.

Miscellaneous: F. W. Hurd [Coal-cutter] 282/03.

STREET LIGHTING IN THE BOROUGH OF HOLBORN

At the last meeting of the Holborn Borough Council just before Easter, the Town Clerk reported that in response to the invitation for new tenders for street lighting (see Electrical Engineering, February 16, p. 81) he had only received a joint tender from the Gas Light & Coke Co., and the Metropolitan Electric Supply Co., the latter company acting on behalf of the County of London Electric Supply Co., and the Charing Cross and West End Electricity Supply Co., apportioning the lighting of the borough between electricity and gas. The tender was for forty-eight lamps of approximately 1,500 c.p. each in High Holborn and New Oxford Street; twenty-eight lamps of approximately 1,800 c.p. in Kingsway and the High Holborn crossing at Southampton Row; twenty 600 c.p. lamps in Tottenham Court Road; four hundred and five 400 c.p. lamps in seventeen streets; forty-eight 300 c.p. lamps, thirty-seven 180 c.p. lamps, and 1,390 90 c.p. lamps in the remaining streets. The lighting would be roughly divided equally between gas and electricity. The total inclusive annual payment under this joint contract would be £6,950, the tender being for ten years, with the option to the Council to terminate it at shorter periods upon certain conditions.

This price, however, was on the basis of the penalty clause for non-maintenance of candle power being waived, but if this were insisted on the amount of the tender was to be increased by 10 per cent. Moreover, the companies were not willing to accept a clause in the specification with regard to adoption of subsequent improvements in burners, lamps, &c., unless the Council would agree to pay the extra cost of such improvements. It will be noted that the price of £6,950 per annum is considerably lower than the £7,527 originally tendered by the gas company, but it is higher than the price tendered in the first instance by the electricity companies, which was £6,602 per annum. It will be remembered that the gas company's tender was first recommended by the Works Committee for acceptance, but the Council refused to adopt the recommendation of accepting the higher tender of the two. Instead of accepting the tender for electric lighting forthwith, however, they called for fresh tenders and will now have to pay more for their lighting if the former tender for electric lighting is now withdrawn.

After a short discussion, it was decided to refer the joint tender to the Works Committee, which is to report to the Council in not less than a month's time. A suggestion that the Council should then consider the report of the Works Committee *in camerâ* met with approval, but a strenuous endeavour should be made to ensure public discussion of the matter when the time comes.

INDUSTRIAL BANKS AND THE ELECTRICAL INDUSTRY

There was a good attendance at the meeting arranged by the National Electrical Manufacturers' Association on Tuesday evening to hear the Paper by Mr. L. Joseph on "Foreign Compared with Home Industrial Finance." Mr. Joseph is not only connected with banking interests, but is also interested in the financial side of the electrical industry. He gave a rough outline of the financial organisation of industry in various countries, and strongly advocated the system of industrial banks which is so common in Germany and the Continent generally, and also in a somewhat different form in the United States. He denied that industrial credit involved bankers in undue risks, and pointed out that Continental industrial banks were equipped both financially and intellectually to cope with industrial requirements, with the result that co-operation between them had proved salutary to both. He attributed the rapid rise and progress of the German electrical industry to the assistance given by their bankers, manufacturing and other concerns being readily granted funds for extensions. He commented upon the fact that whereas in England the capital of industrial concerns was usually inflated through the necessary intervention of the company promoter, who considered his work at an end when he had provided the capital, no matter upon what terms, in Germany the bankers did not consider their function at an end with the issue of the capital, but insisted upon seeing that it was efficiently administered. Figures were given relating to the Siemens and Schuckert firms and the A.E.G. as unmistakable evidence of the good influence of bank assistance.

Mr. T. Rich, Mr. Myers, Mr. G. Hooghwinkel, Mr. H. Hirst (General Electric Co., Ltd.), Mr. Oppenheimer (International Electric Co.), Mr. Donovan, and Mr. W. L. Madgen (Brush Electrical Engineering Co.) took part in the discussion, and the majority of them strongly supported the opinions of Mr. Joseph.

These gentlemen deplored the fact that there are no responsible authorities for looking after industrial promotions in Great Britain, and the formation of industrial banks was suggested, it being put to Mr. H. W. Butler (Chairman of the National Electrical Manufacturers' Association) that some steps should be taken officially by that body in this direction. The circumstances of the promotion of the Victoria Falls power scheme were recounted as showing the advantage of the co-operation of banks with industry, the German electrical manufacturing firms having, with the assistance of their banks, obtained the contracts for this scheme, whilst a number of English bankers were only considering whether it would be worth their while to go into it. Similar schemes are said to be passing British firms in Central and South America and the Far East. Mr. H. W. Butler did not think that the English bankers were so much to blame, as at present they had sufficient employment for their funds to be able to return a 20 per cent. dividend to their shareholders, and naturally they were content. If the suggestion of industrial banks for the electrical industry were to be carried into effect it would be necessary for new institutions to be created rather than the existing banks should be made use of. Mr. W. L. Madgen, of the Brush Electrical Engineering Co., took exception to the general feeling of the meeting being in favour of the German system, and regretted that Mr. Joseph had omitted all mention of the large number of financial companies in this country which had been specially formed to deal with industrial enterprises. He was not quite sure whether the German banks existed for the benefit of the industries or the industries existed for the benefit of the banks. Mr. Oppenheimer was the only other speaker who differed from the author of the Paper in his whole-hearted advocacy of the German system.

LOCAL NOTES

Aberdeen: *Harbour Lighting.*—A new agreement is to be entered into between the Harbour Board and the Corporation for the lighting of the harbour. All public lighting by arc lamps is to be charged at £14 10s. per lamp per annum, including current, trimming, carbons, and ordinary repairs. Incandescent electric lighting is to be charged at a flat rate of 2·75d. per unit, and all current for power and heating is to be charged at the rates in force in the City for this purpose. The agreement is to be for a period of five years from Jan.1st, 1911. The Engineer of the Harbour Board expects that a saving of about £150 per annum will be made by the Board.

Brighton: *The District Tramways Bill.*—It is stated that the Brighton and District Tramways Bill is to be withdrawn for the present session. In a recent issue we reported that the Standing Orders Committee of the House of Commons had refused to pass certain sections of the proposed lines owing to the absence of the consent of various road authorities. The lines remaining represented only a small portion in the centre of the route between Brighton and Worthing, and the promoters do not think it worth their while to proceed with this.

Canada: *Combination of Electrical Companies.*—It is stated that the Toronto Electric Light Co., the Electrical Development Co., the Toronto Power Co., and the Toronto Railway Co., are to be amalgamated. The total capital of these concerns is $19,000,000, in addition to a bond issue of $17,500,000.

Dublin: *Plant Extension.*—Mr. P. C. Cowan, Chief Engineering Inspector, Local Government Board, held an inquiry at the City Hall on the 24th inst. concerning the application of the Corporation for a loan of £128,129 for extensions to the electricity works. He mentioned that he had received two objections to the loan. The Dublin Tramway Company objected to the loan being sanctioned on the following grounds:—They object to further expense on

Hosted by Google

the extension of plant or otherwise in connection with the power station at the Pigeon House; the extension of further public lighting as proposed was wasteful and extravagant expenditure; they object to a loan of more than is necessary for the present requirements of the Corporation; it is unreasonable and inequitable to burden the city with loans for extensions which will not be required, as shown by the Corporation, in some cases before the year 1912, and in other cases 1913; on the further ground that the public electric lighting is carried on by the Corporation at a loss, is too expensive, it is not the best system and should not be continued, and that electricity can be otherwise obtained for the city at much less cost to the citizens. Sergeant O'Brien, for the Corporation, said that the Pigeon House Fort site had been selected on the advice of experts. Up to the present £620,742 had been sanctioned in connection with contracts, and of that sum £137,525 had been repaid. An extension was necessary having regard to the financial prospects

Leeds: *Tramway Profits.*—The sum of £51,888 are to be handed over to the relief of rates from the tramway profits for the past year.

London: *L.C.C. Tramways.*—The Wandsworth Council have been informed that the construction of the tramways from Putney Bridge along Putney High Street, and Putney Bridge Road to High Street, Wandsworth, will shortly be commenced.

Macclesfield: *Trolley Omnibuses.*—The Macclesfield and District Railless Traction and Electricity Supply Co have applied to Parliament for the insertion, in their Bill deposited in November, of an additional provision giving them powers to run trolley omnibuses along a number of other routes to those specified in their original application.

Malvern: *Railless Electric Traction.*—A meeting of ratepayers has passed a resolution calling upon the Council to support a Bill which proposes to instal a system of trolley omnibuses in Malvern.

Manchester: *Electricity Profits.*—The Electricity Committee have offered to base their contributions to the City Funds, commencing with 1911, at the rate of 1 per cent. on the outstanding indebtedness of the undertaking. On this basis the amount to be allocated this year will be £19,496, as against £15,000 last year. This sum is to be calculated after meeting instalments for sinking fund and interest charges.

Stoke-on-Trent: *Proposed Electricity Extensions.*—Notice has been given by a member of the Town Council that he will move at the next meeting that the resolution to expend £60,000 upon the re-arrangement of the electricity supply should be rescinded.

Swansea: *Proposed Purchase of Tramways.*—It is stated that the Swansea Improvements and Tramways Co. have indicated their willingness to agree to the purchase of their undertaking in 32½ years' time. Mr. J. M. McElroy, General Manager of the Manchester Corporation Tramways, has been appointed to advise the Corporation at a fee of £50 and travelling expenses.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Alloa.—Extensions are to be carried out at the generating station at an estimated cost of £3,400. The Town Council recently took over the undertaking from the British Electric Plant Co., and now propose to duplicate the plant.

Barking.—Tenders are invited by May 10th for extensions at the electricity works.

Barnes.—A combination de-oiling, softening, and feed-water heating plant is required for the electricity works. (See an advertisement on another page.)

Greenock.—It was stated at the last monthly meeting of the Corporation that it will soon be necessary to instal another turbo-alternator.

Ilford.—Tenders are invited by May 9th for a distributing switchboard, feeder cable and stoneware conduits. Particulars from Borough Electrical Engineer.

Mirfield.—Tenders are invited by April 29th for an electrically driven centrifugal pumping plant. Particulars from Engineer to Council.

New Zealand.—The Auckland Council invite tenders for complete boiler-house and engine-room equipments for their electrical power station. Copies of the specification may be seen at 73 Basinghall Street, London, and tenders should be sent to the Town Clerk, Auckland, by June 15th.

South Shields.—Tenders are invited by May 24th for 1,500 kw. steam turbine driving in tandem, a 1,000 kw. C.C. generator and 1,100 kw. A.C. alternator complete with switchgear and instruments. Particulars from Borough Electrical Engineer.

WIRING

Ashton-under-Lyne.—Elementary school at Droylsden. Architect, H. Littler, 16 Ribblesdale Place, Preston.

Bradford.—Rebuilding of Queen's Hotel, Listerhills Road.

Coatbridge.—Extensions to Woodside Iron and Steel Co.'s works.

Coventry.—Alterations and additions to Messrs. Thomas Bushill & Sons' premises, Little Park Street. Architects, G. & I. Steane, 22 Little Park Street.

Edinburgh.—Electric lighting of new school in Duncan Street. Specifications from Mr. J. A. Carfrae, 3 Queen Street, Edinburgh.

Extensions to Royal Scottish Museum.

Eton.—Town Hall and institute.

Halifax.—New church at King Cross.

Mansfield.—Extensions to Hospital.

Margate.—Electric lighting of concert pavilion and buildings at the Fort. Plans and specifications from F. W. Borg, Borough Surveyor, 13 Grosvenor Place, Margate.

Newport.—Monmouthshire County Training College at Caerleon.

Newton Abbot.—Extensions to Seale-Hayne College.

Southampton.—Additions to the Royal South Hants and Southampton Hospital.

Swansea.—Eighteen houses in Reginald Street, Mr. J. Thomas.

Wolverhampton.—Eighteen houses in Bruford Road, Mr. M. Westwood, Upper Villiers Street.

MISCELLANEOUS

Australia.—The Deputy Postmaster-General at Brisbane invites tenders by June 14th for the supply of telegraph and telephone material, including paper-insulated lead-covered cable, jointing sleeves, battery material, &c. Copies of the specifications may be seen at 72 Victoria Street, S.W., or 73 Basinghall Street, E.C.

Bolivia.—The Executive Authorities have, reports *The Board of Trade Journal*, been authorised to raise a loan of £50,000 for the installation of wireless telegraph stations.

Glasgow.—The arc lamps on the main routes to the Scottish Exhibition are to be changed over to flame arc lamps. In addition, all the street electric lighting in the City is to be brought up-to-date.

London: *Islington.*—Tenders are invited by May 4th for installation of fire alarms, &c., at the Guardians' School, Hornsey Road. Particulars from Guardians' Offices, St. John's Road, Upper Holloway.

Tenders are invited by the Commissioners of H.M. Works and Public Buildings for supply of carbon and metal filament lamps for one year from May 1st. Particulars from Storekeeper, H.M. Office of Works' Stores, 2 Lambeth Palace Road, S.E.

Tenders are also invited for supply of electric gas torches.

Malta.—A supply of arc lamp carbons is required at Valletta. Particulars from the Crown Agents to the Colonies, Whitehall Gardens, London.

Parliamentary Intelligence.—Liverpool Overhead Railway Bill was read a third time in the House of Commons on Thursday.

The Central London Railway Bill was read a third time in the House of Commons last week.

Manchester Local Section of the Institution of Electrical Engineers.—The annual report records the holding of eleven meetings during the session, an annual dinner, and conversazione. There are now 769 members of the Section (including 269 students), and the following Committee for the ensuing year was elected at the general meeting on March 28th. *Chairman,* W. Cramp. *Vice-Chairman,* J. Frith. *Members,* C. J. Beaver, A. A. Day, M. B. Field, G. Layton, Prof. E. W. Marchant, T. L. Miller, S. L. Pearce, Dr. E. Rosenburg, C. F. Smith, C. D. Taite, B. Welbourn, P. P. Wheelwright. *Past-Chairmen,* Miles Walker, S. J. Watson, and J. S. Peck. *Hon. Secretary and Treasurer,* H. W. Wilson. *Assistant Secretary and Treasurer,* A. L. Green. The Manchester Students' Section has held nine meetings, at which the average attendance was thirty-four. Messrs. P. Kent and W. A. Stephens have been awarded a Premium of £5 for their Paper on "High-tension Spark Discharges."

TENDERS RECEIVED AND ACCEPTED

Atherton.—The Council has accepted the following tenders :—British Westinghouse Co., two 50 k.v.a., and two 85 k.v.a. transformers; Messrs. Ferranti, three switch panels; Messrs. W. Boydell & Sons, Ltd., three feeder pillars.

Edinburgh.—The Corporation have accepted tender of the Bastian Meter Co. for the supply of 5 ampere meters for the ensuing year.

Govan.—The contract for a 500 kw. rotary converter has been placed with the British Westinghouse Co.

Grimsby.—The tender of Messrs. Hobdell, Way & Co., has been accepted for the lagging of the boilers at the electricity works at £47 10s.

Leith Docks.—The contract for 250 cells, 1,200 ampere-hour capacity, Entz booster, and switchboard, has been placed with the Chloride Electrical Storage Co., Ltd.

London.—Messrs. Waygood have been commissioned to construct a special electric passenger lift for the use of his Majesty King George upon the occasion of his visit to the Festival of Empire at the Crystal Palace. The lift will communicate between the terrace of the Palace and the King's Pavilion, and the arrangements for the control of it will be in all respects similar to those on the London underground railways.

Stoke-on-Trent.—The following tenders have been accepted :—Two 600 kw. rotary converters for Burslem works, British Westinghouse Co., £2,490; two 300 kw. rotary converters for Longton works, and two 500 kw. motor generators for Stoke works, Bruce, Peebles & Co., £1,310 and £2,250 respectively.

Southend.—A contract has been given to the North-Eastern Steel Co., for 750 tons of rails required by the Tramways Committee, at £6 10s. per ton.

Swansea.—Messrs. Crompton & Co., Ltd., have received a contract from Messrs. Vivian & Sons, of Hafod, near Swansea, for the electrification of their copper rolling mills. The mills, which are continuous running, are to be driven by two 300 h.p. motors running at a speed of 150 r.p.m. The contract includes a 1,000 ampere storage battery with automatic reversible booster of the Chelmsford type. The battery is provided to deal with the peak loads of the motors, and thus give a steady load on the generating plant. The motors will drive the mills through Citroen double helical gear.

Telegraph Traffic.—An interesting Paper on "Imperial Telegraphs" was read by Mr. Charles Bright, F.R.S.E., at the Royal Colonial Institute on Tuesday, and was followed by a short discussion. Mr. Bright pointed to the desirability, from a strategic point of view, for further State-owned cables connecting the Colonies and Dependencies with the Mother-Country, and in particular a cable from Great Britain to Canada, supplemented by a land-line across the Dominion. He criticised the recent proposal for a cable from Scotland, *via* Iceland and Greenland, to Labrador, and suggested as an alternative one from the West Coast of Ireland to a point near Montreal, with intermediate stations at Cape Bauld (Newfoundland) and at Cape Whittle. Communication with South Africa, he pointed out, was obtained by a cable landing on foreign territory, and he proposed that one should be laid from Gibraltar to Bathurst, another from Bathurst to Halifax (Nova Scotia), and that a complete All-British chain should be completed, embracing Canada, the West Indies, South Africa, St. Helena, Sierra Leone, and Ascension.—On the 18th inst. we were advised that telegrams could not be accepted unti lfurther notice for Arizpe, Babicora, Banamichi, and Ures in Mexico, and on the same day the lines between Mossuril and Ternas Vellozo, Mozambique, were down.—On the 19th, the Zanzibar-Mobassa cable failed, as well as the lines between Quelimane and Mhassurge.—On the 21st inst., telegrams could not be accepted until further notice for Haimanguillo, Santonio, Cardenas, and Cunduacon, in the State of Tabasco, Mexico.—The El Arich and Hanekin routes were restored on the 21st, inst., but the Bagdad-Bassorah line was still down.—On the 24th inst., the Hanekin route was *hors de combat* again between Bagdad and Hanekin.—The Campagnie Française des Cables Télégraphiques has not yet restored its West Indian system to French and Dutch Guiana.—The cable between Hwandang and Menado is broken, and telegrams for the latter place have to be sent *via* Japan, and those for other places in the Dutch Indies *via* Singapore, Saigon, or Cocos.—It is reported that a working agreement is about to be entered into by Anglo-American, Direct United States, and Western Union Cable Companies.

OSRAM-LAMPS

APPOINTMENTS AND PERSONAL NOTES

A third-class clerk is required in the Wolwich Electricity Department. Commencing salary £95, rising to £140 per annum. Applications to Town Clerk by May 6th.

Mr. Ashton Bremner has been appointed assistant electrical engineer at Walsall to take charge of the electrical undertaking of the Corporation during the temporary absence of Mr. A. S. Barnard, the Borough Electrical Engineer, through illness.

At the recent examination for entrance scholarships held at Faraday House, the following awards were made :—Harry Ellis Smith, Dulwich College, to the Faraday Scholarship of fifty guineas per annum, tenable for three years; special prizes of twenty-five guineas each were also awarded to Alexander Bell, Royal School, Dungannon, and W. H. Chaplin, Christ's College, London.

The Belfast Electricity Committee require a sub-station attendant. (See an advertisement on another page.)

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £56 15s. to £57 5s. per ton (last week, £56 to £56 10s.).

Liquidation.—A meeting of the Sylverlyte Electric Lamp Co., Ltd., will be held at 46 Culverden Road, Balham, on May 27th, at 10.30 a.m., to receive the liquidator's account of the winding-up.

Dissolution of Partnership.—E. L. Pinching and W. H. Walton, electrical engineers, 52 Cannon Street, E.C., have dissolved partnership. The business will be continued by W. H. Walton under the old style.

Agency.—The Adams Manufacturing Co., Ltd., have concluded arrangements with Messrs. Heringa & Wuthrich, of Technisch Bureau, Haarlem, Holland, to act as their sole agents for Holland and Java.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Edmundsons' Electricity Corporation.—The *Stock Exchange Gazette* states that the directors are considering a scheme of capital reorganisation for the funding of the four and a half years arrears of preference dividend, the scheme being to capitalise the sum into a form of certificates redeemable out of profits after a moderate dividend has been paid on the ordinary shares. For some time past there has been a steady demand for the £5 preference shares of Edmundson's, and there is every indication of a continuance of the advance in the price which has been taking place recently.

Babcock & Wilcox.—At the annual meeting last week Mr. J. Dewrance, who presided, said that during the past year many improvements had been carried out at the Company's works which had enhanced the quality of their manufactures and reduced the cost. As the report showed, all these benefits had been given to their customers, as although the turnover was larger, the net profits were less than in previous years. This was, unfortunately, the trend of all industrial concerns, and it was what the shareholders must expect in the future.

Calcutta Tramways Co.—At the annual meeting last week Mr. E. C. Morgan, Chairman of the Company, stated that during the past year they had run about 40,000 more car-miles and carried a million and a half more passengers than in 1909, and that whilst traffic receipts had increased by £10,500, expenditure had been less. The new car shed has enabled the staff to deal with the maintenance of the cars in a more economical manner, and at the same time to vastly improve the appearance of the rolling stock. The most encouraging feature was that the directors' policy in carrying out the extensions in Calcutta itself, and also in Howrah, had been completely justified by the results.

British Westinghouse Co.—The report for 1910 is a very satisfactory one. Trading profits amounted to £112,538, and, after deducting £24,423 for depreciation on machinery plant, tools, &c., in addition to £5,550 for general depreciation, and meeting interest on all classes of debentures, there is a net profit of £12,436. From this is deducted the debit balance of £7,319 on the working for 1909, leaving £5,117 to be carried forward. During 1910 the increased demand previously shown by the export market continued, and also extended to the home market. The orders received during 1911 show a considerable increase over those for the corresponding period of 1910. Mention is made of the arbitration proceedings between the Company and the Underground Electric Railway Co. of London, which will involve the Westinghouse Co. in a considerable sum of money, and the directors have been advised to appeal against the arbitrators' award.

SUMMARY

Our monthly Supplement on Electrical Engineering in Mines is included in this issue. It opens with an article on electric safety lamps for mines Some amendments proposed to the new Coal Mines Bill are given, and the most important electrical mining patents published in April are dealt with. Some new motor switch pillars are also described and illustrated.

The British Westinghouse Co. are suing the Electrical Co. for alleged infringement of the Bremer arc lamp patent. In addition to denying infringement, the Electrical Co. allege anticipation of the Bremer patent, and quote the Graham and Crosby specifications mentioned in the proceedings for infringement of the Bremer patent, in which the Westinghouse Co. were successful against Mr. Braulik. A point in the Appeal Court judgment in this action was that no lamp had ever been made according to the Graham specification, but a model has now been made, and evidence was called as to its satisfactory working. (Page 233.)

We are able to publish a few particulars of life tests of a well-known make of metal filament lamp. (Page 234.)

The application of Sir Oliver Lodge for an extension of his patent for "Improvements in Syntonized Telegraphy without Live Wires" was before Mr. Justice Parker last Friday. In granting an extension of seven years under certain claims in the specification, he complimented the patentee on his successful introduction of resonance for the first time. (Page 234.)

We are able to give the results of the official tests of a new 3,000 kw. turbo-alternator at Bristol which shows steam consumption down to 13·47 lbs. per kw.-hour. (Page 235.)

A road trial by the Automobile Club is in progress of a 3-ton lorry fitted with the Thomas transmission gear, which is partly electrical and partly mechanical. The gear provides about ten different torque ratios, and has many interesting points. (Page 236.)

A description is given of a new impulse disc and drum turbo-alternator recently installed at Bridlington. (Page 237.)

Among the specifications published by the Patent Office on Thursday last was one by P. Marino for storage battery separators of treated woven fabric which enable a very low internal resistance to be obtained.—R. A. Fessenden has patented a telephone relay with a brass-silicon contact, and H. E. Moul describes a feeding mechanism for flame arc lamps designed to obviate the trouble due to slag or deposit on the carbon tips.—An appeal has been lodged against the decision of the Comptroller to grant a patent to A. W. Leonard for an electrically-driven and illuminated advertising device.—A patent for an iron-nickel alloy for the leading-in wires of incandescent lamps expires on Thursday next, after the full life of fourteen years. (Page 238.)

A festival dinner in support of the Electrical Trades Benevolent Institution was held last week. Lord Justice Fletcher Moulton presided. Liberal donations were given, and we publish a complete list. Further contributions are earnestly solicited. (Page 239.)

Mr. A. M. Taylor read a Paper before Birmingham and London meetings of the Institution of Electrical Engineers last week on the use of storage batteries. He dealt with a number of aspects of battery working, deprecating the use of regulating cells, and putting forward a system of boosting, which he claimed would reduce the size of the boosters employed, and would give other advantages. In the London discussion Mr. B. M. Jenkin proposed a modified system in which the booster wires were eliminated at times of heavy discharge, and Mr. S. L. Pearce gave interesting

Hosted by Google

figures of the savings effected at Manchester due to the large battery installed at Dickinson Street. Several other well-known central station engineers also spoke. (Page 240.)

THE Aberdeen Corporation are considering the introduction of trolley omnibuses.—Mr. Arthur Wright has agreed with the Brighton Corporation to accept £1,000 in settlement of his claims.—The Edinburgh Corporation have decided to transfer the profits from the electricity undertaking towards reducing the outstanding capital.—The Arbitrator in connection with the dispute between the Manchester Tramways Committee and their employees has decided against the men.—A new tramway brake is being experimented with in Halifax.—It is expected that the trolley omnibus system in Leeds will be opened in a few weeks. (Page 242.)

EXPENDITURE upon new generating plant is contemplated as follows:—Rochdale, £8,700; Finchley, £15,410; Dublin, £128,129; Worthing, £5,000; Eccles, £3,783; Belfast, £40,000; Bath, £7,500.—A 1,200 ampere-hour battery is to be installed at Barnstaple, and a 2,500 kw. set at Stalybridge.—The Hackney Council require 100,000 pairs of flame arc lamp carbons; twenty-four new tramway cars are required at Hull, and new mains at Stoke-on-Trent. The Wanganui (N.Z.) Council require a complete generating station for their new tramways.—Considerable extensions are to be made to the long-distance telephone system of British Columbia. (Page 243.)

AT the meeting of the British Westinghouse Co. last week it was stated that if the appeal against the arbitrator's award in connection with the Lot's Road turbines is unsuccessful, it may be necessary to write down the Company's capital. (Page 244.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 4TH.

National Electrical Manufacturers' Association.

2.30 p.m. Council Meeting at Balfour House, Finsbury Pavement, E.C.

Institution of Electrical Engineers.

8 p.m. "Practical Aspects of Printing Telegraphy," by Donald Murray.

TUESDAY, MAY 9TH.

Institution of Electrical Engineers: Glasgow Section.

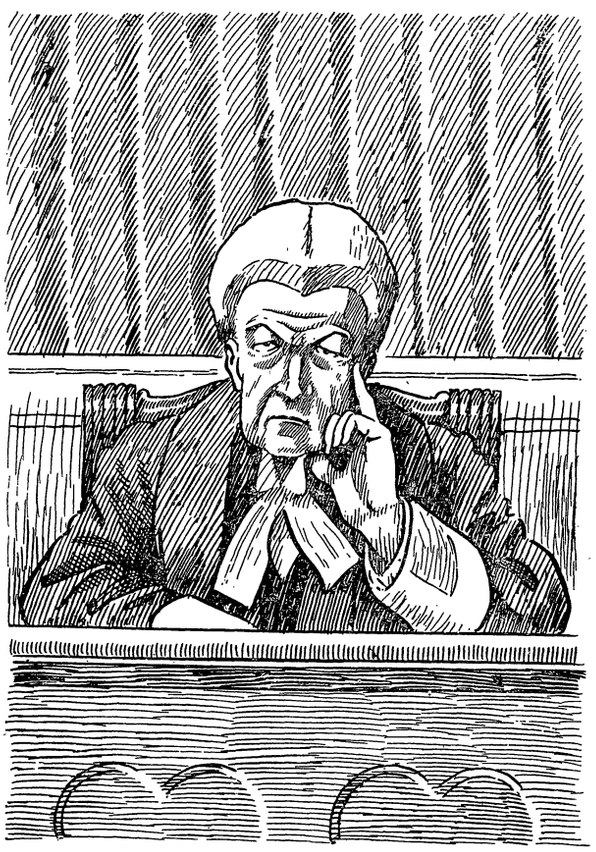
8 p.m. At 207 Bath Street.

WEDNESDAY, MAY 10TH.

Junior Institution of Engineers.

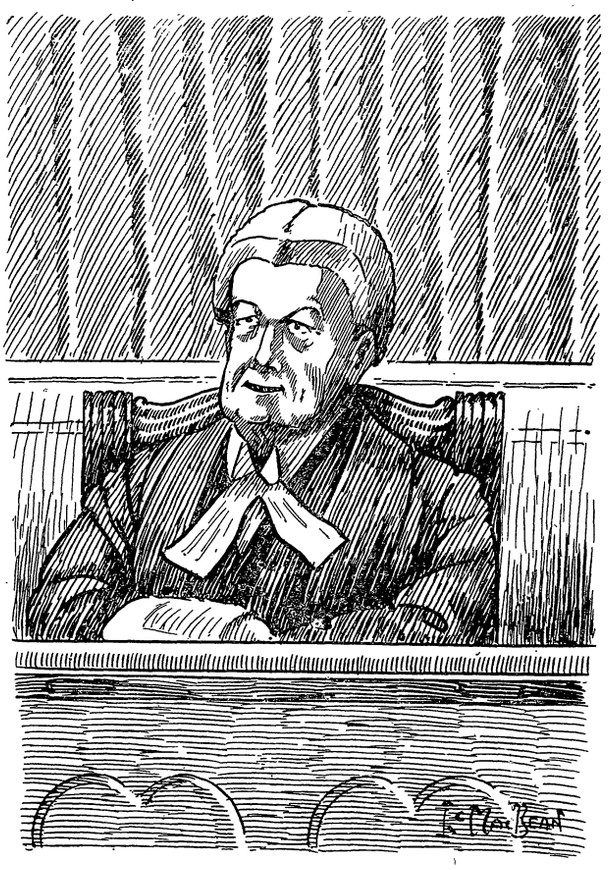
7.30 p.m. At Institution of Electrical Engineers, Victoria Embankment. "Notes on Illumination by Gas and Electricity," by F. J. Hawkins.

THURSDAY, MAY 11TH.



Institution of Electrical Engineers.

8 p.m. "The Driving of Winding Engines by Induction Motors," by H. J. S. Heather.



Institution of Electrical Engineers: Dublin Section.

8 p.m. At Royal College of Science.

Faraday House.—The seventh annual dinner of the Faraday House Old Students' Association took place at the Holborn Restaurant on Wednesday, April 26th. Mr. H. H. Perry, the President, was in the chair. Amongst the guests present were Mr. S. Z. de Ferranti, President of the Institution of Electrical Engineers; Professor J. D. Cormack, Mr. W. Duddell, F.R.S., Mr. J. S. Highfield, and Mr. Arthur Wright. Mr. S. Z. de Ferranti, in proposing the toast of "Faraday House and its Old Students," referred to the good work which had been done by Hammond College and its successor, Faraday House. Mr. Robert Hammond, in replying, reminded the company that although this was only the seventh annual dinner of the Old Students' Association, it was actually the twenty-sixth annual dinner of the old students. Mr. D. Wilson proposed the toast of "The Chairman," whilst "The Visitors" was given by Mr. A. F. Berry, and replied to by Mr. W. Duddell.

Expression on the face of a learned Judge of the Chancery Court after hearing Counsel's opening speech in a highly technical patent case.

Expression of relief on the face of the same Judge on being informed that a verbatim shorthand note would be taken.

THE BREMER FLAME ARC LAMP PATENT

Action by the Westinghouse Co. Against the Electrical Co.

AN action of considerable interest in which the British Westinghouse Co. are proceeding against the Electrical Co. for alleged infringement of the Bremer flame arc lamp, patent No. 18,786 of 1902, commenced before Mr. Justice Swinfen Eady on Thursday.

In spite of the Appeal Court decision, which upheld the validity of the Bremer patent (ELECTRICAL ENGINEERING, Vol. VI., p. 122), the defendants not only deny infringement, but also contend that the patent is invalid owing to anticipation and want of subject-matter. The patents quoted as anticipations include most of those mentioned in the defence to the action against Mr. Braulik (ELECTRICAL ENGINEERING, Vol. V., p. 617), with some additional ones, making 8 British, 3 United States, 1 French, and 2 German. As in the action against Mr. Braulik, the United States specifications of Graham No. 268,218 of 1882 and Crosby No. 553,335 of 1896 are chiefly relied upon.

The Bremer patent, No. 18,786 of 1902, relates to the feeding of the carbons in arc lamps of the converging carbon pattern. The patent—as amended in December, 1907, when one of the claims was struck out and a disclaiming note added—describes mechanism for the purpose of obtaining a lateral movement of one or both carbons in addition to the downward feeding motion. Two alternative mechanisms are described in the specification, and the accompanying figures are reproduced below in Fig. 1. The first consists of an arm which bears against one carbon. An armature attached to the upper end is attracted by an electro-magnet connected in shunt across the arc, and this end also holds the detent, which engages with a star-wheel geared to the feeding-cord drum. If the arc lengthens, the armature is attracted to the magnet, and the swinging carbon pushed towards the other carbon, and this action is continued until the armature has moved to such a point that the star-wheel is released. Feeding then takes place. In the second mechanism, shown in the two right-hand figures, the swinging carbon is

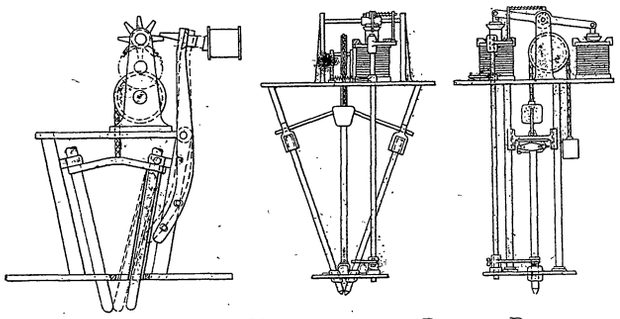

FIG. 1.—THE THREE FIGURES OF THE BREMER PATENT, No. 18,786/02.

moved by means of a loose collar near its burning end, this movement being controlled by a vertical shaft which is given a rotary motion by means of the differential action of the shunt and series coils.

The single claim attached to the specification is as follows:—

An arc lamp having downwardly pointing electrodes and provided with both downward and horizontal feed mechanism, so arranged that a certain amount of operation of the horizontal feed mechanism takes place before the downward feed mechanism is permitted to operate, subject to the disclaiming note.

The disclaiming note reads as follows:—The lamps to which my invention applies are of the type in which the current is supplied to the electrodes through electrode-holders, in which the upper ends of the electrodes are firmly clipped, and which are capable of being lowered simultaneously through the same distance, and about one of which the corresponding electrode can swing under the action of a device acting near its lower end, and I limit my claim to lamps of this description.

Mr. A. J. WALTER, K.C., opening the case for the Westinghouse Co., reminded the Judge that the patent had already been certified by the Court of Appeal in the previous case; yet the present defendants, the Electrical Co., were suggesting the same documents as anticipation of the patent as before, plus a large number of "eccentricities," unearthed from the Patent Office Library. He then reviewed the contents of the patent, and next exhibited a drawing (Fig. 2, opposite) of the alleged infringement—the "Sunshine" arc lamp sold by the Electrical Co. He explained that the carbons, which are inclined to one another, descend in a swinging frame which is pivoted top and bottom, and is caused to rock by the downward movement of an arm at the end of an oscillating lever. He contended that the mechanism contained every essential element of the Bremer specification—one of the carbons swung by a device acting at its lower end and the horizontal feed mechanism.

Mr. JAMES SWINBURNE, F.R.S., was the only witness put in by the plaintiffs. He said, in answer to questions put by Mr. Walter, that the special point in the Bremer patent was the downward feed of the carbon, that is to say, they were fed axially; there was no draw-back, and the end of one carbon was moved horizontally in either direction by the mechanism, and the two movements were so connected that an excessive horizontal movement resulted in a subsequent vertical feed, but a horizontal movement of the tips away from each other did not produce a reverse vertical movement. He endorsed the statements made by Mr. Walter as to the points of similarity between the defendants' lamps and that described in the Bremer patent, and said that, in his view, the modifications were mere additions, and not alterations in the principle of the lamp as invented by Bremer. Mr. Swinburne was then cross-examined at great length by Mr. Bousfield, the cross-examination being only concluded on Friday afternoon.

Mr. W. R. BOUSFIELD, K.C., then addressed the Court on behalf of the Electrical Co. on Friday. He said that much was made of the conditions necessary for introducing regularity in the burning of arc lamps with inclined carbons, but the electrical problem was precisely the same as with vertical carbons. The whole solution of this difficulty was to be found in lamps designed long before 1889; in the early 'eighties, he

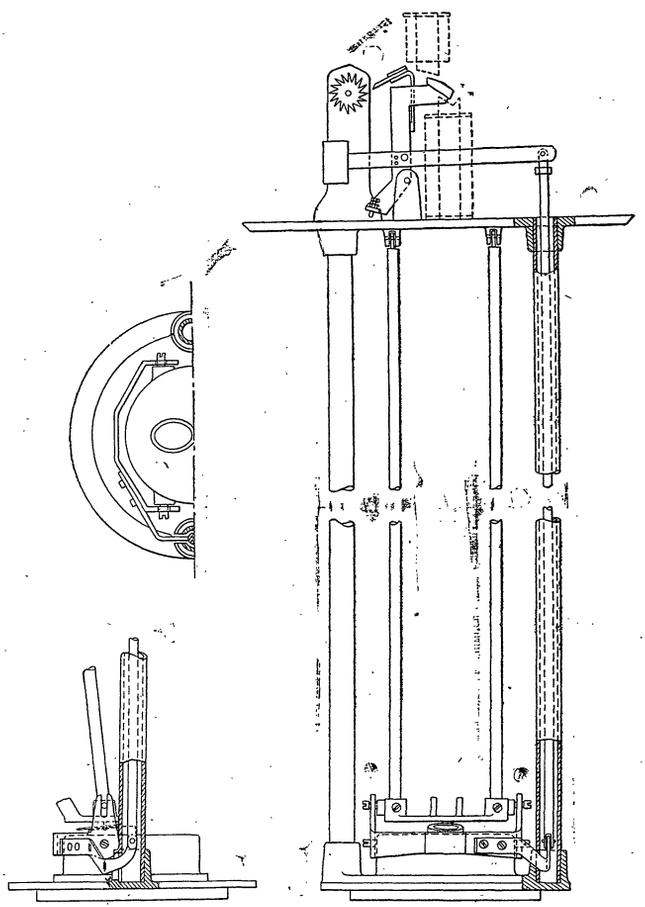

FIG. 2.—DRAWING OF THE ALLEGED INFRINGEMENT.

contended, vertical carbon lamps were made with this retractile motion, and the details were all given in lectures before the Society of Arts by Prof. S. P. Thompson in 1889. Bremer had merely applied an existing idea to an inclined carbon lamp, and despite the decision of the Court of Appeal he denied that this constituted invention. Mr. Bousfield's next point was that the drawings in the Bremer specification were admittedly unintelligible, and that a lamp having the advantages claimed in the specification could not be made from them. As a sample of the lamp made under the Bremer patent, the Westinghouse Co. had produced an Excello lamp, sold in this country by the Union Electric Co., which was quite different to the lamp described in the Bremer specification, and also different to the lamp of the Electrical Co. The alleged infringing lamp had a pivoted frame and not pivoted carbons, so that, no matter how much the carbon was burned, the movement at the end

Hosted by Google

of the carbon was precisely the same. Mr. Swinburne, in his cross-examination, had admitted that there was an advantage in this, viz., that the relation of the striking of the arc to the play of the armature of the magnet was always the same whatever the length of the carbon, although he had thought this advantage was neutralised by the fact that the whole of the frame was moved as well as the carbons.

Dealing in detail with the claims of the Bremer patent, Mr. Bousfield argued that the disclaiming note in the specification given above excluded from infringement any equivalent of an electrode-holder in which the electrodes are firmly clipped. In order to be able to get a monopoly for a retractile motion and horizontal strike of inclined carbons, a patentee must have invented and disclosed to the world one practicable way of carrying out the idea. But Bremer had not done this. He had merely taken one well-known thing and applied it to another well-known thing. Referring to the specifications of Graham and Crosby, he said that models had been made by simply following out the directions of the specifications, and the floating horizontal feed effect was obtained, and they could not be put on one side merely because a floating feed was not specifically mentioned by Graham and Crosby. The idea was outlined in these specifications, and the experiments had shown that in following out the instructions a lamp was obtained which was indistinguishable from the Bremer lamp in this respect.

Mr. Bousfield concluded his speech on Monday. He alleged that the Westinghouse lamps made precisely in accordance with the Bremer patent of 1902 were failures, and had to be withdrawn, and that the existing lamps were not made according to the specification. The design of the magnets had had to be changed in order to get any sort of success. In the figures of the Bremer specification the carbons were suspended in such a way that they rocked upon the suspension, and this had to be changed. Mr. Swinburne had also admitted that taking the Bremer specification, a workman could not construct a successful lamp, but would have to start over again.

Prof. J. D. CORMACK, Professor of Engineering at University College, and also at the London University, said he could find no specific mention of floating in the 1902 Bremer patent. The arrangements shown in Fig. 1 were the worst to obtain floating, whilst the other diagrams in the patent also had features which would prevent successful floating. He produced models made from the directions contained in the Graham and Crosby specifications, and demonstrated that they did get a floating feed horizontally. In the case against Mr. Braulik it had been argued that no lamps had been made in accordance with these specifications, and that therefore there was no evidence that they would work. Two models were shown of the Graham lamp, both of which had been run for 3½ hours, whilst the Crosby lamp had run for three-quarters of an hour. The latter did not run so satisfactorily as the Graham, but with all three models there was a horizontal swing before the downward feed.

Professor Cormack was cross-examined by Mr. Walter on Tuesday. He expressed the emphatic opinion that there was no advance on common knowledge at the time of Bremer's specification in any respect. He admitted that lamps made according to the Graham and Crosby specifications had not been put on the market, and also that in order to make the models from these specifications work satisfactorily slight modifications had had to be made. He further agreed with Mr. Walter that the Electrical Co.'s lamp contained every single element in the combination described in Bremer's patent, but the carbons swung with the frame instead of being pivoted on a frame. This he regarded as a distinct improvement, as it effected a much better regulation.

At the conclusion of Professor Cormack's evidence Mr. Bousfield caused some amusement by putting in the witness box Mr. J. Hunter Gray, one of the junior counsel for the Westinghouse Co. in this case, but who had appeared as junior counsel with Mr. Bousfield against the Westinghouse Co. in the application for revocation of the Bremer patent brought by Mr. Braulik. Mr. Gray was called to prove that an affidavit by Mr. Belfield, at that time in charge of the Westinghouse Patent Bureau, had been used in evidence in that case. It was a technical legal point, but was necessary in order that Mr. Bousfield could bring in as part of his case the fact that lamps originally made according to the Bremer specification had had to be withdrawn from the market owing to their unreliability, and that the present lamps on the market are made in a manner totally different from that described in the specification.

Professor S. P. Thompson, F.R.S., confirmed the main facts spoken to by Professor Cormack, and said that from the early 'eighties the majority of arc lamps had a retractile strike, and that by 1900 no less than nine-tenths of the arc lamps of the market were fitted with this movement. Even the old Brockie-Pell lamp was fitted in this way, and could easily have been made to burn flame carbons with slight modifications to secure better ventilation. A good deal of invention would be necessary to produce a satisfactory flame arc lamp if a workman were given the Bremer specification and drawings without any further instructions.

The cross-examination of Professor Thompson took place yesterday (Wednesday), and the case was still proceeding when we went to press.

THE LIFE OF METAL FILAMENT LAMPS

WITH reference to a letter in our correspondence columns on p. 175, of ELECTRICAL ENGINEERING of April 6th, taking up the subject of some recent tests of metal filament lamps of various makes carried out by the Westminster Electrical Testing Laboratory as they affected the Cryselco lamp, we have received an interesting communication from Mr. J. J. Fletcher, manager of the Osram lamp department of the General Electric Co. He remarks that as none of the Osram lamps tested had failed at the end of 2,000 hours, they had the test carried out for a further thousand hours—making 3,000 hours—and as no lamps had failed at the end of this period the test was prolonged for a further 1,000 hours—making 4,000 hours in all. One lamp failed at 3,600 hours, and the remaining three lamps were intact at the end of 4,000 hours. He comments with regard to the Cryselco tests that two lamps failed at 1,250 and 1,440 hours respectively.

Mr. Fletcher sends us some particulars of the tests of the four Osram lamps. At the commencement the average British c.p. was 21.4, and the average consumption 1·49 watts per c.p., while at the finish these figures had become 18·7 c.p. and 1·695 watts per c.p. The behaviour of the four lamps was remarkably close. During the continuance of the tests one lamp was broken in removal from the rack after 3,600 hours, but at the end of 4,000 hours the average c.p. was 18·5, and the consumption 1·72 watts per c.p.

THE LODGE WIRELESS PATENT

ON Friday last Mr. Justice Parker gave judgment in the petition of the Lodge-Muirhead Wireless & General Telegraphy Syndicate, Ltd., for an extension of the term of Patent No. 11,575 of 1897, granted to Sir Oliver Lodge. The arguments and evidence in favour of the petition were reported in our issues of April 6th and 13th.

The Judge complimented the patentee on being the first to make use of the principle of resonance, and the consequent possibility of securing that selectivity which was indispensable for practical purposes.

These methods are set forth in claims 1 and 2 of the specification.

The Judge, in taking into consideration the time and money required to put such a system on a commercial basis, and the fact that it had taken years of experimenting to obtain a satisfactory coherer, considered that the patentee had been inadequately remunerated. He thought that under Section 18 of the Patents Act, he would be justified in extending the patent on some of its claiming clauses only, and he would therefore grant an extension of seven years from the expiration of the existing patent, to be confined to claims 1, 2, 6, 7, 9, 10, and 11 of the existing patent. This grant was given on condition that the patentee should grant licences to those desiring to make use of the protected invention on terms to be arranged by a qualified representative of the Board of Trade.

Clause 11 is generally for the specific arrangement described and illustrated in the specification, and the other clauses extended are as follows :—

1. In a system of Hertzian wave telegraphy, the combination with a pair of capacity areas (of which one may be the earth) of a self-inductance coil inserted between them electrically, for the purpose of prolonging any electrical oscillations excited in the system and constituting such a system a radiator of definite frequency or pitch.

2. In a system of Hertzian wave telegraphy, the combination with a pair of capacity areas (of which one may be the earth) of a self-inductance coil inserted between them electrically for the purpose of prolonging any electrical oscillations excited in the system, and thereby enabling a distant radiator to act cumulatively if of corresponding period; thus constituting the system a resonator or absorber of definite frequency or pitch.

6. In combination, a pair of capacity areas connected by a coil of wire serving as a radiator in a system of Hertzian wave telegraphy, means for syntonising such radiator and means for charging it by aerial disruption or impulsive rush.

7. In a system of Hertzian wave telegraphy, the combination of a pair of capacity areas such as h h^1 [shown in various shapes in the drawings], means for syntonising such capacity areas, a receiving circuit completed through one or both of such capacity areas or their adjuncts, and means for bridging over the discharge gap between such capacity areas when they are to be used as a receiver whereby such capacity areas are rendered adaptable for use at will either as a radiator or resonator.

9. In a system of syntonic Hertzian wave telegraphy the combination with the self-inductance coil of the receiver of a secondary coil surrounding the same, which secondary coil forms part of the coherer circuit substantially as and for the purpose set forth.

10. The combination, in the receiving circuit of a system of Hertzian wave telegraphy, of an adjustable or replaceable self-inductance coil, connecting the capacity areas, a coherer, a battery, a telegraphic receiving instrument or a telephone with or without a shunt across the coils thereof substantially as and for the purpose set forth.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

ELECTRIC SAFETY LAMPS

IN the exhaustive report by Prof. Redmayne on the disastrous explosion and underground fire which occurred in the Wellington Pit of the Whitehaven Colliery about a year ago, there was an interesting Note by Mr. Robert Nelson (H.M. Electrical Inspector of Mines) which has not yet received the notice it deserves, although the report has been published several weeks. It will be remembered that the most accepted theory as to the cause of the explosion and fire was that fire-damp was ignited by a safety lamp, which may or may not have been defective, and that it was carried on by means of coal dust. The explosion occurred in the neighbourhood of a "goaf," and it is suggested that a heavy fall of roof might drive a large volume of collected gas out with such force that the gauze of the lamp afforded no protection. Prof. Redmayne recommends that men working in the neighbourhood of those goaves the roof of which consists of a thick bed of hard rock, as was the case here, should be provided with electric lamps in place of the usual oil safety-lamps.

Mr. Nelson, in the Note to which we have alluded, points out that the only fundamental objection to electric safety-lamps is that they will not, unless they are fitted with a cumbrous and delicate attachment, detect the presence of explosive gas. Any other defects in electric safety-lamps are purely of a constructional nature, and can be overcome with more or less ease by applying latter-day knowledge and experience; in fact, it is safe to prophesy that the electric lamp will have superseded the Davy lamp completely in six or seven years' time, and that independent devices will be employed for the detection of fire-damp.

Of these constructional defects, Mr. Nelson particularly mentions the switching arrangements. These should, of course, not be outside the box, and if properly constructed and placed within the lantern in a gas-tight case there can be no danger from the spark or break. With primary batteries, Mr. Nelson points out that switches may be dispensed with. The cell or cells can be half full of the electrolyte, and the plates extend only half-way down, and to light the lamp the box is simply inverted to allow the liquid to surround the plates. This principle is used in the lamps supplied by the Float Lamp Co. and the Chromolyte Syndicate. Another device suggested by Mr. Nelson is the use of a dry battery loose in the box, with contacts on it which come up against contacts connected to the lamp terminals within the box when the latter is turned one way up, and fall away from them by the weight of the battery when the box is inverted. A second defect which Mr. Nelson alludes to is that most of the electric lamps on the market give a "sort of search-light effect" and poor general lighting, but this is also easily remediable by a modification in construction and the choice of a suitable lens and reflector.

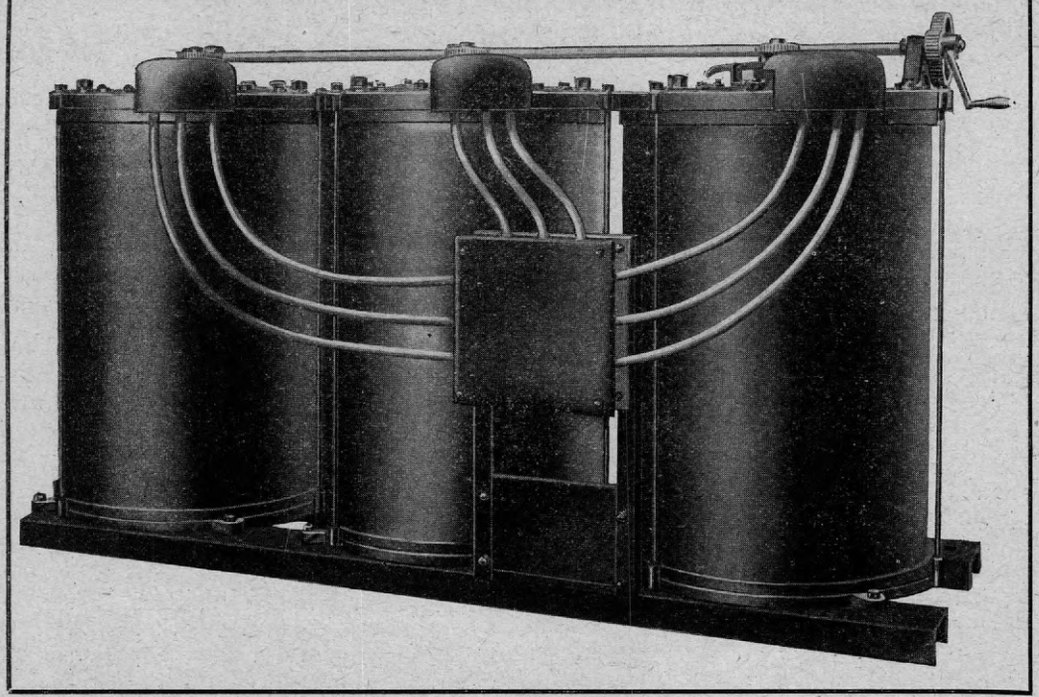
Of secondary battery lamps, the Oldham and Sussmann lamps seem to be most used, and the Bristol and Lithanode lamps are also employed to some extent.

Too much has been made of the possibility of a broken lamp igniting gas. As Mr. Nelson points out, the lamp is invariably protected by an outer glass, and the liability of damage or breakage to the actual lamp is certainly less than the corresponding risk attaching to a safety lamp, the glass of which may be subjected to unusual heat, and if the latter is cracked or broken the lamp immediately becomes dangerous. In fact, the electric lamp is by far the safer of the two, for the glass of a Davy lamp may become cracked by the lamp being left tilted; or, again, the lamp may have been left burning in a gaseous mixture until the gauze becomes red hot, and the gauze and glass are easily broken by a blow from a pick. Those engaged in mining work know that, immediately after an accident, electric lamps are called for and are used rather than oil lamps.

Coming to the question of practicability in regular service, the problem has now a far different aspect to formerly by the introduction of the metal filament lamp. The question of electrical efficiency is of the very greatest importance indirectly, although the cost of energy may be practically negligible, for as the metal filament lamp takes one-third of the power of the carbon lamp for the same light, the batteries can have one-third the capacity, and therefore little more than one-third the weight of the older ones. Moreover, there is no difficulty in constructing two-volt metal filament lamps, so that single-cell secondary batteries can be employed instead of two-cell, which means the possibility of a far better mechanical construction, greater durability, and lower maintenance costs.

The colliery in this country that has done most in connection with electric lamps is the Merton Colliery, in which the Sussmann secondary battery lamp has, we believe, been in use for some fifteen years. During this prolonged trial the lamp has been gradually improved, and there is little reason to doubt that the example will now be widely followed.

We invite correspondence from makers of electric safety lamps, and from the officials of the collieries in which these lamps are employed.



ABSENCE OF SEALING CHAMBER SUSPECTED OF CAUSING A FIRE

ON April 19th a fire occurred in a downcast shaft of the Brookhill Pit of the Pinxton Colliery Co., Derbyshire. Fortunately, the 400 men who were in the pit at the time were able to get to the surface in safety, and the fire was extinguished by rescue teams from Pinxton and Mansfield. We regret to say, that there is a well-founded suspicion that the fire was caused by a burn-out near the end of a cable supplying a pump motor. The outbreak was in a pump house, and we understand that the 3-core cable—a paper-insulated lead-covered cable working at 400 volts pressure—was connected up without there being any sealing chamber at its end, the hydroscopic paper insulation on the cores being protected from moisture in the atmosphere by a covering of tape only.

What appear to be the surrounding circumstances of this accident—heralded in the press and elsewhere as another instance of the danger attendant upon the use of electricity below ground—have been made quite familiar by experience, namely, neglect of an elementary precaution in the installation of the plant, added to failure of those in charge to realise the point or points of weakness in the plant under their care.

It is the neglect of such details, that is frequently the cause of accidents which bring electricity into disrepute for the time being in colliery practice, and, although in this case it cannot be definitely ascertained how the fire was caused, we have no hesitation in publishing the formation which we have obtained for the benefit of those, happily diminishing in numbers, who permit work to be done in collieries that is, to say the least, not in accordance with the best practice.

THE COAL MINES BILL

A LARGE number of amendments to the Coal Mines Bill have been placed on the paper by Mr. Markham (Member for Mansfield, Notts). Several of these relate to electrical working. One of them requires that the "electrician" appointed to supervise the electrical apparatus shall be over twenty-one, and, if necessary, shall be provided with assistants. His duties, according to another amendment, would be defined as follows:—

The electrician shall be in daily attendance at the mine. He shall be responsible for the fulfilment of the following duties, which shall be carried out by him, or by an assistant, or assistants, duly appointed under Sub-section 3 of this section:—The thorough examination of all apparatus (including the testing of earth conductors and metallic coverings for continuity) as often as may be necessary to prevent danger. The examination and testing of all new apparatus, and of all apparatus removed from one position in the mine to another, before it is put into service in the new position. The electrician shall keep at the mine a log book, made up of daily log sheets kept in the prescribed form. The said log books shall be produced at any time to an inspector of mines. Should there be any fault, or leakage, of current in any circuit, the part affected shall be made dead without delay, and shall remain so until the fault has been remedied. Inflammable or explosive material shall not be stored in any room, compartment, or box containing apparatus, or in the vicinity of such apparatus. Where electricity is used for signalling, the pressure in any one circuit shall not exced 25 volts. A proper plan, on the same scale as that kept at the mine in fulfilment of the requirements of this Act, shall be kept in the office at the mine, showing the position and size of all fixed apparatus in the mine. The said plan shall be corrected as often as may be necessary to keep it reasonably up to date, and it shall be produced to an inspector of mines at any time. Haulage by electric locomotives on the overhead trolley wire system is prohibited in any part of a coal mine.

The Bill was discussed on Thursday last by a conference between the Executive Committee of the Mining Association of Great Britain, representing the coal-owners, and the Executive Committee of the Miners Federation, representing the miners. The proceedings were private, but it is understood that the prevention of danger due to the use of electricity in mines was one of the matters discussed. At the general conference of the Miners Federation on the same day it was decided that the whole question of the use of electricity in mines be referred to the Executive Committee and they be asked to draft an amending clause to be submitted to a subsequent conference.

ELECTRICAL MINING PATENTS OF APRIL

AMONG the patents published during the past month and of interest to electrical mining engineers was one (No. 9,740 of 1910) by the Float Electric Co., Ltd., and W. J. L. Sandy for a miner's electric safety lamp. The case has a flanged lid which is forced into position, until it is held by catches, by means of a press against the force of a powerful spring under the lid. The miner cannot, therefore, tamper with the lamp as a special press is needed both to open and close the case.

Specification No. 12,360 of 1910, by G. S. Bragge of Burton-on-Trent, describes a machine, which may be electrically driven, for sprinkling stone dust or other material on the floors, walls or roofs of roads or galleries in coal mines for the purpose of reducing the danger of explosions.

Specification No. 15,098 of 1910, by M. Hart of London, communicated from F. W. Bawden, of Johannesburg, describes a tool for the electric ignition of safety fuses used in blasting. It consists of a pair of pliers with double jaws. One pair of jaws has spikes which perforate the fuse and meet in the powder, while the other two have contacts which complete the circuit through the spikes where the spark ignites the powder.

An Electrical Mining Alarm.—The *Electrical Record* (Melbourne) describes an appliance which is being tested in Australia to give signals in case of small movements of roof, &c., in mines. A tripod stand has a telescopic extension terminating in a fork, which can be arranged to press against the roof. The top part is flexible, and is pressed upwards by springs, and carries a cross arm provided with contacts at each end, set to be just not touching those on a similar cross arm on the section, within which the top section slides; thus any slight movement of the roof closes one or other of the pairs of contacts, and works bells or other signals.

OFFICIAL TESTS OF A 3000-K.W. TURBO-ALTERNATOR AT BRISTOL

AS the question of steam turbine efficiencies is very much to the fore, the results of the official tests of the first of the two new 3,000-kw. impulse type three-phase turbines built by the British Westinghouse Company, Ltd., for the Bristol Corporation Electricity Department may prove of interest as showing the efficiencies obtained on turbines of this description.

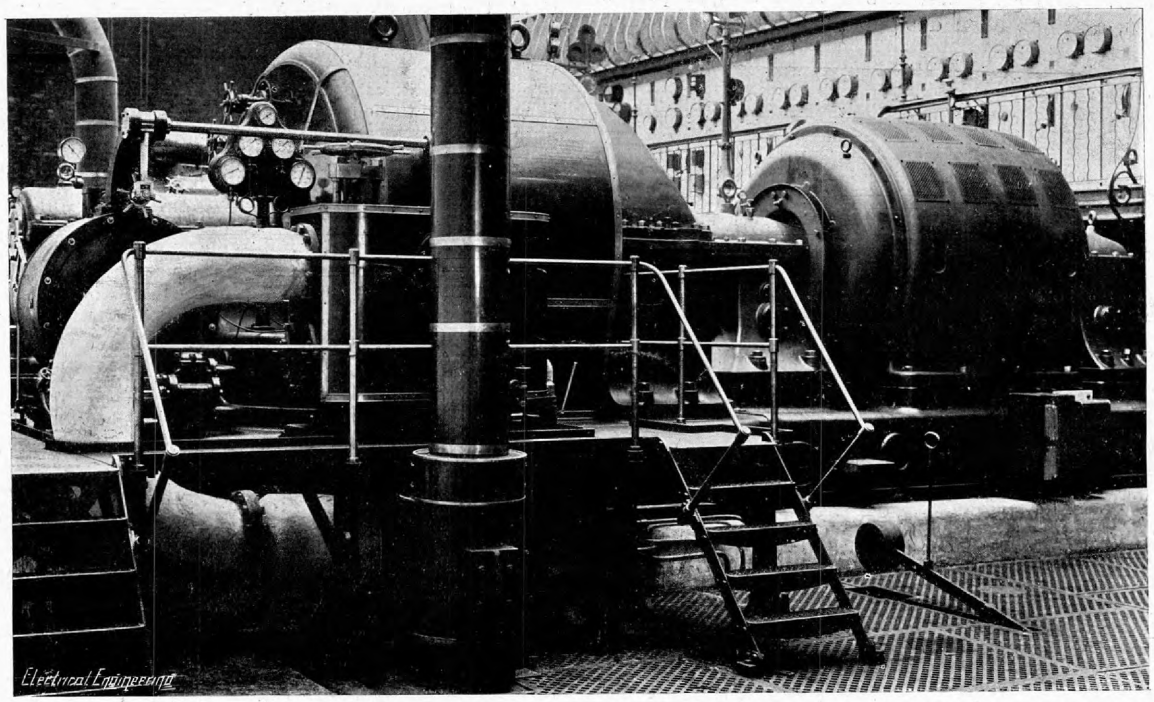

FIG. 1.—GENERAL VIEW OF 3,000-KW. WESTINGHOUSE TURBO-ALTERNATOR AT BRISTOL.

The specified conditions of test are as follows :—Normal output of turbine, 3,000 kw., three-phase, 50 periods, 6,000 to 6,600 volts. Steam pressure, 200 lbs. above atmosphere. Superheat 200° F. Vacuum, 28 in. in relation to 30 in. barometer. Speed, 1,500 r.p.m The sets are designed for an overload of 25 per cent. for two hours, or 50 per cent. for short periods. A photograph of the set is reproduced in Fig. 1. The turbine is of the design described in the ELECTRICAL ENGINEERING, April 20th, p. 205, where a detailed cross section of a similar machine was given. This type of turbine enables the use of very high steam pressures and temperatures without risk of injury to either blading or casing, as only the nozzle boxes—which are two in number—are subjected to maximum pressure and temperature. The steam expands in the nozzles from 200 lbs. per sq. in. (total temperature 590° F.) to about 45 lbs. per sq. in. pressure (the temperature being reduced to

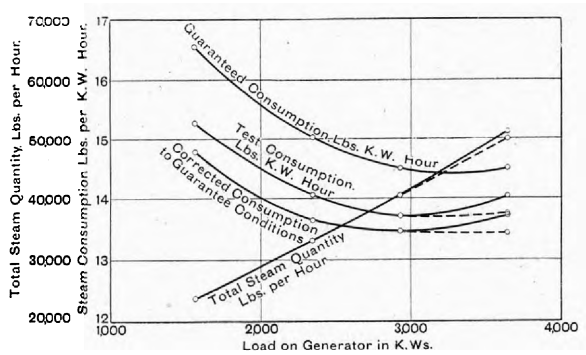

FIG. 2.—STEAM CONSUMPTION CURVES.

350° F.), the superheat and pressure being converted into kinetic energy, which is absorbed efficiently in the velocity wheel. The casing is thus subjected to comparatively low pressures and temperatures, so that no trouble is experienced due to distortion and expansion of the casing of the shaft. In addition to the nozzles capable of carrying full load, separate nozzles are provided for 25 per cent. overload and full load non-condensing. Thus, the consumption at 25 per cent. overload is even slightly better than at full load, since no steam is by-passed into a lower stage of the turbine.

The official tests were carried out at Avonbank Electricity Works, Bristol, on March 18th and 19th, 1911, by the British Westinghouse Company, in the presence of Mr. H. Faraday Proctor and other officials of the Bristol Corporation. Steam consumption tests were taken at ½, ¾, full load, and 25 per cent. over load, each for a duration of one hour, and all instruments used were specially calibrated immediately before and after the test. The following are the results obtained :—

Approximate Load	½	¾	full	1¼
Output	1563 kw.	2344·5 kw.	2930 kw.	3645 kw.
Speed	1505	1490	1500	1501
Steam Pressures...	192·5	189·2	195·4	193·6
Steam Temperature	556	560	568·1	565
Steam Superheat	171·2	176·6	182·1	179·7
Vacuum (30in. Barometer)	28·42	28·47	28·18	27·78
Circulating Water Inlet	41° F.	41°	43°	41°
Circulating Water Outlet	59°	61°	64°	66°
Energy for Air and Circulating Pumps ...	45 kw.	46 kw.	48 kw.	46 kw.
Steam Consumption. Total ...	23,887 lbs.	33,015 lbs.	40,200 lbs.	51,171 lbs.
Steam Consumption, lbs. per kw. hour	15·28	14·08	13·72	14·03
Ditto, corrected for 200 lbs. pressure 200° F. superheat (Vacuum as during test)	14·78	13·64	13·47	13·71

The corrections allowed for variations in the steam pressure and temperature as from the specified conditions are 1 per cent for 10 lbs. pressure, and 0·9 per cent. for 10° F. superheat. No corrections have been made for vacuum as contractor has benefit of more than 28 in. with Bar. 30 in. Fig. 2 shows the result of the tests in diagrammatic form. Due to an error when the overload test was made, the by-pass valve for running the turbine non-condensing was open instead of the valve provided for 25 per cent. overload. The dotted lines in the diagram show the results which would have resulted under proper conditions. The generator is separately excited from a 100-volt exciting system, the field absorbing from 276 amperes at 51 volts at half load, to 291 amperes at 55 volts at 25 per cent. overload.

THE THOMAS TRANSMISSION

A 3,000-MILES road trial is being carried out by the Royal Automobile Club of a lorry to carry a load of three tons, fitted with a form of transmission gear which is partly electrical and partly mechanical. The gear presents several unique points of interest, and has been designed by Mr. G. Thomas.

FIG. 1.—VIEW OF TEST VEHICLE.

The lorry was entered for the trial by The Thomas Transmission, Ltd. (14 Leonard Place, Kensington), and apart from the nature of the vehicle itself the trial is of interest as being the first time a heavy commercial vehicle has been subjected to a test of this kind by the R.A.C. The route is exceptionally hilly, and the trial consists of continuous trips day and night from Cooper's Green, near Uckfield, to Bromley Common, about thirty-seven miles, viâ Tonbridge and Sevenoaks. The most serious incline is River Hill, parts of which are said to be 1 in 6½. A photograph of the vehicle, which weighs about 7 tons 15 cwt. with passengers and load, is given in Fig. 1.

Before describing the actual vehicle, we must explain the general principle of the transmission gear, which is shown diagrammatically in Fig. 2. The arrangement of the parts in a touring car chassis is seen in Fig. 3. The engine drives a casing D forming the flywheel, which contains a double system of epicyclic gearing arranged as shown, with one central pinion W keyed to the inner shaft H, which is the actual propeller shaft, and the other, W_1, of smaller diameter, mounted on the sleeve K. Each pair of surrounding "planet" pinions are keyed to the same spindles. Two identical electrical machines, acting as we shall see sometimes as dynamos and sometimes as motors, have their armatures mounted respectively on K and H, and their fields fixed to the chassis. These machines are series wound, and are connected permanently in series. There are two paths of power between the engine and the road wheels—a direct mechanical path from W along the shaft H, and an electrical path through the two electrical machines BB_1 and CC_1. If W is larger than W_1, then for a certain rotation of the casing, W_1 will tend to rotate backwards and W forwards, at speeds depending upon their relative resistances to motion. If the speed of D is constant, the speed of H will vary with the speed of K, and since the speed of K depends on its resistance to motion and therefore on the load on the machine BB_1, the speed of H can be varied by the variation of power transmitted electrically.

The actual series of operations is as follows:—The casing D is rotated by the engine at a speed controlled by the throttle. Before starting, W_1 will rotate freely backwards and W remain stationary. To start the vehicle current is taken from BB_1 to CC_1—this has a double effect on the load shaft H. The current

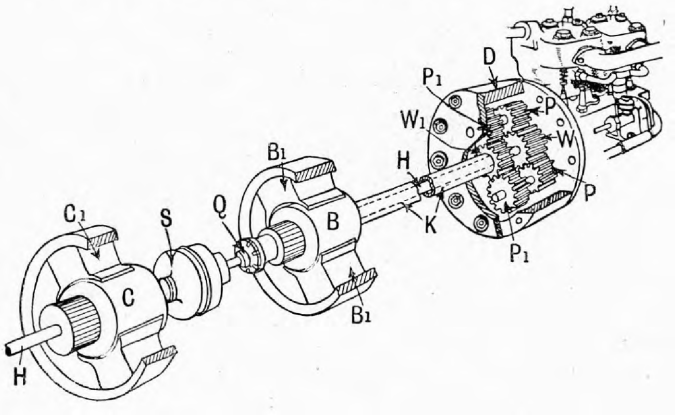

FIG. 2.—DIAGRAM SHOWING PRINCIPLE OF THE THOMAS TRANSMISSION SYSTEM.

transmitted to CC_1 exerts a large starting torque on H and the loading of BB_1 with this current decreases the speed of K, and therefore causes W to rotate. In this manner a large starting torque is exerted on the road wheels. As BB_1 is gradually decreased in speed by controlling the relative fields of the machines, the vehicle increases in speed until K practically comes to rest. Up to this point BB_1 has been acting as dynamo and CC_1 as motor. If now K is forced to rotate against and in the same direction as the engine it is evident that H can still further be increased in speed. This operation is performed by transmitting power from CC_1 to BB_1—both machines now changing their functions. K increases in speed more rapidly than H, due to the gear ratio, until finally they are both travelling at the same speed. The coupling Q is then engaged, with the result that the current in the electric circuit dies down to zero.

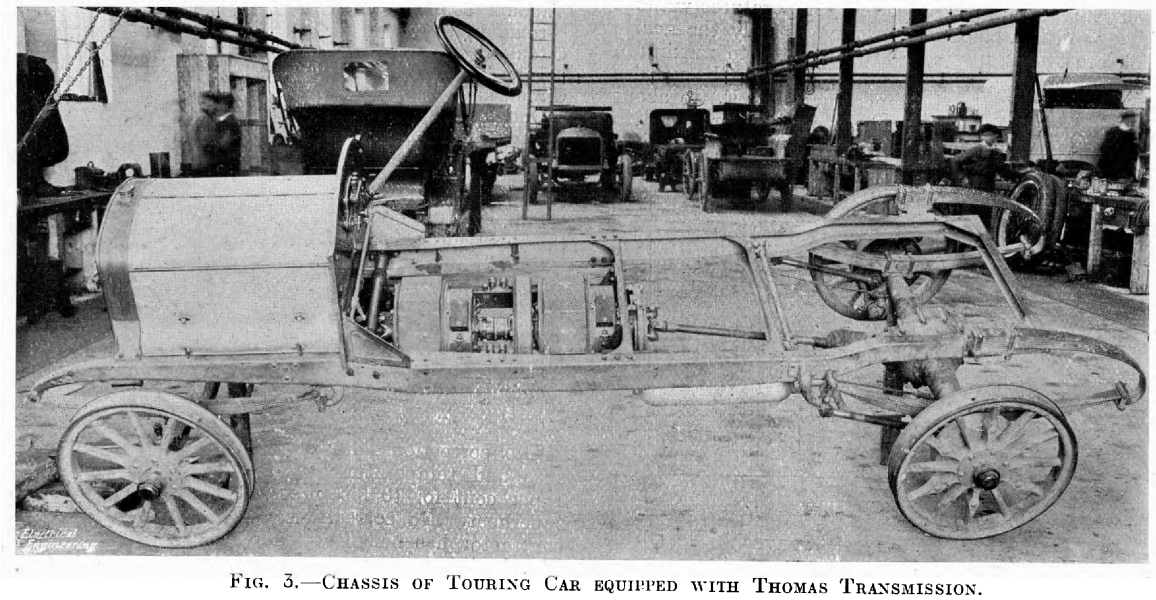

FIG. 3.—CHASSIS OF TOURING CAR EQUIPPED WITH THOMAS TRANSMISSION.

All electrical losses are thus eliminated and a direct drive is obtained from the engine to the road wheels as a top speed. The control is effected by a single lever working a controller which regulates the relation of the field strength of the two machines by suitable diverting resistances, and also in its top speed position controls the engagement of the jaw clutch Q. It has, in addition to 10 intermediate electrical positions or

Hosted by Google

"speeds," the top speed position, a position for converting one of the machines to shunt connections, and inserting suitable resistances for charging the small battery which is carried, and a position in which this battery drives one of the machines as a motor to start the engine from the driver's seat, and a reverse position, reversing the connections of one machine and letting the other drive it backwards with the jaw clutch in and the cone clutch (which is controlled by a pedal) out.

One of the main points of the system is the possibility of so many graded variations of torque ratio, providing very nearly the equivalent of a continuously variable gear ratio. The engine can consequently be run always under the best conditions, resulting in the possibility of using a smaller engine than would otherwise be required, and a great gain in petrol consumption. The efficiency is much higher than in those systems where the whole of the power is transmitted electrically, as the electrical losses are only a percentage of that part of the power transmitted electrically. The electrical efficiency is highest at the half-way point, where one machine is stationary, and then amounts to about 94 per cent. On the lowest speed running notch it is about 80 per cent., and on the highest electrical notch about 86 per cent. The current in the machines is practically constant, and there is no possibility of an armature burning out through being overloaded. The weight of the equipment is certainly heavier than that of the ordinary gear-box, but this is more than counterbalanced by the efficient conditions under which the engine works, as has been shown by hill-climbing tests with cars with identical chassis, one with an ordinary gear-box and one with this system, the latter proving 20 per cent. faster. Again, a smaller engine can be used, and it can be given higher compression, as it can run at practically constant speed, and it must not be forgotten that a complete electric lighting equipment is incidentally provided. The size of the electrical machines is determined by the torque range required, and in machines for hilly roads these are not larger than motors for one-third the continuous output of the engine.

The particular vehicle being tested by the R.A.C. is adapted from a standard 36/40-h.p. Leyland chassis, with engine 4¾ ins. bore. The motors, which are thoroughly dust-tight, weigh from 5 to 6 cwt. each. They have six poles each, and were made to Mr. Thomas's designs by Messrs. Mawdsley's, Ltd. (Dursley, Glos.), and, using entirely single-turn coils, are very free from sparking. The controller was made by Cowans, Ltd., and weighs about ½ cwt. It is fully enclosed, with all contacts and resistances under oil. A 180-ampere hour 12-volt Tudor battery is carried for starting the engine and supplying the lamps. During the trial this has been put on charge only on downhill stretches, but has been able to run the lights for 8 hours every night. The total weight is 7 tons 15 cwt., including chassis, accessories, passengers, and 3 tons 7 cwt. of sand. Previous tests in Lancashire have shown a petrol consumption of 9·7 tons per gallon fully loaded, but the result of this trial will not be as good, as the road is exceptionally hilly, and the R.A.C. observers do not allow the speed ever to exceed 12 m.p.h.

The system has been applied to touring cars, and we can speak from experience of the excellent running of one of these, and an experimental railway coach equipped on the same principle is now being tested. Space forbids us to enter in further particulars, but in conclusion we wish to express our thanks to Mr. G. Thomas and to Mr. Thompson, of the Thomas Transmission, Ltd., for their courtesy in demonstrating the system to us, and their hospitality on the occasion of our visit to Sevenoaks to see the trial vehicle and a lighter car equipped with the transmission.

AN IMPULSE-DISC AND DRUM MIXED PRESSURE TURBO SET AT BRIDLINGTON

AMONG recent tendencies in turbine design, one of the most important is the combined impulse and reaction turbine. A fine example is presented in the machine which Messrs. Willans & Robinson, Ltd., of Rugby, who have adopted this design as their standard for all high pressure and mixed pressure work, and are supplying them in increasing numbers to colliery installations, have supplied to the power station of the Bridlington Corporation, to the specification of Mr. A. J. Beckett, the Borough Electrical Engineer.

It consists of a wheel carrying the high pressure impulse blading and a drum on which is mounted the low pressure reaction blading. Two inlets are provided, one for the high steam, and one for low pressure steam, and the admission is controlled in both cases by throttle valves. The governing arrangements are remarkably simple, as both throttles are actuated direct by the centrifugal governor.

The generator is of the standard continuous-current type made by Siemens Brothers Dynamo Works, fitted with ventilated commutator, and having a normal output of 300 kw. at 440 to 500 volts, when running at a speed of 2,700 r.p.m. The full output can be obtained when the turbine is supplied with exhaust steam from the existing engines, or any mixture of exhaust and live steam. No live steam is admitted until after all the exhaust steam available is being utilised. The turbine will also give its full load, 25 per cent. overload, and a non-condensing output of 250 kw. on live steam.

Although the plant has not been installed for more than a short period, very satisfactory economies are being obtained with the combined plant as compared with the engine-driven sets alone. When running on high pressure steam, the results are much better than when the engines alone were run condensing. In changing over from high to low pressure, the speed variation does not exceed 1 to 2 per cent. as a maximum. Other points worth noticing are the absence of vibration and the excellence of the bearing design and oil cooling arrangements.

We are informed that Messrs. Willans & Robinson, Ltd., have installed a large number of similar machines which are giving equally good results. Among those working at collieries may be mentioned the mixed pressure sets at the Blairhall Colliery, Fife, the Rothervale Collieries, near Sheffield, and the Tredegar Coal & Iron Co.'s Collieries in South Wales; also the plain exhaust set at the Pleasley Colliery, near Nottingham.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ALUMINIUM v. COPPER CABLES.—The British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), have sent us a table giving the aluminium equivalents and standard sizes of low-tension paper-insulated lead-covered cables—calculated in accordance with the standards of the Engineering Standards Committee for all sizes from the equivalents of 0·025 to 1 sq. in. copper. The table gives dielectric and lead thicknesses and weights, and should be of considerable service to those considering the question of using aluminium cables, and it may be taken as an appendix to the articles published in our issues of November 24th and February 9th last. The company also send a curve showing the saving arrived at by using aluminium cable at about present prices of aluminium and copper, and ask us to say that they will be pleased to send copies of both the table and curve to any of our readers who may be interested.

TELEPHONES AND BELLS.—The Sterling Telephone & Electric Co., Ltd. (200 Upper Thames Street, E.C.), have sent us the revised edition of their abridged catalogue, dealing with equipments of all kinds for telephones, including their wonderful "Primax System" of intercommunication, designed to reduce cross-talk to a minimum.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

METALLIC DIMMERS.—A pamphlet from the Adams Manufacturing Co., Ltd., Bedford, deals with their Igranic Metallic Theatre Dimmers. They consist of a resistance divided up into a number of small steps, so that the lamps can be made to glow or fade gradually. They are worked by means of a lever working on a rigid rod drive. Any combination of lamps can be worked by a method of interlocking by means of a master lever, connection being made by half a turn of the lever. We understand the company have obtained a contract for a complete installation of these dimmers for one of the largest theatres in St. Petersburg.

INSTALLATION ACCESSORIES.—Two catalogues have reached us from Messrs. Siemens Bros. Dynamo Works, Ltd. (Supply Department, 39 Upper Thames Street, E.C.), chiefly illustrating various types of tumbler switches and lampholders. Included in these are the latest forms of the Watkin switch. Another feature is an insulated switch lampholder, for which a patent is being applied, consisting of a fireproof insulating case enclosing the porcelain interior of a switch lampholder. The illustrations, which number some 150, show the following sections very clearly: Ceiling roses, porcelain connectors, electric heaters, fuse-boards, cut-outs, the Fuller electric geyser, various wall plugs, and insulators.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—Member: H. B. White. Associate Members: R. Ayton, J. H. Bell, W. Bowen, G. B. Burrows, J. Carnie, W. W. Crompton, E. P. Elwin, E. Henkhe, W. J. Henry, C. H. Hird, W. Hodson, R. S. Hubbell, E. Hughes, A. Hutcheson, S. B. Iyengar, A. W. Maley, F. M. Ward, R. H. Wilkinson. Associate: H. C. Townsend. Students: A. H. Barrett, E. F. Boynton, D. D. Campbell, S. A. Campbell, K. C. Mittra, E. Potter, R. W. Shackell.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 27th, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

30,602/09. **Accumulator Separators.** P. MARINO (London). Separators for storage batteries in which the plates are packed closely together consist of woven fabric of animal or vegetable fibre (wool or cotton) treated to strengthen it and protect it from the action of the electrolyte by immersing the material in an alkaline silicate bath and then in a bath of dilute sulphuric acid, finally coating it with a thin film of gutta-percha, india-rubber or celluloid. The fabric retains its porosity, and enables a very low internal cell resistance to be reached.

2,829/10. **Heating and Cooking.** G. G. BELL (London). This specification describes a combined electric water-heater, oven, and heat-conserving apparatus, consisting of a large mass of material of high specific heat and a good heat conductor with an electric heating element embedded in it, and a hollow space in the mass to form an oven. Two figures.

9,097/10. **Lift Controller.** ADAMS MANUFACTURING CO., LTD. (*Cutler Hammer Manufacturing Co., U.S.A.*). A controller for lift and other motors provided with an automatic device to slow down the motor before the circuit is opened, is further provided with a device to disconnect the motor from the supply automatically if the slow-down mechanism fails to work, thus ensuring that the motor will have sufficient time to come to rest before the limit of travel of the lift is reached. One diagram.

10,790/10. **Flux for Soldering Aluminium.** W. FRIES (Berlin). A flux for soldering aluminium consists of a mixture of 90 parts of chloride or hypochlorite of zinc and 10 parts of common salt, and an addition of from 2 to 20 per cent. of iron oxide. The specification describes the method of using the flux, which removes the film of oxide, enabling the solder to unite with the metal.

11,602/10. **Telephone Relay.** R. A. FESSENDEN (*Brant Rock, U.S.A.*). The weak received currents pass through the coils of a receiver on the diaphragm of which is a silicon button in contact with a brass pin. This contact is in a local circuit containing a battery and an ordinary telephone receiver. Two figures.

13,528/10. **Arc Lamp.** H. E. MOUL (London). A feeding mechanism for flame arc lamps of the converging carbon pattern, allows one carbon to feed gradually, but the other at intervals, so that it drops suddenly and rubs off any slag or deposit from the tips. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: JANDUS ARC LAMP & ELECTRIC CO. and JONES, 15,807/10; MICHOTTE, 28,888/10; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Vapour devices] 3,268/11.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: VON PINDTERSHOFEN [Cables] 14,496/10.

Dynamos, Motors and Transformers: LAYTON [Generating systems] 12,261/10; WARBURTON [Combined reciprocating engines and turbo-generator plant with motors for driving ships, &c.] 18,307/10; SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens-Schuckertwerke Ges.*) [Polyphase induction generators] 23,634/10; SIEMENS BROS. DYNAMO WORKS, LTD., KIEFFER and KLOSS [Ventilation of machines] 2,317/11.

Electric Ignition: LAMPLOUGH [Sparking-plug] 12,856/10; R. BOSCH, 20,968/10; RENO and BLOIS [Distributor] 21,949/10.

Electrochemistry and Electrometallurgy: COWPER-COLES [Electro-deposition of iron] 9,082/10; WALKER and SEAMAN [Electroplating] 9,129/10; HENRI, HEILBRONNER and VON RECKLINGHAUSEN [Sterilisation of liquids] 14,127/10; REID [Regulating electrodes of furnaces] 19,805/10; HEIL [Primary cells] 207/11.

Incandescent Lamps: BRITISH THOMSON-HOUSTON CO. and GRAY, 8,984/10; GRIGGAL and BRITISH VITRITE WORKS, LTD. [Manufacture of lamp bases] 8,988/10; MALACHOWSKI [Manufacture of lamps] 10,041/10.

Storage Batteries: JOHN and BERRY [Non-spillable vents] 17,308/10.

Switchgear, Fuses, and Fittings: HIRST and BROOK [Motor starters] 5,765/10; BOOTH [Connection of incandescent lamps in series] 8,371/10; SMITH and LARSEN [Motor controllers] 15,343/10; BULLIMORE and A. C. COSSER, LTD. [H.-T. condenser] 15,873/10; BERRY and MARKHAM [Insulating parts of switches] 22,380/10; CROSHER [Connecting wires to lamp-holders] 1,614/11.

Telephony and Telegraphy: COLWILL [Sound-proof telephone box] 9,326/10; SOC. DES TELEGRAPHES MULTIPLEX (SYSTEME E. MERCADIER) [Mono-telephonic relays] 29,271/10.

Traction: ANGUS [Preventing collisions] 756/10; HADFIELD [Tramway points] 8,834/10; SEFTON-JONES (*Soc. pour l'Exploitation des Brevets d'Aiguillage Samaia*) [Tramway points] 8,863/10 and 27,487/10.

Miscellaneous: BRIGHTMAN [Automatic temperature control] 1,943/10; REILLY [Electric alarm and lock for tills, &c.] 8,743-4/10; BROWN, BOVERI ET CIE. [Operation of pumps and compressors] 9,201/10; BRITISH INSULATED & HELSBY CABLES, LTD., and BUCHER [Jointing sheet-metal articles] 11,003/10; LAXTON [Combined fire alarm and bell push] 14,985/10; BENTLEY [Electric clocks] 19,044/10; LUCAS and EDWARDS [Electric horns] 22,482/10; FREUND [Electrically controlled bell-ringing mechanism] 30,397/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distributing Systems, &c.: SOC. VEDOVELLI PRIESTLEY ET CIE. [Suspension chain for H.-T. transmission wires] 27,174/10; HULTMAN [Cable drums and channels] 5,812/11.

Dynamos, &c.: ALEXANDERSON [Control of A.-C. motors] 8,149/11.

Incandescent Lamps: SCHILLING [Cementing process for lamp filaments] 23,640/10.

Instruments: H. ARON ELEKTRICITÄTS-ZAHLER FABRIK GES. [Prepayment meters] 3,450/11.

Telegraphy: GOLDSCHMIDT [Wireless telegraphy] 8,387/11.

Opposition to Grant of Patents

6,700/10. **Blowers.** W. MULHOLLAND. The grant of this patent is opposed. The specification describes a particular construction and arrangement of the blades of centrifugal fans with axial suction and circumferential discharge, which is claimed to obviate the partial vacuum behind the blades and to increase the efficiency of the blower.

28,210/09. **Advertising Sign.** A. W. LEONARD. An appeal has been lodged against the decision of the Comptroller-General granting this patent. The patent covers an electrically-driven and illuminated advertising device in which transparent advertisements are exhibited successively through apertures in a box.

Extension of Term

11,575 of May 10th, 1897. **Wireless Telegraphy.** SIR OLIVER LODGE. This patent would, in the ordinary course, expire on Wednesday next, but its term of life has been extended for another seven years. Mr. Justice Parker's judgment granting this extension is given on another page.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:

11,695 of May 11th, 1897. **Iron-nickel Alloy.** J. C. MEWBURN (*Soc. Anon. de Commentry-Fourch-ambault*). This patent covers an alloy of iron containing 37 per cent. of nickel, which does not expand when heated. It is used for leading-in wires in incandescent lamps, for parts of fire-alarms and of instruments, and for other purposes.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: G. W. MASCORD [Electric driving of printing machinery, &c.] 727/04; G. E. GAIFFE [Magneto generator for therapeutic purposes] 890/06; C. A. PARSONS [Cooling of armatures and transformers] 1,068/06.

Electric Ignition: F. R. SIMMS, 909/02; ELECTRIC IGNITION CO. and F. H. HALL [Sparking-plug] 735/06.

Instruments, &c.: V. FEENY (*Allgemeine Elektricitäts Ges.*) [A.-C. induction meter] 683/00.

Switchgear, &c.: W. H. BOWLEY [Jointing flexible metallic tubing to conduit fittings] 632/03; BRITISH THOMSON-HOUSTON CO. and E. B WEDMORE [Overload and reverse current relays] 718/05; P. H. THOMAS [Mercury-vapour rectifier] 222/06.

Traction: F. C. NEWELL [Wheel brakes operated by magnetic track brakes] 998/01; W. and T. W. PHILIPSON [Brakes] 928/03; W. WARNER [Rail-joints] 1,009/03; F. L. CLARK [Air brakes] 901/04; A. NEELEMANS [Electric signalling system] 1,095/04.

Miscellaneous: H. H. CUMMINGS [Electric aim recording shooting apparatus] 745/03; S. C. DAVIDSON (SIROCCO ENGINEERING WORKS) [Electric fan equipments for mine and tunnel ventilation] 926/04; H. PFEIFFER [Submarine boat amusement device as at the "White City"] 1,098/04; H. CRUSE [Steam superheaters] 548/05.

THE ELECTRICAL TRADES BENEVOLENT INSTITUTION

A STRONG appeal was made for donations and subscriptions at the Festival Dinner of the Electrical Trades Benevolent Institution on Wednesday last week. Lord Justice Fletcher Moulton, K.C., F.R.S., presided, and was supported by the majority of the members of the Committee of Management and a number of subscribers to the fund and others.

Lord Justice FLETCHER MOULTON explained that he took the chair in the absence abroad of Sir William H. Preece. His own entry into the scientific world had been due to Sir William Preece, who had come to him in an endeavour to find something more convincing than an affidavit of seventeen men to prove that a telephone was a telegraph. He next had to represent the whole of the electrical industry in connection with the first Electric Lighting Bill (1882), and referred to the niggardly action of the municipalities at that time in crippling the industry by the purchase clause in that Act. In fact, he had had to do with the industry since it was an isolated patch of human thought until it had got to a position in which it seemed as if it would do all the higher class of work of the world. The industry required trained men, almost as many officers as men, and between the officers and artisans were the intermediate class who, if they were not scientific men were scientific workmen. It was these largely that the fund would be destined to help. The best charity included individual examination of cases, and this personal element was one of the features which was practised by the Electrical Trades Benevolent Institution, and enabled it to do good work.

Mr. HUGO HIRST enlarged further on the function of the Benevolent Institution in the important work of giving temporary relief until employment should be found. The fund was particularly intended to assist the staffs of firms who were neither capitalists, nor working men who could rely on their unions for support. Ninety per cent. of those in adversity had not themselves to blame, for there were frequently rapid changes in ways and methods in an industry such as ours which only those financially strong could withstand. To such, temporary relief meant the possibility of a fresh start. He suggested that members of the staffs of firms should be encouraged to collect subscriptions to the fund by prizes being offered for the best results.

Mr. A. J. WALTER, K.C., followed with an eloquent appeal.

At the close of the dinner it was announced that the contributions collected had been £520, of which no less than £240 had been subscribed at the dinner.

The following is a complete list of donations and subscriptions received or promised at the dinner. Subscriptions are marked with an asterisk.

Further contributions received will be announced in our columns.

The Vandervell System of Motor-car Lighting.—Messrs. C. A. Vandervell & Co. (Warple Way, Acton Vale) write informing us that in view of the rather bad luck experienced in one or two details during the recent 4,000 miles trial by the Royal Automobile Club of one of their complete motor-car lighting outfits, they have determined to enter a similar outfit for another 4,000 miles R.A.C. trial, including not only the road test carried out in the former trial, but also subsequent tests upon Brooklands track to secure the necessary data as to the output of the dynamo at various engine and car speeds. Photometric tests of the headlights and complete lamp equipment will also be made. We understand that over 1,000 of these sets have been installed upon various makes of car, and that satisfaction has been expressed with their running.

Telegraph Traffic.—The lines between Inhassunge and Vicente, and between Quelimane and Villa Bocage were restored on the 25th ult. On the 26th the Via Hanekin route was in normal condition, and on this day the line between Tangier and Mogador was down, telegrams for the latter place being sent by post from Casablanca. On April 27th telegrams addressed to Chihuahua and Sinaloa in Mexico, were subject to very heavy delay, while on April 29th lines between Mossuril and Fernando Vellozo were restored, but those between Quelimane and Chinde, and Quelimane and Villa Bocage remain down. The Bagdad Bassorah line was down on 1st inst., and the Tangier-Mogador line was repaired, but there is still delay on the line. The Bagdad-Bassorah line was working again on the 2nd inst. The French Company has succeeded in once more repairing the Martinique-Paramaribo cable, and the ship is at present engaged on the Paramaribo-Cayenne section. The Direct United States Cable Company has had some trouble with the Newfoundland-Nova Scotia cable, but it has now been overcome.

THE USE OF LARGE STORAGE BATTERIES

A PAPER by Mr. A. M. Taylor, entitled "Battery Economics and Battery Discharge Arrangements," was discussed by the Birmingham Local Section of the Institution of Electrical Engineers on Wednesday, April 26th, and at the London meeting of the Institution on Thursday, April 27th.

The author dealt first with the effect of rapid discharge rates on the total ampere hour capacity and terminal E.M.F.'s of batteries, and gave the curves reproduced in Figs. 1 and 2, based above the one-hour rate on tests of English batteries and heavier discharges than this on tests on American cells.

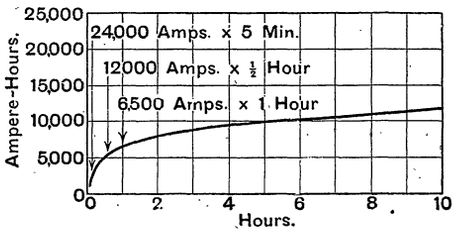

FIG. 1.—CURVE TO SHOW VARIATION OF CAPACITY WITH DISCHARGE RATE.

Passing on to methods of controlling discharge, he condemned the system of relying entirely on regulating cells, as is done to a very large extent on the Continent and in America, and showed by an ingeniously arranged diagram how in a 500 volt battery with sufficient regulating cells to enable a 5-minute discharge rate to be attained that 57 of the cells do not become properly charged unless the battery be charged very slowly, and that some of the cells are practically never discharged, especially if the battery, although equipped for occasional heavy discharges, is normally used at the one hour rate. In the case of booster control there is also considerable expense incurred if these heavy discharge rates are to be attained, as the voltage of the boosters, combined with the heavy currents, means considerable kilowatt capacity. In some stations, however, it is considered good enough to throw the batteries direct on the bus-bars under emergency conditions, but in this case either the batteries will never give the discharge they are capable of giving, or that the bus-bar pressure must fall tremendously. The author, however, proposes a method whereby the cost of a booster equipment suitable for quarter-hour discharges need not exceed that now incurred for the one hour rate.

The system which he advocates is the triple series arrangement shown diagrammatically in Fig. 3. A motor is employed to drive two double-wound booster armatures, each having two commutators, giving four booster armature windings, which can be coupled in series or parallel; the fourth, however, would be used as a spare. Comparisons are gone into at some length of this system, arranged with a static balancer, against the ordinary booster-balancer system and extra cells with regulating switches, showing considerable advantage for the author's proposals as regards estimated cost of equipment.

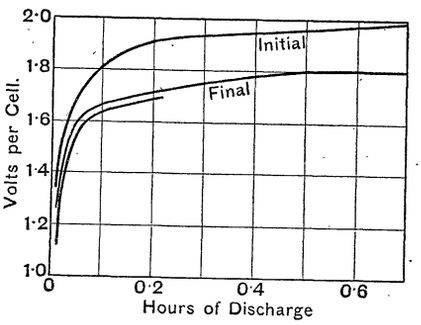

FIG. 2.—TERMINAL VOLTAGE ON DISCHARGE FOR HIGH DISCHARGE RATES.

In Fig. 4 the author shows an arrangement which, it appears to him, might with advantage be employed in cases where the battery has to be used with a regular load of known amount daily, and more particularly where the cells can be either charged from traction bus-bars or preferably where rotary converters of the split-pole type (or of the alternating-current booster type), having a large range in their voltage, are available. Where desired, existing rotary converters can be adapted for this purpose quite easily and at a low cost.

In this scheme the number of cells is so chosen that the maximum, or peak, output occurs at such a period of the discharge of the battery that practically no boost is at that time required for the latter (see central point of the 510-volt bus-bar line of Fig. 4). For, say, one-quarter of an hour on either side of this point the boosters are worked with their armatures in parallel and are thus able to deal

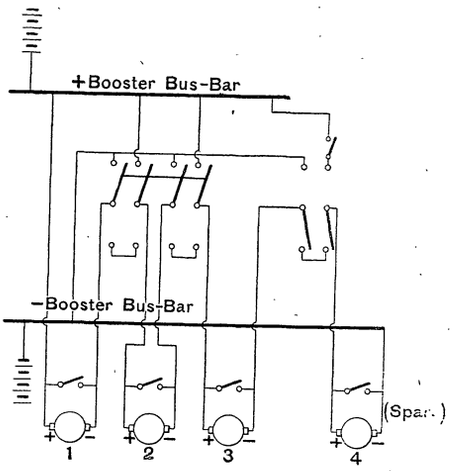

FIG. 3.—TRIPLE SERIES ARRANGEMENT OF BOOSTERS.

easily with the 6,650 amperes. During the earlier and later portion of the peak, however, the current being then much less, the booster armatures are put in series with each other. A few regulating cells, as indicated, may be employed if desired, and these could be cut as shown, should the discharge rate require to be reduced in the early part of the discharge beyond that shown by the curve.

If traction bus-bars were available, or a rotary converter could be modified to give sufficient voltage range for the charging of the cells (assisted by the battery boosters), the output of the battery boosters could be reduced to 66·5 kw. If the boosters only were employed for charging, their capacity would have to be 198 kw., against 730 kw. for the ordinary arrangement. The fourth or reserve armature would be used during charging, and special switchgear would enable the

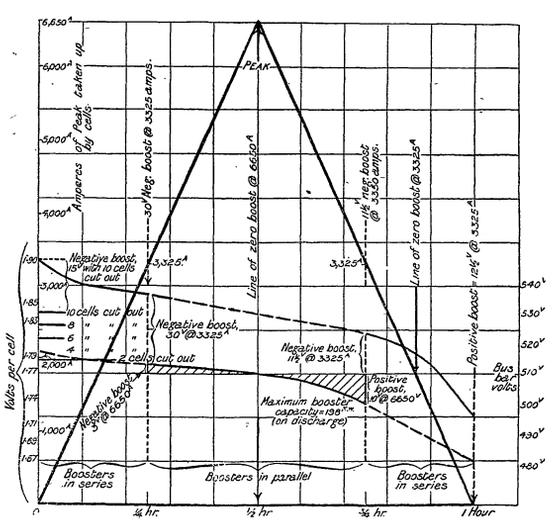

FIG. 4.—BOOST ARRANGEMENTS FOR A SPECIAL CASE.

changes between series and parallel to be made without breaking the circuit.

Mr. Taylor then passed on to the employment of storage batteries purely for stand-by purposes in view of breakdowns of generating plant, and mentioned some large batteries put down for this purpose in America, but did not on the whole commend the practice. With regard to the question of automatic or non-automatic boosters, he favoured batteries installed to deal with time peaks being equipped with hand

Hosted by Google

regulated boosters, but suggested the use of a smaller battery, which might be of the nature of a buffer battery to take up the "instantaneous" peaks by means of an automatic booster, and so keep the bus-bar pressure constant, while the main battery would be regulated by hand in such a manner as to enable boilers and engines to be shut down to the maximum possible extent.

The latter part of the Paper contained an investigation of the possible saving in a concrete case by the introduction of accumulators in place of additional steam or gas generating plant. Estimates were worked out in some detail for a peak load of 1,450 kw., and it was seen that on a one-hour basis and with coal at 8s. per ton, the total annual cost with the batteries was only £2,752 as against £5,576 when delivering the power direct to the bus-bars without cells by means of rotary converters. The cost of the energy wasted in the cells and boosters in the case of the gas plant was only 0·04d. per unit, and in the case of the steam plant with coal at 8s. per ton only 0·07d. per unit delivered to bus-bars. With coal at 12s. per ton, and with steam plant, the cost of the energy wasted in the cells and boosters is 0·11d. per unit. The higher the fixed charges and the lower the running cost of the generating plant, the better does the battery show up as a substitute for it. It would seem, therefore, that even, however, where coal is dear, Mr. Taylor claims that there is generally a sufficient saving in stand-by losses, on boilers and engines, which can be entirely shut down to make the value of the coal so saved fully equal to that lost in the inefficiency of the battery.

The author points out that the development of the split-pole rotary converter in the United States has resulted in extended use of batteries for load equalisation on alternating circuits, and he remarked incidentally that he had devised a rectifier capable of withstanding particularly heavy overloads. He also proposed to make use of accumulator sub-stations for improving the power factor of alternating current systems by causing them to discharge through over-excited rotary converters.

A further section of the paper deals with an alternative proposal to batteries as a means of dealing with peak loads, put forward by H. G. Stott of America, employing exhaust turbo-generators and boilers with enlarged fire-grates, but the author goes into some figures to show that better economy could have been obtained with batteries. Extensive tabulated particulars of recent Continental and American battery installation are given in an appendix.

Discussion.

The discussion was opened by Mr. B. M. Jenkin (Messrs. Kennedy and Jenkin), who expressed great interest in the author's proposal for reducing the size of the boosters. A feature of this arrangement was the use of a few more cells than usual. He would suggest that the matter be carried still further, and enough cells be provided to give the emergency discharge rate straight on the bars. In these circumstances, the whole resources of the battery should be used to help the load, and no part of it expended on booster losses. The author's proposals as to switching arrangements were unnecessarily complicated, and he thought that the use of double commutator armatures in single fields was out of the question, as the voltage of each must be capable of being regulated independently. The absence of boosters during emergency discharge would also be an advantage from the switching point of view. The author was a little inconsistent in his general condemnation of regulating cells and his adoption of them in his proposed system. The system Mr. Jenkin advocated was to put sufficient regulating cells on a battery to give the emergency discharge rate and to put the booster in parallel with the regulating cells. On normal discharge the booster would be used as a "bucking" booster in series with the battery, and by means of a local circuit arrangements would be made to give the necessary extra charges to the regulating cells. The booster could be kept quite small, and would be automatically cut out on heavy overloads. This method had not yet been tried, but he fully intended to put it into practice as soon as he had an opportunity.

Mr. C. E. C. Shawfield (Borough Electrical Engineer, Wolverhampton) did not see much point in putting in heavy discharge batteries for standby purposes. Circumstances which entailed a battery being discharged at a five-minute rate would involve trouble lasting longer, and the battery would only defer the inevitable shut-down for a few minutes. A one-hour rate was in his opinion the heaviest that paid. Regarding the controversy between regulating cells and boosters, on the Continent boosters were almost unknown except to a limited extent for charging. He had seen, in Berlin, wonderfully perfect automatic regulating switches which did not appear to cost any more than booster equipments, and, of course, the efficiency of the system was much higher without boosters. Batteries were used to a startling extent in Berlin, and were of sufficient capacity to take the whole load of the city for as much as two hours. He thought their adoption was due partly to the desire for boiler house economies owing to the high price of coal, but mainly to the heavy penalties, as much as £100 per minute, imposed by the authorities for interruptions of supply. He was interested in Mr. Taylor's remarks about Exide cells, but hardly saw where they came in if they were suited to emergency work, but not to regular work. He thought that Mr. Taylor had taken much too high figures for standing charges in his comparisons between batteries and extra generating plant.

Mr. S. L. Pearce (Chief Electrical Engineer, Manchester Corporation) thought that some figures of the result of the first complete year's working of the large battery at the Dickinson Street station, Manchester, would be of interest. This battery had been originally installed to be charged from the traction bars and to be discharged on the lighting load. Its capacity was 3,000 kw. at the one-hour rate, and the boosters would be driven from either set of bars. The battery could, however, be used entirely on the lighting system, and, as a matter of fact, the most economical result had been obtained in this way. The interconnection of the large Stuart Street station with those at Dickinson and Bloom Streets, provided great flexibility. Thus at the dinner-hour, when the heavy power-load from Stuart Street fell off, its resources could be utilised in giving the battery a very considerable amount of charge. He reckoned the savings due to the introduction of the battery for the first completed year to be as follows: The cost of coal per unit generated had been reduced from 3·33d. to 2·29d., which represented no less than £3,348 in coal alone for the year. Other savings amounted to 0·064d. per unit, and brought the figure up to £7,762 for the year. Deducting all capital and maintenance charges, the net saving left was £3,041. They must, however, add to this the capital charges saved in adopting the battery instead of extra steam plant, and taking the capital cost of steam plant as £13 per kw., and the battery as £8 per kw., this came out, on an 8½ per cent. basis, at £1,950, so that, finally, the saving due to the use of the battery would be written down as about £5,000, which was not far off Mr. Taylor's estimates. The steam-plant load factor had been brought up from 32 to about 47 per cent., and the over-all efficiency of the battery had come out as high as 71 per cent. Its discharge rates were 8,400 amperes for one hour, 13,000 amperes for half-hour, and 17,000 amperes for five minutes. High discharge rates were largely a question of switching, and he marvelled how the 40,000-ampere emergency currents in the large American batteries could be satisfactorily dealt with. He agreed with the author that it was not advisable to put down these large batteries solely as stand-bys. The Manchester boosters were fully able to carry the maximum current at maximum boost when connected three in parallel, and there was no complication in the change over switchgear. Finally, he said that the use of central-station batteries was usually handicapped by the fact that the Local Government Board only allowed a period of seven years for battery loans, which was out of all proportion to the maintenance guarantees now given by battery makers at 8 per cent. for fifteen years.

Mr. A. H. Seabrook (Electrical Engineer to the Marylebone Borough Council) said that in common with many of the central station engineers, he had been driven to think seriously upon batteries by Mr. Taylor's persistent advocation of them. At Marylebone an additional load of some 3,000 kw., mostly in the Oxford Street district, about 3,000 yards from the generating station, would have to be provided for in the near future. He had estimated the cost of steam extensions suitable for the case at £5,700, and of a 4,000-kw. battery for a one-hour rate discharge at only £2,600. The economy obtained by batteries had been fully brought home to him by the small battery they already had at Marylebone. He joined with Mr. Pearce in the protest against the loan period allowed by the Local Government Board for batteries, but was amazed at his 71 per cent. efficiency; his own little battery only gave something like 54 per cent. He did not think that regulating cells should be passed over so lightly. He had himself bought sufficient extra cells to do away with the boosters at times of heavy discharge. End cells were, in his opinion, more reliable than boosters, and the cost of switchgear could be reduced by making the switches cut in more than one cell at a time. He had experimented in that direction, and found that a step of three cells gave no appreciable flicker of the lights.

Mr. Leonard Andrews (Key Engineering Co.) rose to disclaim some figures in Mr. Taylor's detailed comparisons which were said to be taken from the Paper by himself and Mr. Porter. He went into the matter in some detail to show how Mr. Taylor, in working on his figures, had made deductions which were not quite warrantable in that for one thing they exaggerated the difference in cost of labour and attendance. He finally admitted, however, that even if Mr. Taylor's figures were modified to suit his views there would still be a margin left in Mr. Taylor's favour.

Mr. Taylor replied briefly, reserving his full reply for the *Journal*. Mr. Jenkin had, he thought, exaggerated the complication of the switchgear he proposed, and Mr. Shawfield had rather over-estimated the proportion of the losses in the booster and in the battery itself. His desire in reducing the size of booster was not so much to save money as to enable

Hosted by Google

it to be spent in spares. The weak point of the Manchester installation was, in his opinion, the absence of spare booster plant. He suggested that with his own scheme Mr. Pearce's savings would have been even greater. He heartily agreed with the protest against the loan period of the Local Government Board. He was not sure that the method at Manchester of giving the battery two charges a day was quite the best procedure, looking at the life of battery plates as a function of the total number of charges and discharges they received. This was what made the Exide cell unsuitable for regular use, as although it could be used for very high rates it would not stand so high a total number of charges and discharges.

DISCUSSION AT BIRMINGHAM.

The discussion was opened by Mr. W. FENNELL (Wednesbury Corporation), who said that only wealthy undertakings could afford to purchase their batteries out of revenue and that 5 per cent. for sinking fund was insufficient to obtain the L.G.B. sanction to a loan. He agreed that there should be as little booster output at the peak as possible, but that spare boosters should be provided. He considered that for small stations regulating cells were preferable to boosters, and suggested that the regulating cells might be of different type to the main battery, as the demand upon them is for much shorter periods than upon the latter.

Mr. F. FORREST (Birmingham Corporation) held that there would be difficulty in keeping the connection to neutral when the battery used as a balancer was cut out. In the author's table of capital costs 50 per cent. should be added for spare battery and steam plant, as it is bad practice to regularly take more than two-thirds of the charge out of the battery, but the author appeared to run it right down. He considered that if batteries were used for very heavy peak loads on A.C. systems with rotaries the latter would flash over. It is unwise to expect too much from Exide cells, as he understood that they will not stand more than 50 discharges.

Mr. F. BROWN (Walsall Electrical Co.) asked what the life of a battery in regular and constant work would be. He mentioned how he had tried recently to obtain one of the latest Edison batteries, but the company stated they were unable to supply at present.

Mr. A. T. BARTLETT (General Electric Co.) thought that the figure of £3·89 per kw. for fixed charges for steam plant, given in Mr. Taylor's comparison, was altogether too high.

Mr. TAYLOR, in reply, said that the correct figures for interest and sinking fund was a vexed question, but that the L.G.B. rate for batteries was unduly high. The charges for boosters are important, but not so much so with his system, as he keeps down the capacity of the boosters and therefore the costs. If regulating cells are used for very large batteries the contacts and connections must be very heavy. He saw no difficulty in keeping the connection to neutral when the battery used as a balancer was cut out. As to batteries with rotaries on an A.C. system, he held that they would take the six minutes discharge rates satisfactorily, as it only meant four times the one-hour rating. Ordinary rotaries take 3·5 times full load without flashing over. The number of discharges of which the Exide cell is capable is 300, not 50. These cells would only have to deal with the emergency peak, and not the ordinary peak, and would therefore be discharged only 20 or 30 times per annum, giving a life of 10 years. Ordinary batteries can be discharged 3,000 times during their life.

LOCAL NOTES

Aberdeen: *Trolley Omnibuses.*—The Tramways Committee have under consideration the question of providing some form of locomotion for the Footdee district, and it is not improbable that a deputation will visit Leeds to inspect the system of trolley omnibuses which will shortly be working there.

Blackburn: *Electricity and Tramway Profits.*—The net profit upon the electricity undertaking for the past year, after meeting capital charges, was £697, against £1,387 in the previous year. There was a loss of £181 upon the tramway undertaking, compared with a profit in the previous year of £453.

Brighton: *Consulting Engineer's Fees.*—Mr. Arthur Wright, who recently resigned his position as consulting engineer to the Corporation, has agreed to accept £1,000 in settlement of the amount due to him by way of commission upon profits of the undertaking, under the terms of his agreement.

Dundee: *Electricity Staff Social Club.*—Notwithstanding the somewhat mediocre results which in some cases have attended the institution of social clubs, Dundee Electricity Department bids fair to be a particular exception in such matters. The formation of a club and club-room suggested itself to the members of the staff some little time ago. The idea was enthusiastically received, and Tuesday night saw the opening of a splendidly fitted club-room, where members of the staff can enjoy their leisure hours when "off shift." Mr. Chas. Lamb, as Vice-President of the club, performed the opening ceremony, while speeches were also given by Mr. H. Richardson, the genial manager of the department, to whom the members of the staff are indebted for many facilities in connection with the scheme, and Messrs. D. H. Bishop and J. H. Wright.

Dunfermline: *Tramway Extensions.*—The Dunfermline and District Tramways Co. are being urged to push forward with the extensions of their lines in a westerly direction.

East Kent: *Electric Lighting.*—The Dover Rural District Council have given consent to the Sandwich, Deal and Walmer Electric Lighting Co., to run mains along the Dover and Deal road.

Edinburgh: *Electricity Profits.*—The Electric Light Committee recommend the Council to apply the surplus of £7,300 from the 1909–10 accounts to the reduction of the capital debt upon the undertaking. Every year there is considerable controversy as to whether the profits from the undertaking shall be dealt with in this manner or transferred to relief of rates.

Grimsby: *Electricity for Domestic Purposes.*—The Corporation have approved of a recommendation by the Electricity Committee to reduce the charge for electricity for domestic purposes to 1d. per unit.

Halifax: *New Tramway Brake.*—A new brake, which has been invented by Mr. C. J. Spencer, the tramway manager, is now undergoing trials.

Leeds: *Trolley Omnibuses.*—It is expected that the Corporation system of trolley omnibuses will be in operation this month, the cars being expected within a fortnight.

Manchester: *Tramways Committee and the Employees.*—The Arbitrator who was appointed by the Board of Trade to consider the dispute between the Tramways Committee and the tramway employees mainly on the question of hours, has now given his award. He decides that no case has been made out for a reduction of the working hours from nine to eight per day without a diminution in the weekly wages or the curtailment of any of the other privileges which the men now enjoy.

New South Wales: *Electric Tramways.*—The revenue from the New South Wales tramways for the quarter to March 31st amounted to £353,000, an increase of £43,000 compared with the corresponding quarter of last year, whilst the expenditure, viz., £262,000, was increased by £26,000.

Pinner: *Maximum Price in Lighting Order.*—The Hendon Rural Council suggested to the Harrow Electric Light Power Co. that a lower maximum price should be inserted in the Provisional Order which the Company is seeking for the Pinner district than the usual allowed by the Board of Trade. The Company offered 7d. per unit, but this did not meet with the approval of the Council. When, however, the matter came before the Board of Trade the latter decided that under no circumstances could they insert a lower figure than the usual maximum of 8d. per unit. The Rural Council also desired to have a purchase clause inserted in the Order, but the Board of Trade refused this also on the ground that it was not thought desirable for a Rural Council to have purchase powers over an undertaking relating only to a portion of their area.

Preston: *Tramway Profits.*—After meeting capital charges, there was a net profit of £4,369 upon the working of the tramways during the past year.

Rotherham: *Electricity Profits.*—After meeting capital charges, the accounts of the Electricity Department for 1910–11 show a net revenue of £7,848.

Russia: *New Electrical Undertakings.*—According to the *Financial News* an English syndicate some time ago submitted to the Russian Government a scheme for the establishment of electrical works in the Caucasus to supply light and power to numerous industrial undertakings in the district. The Syndicate also proposed further works in connection with an electric railway. It is now stated that the Commission which was appointed to inquire into the proposals will report in favour of the English syndicate.

Stoke-on-Trent: *Electricity Works Extensions.*—There seems to be a good deal of opposition on the part of the ratepayers in the new Federated County Borough to the proposed expenditure of £60,000 upon remodelling the system of electricity supply. At the last meeting of the Council, however, a resolution not to go forward with the proposal was defeated.

Hosted by Google

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Barnstaple.—Mr. Albert Gay, Borough Electrical Engineer at Islington, who has been advising the Council with regard to extensions, recommends the installation of a 1,120 ampere-hour battery.

Bath.—An expenditure of £7,500 to be incurred on new generating plant.

Belfast.—The extensions to the power house authorised in 1909 are nearing completion, and the City Electrical Engineer reports that it is necessary to anticipate the requirements for the next two years. He recommends that additional plant and machinery, mains, services, and meters should be provided at an estimated cost of £40,000.

Blackburn.—The Corporation propose to apply to the Local Government Board for sanction to borrow £45,170 for the purposes of extension to the Corporation Electricity Works.

Brazil.—Fresh tenders are to be invited for a telephone system between Rio de Janeiro and Sao Paulo.

Burnley.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £9,023 for the extension of plant at the electricity generating station.

Dublin.—A Local Government Board inquiry was held last week concerning a loan of £128,129 for extensions to the electrical undertaking. Considerable controversy has been taking place in regard to this proposed loan, the Tramways Company being especially concerned in it. Arguments have been put forward that extensions of the Pigeon House Fort Power House would be uneconomical, and that the best plans would be to erect a new power house more centrally situated. Mr. S. L. Pearce, Chief Electrical Engineer to the Manchester Corporation, gave evidence on behalf of the Corporation, and strongly supported Mr. Mark Ruddle's recommendations to add plant at the Pigeon House Fort Station rather than to shut down these works and build a new station. He saw no reason why extensions should not be carried out at Pigeon House Fort to the extent of 12,000 kw. capacity. The inquiry was resumed on Tuesday.

Eccles.—A Local Government Board inquiry was held last week concerning a loan of £3,783 for new plant at the electricity works.

Finchley.—A loan of £15,410 has been sanctioned.

Govan.—Extensions to the generating plant at the Electricity Works are to be put in hand.

New Zealand.—Tenders are invited by the Wanganui Borough Council for a complete generating plant for their tramway system. Tenders to the Town Clerk, Borough Council Offices, St. Hill Street, Wanganui, by June 12th. Copy of the specification can be seen at 73 Basinghall Street, E.C.

Stalybridge.—The Works Sub-Committee have under consideration the installation of an additional 2,500 kw. turbo-generator at the electricity works.

Worthing.—An expenditure of £5,000 is contemplated upon new generating plant. Mr. J. F. C. Snell has presented a report upon the proposed extensions, in which he recommends the installation of two Diesel engine sets.

Rochdale.—The Electricity Committee have decided to carry out extensions at the electricity works, at an estimated cost of £8,700.

WIRING

Aberdeen.—Additions to works of Messrs. Alexander Pirie & Son. Architects, Messrs. Jenkins & Marr.

Ayr.—Alterations at Newton Academy.

Blackburn.—Public Hall on Blakey Moor; also reconstruction of present Town Hall.

Chelmsford.—Alterations and additions to Friars Council School. Architect, Mr. W. H. Pertwee, Chelmsford.

Coventry.—New municipal buildings.

Glasgow.—Extensions to works of Messrs. Redpath, Brown & Co., Ltd.—Additions to schools in Ropework Lane.—Block of shops and offices at Hyndland Road. Architects, Messrs. J. M'Kellar, Davies & Gunn.—Electric theatre at 421 Sauchiehall Street.

Gloucester.—Tenders are to be invited for lighting the Corn Exchange by electricity.

Eastbourne.—New post office. Builders, Messrs. J. & M. Patrick, Wandsworth Common, S.W.

Edinburgh.—Freemasons' Hall, George Street.

Manchester.—Theatre in Great Bridgwater Street.

Newcastle-on-Tyne.—Art School at Armstrong College.

Plymouth.—Conversion of Free Library into Municipal Offices.

Tipperary.—Electric lighting of workhouse premises.

MISCELLANEOUS

British Columbia.—It is reported that the Dominion Government propose to considerably extend the long-distance telephone service in British Columbia.

Eccles.—The Corporation has decided to adopt electric lighting in certain public streets. Application is to be made to the Local Government Board for the necessary loan.

Hull.—The tramway manager reports that twenty-four new cars will be required within a very short time.

London: *Hackney.*—Tenders are to be invited for 100,000 pairs of yellow flame arc lamp carbons.

TENDERS RECEIVED AND ACCEPTED

Accrington.—The tender of Messrs. W. T. Glover & Co., at £4,333, for the supply of extra high-tension mains has been accepted. The same firm has got the contract for a twelve months' supply of electric cables. The tender of the British Thomson-Houston Co., at £428, for the supply of high-tension sub-station switchgear has also been accepted.

Bridgwater.—The tender of the Bridgwater and District Electric Supply Co. has been accepted for the electric lighting of the Blake Gardens. There was keen competition for this work between Gas and Electric Lighting Companies.

London: *Hackney.*—The following tenders have been received for two water-tube boilers:—Messrs. Hawkesley, Wild & Co., £3,083; Messrs. Clarke, Chapman & Co., £2,644; Messrs. Babcock & Wilcox, £2,570; Howden Boiler Co., £2,500. The tender of Messrs. Babcock & Wilcox is recommended for acceptance. The heating surface is 4,226 square feet, and the grate area 80 square feet.

Nine tenders have been received for a turbine feed pump, varying from £131 to £258. That of Messrs. Hayward, Tyler & Co., at £165, is recommended for acceptance. The tender of Messrs. Babcock & Wilcox, at £445, is recommended for the reconstruction of a portion of the coal-conveying plant at the electricity works.

Liverpool.—The Mersey Docks and Harbour Board has accepted the tender of Edison & Swan United Electric Light Co., Ltd., for a motor generator.

Mansfield.—The tender of Messrs. Bellis & Morcom, Ltd., for engines, has been accepted at £1,460, and that of the British Thomson-Houston Co., Ltd., for dynamos, at £915.

Stoke-on-Trent.—The tender of Messrs. James Howden & Co., at £8,905, for two 1,500 kw. turbo-generator sets has been accepted. There were twelve tenders for this plant.

Worthing.—The tender of The Hart Accumulator Co. has been accepted, at £864, for the replating of the storage battery.

OSRAM·LAMPS

Railway Rates on Electrical Goods.—In November last the General Electric Co. were fined by the Aston Petty Sessions for misdirection in consigning stator parts as "bearers." The action was taken at the instance of the Midland Railway Co., by whose line the goods were consigned from Birmingham to Bedford, the alternator being to the order of the Bedford Corporation. According to the general railway classification of goods, "bearers" are chargeable at 9s. 2d. per ton, whilst electrical appliances are chargeable at 22s. 9d. per ton. The General Electric Co. contended that the function of the stator is to carry or bear the laminations and coils, and that in the absence of definition in the classification by the railway company they were entitled to consign the goods as "bearers." Before a Divisional Court in London last week, consisting of the Lord Chief Justice and Justices Pickford and Lush, the General Electric Co. appealed against the fine of the Aston Petty Sessions, but the Court held the view that the magistrates were right, and dismissed the appeal with costs.

Hosted by Google

APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. Wilson, Mains Superintendent in the Maidstone Electricity Department, is to be increased from £120 to £130 per annum.

It is stated that Mr. L. Birks will be chief assistant to Mr. E. Parry, who has recently been appointed Electrical Engineer to the New Zealand Government.

The Hackney Electricity Committee recommends that the salary of Mr. J. R. Bowden, Distributing Engineer, to be increased from £325 to £400 per annum, by annual increments of £12 10s. Mr. Bowden will take the title of Deputy Engineer.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars, net c.i.f. port of arrival, quoted on Tuesday night, was £56 5s. to £56 15s. per ton (last week, £56 15s. to £57 5s.).

Bankruptcies.—A petition has been filed in the Canterbury Bankruptcy Court by A. C. Wampach, electrical engineer, Formby Lodge, Seabrook Road, Hythe.

Unica Gearing.—Messrs. Rodgers Bros. (Baker Street, Brighton) have acquired the business of Messrs. J. B. Hamilton & Co., Ltd., of gear specialists and general engineers. The sole agent for the Unica gears which Messrs. Rodgers will now manufacture will be Mr. P. F. Brittain (110 Cannon Street, E.C.).

Vickers, Sons & Maxim.—The name of this company has been changed to Vickers, Limited.

Change of Address.—The St. Helens Cable & Rubber Co., Ltd., have altered the address of their Newcastle office and stores to 8 Charlotte Square, Cross Street. An attractive coloured card announces the fact.

Meter Approved.—The Board of Trade have approved of Messrs. Chamberlain & Hookham's patent continuous current meter combined with Lackie's patent demand indicator, and also means provided for fixing same.

"Witching Waves" in the Roadway.—Under this heading, the *Evening News* of Wednesday, last week, described a disturbance on the mains of the Charing Cross, West End, and City Electricity Supply Co., which occurred early in the afternoon. Although not of a very startling character from an electrical point of view, the occurrence must certainly have appeared mysterious and sensational to the general public. A short had occurred in a distributing box in Cannon Street, and the bitumen in it had smouldered, emitting quantities of smoke, not only from between the box and its cover—the pit of which had been rendered bad owing to the swelling of the wood pavement blocks in the roadway—but also between crevices in the blocks, so that smoke actually rose all over the road. On opening the box and part of the road, the smoke escaped fairly thickly for some time. The interruption to supply was quite local and not at all of a serious nature, and traffic in the street, which had had to be diverted, was resumed in about an hour.

"The Chief."—Several generations of Ferranti staff met on Saturday last at the Trocadero to entertain Mr. Ferranti, and to present to him a memento in the shape of a silver inkstand. Those who went through the works in the old days, at the Grosvenor Gallery, Deptford, Charterhouse Square, or Hollinwood, all knew Mr. Ferranti as "the Chief," and apparently the present generation at Hollinwood still retain the old title, for when the toast of the evening was proposed by Mr. C. P. Sparks, Mr. Ferranti was universally hailed as "the Chief." Those who have worked with Mr. Ferranti have all been imbued with some of his enthusiasm, and have always had unlimited confidence in his genius. That enthusiasm, his magnetic personality, and charm of manner are responsible for drawing all to him. The speeches at the dinner partook mostly of reminiscences and anecdotes. "The Chief" took us back to the good old days when cables to carry unheard-of pressures had to be evolved from nothing but a fertile brain, and when men had to risk their lives to demonstrate the safety of a system of transmission. He told something of the evolution of the Ferranti meter, and the special winding of the Ferranti alternator, the Grosvenor Gallery plant and the fire, when high hopes disappeared in a flash, and the whole plant had to be reconstructed with apparently high hopes as the only asset, and so on, down to the present day and even into the future. Mr. Ferranti himself suggested the publication of a volume of such reminiscences, and this would indeed make interesting reading in the history of the electrical industry. About ninety old Ferrantians foregathered at the dinner; old friends met old friends, and an extremely pleasant evening was spent.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

City of Santos Improvements Co.—At the meeting last week it was stated that a contract has been entered into for the complete electrification of the tramway system in Santos. Messrs. Mordey & Dawbarn have been entrusted with the preparation of the scheme, and Mr. Dawbarn has recently left for Santos in order to discuss details with H. M. Sayers, the company's resident engineer.

City of Birmingham Tramways Co.—Mr. Emile Garcke presided at the annual meeting in London on Monday. The accounts for 1910 enable the payment of a 10 per cent. dividend upon the ordinary shares, and the transfer to reserve of £36,513. The Chairman reminded the shareholders that after June 30th their profits will undergo a serious diminution, as of the 18 miles at present worked in Birmingham, more than half pass into the hands of the Corporation on that date, and of the remaining mileage six miles are in Aston, and are being worked without profit. Nevertheless, the position of the company as a revenue earning undertaking will remain satisfactory owing to the return from their investments, and the Chairman thought the prospects of continuing to pay 10 per cent. on the ordinary shares were good.

British Westinghouse Co.—At the annual meeting on Monday the Chairman of the company, Mr. J. A. Bryce, M.P., after referring to the satisfactory result of the year's working, which has enabled the Board to transform a debit balance of £7,319 from 1909, into a credit balance of £5,117 for 1910, in addition to making provision for substantial reserves, referred to the arbitration award in connection with the turbines at the Lot's Road power house. If the result of the appeal against this award was unsuccessful, a very serious loss would have to be faced, and would probably mean the occasion for writing down the capital. He impressed upon the shareholders that the contract over which this dispute has arisen was made at the very commencement of the company, and that no blame attaches to the presnt Board. Very satisfactory results, he continued, have been obtained with the Rateau steam turbines, which were making a reputation for reliability in running.

Electrical Distribution of Yorkshire.—A dividend at the rate of 2½ per cent. for 1910 is recommended, and after placing £400 to reserve a sum of £109 is carried forward. In order to provide the necessary capital for laying mains in Castleford, Hipperholme, and Sowerbridge, the directors have made arrangements with the Yorkshire Electric Power Co. for temporary borrowings.

Brisbane Electric Tramways Investment Co.—A final dividend, making 8 per cent. for 1910, is recommended on the ordinary shares. Whilst the total receipts have increased by £23,302, the expenses have only gone up by £10,740. During the year there was a large expansion in the sale of electrical energy for power purposes. Many newly erected wharves and wool stores have now been fitted for electrical operation. With reference to the suggestions that have been made that the local authorities in Queensland have power at any time after 1920 to purchase the company's undertaking at constructional value less depreciation, the Board have obtained the opinion of Sir Robert Finlay, K.C., and two other lawyers, which is to the effect that any purchase by the local authorities must be upon going concern value.

Oldham Ashton & Hyde Electric Tramway Co.—There was a net profit of £6,824 for 1910, and after placing £1,250 to reserve a final dividend making 6 per cent. for the year is recommended, carrying forward £151.

Merthyr Electric Traction & Lighting Co.—The accounts for 1910 show a net profit of £5,070. The sum of £1,000 is placed to reserve, and a dividend at the rate of 6 per cent. is declared on the ordinary shares, carrying forward £457.

Arbroath Electric Lighting & Power Co.—There was a net profit of £1,601 for 1910, and, after meeting interest charges, a balance of £1,097 is carried forward.

British Columbia Electric Railway Co.—Interim dividend at the rate of 8 per cent. per annum on deferred ordinary stock for the December half-year.

South Metropolitan Electric Tramways & Lighting Co.—The full dividend on the 6 per cent. preference shares for the year to December, 1909, is declared, placing £2,500 to depreciation and reserve, 2,000 to renewals, and carrying forward £339.

River Plate Electricity Co.—A dividend of 10 per cent. on ordinary shares for 1910, carrying £14,000 to reserve, and £5,880 forward.

Batti-Wallah Society.—The last smoking-concert of the season was held in the Council Chamber, Holborn Restaurant, on Tuesday, May 2nd. Mr. Slade-Olver, the new President of the Society, took the chair, and with the assistance of the genial and energetic entertainment secretary, Mr. Robinson, kept things going with great verve throughout the evening. An exceptionally good musical programme was provided, and according to general consensus of opinion of those present, the smoker was the most enjoyable of the year. Those members who did not attend have every reason to regret their non-attendance.

SUMMARY

A new edition of the Institution of Electrical Engineers' Wiring Rules has just been issued. Among the alterations are increases in the permissible current density and voltage drop in conductors, modifications in the rules relating to surface wiring, and a long section on the earthed concentric system applicable to "Stannos" wiring. A summary and critical review of the new rules appears on page 247.

The action by the British Westinghouse Co. against the Electrical Co. for alleged infringement of the Bremer flame arc lamp patent concluded on Thursday. Judgment was reserved. (Page 248.)

The full programme of the Brighton Convention of the I.M.E.A. is now issued. Papers will be read on "Electricity Supply Viewed from the Municipal Committee's Standpoint," "Modern Wiring Practice," and "Internal Combustion Engines in Power Stations," and discussions will take place upon "Purchase of Fuel" and "Street and Shop-front Lighting." (Page 248.)

We publish this week the second half of Mr. G. W. Partridge's article on the single-phase plant supplying the London, Brighton, & South Coast Railway. Particular interest attaches to the governors employed, the use of Temperley-Cockburn steam-extracting pipes in the water-tube boilers, and a rotary strainer for the condensing water from the river. (Page 249.)

Short illustrated articles deal with a new automatic starter on the contactor principle for squirrel cage motors and the use of metal filament lamps for church lighting. (Page 251.)

Our monthly article on New Electrical Supplies and Accessories contains illustrated descriptions of a new metal filament candle lamp, a temporary wiring lampholder, an illuminated shaving-mirror, a spring shade-carrier, making removal of the shade very easy, a semi-automatic door switch, a new design of ironclad switch, and a tumbler switch with automatic overload release. Other novelties mentioned include a choking coil dimming switch and a motor control pillar. (Page 252.)

The section of the London, Brighton, & South Coast Railway from Victoria to the Crystal Palace is to be opened for traffic under electric traction to-day. (Page 253.)

A paper on light and illumination dealing more particularly with interior lighting, by Mr. Haydn T. Harrison, and one on the effect of wall-papers on illumination, by Mr. P. J. Waldram, were discussed at a recent meeting of the Illuminating Engineering Society. (Page 254.)

Mr. Donald Murray read a long Paper at last Thursday's meeting of the Institution of Electrical Engineers on the practical aspects of printing telegraphy, in which he reviewed generally the field for printing telegraphs dealing in some detail with the practical difficulties to be overcome, and described the latest forms of his apparatus, including the Murray automatic printing instruments and the new Murray multiplex

Hosted by Google

system. The discussion dealt more with the traffic than the engineering side of the problem. (Page 255.)

THE Corporation of the City of London have issued a short series of recommendations regarding temporary wiring for illuminations. (Page 256.)

THE Hindhead Electricity Works was almost destroyed by fire on Wednesday last week, but supply had already been partially resumed on Friday. (Page 256.)

MR. A. M. TAYLOR contributes a long letter, forming a reply to the discussion on his recent Paper before the Institution of Electrical Engineers on the use of batteries, and the correspondence on life tests of metal filament lamps is continued. (Page 257.)

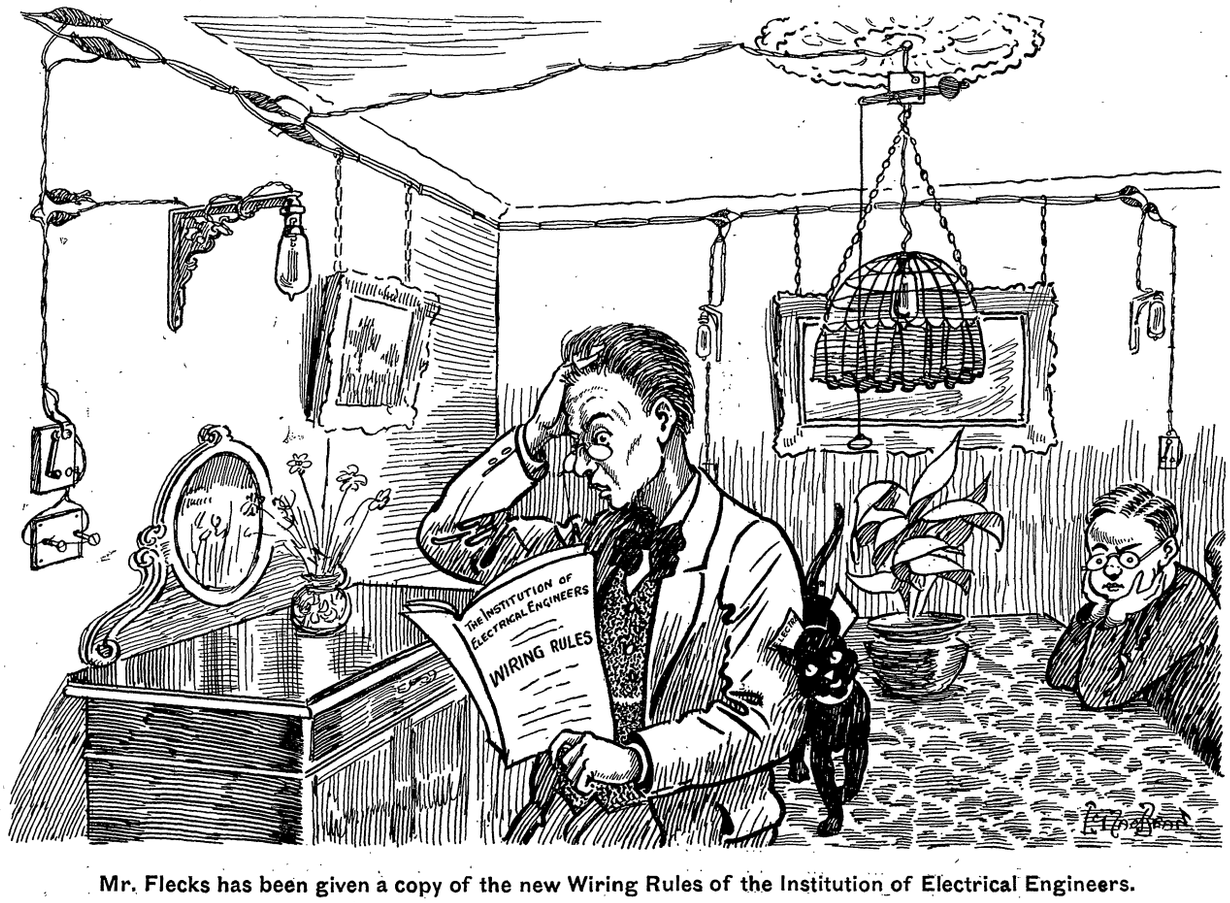
BEFORE the Junior Institution of Engineers yesterday Mr. F. J. Hawkins read a Paper on illumination, dealing with the points to be observed to obtain the maximum distribution of light with the minimum glare effect. (Page 257.)

AMONG the specifications published by the Patent Office on Thursday last was one by J. E. Criggal and the British Vitrite Works, Ltd., describing a method for manufacturing lamp caps. The British Thomson-Houston Co. and J. Gray have introduced a method of making drawn tungsten filaments. W. & R. Bullimore and A. C. Crosser describe a means of preventing breakdowns by sparking in condensers. A. Heil has produced a new primary battery. A patent for improvements in railway signalling expires on Thursday next, after the full life of fourteen years. A grant has been allowed to A. F. Berry, in spite of opposition, for a patent for heating and cooking apparatus. Opposition has been entered to the grant of a patent to J. Keith for centrifugal fans. (Page 258.)

THE legal expenses in connection with the bank overdrafts at West Ham amount to a penny rate.—The price to be paid by the West Hartlepool Corporation for two sections of the local tramways is £12,096, against £22,000 claimed.—The conduit tramway system in Bournemouth has now been entirely converted to overhead, and the cars are running.—Sums of £40,000 and £15,000 respectively will be paid over to relief of rates out of the profits of the Birmingham tramways and electricity departments. (Page 259.)

PLANT extensions are contemplated as follows:—Blackburn, £45,170; Colwyn Bay, £2,700; Leicester, £17,000; South Shields, £8,960; Newcastle-under-Lyme, £5,000; and Stockton, £6,750. The storage battery at Worthing is to be replated; mains extensions are to be carried out at Colne (£1,000); a supply of cable is required at Manchester; and electric supply schemes are under consideration at Donaghadee and Armagh. The sum of £14,650 is to be spent on tramway extensions at Burnley. (Page 259.)

ARRANGEMENTS FOR THE WEEK



(TO-DAY) THURSDAY, MAY 11TH.
Institution of Electrical Engineers.
8 p.m. "The Driving of Winding Engines by Induction Motors," by H. J. S. Heather.
Institution of Electrical Engineers: Dublin Section.
8 p.m. At Royal College of Science.

SATURDAY, MAY 13TH.
Birmingham and District Electric Club.
7 p.m. At Colonnade Hotel, New Street. "Exhaust Steam Utilisation for Generating Electricity," by V. E. Walters.

TUESDAY, MAY 16TH.
Institution of Electrical Engineers: Glasgow Section.
8 p.m. At 207 Bath Street. Annual General Meeting (postponed from May 9th).

WEDNESDAY, MAY 17TH.
Institution of Electrical Engineers: Yorkshire Section.
7 p.m. At Leeds University. Annual General Meeting.

THURSDAY, MAY 18TH.
Institution of Electrical Engineers.
8 p.m. "Automatic Telephone Systems," by W. Aitken.

Mr. Flecks has been given a copy of the new Wiring Rules of the Institution of Electrical Engineers.

Hosted by Google

THE NEW WIRING RULES OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE Institution of Electrical Engineers, before finally adopting the new edition of its wiring rules which has just been issued (the 6th edition), would have done well to have adopted the practice of some Government Departments, and to have issued them at first only tentatively in draft in order to invite general discussion and criticism; in fact, a discussion on the draft rules at an ordinary meeting of the Institution would have been desirable.

It is true that the Electrical Contractors' Association and other Associations were represented on the Committee, but this is not the equivalent of inviting comment from the whole electrical public, as the representatives of each society constitute only a minority by themselves. That the rules before being issued to the public were sent to the fire insurance companies and to the supply authorities for their approval, and 49 fire offices and 232 supply authorities have accepted them, may perhaps be thought sufficient evidence of their being what is required, but although in general they form an excellent definition of the best practice in wiring work, yet there are a few details to which exception may justly be taken, and some precautions which may be regarded as unnecessary.

There is, however, one important alteration in the opposite direction, namely, the permissible use of a far higher current density in conductors than has hitherto been thought expedient. For instance, if the drop of pressure is not too great, a 3/22 wire may be loaded up to 7·2 amperes—equivalent to a current density of no less than 4,000 amperes per sq. in. However, as the table of conductors is based on experiments made by the National Physical Laboratory, we must not find fault with it, but such current densities are certainly high. A few of the other changes are in the direction of allowing more leniency, but, as we have said, there are some details in which excessive precaution has certainly been observed.

The chief alterations are as follows:—

One of the first alterations is the omission of what is sometimes called the "six-foot" rule, applying to cases in which a building is connected on both sides of a three-wire network. In the old rules, it was specifically stated that the wiring must be so arranged that a person cannot simultaneously touch two points respectively in contact with the outer conductors, but the new rules simply say that the two pairs of terminals shall be arranged so as to minimise the danger of shock, and that the wiring from them, including that behind the distribution boards, shall be kept distinct throughout in separate circuits. The old rule, although stricter, was certainly better.

The increased maximum current density allowed in conductors has already been alluded to. Formerly it was stated that in calculating the size of circuits, every point must be assumed to require at least 60 watts, but this has now been omitted, as it should be, as the larger proportion of metal filament lamps now in use are of smaller wattage.

Doubtless in view of the less sensitiveness of the metal filament lamps to drop in pressure, the permissible drop has now been increased from 2 per cent. to 2 per cent. plus one volt, so that, for instance, on a 200 volt system, a 5 volt drop would be allowed, and on a 100 volt system a 2 volt drop. We recommend wiring contractors not to go to this extreme limit, for at times of peak load the central station will probably avail itself of the full 4 per cent. drop allowed by the Board of Trade regulations, so that on a 100-volt circuit the voltage might be 7 volts down on the furthest point of the house wiring, and on a 200-volt circuit 13 volts down.

For power and heating circuits, conductors need not be dimensioned to keep down the voltage drop, but it is simply specified that their temperature must not rise 20° F. in the case of rubber cables, or 50° F. in the case of paper or fibre cables; the maximum current for this rise is given in the conductor table at the end. In this table we regret to see that the sizes of flex are no longer included. This would have been a convenience especially with regard to the larger sized flex used for radiators, and the information would have been of far more use to the wiring contractor than a prolonged table to embrace all sizes of conductors up to one sq. in. section. The table will, however, be very useful, as it gives, besides the maximum permissible currents for any conductors, the length of the circuit for one volt drop at maximum current, conductor resistances, radial thicknesses, &c. Radial thicknesses for paper cable below 7/18 are still omitted, however, and we are surprised to note that the low insulation of from 70 to 140 megohms per mile is still specified as the minimum for cables of this class. The latter, we think, is a serious mistake, for a well-insulated lead-covered paper cable has a far higher insulation resistance, and it is quite conceivable that a fault in the lead might not bring the insulation down below 140 megohms after 24 hours' immersion in water.

The test for dielectric strength was formerly at 2,000 volts and has now been decreased to 1,000 volts, and the specification of frequency and wave form has now been omitted.

A modification has been made in the salutary rule that rubber conductors for drawing into conduit should be braided, and now the braid is not insisted on if the tubes have a polished internal surface. We think this is wrong, as the place where wires are cut in the drawing-in is at the ends of the tubes. The extra money spent on internally polished tubes would be far better expended in braiding on the cable.

Flexibles may be insulated either with pure or vulcanised rubber, but pure rubber is recommended for pendants.

Although we agree that the use of the standard specifications of the Engineering Standards Committee should be recommended, yet they certainly ought not to be made compulsory in general rules of this class. For instance, the rule relating to metal conduits reads as if the only conduits permitted other than brass or copper ones are those in accordance with the above specification, although we cannot think that it is the intention of the Institution to bar heavier material or galvanised barrel. Again, lampholders "must" be in accordance with E.S.C. standards.

A rule has been added that the ends of the conduits must either terminate at metal outlet boxes, or must socket into boxes, preferably of incombustible material. We must take it that teak blocks are meant, as this wood is practically incombustible. The free ends of the tube must be bushed excepting where wooden bellmouths are used.

As in previous rules, casing is not allowed to be buried in plaster or cement.

Flexible is allowed to be fixed on insulators on the surface of walls, but must not be carried unprotected within four feet of the floor level, and must not pass through floors. The supports must not be more than 3 ft. apart, and there must be no joints except in junction boxes. The rule has been retained to the effect that flexibles must be connected to ordinary wires only by screw terminals in boxes or ceiling roses, and not by soldering, and that flexibles entering from fittings and passing into ceilings must be enclosed in conduits terminating in metal junction boxes. The first part of this rule is frequently disregarded, even by some of the best wiremen.

Ordinary unarmoured conductors, that is to say, not flexibles, may be run on the surface, but need not be fixed on insulators. They must be spaced from the wall, and metal staples must not be used with them. Armoured conductors may, of course, be fixed right on the wall and with metal staples if desired, and they must be earthed.

It is not made quite clear whether wiring of the Stannos class would rank as armoured wiring, but there can obviously be no objection to its being fixed right on to the surface of the wall; there must be hundreds of miles of this class of wiring so erected. As to whether it may be buried in plaster there is room to doubt, especially as the rules do not even make it clear that ordinary armoured cable may be employed in this manner.

A long section is devoted to earthed concentric systems, from which it is evident that "Stannos" wiring is absolutely accepted for this purpose. The voltage drop allowed for lighting is the same as for ordinary wiring, and a drop of 7 volts on the bare outer conductor is allowed on heating circuits. The metal parts of fittings must be connected to the outer conductor. Fuse boards on these systems must either be in metal cases or have metal backing, to which the outer conductors are bonded.

All joints must be soldered except where flexibles are connected to ordinary wires, and it is specified that conductors larger than 7/18 must be soldered to proper lugs for connection. The latter rule was also in the last edition, but, needless to say, is not always observed.

The specification for ordinary distribution boards in the previous edition of the rules was unnecessarily severe, and was certainly not always followed, but it has been retained. The bases are to be of incombustible and insulating material, and if the cases are of wood, they must be protected with fire-resisting material, a minimum clearance of 1½ in. is to be provided, and the distance from the glass front of the case to

Hosted by Google

the fuse is not to exceed 1 in. In a well-known type of distribution board very largely used all over the country, and giving no trouble, there is a bare ½ in. between the sides of the cover and the terminals of the fuse carrier, and the wood cover is not lined with asbestos. Teak is, of course, employed for these distributing board cases in the best practice, and if this is done, we fail to see that they should be deemed dangerous.

The rule for the rating of fuses is that the conductor which the fuse protects must not rise in temperature above the limits already specified, provided that the fuse shall blow at 200 per cent. overload in circuits up to 10 amperes and 100 per cent. overload on larger circuits. On the other hand, no smaller fuses are insisted on than those blowing at 9 amperes, which are destined to protect ordinary three-ampere circuits. Contractors should be warned, however, that the Phœnix Fire Office does not allow such heavy fuses, and that the majority of the supply authorities would endeavour to insist on a lower rating for their main fuses than 100 to 200 per cent. overload.

The regulations for switches have been slightly altered. The old rules state that switches should be tested with pressures and currents 50 per cent. in excess of those for which they are rated. In the new rules, "must" is substituted for "should," which imposes a very unnecessary obligation on the manufacturer, for it cannot be expected that the contractor will test in this manner every switch that is to be used. The metal covers of switches for pressures above 125 volts are to be lined with insulating material on circuits of over 6 amperes; the old rule was 5 amperes, probably the new rule will be as frequently disregarded as the old one. Where switches are liable to come in contact with goods, they must be protected by an open-fronted box or other suitable guard.

Wall sockets and plugs are now called "plug connectors" instead of simply "connectors," as in previous editions of the rules. It is certainly less confusing, but why object to the names wall sockets and plugs. The old rule so frequently disregarded is retained to the effect that every wall socket must be independently controlled by a fixed switch on the live side. It is added, however, that a combined switch and wall socket complies with this rule, but apparently the Committee has forgotten that a large number of a useful form of combined switches and wall sockets are now used, in which the wall socket is always live, and independent of the switch. The rules recommend that portable fittings should not be supplied with switches, and suggest that, where switches are used on them, at least one lamp of a group must be controlled only by the fixed switch on the live side of the wall socket.

In the case of switch lampholders it is specified that they must be controlled, preferably in groups of not more than ten, by a master switch, and that one of the lamps controlled by this switch shall not have a key holder. All these rules will be found very troublesome in practice if they are followed, for these are all matters which the consumer wishes to decide for himself.

Another rule relating to portable hand lamps is that the lamp holder must not be in metallic connection with the guard or other exposed metal work. This is the Home Office rule for damp or metal floors, and, if it need not apply in the case of dry floors in factories, we fail to see why it should be imposed in the case of an ordinary house, for it prohibits the use of a metal shade on the shade carrier of a hand lamp.

As hitherto, portable heaters must be independently controlled by a wall switch, whether there are switches on the heater or not. A good rule has been added, but one which, we fear, will be disregarded, that at least one section of the heater must be controlled solely by the wall switch.

It is specified that D.C. motors over ½ h.p. must be fitted with a regulating switch with no-volt release; we presume a starting switch is meant, and that a regulating switch is not insisted on.

Portable accumulators with celluloid cases must be so arranged and placed during recharging, that if they become ignited the fire cannot spread.

The rules are published at the price of 6d. (post free, 7d.), bound up with the Home Office regulations for factories, and those of the Board of Trade Regulations which relate to the use of pressures from 250 to 650 volts for motors, &c., in buildings, but in this edition the rules for electricity in mines are not included, presumably because they are at present under revision by the Home Office.

Telegraph Traffic.—The cable between Zanzibar and Mombasa was restored on the 2nd inst. Communication between Gaza and El Arich failed on the 3rd, but was put right on the 4th. The Eastern Telegraph Company's cable between Kwandang and Menado has been in working order again since the 5th inst. Telegrams for offices of the Mexican Government are subject to very great delay, and the lines to all offices in the States of Sinaloa, Sonora, Chihuahua, Durango, Guerrero, and Morelas, excepting Cuernavaca and Puente de Ixtla, in the State of Morelos, are interrupted. Cable steamers on the Western Atlantic coast have been very idle lately, some of them not leaving port at all during March.

THE BREMER ARC LAMP PATENT

THE action by the British Westinghouse Electric & Manufacturing Co., Ltd., against the Electrical Co., Ltd., for alleged infringement of the Bremer flame arc lamp patent No. 18,786 of 1902 concluded on Thursday, and Mr. Justice Swinfen Eady reserved judgment. We dealt in our last issue with the whole of the case for the Westinghouse Co., and also that for the Electrical Co. down to Wednesday, when Prof. Silvanus P. Thompson, F.R.S., was giving evidence. The cross-examination of Prof. Thompson was directed to showing that no new facts had been brought out by him as compared with his evidence for Mr. Braulik in the action against him by the Westinghouse Co., but, in reply, stress was laid upon the point already made by Mr. Bousfield, K.C., that no Graham model had been made for the purpose of the previous action.

Mr. Bousfield, K.C., then replied for the Electrical Co., and was followed by Mr. Russell Clarke for the British Westinghouse Co.

THE I.M.E.A. CONVENTION

THE full programme of the Brighton Convention of the Incorporated Municipal Electrical Association, which will be held from Tuesday, June 27th, to Friday, June 30th, is now to hand.

The Mayor of Brighton will welcome the Association at the Royal Pavilion at 10 a.m. on Tuesday, June 27th, after which Mr. J. Christie, Engineer and Manager of the Brighton Corporation Electricity Department, will deliver his Presidential Address. The following two papers will then be read and discussed:—(1) "Electricity Supply viewed from the Municipal Committee's Standpoint," by Councillor H. Leese, Stoke-on-Trent; (2) "Modern Wiring Practice," by Mr. W. J. Beauchamp, Chief Electrical Engineer, Tunbridge Wells. In the afternoon visits will be paid to the Southwick Power House of the Brighton Corporation, and the works of the Brighton & Hove General Gas Company. In the evening there will be a Reception and Conversazione at the Royal Pavilion by invitation of the Mayor and Mayoress of Brighton.

The meeting on Wednesday, June 28th, will be held at the Municipal College, Portsmouth, and only one Paper is down for reading, viz., "Internal Combustion Engines in Power Stations," by Mr. H. L. Howard, Chief Electrical Engineer, Barking, and Mr. R. M. Carr, Chief Electrical Engineer, Leek. A visit will be paid in the afternoon to H.M. Dockyard Power House, and a ship of the "Dreadnought" class and the Portsmouth Corporation Lighting and Tramway Power Houses will also be open for inspection. At 5.30 p.m. a cruise will be made through Portsmouth Harbour to Ryde and Cowes.

On Thursday, June 29th, no Papers will be read, but discussions will take place at the Royal Pavilion, Brighton, on (1) "Purchase of Fuel," to be opened by Mr. C. E. C. Shawfield, Chief Electrical Engineer, Wolverhampton; (2) "Street and Shop Front Lighting," to be opened by Mr. A. H. Seabrook, Chief Electrical Engineer, Marylebone. A visit will be paid in the afternoon to the Brighton Corporation Electricity Department Sub-Station in Church Street, and the electrically driven locomotive workshops of the L.B. & S.C. Railway. The annual dinner will be held in the evening at the Dome.

The Annual General Meeting will be held at the Royal Pavilion on Friday morning, June 30th, for the election of officers for 1911–12, place of meeting, &c.

In addition to the visits mentioned above, the following will be open for inspection during the Convention:—Brighton Corporation Car Sheds and Workshops, Lewes Road; Reason Manufacturing Co.'s Works, Lewes Road; Volk's Electric Railway, and the Electrobus charging garage of the Brighton, Hove & Preston United Omnibus Co., Montague Street.

For the first time ladies are invited to the Annual Dinner, and the Council hope that all members will support them in their efforts to make this function a success.

All communications regarding the Convention should be made to The Secretary, Mr. C. McArthur Butler, 28 Bedford Square, London, W.C., but owing to the Coronation holidays in London, no communications can be dealt with between June 21st and the opening of the Convention on June 27th. It is requested that tickets be applied for not later than June 14th.

The Forthcoming Olympia Exhibition.—We are informed that a number of panels, each 32 ft. by 3 ft. 6 in., round the gallery, are available for the exhibition of electric signs, at the nominal rental of £10 per panel. These spaces will be very prominent, and in addition to serving as an exhibit for signs or decorations, would also constitute a valuable advertisement to the firms securing them.

THE SINGLE-PHASE PLANT SUPPLYING THE LONDON, BRIGHTON AND SOUTH COAST RAILWAY

By G. W. Partridge, M.Inst.C.E.

(*Engineer-in-Chief to the London Electric Supply Corporation.*)

PART II.—THE MECHANICAL PLANT.

The Engines.

THE engines are of the Ferranti vertical cross compound type, with alternators arranged between the H.P. and L.P. columns, the rotors being both keyed to the shaft and bolted to the 70-ton fly-wheels. The cylinders are 31 inches and 62 inches diameter respectively, by 30 inch stroke.

The valve gear is arranged with a variable cut-off, operated by means of a scroll, which alters the throw of the cams, and is adjustable by hand from the outside of the gear box. In addition to the hand operation, an automatic feature has recently been designed and fitted by the Corporation whereby the cut-off is electrically and automatically worked by means of a solenoid, which is energised in series with the main field windings of the alternator, so that when the field current is automatically increased by the Tirrill regulator, due to a heavy load being thrown on, the action of the solenoid is simultaneously and correspondingly strengthened, and this, operating on the valve gear by a suitable arrangement of levers, causes the cut-off point to be carried later in the stroke. On the load falling off, the cut-off is automatically readjusted to light-load conditions by means of a powerful spring.

By this means a very fair over-all steam economy is obtained, notwithstanding the unfavourable varying load conditions.

With a load subject to such heavy momentary fluctuations, it will be readily understood that the question of good and reliable governing is a very important one, both for voltage regulation purposes and also from a safety point of view. After careful consideration it was decided to fit these engines with the Chorlton-Whitehead isochronous governors. These were specially designed by Mr. Whitehead for the severe conditions obtained, and are the largest and most powerful governors of this type which he has hitherto made.

The balls and springs are entirely enclosed in a neatly finished circular cast-iron housing case, filled with oil, which revolves with the balls, being driven through gearing by means of a Hans Renold chain from the main shaft.

By an ingenious arrangement of oil dashpots and compound springs, the adjustments, which in an ordinary governor have to be done by hand for speed correction between no load and full load, are in the case of the Whitehead governor carried out entirely automatically, the engine speed between no load and full load on a steady rise being practically constant without any hand adjustment, and the momentary variations on an instantaneous throwing on and off of a load of 2,000 kw. with the cut-off properly adjusted, not exceeding 7 per cent., returning to normal within three seconds.

That the selection of this governor has been thoroughly justified will be readily seen from an inspection of the excellent results shown on the speed and corresponding load charts given in Fig. 5.

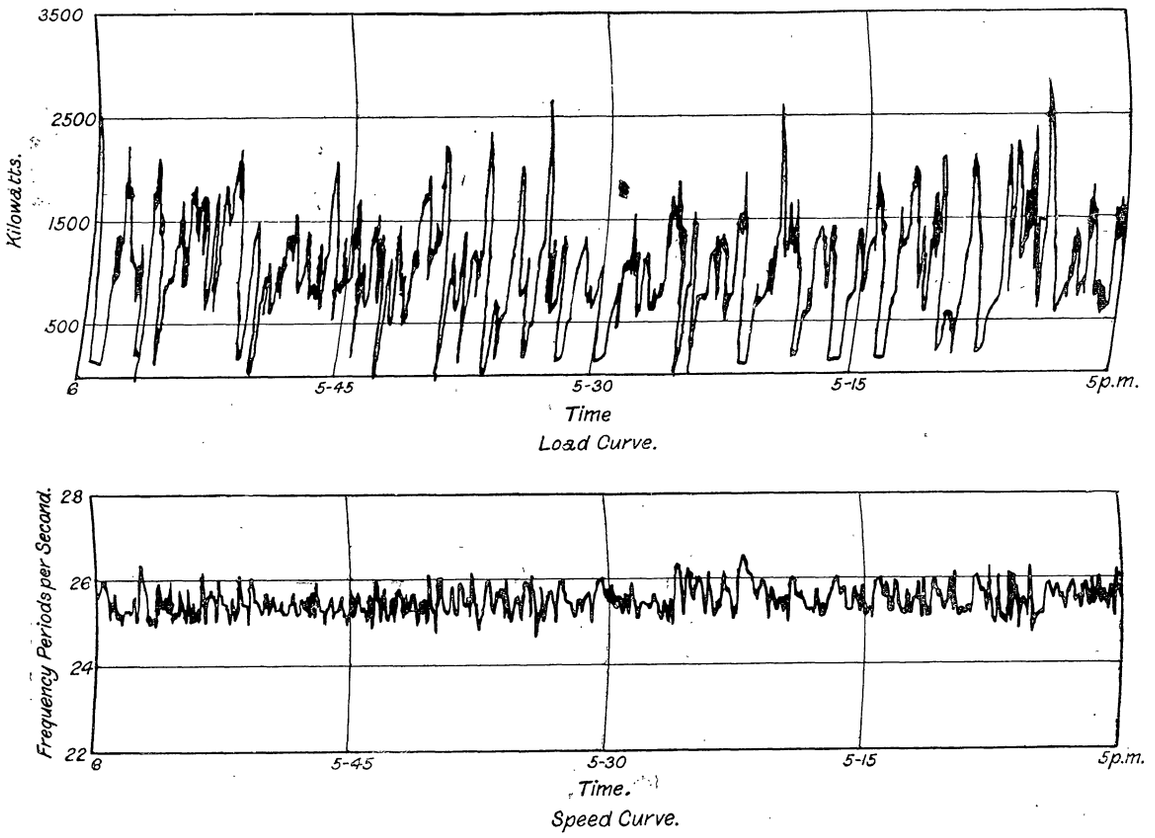

FIG. 5.—LOAD AND SPEED CURVES FROM 5 TO 6 P.M. ON APRIL 12TH, 1911, TO SHOW THE CLOSE GOVERNING.

Boilers.

The steam for the railway plant is obtained from the same boiler system which serves the lighting side of the station, all the boilers and steam mains being connected in parallel.

The boiler plant consists of seventeen boilers of the Babcock & Wilcox land type, arranged in three batteries, and twelve Davey-Paxman dry-back "Economic" in two batteries of six each. Of the the Babcock boilers, five are arranged in one battery and have a heating surface of 4,250 sq. ft. each, and the remainder 3,500 sq. ft. each. The larger boilers and one battery of the smaller size are fitted with chain grate stokers.

The steam from the mechanically stoked boilers is passed through a separately fired superheater of the Stirling Company's make, which is provided with a small boiler section in front of the superheater element, so as to enable economical surface conditions to be obtained without any risk of damaging the steam-filled tubes.

It may be of interest to point out that since the five large

C

Hosted by Google

Babcock boilers were installed we have fitted them with the Temperley-Cockburn system of steam-extracting pipes.

This consists of an arrangement of internal pipes about 1 in. diameter by 8 ft. long, fitted longitudinally in the four bottom rows of boiler tubes at the furnace end, each set of four pipes being connected together inside the front staggered header box to a vertical ascension pipe, which passes up through the front connecting nipples into the steam space of the boiler drum.

The longitudinal extracting pipes are supported on short feet inside the 4-in. boiler tubes, so that they are close up to the top of the latter, and they are perforated on their top side with a number of small holes, the back or remote end of the pipe being plugged up.

The arrangement inside the front header box is illustrated in

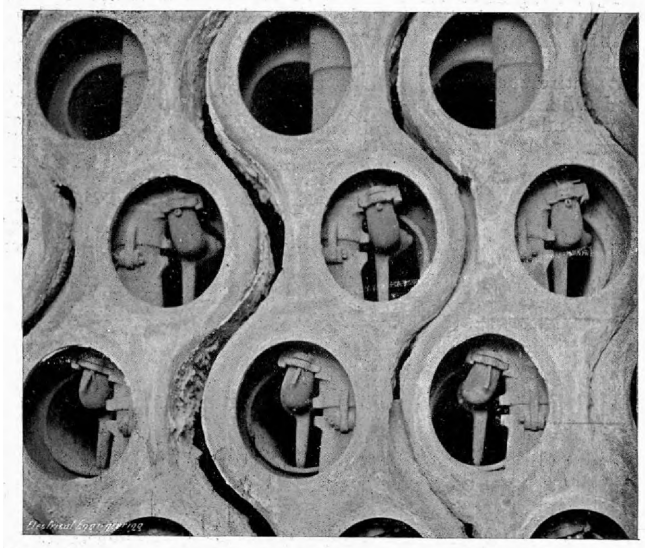

FIG. 6.—INSIDE OF FRONT HEADER BOX, SHOWING ARRANGEMENT OF TEMPERLEY-COCKBURN SYSTEM OF STEAM EXTRACTING PIPES.

Fig. 6, which shows the supporting feet and the connections to the ascension pipes.

By this system the inventor claims that the steam which is generated in the lower rows of tubes over the furnace, where probably 80 or 90 per cent. of the total evaporation of the boiler takes place, is passed freely upwards into the boiler steam space without the possibility of any steam plugging and incidental overheating of the tubes occurring, it being contended that the steam bubbles, as they are generated on the surface of the lower half of the tubes, which are exposed to the maximum furnace temperature, rise to the top of the tube and enter the orifices in the extracting pipe, passing from thence up the ascension pipe into the drum.

Owing to the mixture of steam and water in the ascension pipe being much lighter than the more or less solid water in the header box surrounding it, and also to the frictional loss being less than in the case of the plain header, an upward path of minimum resistance is provided for the steam, thus considerably assisting the circulation of the boiler.

This system has been found very effective in the case of the Deptford boilers, in giving immunity from tube troubles. Since the pipes were fitted, it has been found possible to work the boilers regularly at an evaporation of 25 to 30 per cent. in excess of the makers' rating, without any overheating occurring It has also been found that with these pipes in use, there is no falling off in the boiler efficiency at high overload rates.

The feed pumps are of the slow-stroke vertical compound type, made by Messrs. J. P. Hall & Sons. The feed water from the hot-well gravitates through a pair of Boby exhaust steam heaters, where it is raised to 212° F., the exhaust steam from the exciters, feed pumps, and other auxiliaries being utilised for this purpose. The feed pumps draw their water from the bottom of the Boby heaters, and discharge it through Green's economisers, from whence it passes at a temperature of 280° F. to the boilers.

An "Ados" integrating CO_2 recorder is installed in one of the stoke holes with a system of pipe connections, so that it can be thrown on to any boiler.

A flue gas analysis instrument of an improved "Orsat" type is also provided in a test laboratory adjacent to the stokehole. This laboratory is, in addition, equipped with all the necessary apparatus for coal and water testing, a sample of coal being drawn from each barge and subjected to destructive analysis.

Condensing Plant.

In the first installation of condensing plant laid down some seven years ago three fan-draught cooling towers were erected, the circulating water being obtained from artesian wells on the site of the Deptford works, owing to the difficulties at that time of obtaining water from the Thames for cooling purposes. When the first installation of the railway plant was in contemplation, however, the question of obtaining a supply of circulating water from the Thames was again gone into, and ultimately in 1907 a contract was placed for the laying of four 36-in. diameter cast-iron pipes in the bed of the river, extending outwards from the wharf frontage line some 150 ft., so as to be well beyond the lowest recorded tide line.

In conjunction with this scheme a condenser of 9,000 sq. ft. cooling surface and a set of four throw motor-driven air pumps were laid down. Both the condenser and air pumps were made to the designs of the Corporation, and embody certain unusual features which have been found to work very satisfactorily in practice, the condenser being arranged with special means for quickly clearing the water of condensation from the tubes, and the air pumps having a special design of flat-bottomed buckets without either bucket or foot valves.

The circulating water is obtained by a centrifugal pump of 300,000 gallons per hour capacity, arranged in the river pump house some 500 ft. away from the condenser in the engine-room.

In the pump house is also arranged a rotary strainer of an entirely new type for removing the floating *débris* from the water before it is passed in the circulating system. It was designed by Mr. T. M. Aitken, chief assistant Engineer at the Deptford works, and has been made in the Corporation's own workshops. It was the outcome of a great number of experiments by the Corporation, and has been constantly at work for over eighteen months with very satisfactory results. It can, moreover, be installed at an initial cost of about one-third of that of other strainers on the market. The strainer which is illustrated in Fig. 7 consists of a drum perforated with numerous

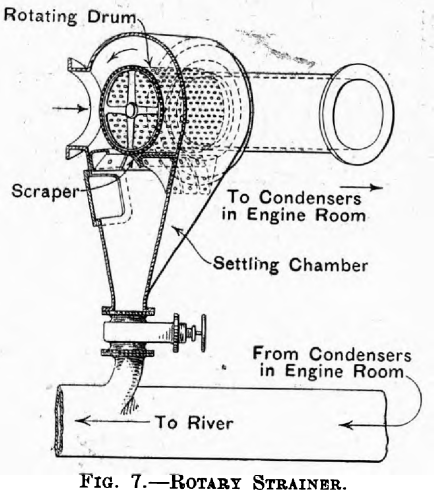

FIG. 7.—ROTARY STRAINER.

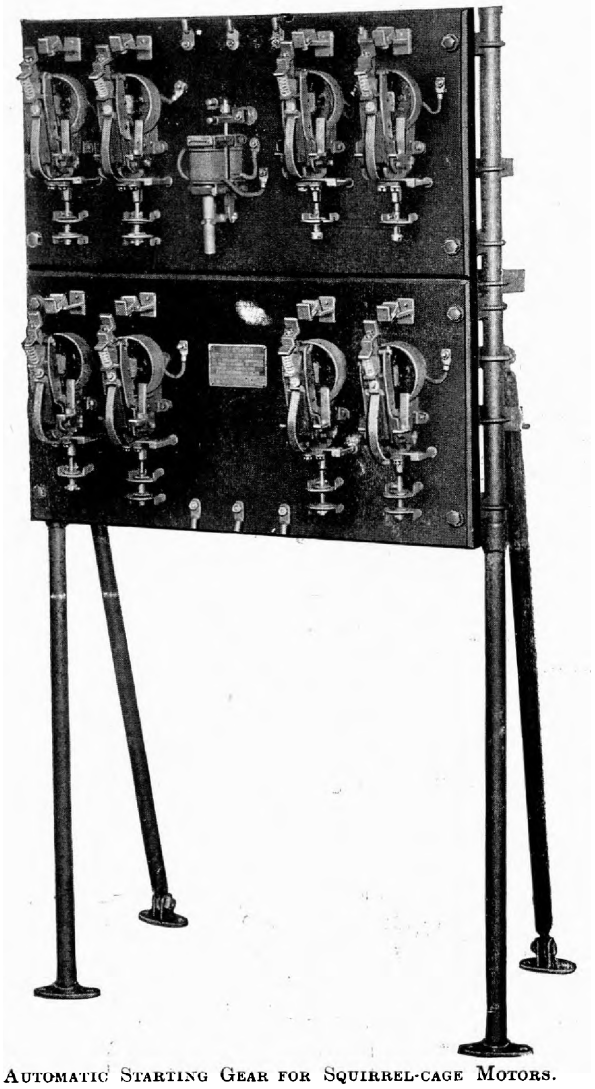
holes, which rotates at about two or three r.p.m. in a cast-iron chamber. It is driven from the centrifugal pump shaft through reduction gear. Any leaves, straw, or other debris entering with the water adhere to the outside of the drum, and are removed by a fixed scraper, the position of which is seen in the figure. This is adjusted so as to have a "shaving" action on the drum surface, so that any solid matter may also be effectively removed, and it all gravitates through a duct at the back of the scraper into the lower part of the housing chamber, which acts as a settling chamber. From this, it is returned to the river through a sludge valve, connected to the return pipe from the condensers, and opened either automatically or by hand. Larger sizes up to 650,000 gallons per hour are in course of construction for the new turbine plant which is being installed this year to deal with further extensions on the Brighton Railway, and designs have been got out for still larger sizes.



The Turin Exhibition.—The following electrical and engineering firms are included in the list of British exhibitors at the International Exhibition at Turin, which was opened by the King of Italy on April 29th :—Edgar Allen & Co. (Sheffield), Alley & MacLellan, Ltd. (Glasgow), British Vacuum Cleaner Co. (Fulham), Cambridge Scientific Instrument Co. (Cambridge), Campbell Gas Engine Co. (Halifax), Crypto Electrical Co. (London), Doulton and Co. (Burslem), Alfred Herbert & Co. (Coventry), Holden & Brooke, Ltd. (Manchester), R. Hornsby & Sons (Grantham), Merryweather & Sons (Greenwich), Nalder Bros. & Thomson (London), National Gas Engine Co. (Ashton-under-Lyne), Ozonair, Ltd. (London), R. W. Paul (London), Reason Manufacturing Co. (Brighton), Reavell & Co. (Ipswich), Hans Renold, Ltd. (Manchester), A. Reyrolle & Co. (Hebburn-on-Tyne), Simms' Magneto Co. (Kilburn), the Synchrome Co. (London), Underfeed Stoker Co. (Finsbury).

AUTOMATIC STARTERS FOR SQUIRREL CAGE MOTORS

THE British Thomson-Houston Co. have given a good deal of attention to the design of automatic starting apparatus on the auto-transformer, a compensator system of squirrel cage induction motors of all sizes from 5 h.p. upward. One of their equipments for this purpose is shown in the accompanying illustration, and consists of a current limit relay, contactors, compensator coils and fuses mounted on a panel supported by pipe frame work. The current limiter controls the contactors, so that the full load line current is not exceeded during starting, and the motor is caused to start quickly or slowly according to the load on it.

The contactor will carry its rated current continuously with a large factor of safety. It opens and closes with a quick positive action, thus preventing fusion of the contacts. It will open the circuit on heavy overloads, arcing being dispersed by means of a powerful magnetic blow-out. Special attention has been given to the design in order to

AUTOMATIC STARTING GEAR FOR SQUIRREL-CAGE MOTORS.

eliminate the objectionable noise and vibration usually associated with alternating current magnets. The only solenoids in circuit after the motor has attained full speed are those on three contactors, and they use a very small amount of energy, and as the contactors open when the voltage fails, efficient no-voltage protection is afforded. Fuses for overload protection are supplied and mounted on the panel. As they are not connected in circuit during the period of starting, fuses of the running capacity of the motor can be used. The motor can be controlled either by opening and closing the circuit of the solenoids by means of a small switch, or by leaving this circuit closed, and using instead a double or triple pole switch (preferably of the oil type) for opening and closing the line circuit.

The system is particularly adapted to pump motors, where the control switch can be automatically actuated by a float or pressure gauge.

METAL FILAMENT LAMPS FOR CHURCH LIGHTING

SIEMENS BROTHERS DYNAMO WORKS, LTD. (incandescent lamp and fittings department, Tyssen Street, Dalston), have sent us the accompanying illustrations of the interior of a church illuminated by gas and electricity respectively. We are assured that the blocks have been made from photographs which have not been "faked" in any way.

FIG. 1.—CHURCH LIGHTED BY "ONEWATT" LAMPS.

In fact, the gas photograph has the advantage owing to the fact that gas-light printing paper has been used, whilst the ordinary chromo paper was used in the case of the electrical photograph. The beautiful outline of the details of the church interior is a testimony to the effectiveness of the electric lighting, which was in this case accomplished by Siemens' "Onewatt" lamps. Apart from the fact of a better illumina

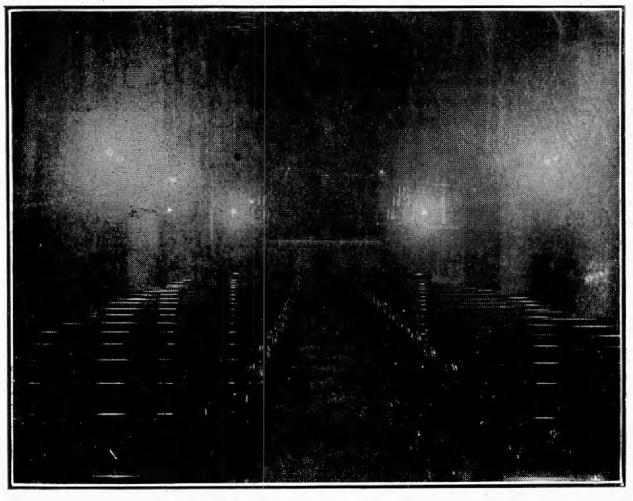

FIG. 2.—THE SAME CHURCH LIGHTED BY GAS.

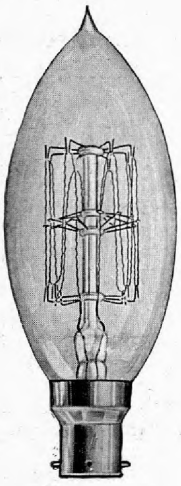
tion, the actual lighting bill is considerably less than with gas, whilst it is also anticipated that money will be saved owing to the more cleanly light reducing re-decoration costs and cleaning bills. These advantages, together with the fact that the initial cost of high c.p. "Onewatt" lamps is now lower, should encourage electrical contractors to make greater efforts in connection with similar installations.



Birmingham Local Section of the Institution of Electrical Engineers.—The annual report of the section, submitted to the annual meeting yesterday, records seven general meetings, at which the average attendance was 77, and the annual dinner. The membership is now 418 (including 134 students), an increase of 20 since last year. The following committee were elected for the next session. *Chairman:* M. J. Railing. *Past Chairmen:* R. A. Chattock, Gisbert Kapp, R. K. Morcom. *Vice-Chairman:* A. M. Taylor. *Committee:* J. H. Barker, W. C. Goodchild, M. Kloss, W. J. Larke, F. M. Lea, F. J. Moffett, D. K. Morris, C. E. C. Shawfield, Maurice Solomon, J. J. Steinitz, W. E. Sumpner, R. Threlfall. *Hon. Secretary:* H. B. Matthews

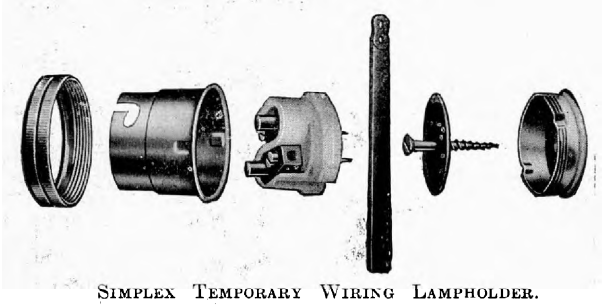
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

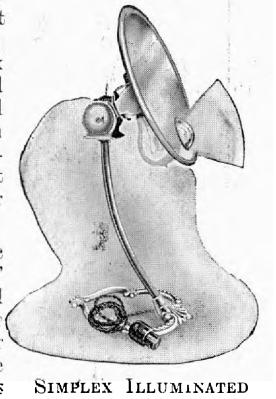
Incandescent Lamps.



Messrs. Siemens Brothers Dynamo Works (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston) announce a further range of "Tantalum" candle lamps. Hitherto, these lamps have not been supplied in higher voltages than 60, in 5 and 10 c.p. sizes, but the new types will be supplied in 10 and 16 c.ps. for 70 to 120 volt circuits. The filaments will, of course, be precisely the same as those of the ordinary "Tantalum" lamps at present on the market. They will be listed at 2s. 9d. each, and it is anticipated that they will be in large demand for series running in candelabra fittings on high voltage circuits. The lamps, one of which is illustrated here, are approximately 5 inches long and 1⅝ inches in diameter.

Tantalum Candle Lamp.

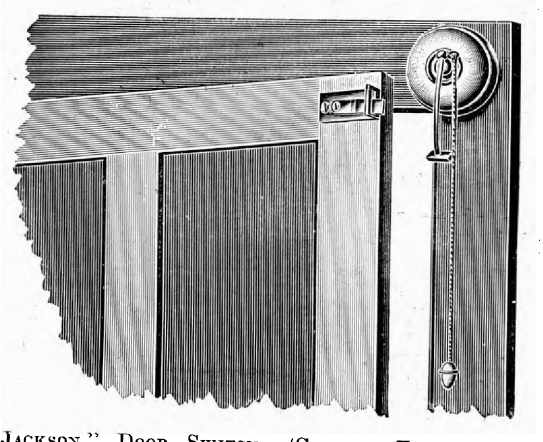
Switches and Switchgear.



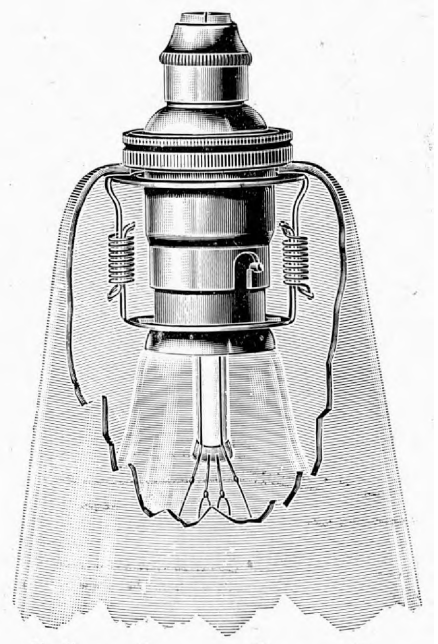
A recent catalogue of Coronation illumination material from Simplex Conduits, Ltd., contains among other interesting items a description of a new temporary wiring lampholder, which we illustrate here, taken apart for the sake of clearness. This holder is specially designed for requirements not easily met by ready-made strip, and should constitute a very inexpensive system quick in erection. It is a slightly modified form of standard holder. In erecting, the brass base is first screwed in the desired position and twin 7/22 wire laid in the grooves provided. The holder is then assembled

Simplex Temporary Wiring Lampholder.

and the screw spikes screwed home, which pierce the insulation and make contact with the conductors. Another feature of the list is a neat flagstaff made entirely of Simplex Conduit tube, which does not require any foundations for erection, and is put on the market at 40s.



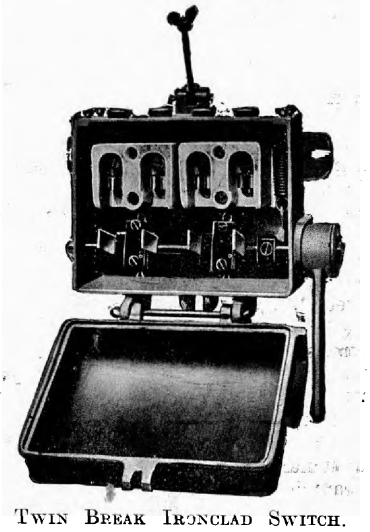
Another article to which Simplex Conduits, Ltd., have specially called our attention is the illuminated shaving mirror illustrated here, in which an ordinary lamp is placed behind the mirror close up to a lens let into the lower part of the mirror which directs the light as required.



Simplex Illuminated Shaving Mirror.

A new pattern of semi-automatic door switch known as the "Jackson" switch, has recently been introduced by the General Electric Co. The arrangement as applied to a door opening inwards is clear from the accompanying figure. With this switch, instead of the light being put on every time the door is fastened whether required or not, the light is switched on by pulling the cord on entering when required, while the action of opening the door to leave automatically throws the switch to the off position. The arrangement can be fixed on the hinge side of the door in the case of doors opening outwards, and is suitable without alteration for right- and left-handed doors.

Another novelty just put on the market by the General Electric Co. is the "Hileach" shade carrier. The arrangement of this, which is shown in the illustration, is such that the ordinary shade ring is not required. The shade is held up by the top ring of the carrier through the action of the springs which are put in compression by inserting the lamp in the holder with its shoulder bearing against the lower ring of the carrier. The shade can be removed simply by

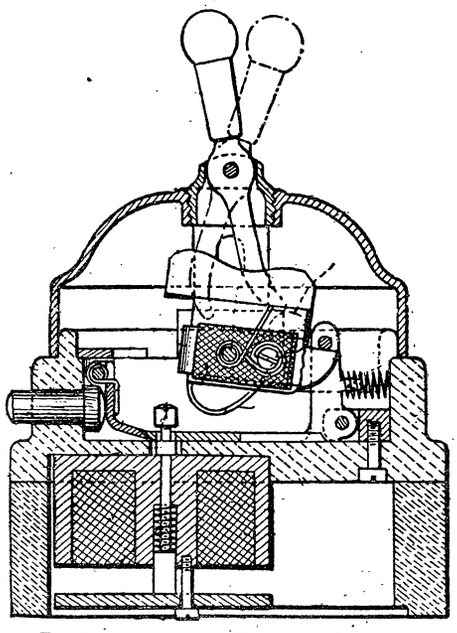


"Jackson" Door Switch. (General Electric Co.)

"Hileach" Shade Carrier. (General Electric Co.)

removing the lamp and the inconvenience of unscrewing the shade ring.

The accompanying illustration shows a new pattern of twin break ironclad switch, which has just been brought out



Twin Break Ironclad Switch.

by the General Electric Co. (67 Queen Victoria Street, E.C.) to meet the demand for a switch where current is not carried

Hosted by Google

through the hinge. A long break is provided, and the contacts are surrounded by porcelain so that a short circuit between poles is practically impossible. The case can only be opened when the switch is off. The handle being in at the side and not projecting through a slot, avoids possibility of shocks through becoming alive, or burns due to flame coming through the slot. The arrangement of the springs is such as not to tend to pull the switch off when closed.

To meet the trade demand for small automatic circuit breakers, which can be relied upon to open an electric circuit immediately an overload occurs, the Thames Ironworks Shipbuilding & Engineering Co., Ltd. (Canning Town), are placing on the market a circuit breaker of little larger size than the ordinary tumbler switch. These switches are manufactured under Denny's Patents, and we give in the accompanying figure a section of the apparatus. In the pattern shown the magnet is protected by a porcelain surround, but another form is made omitting this, which is more suitable for distribution boards and conduit boxes. The switches are made for currents up to 5 amps. and for voltages up to 500. To a large extent they can replace the ordinary small porcelain bridge fuses and cut-outs for lighting and small power circuits, and incidentally avoid the trouble and inconvenience

Denny Automatic Tumbler Switch.
(Thames Ironworks Co.)

of replacing blown fuses. In size and appearance the switches are very similar to the ordinary tumbler switch, and are self-contained with a special type of electro-magnet, the winding of which is in series with the switch. The armature of the magnet is in direct mechanical connection with a tripping lever, which in turn retains the switch circuit closer in the "on" position. Should an overload occur, the armature is attracted by the magnet, and the tripping lever thereby operated, thus releasing the switch, which opens instantaneously, having no time element like a fuse. The operating lever, or knob, is not fixed in any way to the switch parts, so it is therefore impossible to close the switch on a short circuit. To release the switch by hand a push-button is provided at the bottom of the switch, which, on being depressed, operates the tripping lever, giving a quick break to the switch independent of the operator.

A new list of adapters, cord connectors, &c., is to hand from D. H. Bonnella & Son, Ltd. (58 and 60 Mortimer Street, W.). This contains adaptor to allow two or more plugs to be connected to one socket. Lampholder adaptors to take one or two plugs with or without lampholder as well, several patterns of two and three pin cord connectors and china covered wire connectors. Special table connections, sockets, carpet plate, &c., are also included.

The Foster Engineering Co. (Morden Road, Wimbledon) have introduced a dimming switch for use on alternating current circuits, which is really a choking coil of simple design, with tappings brought out to a multiple contact switch. The whole is enclosed in a neat case. The apparatus has the advantage over resistance dimmers that it does not waste energy, but, of course, it is only suitable for alternating current circuits.

Miscellaneous.

A new form of self-contained motor control pillar, consisting of a cylindrical case with a handle resembling that of a tramway controller on the top, has been introduced by the Electric and Ordnance Accessories Co. (Birmingham). The case, which is fully weather-proof, contains a D.P. overload and no-voltage circuit breaker, a drum-type starter, a shunt regulator for speed variation, a pair of switch fuses, and the necessary resistances. In the case of non-reversing motors, there is only one operating handle both for starting and speed regulation with a small push-button which is used to hold the circuit-breaker in during starting. The doors are interlocked so that the circuit breaker cuts current off when they are opened, and the whole construction is designed for heavy service with an efficient magnetic blow-out to the main contacts.

SINGLE PHASE TRACTION ON THE BRIGHTON RAILWAY

CONSIDERABLE progress has been made with the extensions to the equipment of the suburban lines of the London, Brighton, & South Coast Railway for electric traction on the single-phase system, and the portion between Victoria and the Crystal Palace, about nine miles of route, is being opened for traffic to-day. Trial runs have been in progress for some time, and the Board of Trade inspection was made last week. The section in question is only a part of the total extensions in hand, which amount in all to a track mileage of 46½. The Victoria and Crystal Palace section was pushed forward in view of the extra traffic in connection with the Festival of Empire, which could not have been carried by ordinary steam methods. The opening of the whole of the extension has had to be deferred, mainly owing to questions of power supply, as the additional generating plant in the Deptford station of the London Electric Supply Corporation, from whom the power is obtained, is not yet complete. To handle this traffic 30 new trains have been obtained, the stock composing them consisting of 30 motor coaches and 56 trailer cars. The motor coaches are each equipped with four Winter-Eichberg single-phase motors of similar design to those already in use on the South London Line, but larger, for they are rated at 175 h.p. on the one-hour rating, or 100 h.p. continuously. This increase in power does not imply that the original motors were found to be insufficient, or that higher speeds or accelerations are contemplated, but is simply on account of the different make-up of the trains with more trailers to each motor coach.

The equipments, as before, were supplied by the Allgemeine Electricitäts Gesellschaft, and the collections and control arrangements are identical with those used before. The cars themselves were built by the Metropolitan Amalgamated Carriage and Waggon Co. The bodies are of slightly different design from those running on the South London Line in that the side corridor has been omitted. This is not, as has been stated, due to the corridor having proved a failure from the traffic point of view, but is solely on account of the bodies having to be made narrower in order to pass through certain tunnels. The South London cars were exceptionally wide, being 9 feet in width over all, while the new cars for the Crystal Palace service have to be kept down to the standard width of 8 feet. The cars can be made up into two, three, four, six, eight or nine-coach trains, and the fitting of control equipments to some of the trailers enables a train of any size to be driven from either end.

On a special run last week without stops the outward journey from Victoria to the Crystal Palace was made in 15 minutes, and the return journey in 13½ minutes; but, according to the time-table, the ordinary service runs will be 23 minutes out and 21 minutes return, or about 33 per cent. faster than under steam conditions.

The overhead equipment does not present any difference from that employed on the earlier line, and that experience has not suggested improvements is the best proof of its suitability to the work. It was erected by Messrs. R. W. Blackwell & Co., and the whole of the extensions, like the conversion of the original piece of line, has been carried out under the immediate supervision of Mr. Phillip Dawson, Electrical Engineer to the London, Brighton, & South Coast Railway Co. As is well known, a scheme is in preparaton for considerable further extensions of the adoption of electric traction on the Company's lines, involving ultimately the conversion of the main line to Brighton, but at the present time it is premature to make any announcement regarding the adoption of the scheme by the directors.

LIGHT AND ILLUMINATION

AT the meeting of the Illuminating Engineering Society on April 24, Mr. Haydn T. Harrison read a Paper entitled "The Ratio of Light to Illumination," in which he dealt generally with artificial lighting. Illumination he defined simply as the quantity of light falling on a surface. It had nothing to do with the colour or reflecting value of the surface, so that it was not strictly correct to say that instruments such as the Holophane Lumeter (used in Mr. Waldram's experiments mentioned below), measured illumination except when pointed to a surface of similar material to that of the screen in the instrument itself. He had carried out some experiments with his own "Universal" flicker photometer by replacing the comparison screen by the various tinted wallpapers used by Mr. Waldram, and obtained the following figures for the increase in illumination necessary for the rays reflected to have the same effect as when a white paper screen was used:—Bright red, 3·5 times; dull cardinal red, 6·5 times; medium blue, 4·8 times; light blue, 3.2 times; dark green 7·0 times; light green, 2·2 times. Comparisons of the light reflected from the area of these papers with that from white blotting paper gave similar results.

In view of the confusion in the use of terms often arising, he proposed the following definitions:—*Light.*—The emanations from a light source. *Illumination.*—The extent to which anything is illuminated; foot-candles. *Brilliancy.*—Refers to primary light source and is candle-power divided by area. *Intrinsic Brilliancy.*—Candle-power per unit surface. *Brightness and Intrinsic Brightness.*—Same as brilliancy. *Luminosity or Luminous Intensity.*—Same as brilliancy, but applied to secondary sources of light.

Mr. Harrison points out that if luminosity or luminous intensity is used as applied to indirect or secondary sources of light, we could state that any given area in a room was illuminated to a certain degree in foot-candles by direct light from a source plus so many lumens in the form of indirect illumination, and we should know at once the relative reflecting value of the surroundings of the light source, and also the likely density of the shadows.

The measurement of the illumination derived from all sources is an easy matter, but there is more difficulty in ascertaining the light value of the original source, owing to the effect of globes, reflectors, &c. Mr. Harrison then passed on to consider the relative merits of lights with reflectors or globes which increase the illumination in the direction required, versus unprotected lights from which good illumination is obtained by using the walls or ceiling as reflectors.

Few men, he said, would like to work in a study or dine in a dining-room where the light emanates from all directions, and where the iris of the eye is kept constantly contracted by the high luminosity of the surroundings. Shadowless illumination was always depressing, and it would be wise to deliberate carefully before any system of shadowless illumination was adopted, and to remember that the object of all illumination is to produce an effect by which the outlines of objects is easily seen, which result is greatly assisted by the effect of light and shade.

A Paper on the effect of wall papers on illumination, by Mr. P. J. Waldram was read at the same meeting. The author said that the predetermination of interior illumination was not easy, and it was not realised how much light was absorbed by wallpapers, &c., that might be usefully reflected. The author suggests that the reflection coefficient for any paper, colour, or texture can be ascertained with sufficient accuracy for all practical purposes by measuring its apparent surface brightness in a direction normal to its surface as compared with that of white blotting paper, or other suitable standard under the same illumination. Equipped with the distribution curve of the particular light unit or units which it is proposed to adopt, and the reflection coefficient of the wall and ceiling papers or colours, the installing engineer can say what direct flux of light will fall upon the walls, ceiling, and table plane of any room, and what will be the surface brightness due to that flux. All he requires to know is what increase in the flux will be due to reflection.

Some tests by Drs. Sharp and Miller in America in a room 12 ft. by 12 ft. by 10 ft. high, lighted with one pendant; the lamp directed an average flux of 1·20 foot-candles on to the ceiling, 2·50 foot-candles on to the walls, and 1·25 foot-candles on to a table plane 3 ft. from the floor. It was found that the total effect of reflection and counter reflection from walls and ceilings under these conditions was equivalent to an average secondary flux of 1·90 foot-candles on the walls, 0·65 foot-candles on the ceiling, whilst the illumination on the table plane was doubled to 2·5 foot-candles.

In the author's own experiments on a rather larger room, in which observations were taken with various wall-papers, it would appear that under average conditions the increase of flux of illumination on walls by reflection tends to vary somewhere from between 50 per cent. and 70 per cent. with white wall-paper, down to between 20 per cent. and 30 per cent. with very dark papers. The increase of flux of illumination on white ceilings appears to be in about the same proportion as on the wall-papers to which they are adjacent. The increased illumination on table planes in foot-candles appears to be about a mean between the increases in foot-candles of the flux on the walls and on the ceiling.

DISCUSSION.

The discussion was opened by Mr. A. P. TROTTER, who said that the total light in a room entirely covered with a colour with a known coefficient of absorption, such as those which had been given by Dr. Sumpner some time back, could be calculated, but in practice sufficient data could not be obtained, and experiments such as those of Mr. Waldram had to be resorted to.

Mr. JUSTUS ECK suggested the term luminosity for secondary illumination, and favoured the idea that manufacturers should send out polar curves of their lamps.

Mr. V. H. MACKINNEY (Holophane, Ltd.) objected to Mr. Harrison's remark regarding his company's Lumeter, and said with the standard card it could measure true foot-candles. He also pointed out that reflectors and globes had other functions than referred to by Mr. Harrison, such as the avoidance of glare, and said that when reading, darkening the surroundings too much had a bad effect on the eyes. The Holophane reflectors usually transmitted about 22 per cent. of the light upward for general illumination, and reflected 75 per cent. in the direction where most required. His company were carrying out experiments in a room 8 ft. cube, which could be fitted with wallpapers of any colour. Some of the results are given in the accompanying table. It is interesting to observe how the various

Illumination of room 8 ft. cube lighted by one 55-watt tungsten lamp.

Conditions.	Quantity of light (lumens) at working plane. Direct from source.	From ceiling.	From wall.	Total.	Watts required to give 100 lumens.
Bare Lamp—					
White ceiling and walls ...	17	50	53	100	55
Black ceiling, white walls ...	17		33	50	110
White ceiling, dark blue walls (22% reflective coeff.) ...	17		30	47	117
White ceiling, dark red walls (28%)	17		36	53	104
White ceiling, light green walls (45%)	17		53	70	78
Lamp with "extensive" Holophane reflector—					
White ceiling, light green walls	60		40	100	55
Lamp with intensive Holophane reflector	90		35	125	44
Lamp with focussing Holophane reflector	120		36	156	35

components change as different wallpapers are employed, and the figures show that even in a room with light green walls and a white ceiling, a saving of over 30 per cent. can be made by using the correct Holophane reflector.

Mr. T. E. RITCHIE had compared the Lumeter with five other well-known instruments, and regarded it as the second best. He did not agree that shadowless illumination was depressing, and generally defended indirect illumination.

Mr. J. G. CLARKE (Gas Light & Coke Co.) suggested that with a given scheme of lighting, and a given colour of walls, the illumination of the walls ought to be inversely proportional to the square of the linear dimensions of the room.

Mr. W. R. RAWLINGS emphasised how much the requirements of different rooms and of different people varied. Mr. J. Hewitt also spoke, and both Mr. Harrison and Mr. Waldram replied briefly.

The Association of Engineers-in-Charge.—Among the visits arranged are one to the Central London Railway tunnel extension from the Bank to Liverpool Street on May 13th, and one to Cambridge on May 27th, when the electricity works and the works of the Cambridge Scientific Instrument Co. will be inspected.

East London Railway.—It is reported that at a recent meeting of the Joint Committee, which consists of representatives of the Lessee Companies', it was decided to proceed with a scheme for converting the East London Railway, which consists of five miles of line, forming a connecting link between New Cross and north-west London, to electric traction. The estimated cost is said to be £50,000.

THE MURRAY PRINTING TELEGRAPH

At last Thursday's meeting of the Institution of Electrical Engineers, Mr. Donald Murray read a paper entitled "Practical Aspects of Printing Telegraphy." In the first part of the paper he discussed the field for printing telegraphy, the use of which would lie chiefly in connection with centres of population, and in assisting the co-operation between the telegraph and telephone. He suggested that for the transmission of intelligence over considerable distances the most efficient arrangement was a combination of the telephone and telegraph, the telephone acting as the collector and distributor for long telegraph lines. By co-operation between the telegraph and telephone the advantage of the cheap telegraph line was combined with the advantage of the low labour cost and time-saving of the telephone. Printing telegraphs, he said, would form essential links in the telephone-telegraph network, because printing telegraphs were the only means by which the carrying capacity of telegraph lines would be greatly increased and the labour cost at the same time decreased.

The second part of the paper contained a long and detailed account of the difficulties that have been encountered in connection with the development and practical application of printing telegraphs. There were several traffic difficulties such as the difficulty of making a copy of the received message, and changes were necessary in the forms used. The numbering of the messages appeared to present difficulty, and the saving in time theoretically obtainable was limited by a variety of traffic considerations. There were also difficulties with the difference of alphabets and signs in use in different countries. Code messages were, however, handled with less risk of error than by the Morse system. There were also mechanical difficulties of construction. Printing telegraph machines belonged to a theoretically bad group of mechanisms, in which the majority of the actions were striking instead of sliding or rolling, and it was only by close attention to details that success had been achieved.

In the last part of the paper was given a general description of the latest developments of the Murray system, which include the Murray automatic instruments and the new method of multiplex working.

In the Murray automatic system, the messages are first perforated by a keyboard instrument, on a strip of paper tape in the Baudot 5-unit alphabet. The perforated tape is then used to transmit the messages by means of an automatic transmitter at a speed of from 100 to 180 words a minute, and at the receiving station the arriving signals are recorded as perforations in a second paper tape. This reproduced tape at the receiving station then serves to operate an automatic typewriter. The line is worked duplex, giving one transmission in each

Connections of Murray Multiplex System.

direction simultaneously on the one wire. Received messages are printed in page form, at speeds up to about 200 words per minute. The essential feature of the typewriter is that the typebars are very short, only 2 in., to ensure high speed.

In the automatic printer, the letter, line, and column feeds are entirely automatic, but the page-feed is manually operated. The apparatus is rather extensive, and its advantages are more particularly felt in the case of long lines. It is in use with great success between St. Petersburg and Omsk, 2,400 miles, giving 60 to 65 words per minute over a line capable of less than 40 words per minute with Wheatstone apparatus.

The Murray multiplex system is to some extent founded on the Baudot, as it employs a similar distributor, with the important difference that it is driven, like the Delaney multiplex, by a Lacour phonic wheel motor. The system can be worked duplex, and will give up to eight transmissions on one wire. The distributor at one station sends out a governing impulse once in each revolution, which controls the speed and phase of that at the other end. The distributors are of very simple construction. The essential connections are shown diagrammatically in the figure. For the sake of clearness the segments for the other transmissions are omitted, and for the sake of simplicity the Baudot 5-key transmitter is shown at station *A*. The vibrator and phonic wheel that keep the contact brush of the distributor revolving are also omitted. The five transmitting keys at *A* normally rest against the top contact bar, which is connected to the negative end of a split battery. The depression of any key puts it in contact with the positive battery bar. The keys are connected to contact blocks of the distributor, and the various permutations of five positive and negative impulses are transmitted into the line as the distributor arm revolves. Two contacts on the distributor at station *A* are connected direct to the plus and minus poles of the battery. A positive and a negative governing impulse are therefore sent into the line with each revolution to control the speed of the distributor at station *B*. The receiving vibrator is provided with buffer springs so that the speed of the vibrating reed varies with the variation of the electric current driving the reed. The contacts 6 and 7 on the receiving vibrator energise the magnets of the phonic wheel-motor driving the distributor at *B*. Varying the speed of the reed will vary the speed of the distributor. If the contact brushes at the two stations are revolving at the same speed and are in phase with each other, and the brushes at both ends are on the plus contacts, a positive impulse will flow into the line at *A* and will operate the main line relay at station *B*, but there will be no local action nor will there be when the two negative contacts are reached, because the plus contact on the distributor is an idle contact. If, however, the distributor at *B* runs 1 or 2 per cent. faster than that at station *A*, when the brush at *A* is on the plus contact, so that the main line relay contact at station *B* is closed, the brush of the distributor at station *B* will have reached the minus contact, and the circuit through the governing relay will be closed, and the governing relay contact will be momentarily opened, and reduce the amount of current driving the reed. This will slow down.

The printer, with its five setting magnets, which control the equivalent of a combination lock releasing the mechanism of the type line required, acts on the same general principle as the other Murray printer, and is driven by a 1/16-h.p. motor, but space does not permit of full description here. Another instrument is the receiving perforator, which is used to perforate a strip from the received message, so that it can be retransmitted without loss of time.

At the conclusion of reading an abstract of the Paper at the meeting, Mr. Murray gave a practical demonstration of the working of a group of his latest instruments.

Great tribute to Mr. Murray's work was paid by Major W. A. J. O'Meara (Engineer-in-Chief to the G.P.O.), who opened the discussion. Mr. Murray had made good use of his long experience in the Post Office. He agreed that the telephone had a future as a feeder to the telegraphs, and regarded it as the principal requirement of telegraph systems, to make the best use of long lines for numerous short messages. He rather favoured the tape against the page printer as being easier to make corrections with.

A communication was then referred to from Mr. F. Higgins (Chief Telegraph Engineer, Exchange Telegraph Co.), repudiating Mr. Murray's statement that confusion occurred between fractions and shilling strokes on tape machines. An example of a Stock Exchange tape was shown. The conditions of news work, when the same message was sent to 500 subscribers at once, were rather different from Post Office work. In the former case they sacrificed speed in favour of accuracy, and had to have apparatus not requiring skilled attention.

Mr. G. F. Mansbridge (Superintendent, Postal Telegraph Factory) took up the point of telephones acting as feeders to telegraphs, but did not think the telephone could meet the commercial messages as well as the telegraph. With regard to coded messages, he imagined the dismay of a telephone operator at being called upon to pronounce "Jyjeplolyg ayilustma avokkotuj jybofoznit." Mr. F. Ryan (Eastern & Associated Telegraph Cos.) referred to the use of the keyboard perforator, which he did not consider very suitable for code messages. Mr. S. Evershed was very appreciative of the way Mr. Murray had overcome mechanical difficulties, and pointed out that the use of very short type arms was of even greater advantage than Mr. Murray had made out, as the moment of inertia was proportional to the cube and not to the square of the length.

Mr. A. J. Stubbs (Assistant Engineer-in-Chief, G.P.O.) referred to the advantage of simultaneous printing and perforating for retransmission, and mentioned that the Baudot system had been adapted to keyboard transmission.

Mr. W. Judd (Electrician-in-Chief, Eastern & Associated Telegraph Cos.) said that there was very little need for such apparatus on cable systems. Any system they adopted would have to receive the signal in actual Morse in order that when anything went wrong they could change over to standard apparatus. The difficulties in introducing printing systems related more to the traffic than the technical point of view.

Mr. J. Hume Bell (Secretary, Institution of Post Office Engineers) also pointed out traffic difficulties with printing systems. The speed of keyboard work was limited by the time

Hosted by Google

to make out the handwriting of messages, which was often very bad, and the use of different kinds of forms to facilitate the sorting of messages was more difficult. Printers, however, reduced errors, and the receiving perforator saved a great deal of time.

Mr. W. Noble (Superintending Engineer, G.P.O.) remarked that the Baudot system was now at work between Birmingham and London, and 12 Hughes instruments were at work on the lines connecting other large towns. He spoke of the good work being done with systematic Wheatstone working, and doubted whether the Murray apparatus would really be able to keep up such a speed as 40 words per minute.

Mr. Murray said a few words, but reserved his full reply for the journal.

TEMPORARY WIRING FOR ILLUMINATIONS

THE Corporation of London have issued a short series of rules relating to the arrangement of Coronation illuminations in the form of a notice addressed to electrical contractors and others on the same general lines as the recommendations of the L.C.C. Fire Brigade Committee, referred to in ELECTRICAL ENGINEERING, December 8th, 1910, p. 781. The Corporation are, however, more explicit in the matter of the dimensions of signs, and require that they shall not project more than 4 ft. 6 in. from the front of the building to the extreme edge of the device, or be at a less distance than 2 ft. from the carriage-way. The height of such projections must be of a minimum of 8 ft. from the pavement to the underside of the device. Adequate fusing of both poles of all circuits and sub-circuits is required, and the latter are to be limited to 10 amperes. As in the L.C.C. recommendation, bare conductors are tabooed, and the importance of earthing all metal conduits and coverings is emphasised. Switches fuse as terminals are to be protected from the weather, and the insulation is to be of a "satisfactory nature." Festoons, garlands, &c., must have supports independent from the conductors, and an important hint is given that the effect of wind must not be overlooked in their design, and another rule reads as follows:—All shades and decorations of combustible materials in proximity to lamps should be rendered non-inflammable by a process which will withstand the action of rain for several days, and no shades or decorations of celluloid or similar substance should be used.

Manchester Smoke-Abatement Exhibition.—A meeting was held in the Midland Hotel, Manchester, on Friday, April 28th, of the supporters of the Smoke-Abatement Exhibition which is to be held in Manchester in November next. Mr. Alderman Fildes, Chairman of the Sanitary Committee of the Manchester Corporation, presided, and spoke at some length on the injurious effects of the murky atmosphere of Manchester, and said that the Gas and Electrical Committees of the Corporation could help greatly by encouraging the use of gas and electricity for many purposes where at the present time coal is used. Mr. J. W. Graham, Principal of Dalton Hall, moved a resolution approving of the proposed exhibition, which was carried, and said that the Smoke-Abatement League of Great Britain intended to hold their annual meeting and conference in Manchester during the exhibition. An Advisory Committee was appointed, consisting of the technical heads of the Manchester and Salford Gas, Electricity, and Sanitary Departments, and several professional gentlemen. Arrangements have been made with Mr. Walter Cawood, of the City Exhibition Hall, to undertake the management of the exhibition on behalf of the Society, and all communications must be addressed to him at 196 Deansgate, Manchester.

Siemens' "Zed" Fuses.—Messrs. Siemens Brothers' Dynamo Works, Ltd., call our attention to the following extract from the rules of the St. Pancras Borough Council:—"All main fuses should be of the enclosed cartridge type built up of porcelain. . . . All main fuses to be enclosed in a hardwood box lined with asbestos." Mr. S. W. Baynes (Borough Electrical Engineer, St. Pancras) has written to our contemporary, *The Electrical Contractor*, regarding this rule:—"That provided the fuses are protected in a similar manner to the 'Zed' fuses with porcelain, and that no metal parts charged with current are exposed, we do not intend requiring any further protection—that is to say, the teak box lined with asbestos will not be asked for." It will be remembered that one of the essential features of "Zed" fuses is the complete enclosure of all live parts, and, what is even more important, the complete enclosure in a sealed chamber of the fusible portion. We understand that some tests have recently been carried out by the Burma Electric Tramways & Lighting Co., Ltd., of Mandalay, illustrating the suitability of "Zed" fuses for the severe conditions of tramway work. A "Zed" fuse placed in a feeder circuit behaved perfectly, whether under a normal overload in actual practice, under a gradually increasing load, or under a dead short.

FIRE AT THE HINDHEAD AND DISTRICT ELECTRICITY WORKS

AT about 2 a.m. on Wednesday last week a fire broke out in the works of the Hindhead and District Electric Light Co. A few motor-car ignition cells had been sent to be charged, and this was done in the disused boiler room; the station is a Diesel engine one, and the boiler plant is no longer employed. When the fire was first discovered it was seen that the roof of this room was alight, but the generating plant was running as usual, as the fire had not extended to the engine room, in which also the switchboard was placed. The resident engineer, who lives at the station, immediately switched off the supply and stopped the engines, as the fire was spreading rapidly. The fire quickly reached the engine-room and the residential quarters. The engineer's family had to make a hurried escape, and the generating plant and switchboard were severely damaged. As soon as the consulting engineers to the company, Messrs. Handcock & Dykes, were informed on Wednesday morning, Mr. Dykes went down and assisted in the arrangements to enable the supply to be resumed. Part of the supply is direct continuous current for the more immediate neighbourhood, and part 2,000 volts alternating for transmission to Haslemere. It was found that one of the D.C. sets was not so much damaged as the others, and Messrs. Mirrlees, Bickerton & Day and the E.C.C. promptly responded to telegrams for spare parts. A spare balancer was borrowed from the Leatherhead station, and the D.C. supply was resumed on Friday morning. The auxiliary motors had all been burnt, but a lathe motor was found which was utilised to drive the pump for the circulating water. By Sunday one of the alternators had been sufficiently repaired, and the supply to Haslemere was restarted. The other two machines and the switchboard are quite incapacitated, and the company is to be congratulated on having succeeded in resuming supply so quickly, as the roof of the engine-room had fallen in during the fire, and the whole station was in a state of chaos.

The Pretoria Pit Explosion.—The members of the Miners' Federation of Great Britain who were present at the Government inquiry have drawn up their own report on the explosion, which is somewhat at variance with the opinions of the jury at the inquest, of the manager of the mine, the electrical engineer to the mine, and of Mr. Nelson (H.M. Electrical Inspector of Mines), and Dr. W. M. Thornton, none of whom considered that there was any evidence that the cause of the explosion was electrical. The miners' representatives, on the other hand, state that they are satisfied that it was due to an electric spark from the conveyor switch. The report further condemns the use of electrical machinery in parts of the mine where there was an abnormal proportion of gas, and calls for more stringent regulations respecting the use of electricity and their more general enforcement.

Electrical Driving of Weaving Sheds.—A great deal of interest has been taken recently with regard to the individual driving of looms by small electric motors specially designed for high efficiency. Some few months back the British Westinghouse Electric & Manufacturing Co., Ltd., secured an order for the equipment of a weaving shed on these lines from Messrs. Edward Hibbert & Co., of Hyde, through their Consulting Engineer, Robert Blackmore, Esq., of Stalybridge. This installation is now at work, and the following paragraph which appeared in the *Factory Times* is worthy of reproduction:—"The new shed recently built by Messrs. Edward Hibbert & Co., Greencroft Mill, is being driven by motors. The looms are running much quicker and steadier than they did under the ordinary system, and the operatives are well satisfied with the alteration. The motors are so arranged as to use a short belt, and the drive ensures smoothness of running and prevents slips."

Telephone Purchase.—On Tuesday the Railway and Canal Commissioners sat to hear a dispute between the National Telephone Co. and the Postmaster-General as to the plant which the Government is to purchase under the agreement of 1905. With the exception of what is known as the "private wire" business of the company, the whole undertaking is to be acquired on "tramway terms," *i.e.*, upon the basis of the value as plant and material only. At the same time the Postmaster-General has certain rights to refuse to purchase any plant which, in his opinion, is unsuitable for his purpose, and failing agreement in this respect the Railway and Canal Commissioners have to arbitrate. Hence this action. In opening the case for the company, Sir Alfred Cripps, K.C., stated that the Postmaster-General had served notice upon the company refusing to take over plant in certain areas where both the company and the Postmaster-General were at present in competition, but he contended that all this plant was quite up-to-date and had been constructed under the supervision of, and according to, the specification of the Postmaster-General himself. The Attorney-General, on the other hand, argued that the objection to take over the plant in question is because it is worked on the magneto system, and not on the central battery system, which is now standard telephone practice. The arbitration is expected to last a considerable time.

CORRESPONDENCE

THE USE OF BATTERIES.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—While the matter is still fresh in the minds of your readers, may I trespass a little further on your valuable space? I will endeavour to be very brief.

I believe the difference of opinion which exists about the relative values of boosters and regulating cells is largely due to previous impressions. The Britisher comes to the question with the sizes of boosters, as hitherto determined for discharge, rigidly fixed in his mind. He compares this with the regulating switches he sees on the Continent, and at once comes to the conclusion that they are about equal in cost, especially when considering the frightful inefficiency of the ordinary type of booster when charging the battery.

But he overlooks the fact that, in following Continental practice, he must add 20 per cent. additional cells to his battery, and will now require a booster for charging purposes alone, which is big enough (if made triple-parallel) to deal with his discharge.

What, then, is the objection to using this booster for the discharge? It cannot be on the score of cheapness, for the cost with the booster alone is less than one-third of that with the combined arrangement.

The objections alleged are two: (1) that the switchgear is more complicated. This is due merely to insufficient information having been given in the paper, for the use of large "selector" switches has been employed, within my own experience, on some of the heaviest direct-current generator panels in the kingdom for many years with never the least trouble; and the switches would not be touched from the beginning to the end of the discharge. (2) That useful current at time of peak is taken up in driving the booster. This is quite true; but useful current is also locked up in idle cells with the regulator method. A consideration of the example taken in my Paper will show that out of 303 cells a discharge is obtained which is only equivalent to that from 290 cells fully worked, representing a 4 per cent. loss of locked-up current. With the booster arrangement, for the same size of battery, 6 per cent. of the battery current would be taken up by the booster motor, but out of this energy some 4 per cent. is returned to the battery circuit, the actual loss being, therefore, only 2 per cent. Moreover, since the booster only costs about £0·5 per kw., whereas the battery costs about £6·0 per kw., it is obvious that a lot of capital is locked up needlessly in the regulating cells.

It should be mentioned (several speakers having misunderstood this point) that the regulator cells shown in some of my figures are not really regulating cells at all, but are merely for "floating" purposes, and carry no heavy currents. They can be done away with, if desired, by employing a small "bucking" booster; but two or three cells are required to compensate for the non-regulating properties of the static booster, where this is employed.

Avondale, Ashfield Road, King's Heath, May 6th, 1911.

Yours faithfully,
A. M. TAYLOR.

THE LIFE OF METAL FILAMENT LAMPS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I hope I am not trespassing too much on your columns, but I should just like to say in reply to the reference to metal filament lamps on p. 234 of your issue of the 4th inst., that it appears to me there is only one point that should appeal to the consumer, and that is: How to get the desired illumination at the least cost, including current and lamps? And I reply that the report of the Westminster Electrical Testing Laboratory conclusively showed that by using the Cryselco metal filament lamp the desired light is obtained at a less cost per hour than with any other make of lamp tested, including the cost of lamps and current. This to my mind is the crux of the whole question. The Westminster Electrical Testing Laboratory also gave the "economical life of the different lamps," *i.e.*, life to 1·5 watts per c.p. The economical life of the Cryselco lamp was more than fourteen times that of the Osram lamp.

I am, yours faithfully,
CRYSELCO, LIMITED,
H. S. DEACON,
Managing Director.

Bedford, May 4th, 1911.

The Constantinople Telephone Contract.—*The Times* Constantinople correspondent states that the telephone contract was signed on Saturday by Djaird Bey and Mr. H. Laws Webb. He adds that Mr. Webb has left for London in connection with the organisation of the new company and its staff.

Olympia Exhibition, 1905, Trust Fund.—We understand that this Fund has now been realised, and the sum of £378·12s. 8d. been paid into the funds of The Electrical Trades Benevolent Institution, and £203 17s. 7d. to the Benevolent Fund of the Institution of Electrical Engineers. The trustees for this fund were: Sir W. H. Preece, Messrs. E. Cunliffe Owen, J. E. Kingsbury, C. S. Northcote, J. E. Edgcumbe, and W. Davenport.

ILLUMINATION

A PAPER, which was read by F. J. Hawkins yesterday before the Junior Institution of Engineers, dealt with the subject of illumination. After a few remarks on the inverted gas burner, the author took up the electrical side of the question at greater length. Stress was laid on the importance of reducing the glare effect to a minimum, at the same time obtaining the most effective distribution of light. Curves were given showing that the glare effect gradually drops with increase in distance of the source of light in the case of low candle-power intensities, whereas with a 400-c.p. source there was no appreciable difference in this effect under the same conditions. Illumination curves were also given, which showed that the minimum glare effect was to be obtained by keeping the angle between the line of maximum candle power and the vertical as small as possible. With regard to the lighting of main thoroughfares, it was pointed out that, although low candle-power units, correctly spaced, were the most suitable for ideal illumination, the cost of installing and maintaining was greatly against them, and a more economical system was suggested in the adoption of high candle-power units mounted about 30 feet high. An example of this can be seen in Cheapside, where the Oriflamme arc lamps, with prismatic reflectors for obtaining a good diffusion of light, are used on the central suspension principle (see ELECTRICAL ENGINEERING, Vol. vi. p. 803). This is a great advantage where high buildings of a light colour abound, for an equal amount of light reaches both sides, and considerable reflection is obtained. With reference to the lighting of side streets, where the lamp-posts had to be put on the pavements, it was pointed out that, in order to obtain effective illumination, reflectors and shades of proper design were necessary, and a suggested type was illustrated, which shielded the light from the eyes of pedestrians, at the same time giving maximum illumination on the road. No definite data were given on the lighting of interiors, as each particular case was a problem by itself, depending on the dimensions, the height, and colour of the walls and ceiling. A table of the coefficients of reflection (ρ) for the various colours is given, which, if multiplied by the intensity of illumination (I), will give the surface brightness ρI, where $I = c \cos a/d^2$, c = the candle-power of the source of light, d = distance, and a = angle of incidence of rays striking surface.

For the purpose of shop-window lighting, tubular lamps placed round the inside of the windows were suggested, as the whole of the light was then reflected on the goods displayed, and an even distribution obtained. The author concludes with a few remarks on the future aspects of illumination, mention being made of the Moore tube-light and the possibility of improvements in the mercury-vapour lamp to modify the colour of the light.

Electrical Trades' Benevolent Institution.—The following subscriptions and donations have been received since those given in our list last week. Subscriptions:—Nalder Brothers & Thompson, £5 5s.; L. W. Wild, £1 1s.; Hawtayne & Zeden, £1 1s.; Concordia Electric Wire Co., £3 3s. Donations:—Pope Electric Lamp Co., £1 1s.; J. R. Icke, 2s. 6d.; L. W. Wild, £2 2s.; C. Bassett, £1 1s.; R. Hornby & Sons, £1 1s.; J. W. Flower, 10s. 6d.; J. H. Avery, 10s. 6d.; J. S. Plumtree, 10s. 6d.; "Electricity," £1 1s. As announced elsewhere, the grant of £378 12s. 6d. from the Olympia Exhibition of 1905 has now been received.

Parliamentary Intelligence.—The Sidmouth Gas and Electricity Bill was read a third time in the House of Lords on Thursday. The Luton Corporation Bill, which includes a wiring clause, was read a third time in the House of Commons last week.

Before the Standing Orders Committee last week the Yorkshire Electric Power Co., and the Electrical Distribution of Yorkshire, Ltd., unsuccessfully opposed an application by the Pontefract Corporation for permission to introduce a late bill confirming an agreement for the transfer of the Pontefract Electric Lighting to the West Riding Tramways Co.

The Croydon and Southern District Railless Traction Bill has been withdrawn.

The London United Tramways, Liverpool Overhead Railway, Notts and Derbyshire Tramways, Luton Corporation, and the Metropolitan Electric Supply (Acton) Bills were read a second time in the House of Lords on Thursday. The Winchester Corporation (Electric Supply) Bill was read a second time in the House of Commons on Monday.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—Member: G. S. Corlett. Associate Member: E. Hall. Associates: A. B. Anderson, H. Ashton, A. Bursill, W. B. Ellis, A. E. Hall, J. C. Johnston, H. Millar, A. R. Newman, P. H. Nye, E. H. Winton. Students: G. Beaumont, W. Biggam, J Dayal, N. R. De Pomeroy, H. V. Henniker, F. E. Hill, H. M. Jordison, W. Kerr, A. S. MacWhirter, J. Oliphant, J. Parker, C. J. Polden, W. Smith, P. G. Spary, W. W. Stainer, R. V. Stone, C. S. Williams.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 4th, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

8,984/10. **Metal Filament Lamps.** BRITISH THOMSON-HOUSTON Co. and J. GRAY. Filaments drawn from an alloy of tungsten with another metal are strung on the carriers or spiders before the latter metal is driven out by volatilisation. In order to permit of the contraction of the filament during the volatilisation, it is previously corrugated or crinkled.

8,988/10. **Incandescent Lamp Caps.** J. E. CRIGGAL and the BRITISH VITRITE WORKS, LTD. In the manufacture of lamp caps according to the 1902 Swan patent (*see* ELECTRICAL ENGINEERING, November 3rd, 1910, Vol. vi., p. 695), the two metal contact pieces are provided with a metallic bridge to ensure their being correctly spaced in the mould. The machine which pours in and moulds the molten glass filling also cuts away the metal bridge. Fourteen figures.

12,261/10. **Exhaust Steam Plant.** G. LAYTON (Knutsford). To avoid the necessity for a heat accumulator in exhaust steam plants where the supply of steam is intermittent, the exhaust turbine is provided with a heavy flywheel, from which energy is taken between the periods of steam supply, or a storage battery is used in conjunction with the turbo-generator to sustain the supply. Six figures.

15,873/10. **High Tension Condenser.** W. & R. BULLIMORE and A. C. CROSSER, LTD. This is a method for the prevention of sparking from the inner to the outer conductor, as is usual in condensers where thin dielectrics are employed. It consists of a septum, with a central aperture, preferably of the same material as the dielectric, being placed in a suitably-shaped vessel closed at one end, at a point so that the inner conductor terminates near the central aperture of the septum, while the outer conductor is carried up past the septum, thus separating the conductors sufficiently to prevent sparking. Instead of the septum inside, a flange outside can be used, when the inner coating would be extended beyond the flange. Four figures.

17,308/10. **Non-spillable Vents for Accumulators.** D. W. JOHN and J. H. BERRY. This is an invention to prevent the spilling of acid. It consists of a stopper, one end of which is in the form of a valve seat, and the other end in the form of a cup, in which a heavy ball rests. A piece of pure rubber connects this ball with the valve, so that directly the accumulators are tilted the ball rolls about and closes the valve by means of its rubber connection. Eight figures.

207/11. **Primary Batteries.** A. HEIL (Germany). Instead of using the usual dioxide, a depolariser in the form of a dark brown hydrated oxide of manganese mixed with graphite is employed, the whole being placed in a porous cell with solid carbon and with zinc for the other electrodes, which dip into a solution of ammonium-nitrate or ammonium chloride.

14,121/10. **Sterilising Liquids.** V. HENRI and HELBRONNER and VON RECKLINGTON (France). This is a method for treating liquids by means of ultra-violet rays. A hollow cylinder, whose inner periphery is supplied with the liquid, is made to rotate, causing a surface friction between the cylinder and the liquid, which draws the liquid out into a thin film, to enable the rays to penetrate it. Nine figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: REID [Insulating material] 9,858/10.

Dynamos, Motors, and Transformers: BALACHOWSKY and CAIRE [Regulation of machines] 9,373/10; LEHMANN, ROSS-HARVEY and INRIG [Variable-speed dynamo] 12,651/10; A.-G. BROWN, BOVERI & CIE [Repulsion motors operating as generators] 25,473/10.

Electric Ignition: VICKERS, SONS & MAXIM, LTD., and ELIA [Submarine mines] 12,742/10; SEARLE [Control of gas burners] 20,735/10; BLICKENSDERFER [Sparking plug] 181/11; FLETCHER [Contact breaker] 2,435/11.

Electrochemistry & Electrometallurgy: HÄRDEN [Electric furnaces] 9,897/10; JOHNSON (*Chemische Fabrik Griesheim-Elektron*) [Purification of magnesium] 22,016/10; LINDER [Ozoniser] 447/11.

Heating and Cooking: GRAY [Electric ovens] 9,611/10.

Incandescent Lamps: BEUTTELL, 9,615/10.

Instruments and Meters: BIERMASZ [Transmitting compass positions to a distance] 7,906/11.

Switchgear, Fuses, and Fittings: ADAMS MANUFACTURING Co. (*Cutler Hammer Manufacturing Co., U.S.A.*) [Motor controllers] 9,171/10, 9,199/10, 9,276/10, and 9,278/10; HARLOW and FAYE-HANSEN [Protective apparatus for A.C. systems] 9,603/10; BRITISH THOMSON-HOUSTON Co. and WEDMORE [Switch mechanism] 11,707/10; ADAMS MANUFACTURING Co. and ADAMS [Change-over switches] 12,701/10; A. REYROLLE & Co. and SCHUIL [Lightning arresters] 14,476/10; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Protective devices] 14,512/10; DEAN [Ironclad switches and fuses] 15,684/10; Pugh and Gamblee [Time-switches] 22,368/10; LUCAS and EDWARDS [Switch for electric horns] 22,481/10; HOPE [Time switches] 24,439/10.

Telephony and Telegraphy: MARTIN [Telephony] 1,299/10; KEITH [Telephony] 1,421/10; FALES [Telephony] 1,422/10; DICKER (*Automatic Electric Co.*) [Telephony] 1,423/10; FALES [Telephony] 7,876-7-8/11.

Traction: J. STONE & Co. and DARKER [Electric lighting, heating, and ventilating of trains] 6,666/10; W. R. SYKES INTERLOCKING SIGNAL Co., SYKES and TARRANT [Signalling] 9,880/10; CHAPMAN [Signalling] 10,125/10; COOPER [Clutch for electric vehicles] 18,850/10; HARRIS [Air-brake couplers] 20,665/10; FILSELL [Safety apparatus] 20,684/10.

Miscellaneous: CLAYTON [Illuminated signs] 9,069/10; ASTIÉ [Illuminated signs] 9,394/10; GEB. SIEMENS & Co. [Fireproof conductive materials] 19,866/10; BOULT (*Electric Compositor Co.*) [Type line-casting machines] 23,474/10; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [Electro-dynamical couplings] 28,940/10; LEE and WEEDMAN [Mine alarm instruments] 2,382/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution Systems, &c.: HULTMAN [Manufacture of conduits for underground cable] 5,813/11.

Dynamos, &c.: A. G. BROWN, BOVERI ET CIE. [Variable frequency commutator machines] 7,061/11; LEWIS [Control of A.-C. motors] 8,783/11.

Incandescent Lamps: SCHWAB [Filaments] 8,004/11.

Switchgear, &c.: HARTMANN & BRAUN A.-G. [Push-button switches] 6,147/11.

Telephony, &c.: GOLDSCHMIDT [Apparatus for intensifying weak alternating currents] 8,978/11.

Traction: SOC. ANON. FORGES DE BELLECOURT [Tramcar bogies] 15,865/10.

Miscellaneous: KASSEN [Clock-controlled electric alarm] 9,049/11; BURSTYN [Irradiance coils] 9,349/11.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

12,128 of May 17th, 1897. **Railway Signalling.** J. W. WEBB and A. M. THOMPSON. This improves on the system of power signalling, where the points are worked by motors and the signals by electro-magnets, by introducing an interlocking lever frame in combination with the well-known tappet-locking system.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: P. MACGAHAN [Three-phase fault-finding apparatus] 26,887/04.

Instruments, &c.: P. R. ARNO [Current indicator and recorder] 1,221/06.

Storage Batteries: C. P. ELIESON [Accumulator plates] 1,187/04; H. OPPENHEIMER (*A. G. Mix & Genest*) [Battery Tester] 1,151/06.

Switchgear, &c.: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Block Signalling] 1,564/06.

Telephony, &c.: P. A. NEWTON (*Gray National Telautograph Co.*) [Telautographs] 1,103/99; A. J. BOULT (*Gruhn*) [Telegraph systems] 1,178/03.

Traction: W. GRIFFITHS and B. H. BEDELL [Insulators for surface contact systems] 1,537/02; WESTINGHOUSE BRAKE Co. (*Westinghouse Air Brake Co.*) [Air brakes] 1,388/04.

Miscellaneous: F. W. LE TALL (*Cooper Hewitt Electric Co.*) [Vapour apparatus] 1,364/04; P. C. HEWITT [Control of vapour apparatus] 706/06.

Opposition to Grant of Patents

20,639/09. **Cooking and Heating Apparatus.** A. F. BERRY. The grant of this patent has been allowed in spite of opposition. The specification (abstracted in ELECTRICAL ENGINEERING, October 6th, 1910, p. 636) relates to the continuous heating up of a large mass of metal from which heat is extracted by conduction when required.

23,096/10. **Centrifugal Fans.** J. KEITH. Opposition has been entered to the grant of this patent. The specification describes an improved design of runner for centrifugal fans.

Hosted by Google

LOCAL NOTES

Acton: *Electricity Works Transfer.*—It has been agreed that the Metropolitan Electric Supply Co. shall take over the Council's electricity undertaking as from March 31st, instead of waiting until the date of Royal Assent to the Bill which is now before Parliament.

Bacup: *Bulk Supply.*—An agreement has been entered into for the supply of electricity in bulk by the Rawtenstall Corporation.

Bispham: *Overhead Wires.*—The Board of Trade has sanctioned the use of overhead wires in connection with the Council's electric lighting scheme.

Blackburn: *Plant Extensions.*—At a meeting of the Town Council on Thursday a resolution was moved to refer back the Electricity Committee's proposal to invite tenders from certain firms for steam turbines on the ground that the firms in question had not their works in Blackburn. Alderman Higham, Chairman of the Electricity Committee, having pointed out the fact that no firm of turbine builders have works in Blackburn, and that they were advised to adopt turbines in preference to reciprocating engines, the resolution was defeated by a large majority.

Bournemouth: *Abandonment of Conduit System.*—The reconstruction of the conduit system in the centre of the town has been completed, and the cars are now running by permission of the Board of Trade before the official inspection takes place.

Bridlington: *Electrical Fountains.*—The Property Committee propose to erect an electrical fountain on the Princes' Parade, and in this connection a special meeting of the Town Council is to be held to consider a recommendation that the Chairman and Deputy-Chairman of the Committee be sent to Berlin to inspect electrical fountains in operation.

Bury: *Tramway Profits.*—There was a net profit of £4,469 on the Bury tramways for last year. Of this sum £2,800 has been transferred to reserve, and £1,669 to relief of rates.

Dublin: *Electricity Extensions.*—The Local Government Board inquiry into an application by the Corporation for sanction to a loan of £128,129, referred to in our last issue, was resumed on Tuesday last week. Mr. Mark Ruddle, City Electrical Engineer, gave evidence in detail as to the new plant which will be required. The Committee have decided to accept the tender of the Maschinenfabrik Oerliken for steam turbo-alternators, condensing plant, and switchboard at £11,458, and that of Messrs. Babcock & Wilcox for the boiler plant, chimney, pumps, pipe-work, coal conveyer, &c., at £23,240. The acceptance of these tenders, of course, is subject to the Board of Trade sanction to the necessary loan.

Dundee: *Tramway Fares.*—Mr. Peter Fisher, the tramway manager, proposes to introduce a maximum fare of 1d. for any distance to or from High Street, limiting ½d. stages to 880 yards. This new scheme will abolish the present system of cheap workmen's fares.

New Sub-station.—The Electricity Committee have acquired land for a new sub-station at Downfield.

Edinburgh: *Electricity Profits.*—The recommendation of the Electric Light Committee, referred to in our last issue, that the profits on the electricity undertaking for 1909–10, amounting to £7,300, should be applied to the reduction of the capital debt of the undertaking, has been rejected by the Council.

Glasgow: *Tramcar Speeds.*—In reply to a question in the House of Commons by Mr. Watt last week as to the maximum speed sanctioned for the Glasgow Corporation tramway system, Mr. Sydney Buxton, President of the Board of Trade, stated that the maximum speeds vary in different parts of the City from 4 miles to 16 miles an hour.

Heywood: *Electricity Losses.*—The electricity and tramway accounts of the Council for the past year show deficiencies of £2,044 and £1,403 respectively.

Lewes: *Street Lighting.*—The Lewes and District Electric Supply Co. is to be given an opportunity to tender for the lighting of the streets for five years in competition with the Gas Company.

London: L.C.C. Tramways.—The Highways Committee report that the cost of street widenings in connection with the proposed tramways from Marble Arch to Cricklewood will be £277,000, compared with the original estimate of £95,000. Nevertheless, if the support of the various road authorities can be obtained, it is recommended that the scheme be proceeded with.

Portrush: *Electric Supply.*—The Lighting and Water Committee again recommend the Council to proceed with the consideration of an electric lighting scheme.

St. Anne's-on-Sea: *Electrical Engineer's Remuneration.*—The Council have referred back a proposal that the electrical engineer should be paid a bonus of 5 per cent. on the profits of the electrical undertaking.

West Ham: *Bank Overdrafts.*—The legal expenses in connection with the recent dispute concerning the bank overdrafts for the purpose of the electricity undertaking amounted to £11,333. Deducting the amount repaid by the bank, and which had been received as interest, it is estimated that the net cost to the ratepayers will be equivalent to a penny rate.

West Hartlepool: *Electricity Accounts.*—After meeting all charges there is a net surplus of £1,505 from the working of the electricity department for 1910–11.

Tramway Arbitration.—The Arbitrator who sat to decide the price to be paid by the Corporation for two sections of the West Hartlepool Tramway Co.'s undertaking has determined the price at £12,096, the company paying three-fifths of the arbitration costs. The price asked originally by the Tramway Company was £22,000.

Willesden: *Electricity Profits.*—There was a net profit of £1,600 on the electric lighting undertaking for the past year.

Worcester: *Three-phase Supply.*—The Corporation have now agreed to the scheme of the City Electrical Engineer for substituting three-phase supply for single-phase in connection with the offer of Messrs. Heenan & Froude to take a minimum supply for three years equivalent to £500 per annum.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bexhill.—The Electric Light Committee recommend the installation of a new superheater, at an estimated cost of £180.

Blackburn.—An expenditure of £45,170 is to be incurred upon extensions at the electricity works.

Bradford.—The Electricity Committee recommend the extension of the generating plant at the Valley Road works at an estimated cost of £19,440. This amount includes:—A third B.T.-H. turbo-generator, complete with auxiliaries, steam, exhaust, circulating water and drain piping, &c., £10,292; piping, £900; buildings, £1,600; cables for third turbo-generator, £650; works battery and connections, £1,100; deep well pump, with electrically-driven lifting plant, casing 700 to 800 feet deep, £2,500.

Colne.—A loan of £2,000 for mains extensions is to be applied for.

OSRAM·LAMPS

Colwyn Bay.—A loan of £2,700 is to be taken up for electric lighting extensions.

Hastings.—A Local Government Board inquiry was held last week concerning a loan of £1,000 for extensions of the electric lighting mains to the workhouse.

Ireland.—A Board of Trade inquiry was held last week concerning an application by the Donaghadee Council for an electric lighting Provisional Order. Messrs. Wilkins & Burden, of Dublin, are the consulting engineers.

The Armagh Council have under consideration a scheme of electric lighting.

Leicester.—A Local Government Board inquiry has been held concerning a loan of £17,000 for electrical extensions. The main portion of the loan is for extensions to the tramway power station, and the remainder is for the necessary alterations in order to have the tramway power station and the lighting power station under one control.

Manchester.—The Electricity Committee invite tenders by May 17th for three-core, three-phase, paper-insulated plain lead-sheathed cable, and single-conductor, paper-insulated cable. Particulars from Secretary to Electricity Department.

South Shields.—A Local Government Board inquiry will shortly be held concerning a loan of £8,960 for new electrical plant.

Hosted by Google

Stockton.—Application is to be made for a loan of £6,750 for extensions at the electricity works.

Newcastle-under-Lyme.—Extensions to the electricity works, at an estimated cost of £5,000, are contemplated.

Worthing.—The storage battery at the electricity works is to be replated at an estimated cost of £900.

WIRING

Bradford.—Tenders are invited for an electrical installation at the new department of textile industries at the Technical College. City Architect.

Cardiff.—Extensive alterations to the premises of Messrs. Waddington, Sons & Co., City Road. Architect, R. O. Dowdeswell, Cardiff.

Cheltenham.—New municipal offices.

Edinburgh.—New school in M'Leod Street.

Exeter.—Additions to Okehampton Road Schools. Architect, J. Jerman, 1 Bedford Circus.

Leeds.—Hostel for women students at the City of Leeds Training College, Headingley. Architect, G. W. Atkinson, 1 Mark Lane.

Leyton.—The Council invite tenders for the lighting of the Town Hall and two branch libraries, by electricity. Particulars from the Borough Electrical Engineer.

Llandudno.—New church at W. Llandudno. Builder, Mr. P. Edwards, Chester.

London.—Tenders are invited for wiring two wards at the Mile End Infirmary. Chief Engineer of the Workhouse, Bancroft Road.—Twenty-three houses in Strathyr Avenue, Croydon. C. S. Banks, 16 Oakfield Road, Croydon.—Twenty-five houses in Kingscote Road, Croydon. R. Palmer, Sherwood Road.

Northampton.—Proposed secondary school for girls in St. George's Avenue.

Southsea.—Cinematograph theatre. W. H. Marshall, 38 Clarence Parade.

Wellingborough.—New elementary school. Architects, Messrs. Talbot, Brown & Fisher, Wellingborough.

West Ham.—New fire brigade quarters. Town Clerk.

Wolverhampton.—Considerable extensions at St. Jude's school.

MISCELLANEOUS

Bampton.—The Council have decided to light the streets by electricity.

Burnley.—The Tramway Committee recommend an expenditure of £14,650 on extensions to the tramway system. The new work includes three new single-deck cars, overhead equipment, and cables.

Carnarvon.—The Council will shortly consider the conversion of the lighting of the streets from gas to electricity.

London: *Hammersmith.*—Following out the decision of the Council in 1908 to substitute electric lamps for gas lamps in all streets where low-tension mains are laid, the Electricity Committee recommend the conversion of a further sixty-eight posts at an estimated cost of £393.

Portsmouth.—Tenders are invited for supply and fitting of sixty-eight Mazda electric lamps at the Town Hall. Particulars from the Borough Engineer. Tenders by May 22nd.

Swansea.—The Council will shortly be advertising for a supply of motors and starting switches for one or two years.

TENDERS RECEIVED AND ACCEPTED

Chelmsford.—Messrs. Aiton & Co. tendered at £200, and Messrs. Babcock & Wilcox at £230, for steam piping for the motor generator. The former tender has been accepted. The tender of Messrs. Warren, Beattie & Co. for the supply of a Taylor-Scotson regulator at £95 has also been accepted.

The Diesel Engine Co. have received a large number of orders since February, including 420 b.h.p. engine for Letchworth Garden City; 330 b.h.p. engine for the Leek Council; 340 b.h.p. engine for the Great Northern Railway Co.; 525 b.h.p. and 225 b.h.p. engines for Messrs. Dick Kerr & Co.; two 150 b.h.p. engines for the Reigate Council; two 270 b.h.p. and two 200 b.h.p. engines for the Chilian Government; and 320 b.h.p. engine for Chili (per Messrs. Balfour, Williamson & Co.); in addition, a large number of engines of smaller capacity for England and abroad.

APPOINTMENTS AND PERSONAL NOTES

An engineer is required by the Australian Commonwealth Government capable of designing and superintending the establishment of wireless telegraphy stations. Salary £600 per annum. (See an advertisement on another page.)

The South Wales Electrical Power Distribution Co. require two young architectural draughtsmen. (See an advertisement on another page.)

Mr. J. Harland Bowden has been nominated for the election as President of the Electrical Contractors Association.

Mr. F. W. Roberts, who has been with the National Telephone Co. for twenty-five years, and was until September last Brighton Manager for the company, has left England to take up the post of Engineer-in-Chief to the United River Plate Telephone Co., of Buenos Ayres. During the past six months Mr. Roberts has been engaged on the staff of the National Telephone Co. who have been entrusted with the task of preparing an inventory of the plant in view of the forthcoming purchase by the State.

The Highways Committee of the L.C.C. recommend the appointment of Mr. W. W. Warren and Mr. R. A. S. Duncan as shift engineers at the Greenwich power-house, at a salary of £250 per annum, rising by £10 per annum to a maximum of £300 per annum.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5, Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars, net c.i.f. port of arrival, quoted on Tuesday night, was £56 to £56 10s. per ton (last week £56 5s. to £56 15s.).

Unica Gearing.—Through a printer's error the address of Messrs. Rodgers Bros., who have acquired the gear cutting business of Messrs. J. B. Hamilton & Co., was given as Baker Street, Brighton. This should have been Baker Street, Brixton.

The Electrical Apparatus Co.—This firm have now moved into their new factory at Vauxhall, which has six or seven times the accommodation of their Battersea works. The new address is Vauxhall Works, South Lambeth Road, S.W., and the telephone number is Brixton 1975.

Agency.—Messrs. William Sanders & Co., switchboard and switch manufacturers, Falcon Electrical Works, Wednesbury, have terminated their agency with Messrs. O'Reilly, Holt & Fielden, and have appointed Mr. H. V. Sadler as their sole London and district representative, who will have charge of their new office at 90 Charing Cross Road (second floor).

Patent for Sale.—The owner of British Patents No. 7,286 of 1905 and 7,286a of 1905 relating to prevention of sparking in motors and to improvements in variable speed motors, desires to dispose of same. (See advertisement on another page.)

Silvertown Works Athletic Club.—The first annual sports meeting of this club was held on Saturday last at the Memorial Grounds, Canning Town, and was highly successful. The prizes were presented by Mrs. P. S. M. Brodie, and music was provided by the "Graysilver" Band.

Liquidations.—The North-Western Electricity and Power Gas Syndicate, Ltd., is to be wound up voluntarily. Creditors are requested to send particulars of their claims to the liquidator, Mr. C. E. Bullock, Albion Street, Hanley, Staffs, not later than May 30th.

The Electric Fog Signal Co., Ltd., is to be wound up voluntarily. Mr. A. T. Spear, 44 Myddleton Road, Uxbridge, is liquidator.

A meeting of the British Radio-Telegraph and Telephone Co., Ltd., will be held at 5 London Wall Buildings, London, on June 6th at 2.30 p.m. to hear the liquidator's account of the winding-up.

Bankruptcy.—Mr. W. H. Illingworth, trading as the Yorkshire Metal Filament Lamp Co., 14 Upper Fountaine Street, Leeds, has been adjudicated bankrupt. The public examination will take place at 10.30 a.m. on May 19th at the Halifax County Court.

The Thomas Transmission.—We understand that the road trial of the Thomas lorry, which we described on page 236 of our last issue, has been satisfactorily concluded. The tests at Brooklands, which were to follow the road trial last Saturday, have, however, not been proceeded with, as the authorities at Brooklands were not willing to allow the track to be used for such a heavy vehicle. A slight error was unfortunately made in our description. The petrol consumption in the previous Lancashire test should have been 9·7 miles per gallon, and not 9·7 tons, as printed.

Hosted by Google

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

South Metropolitan Electric Tramways & Lighting Co.—At the meeting last week, the chairman stated that considerable reduction in the working expenses could be made if the company were free to generate their own electricity, but unfortunately they were bound to take all their current from the Croydon and Beckenham Councils.

Dinner to Mr. Evan Parry.—On Saturday a farewell dinner was given to Mr. Evan Parry, B.Sc., who is leaving this country to take up an appointment as electrical adviser to the New Zealand Government in connection with the large scheme which that Government propose to carry out for the development of electric power transmission and the utilisation of the various sources of water power available. The dinner was held at the Trocadero Restaurant, and between seventy and eighty friends and well-wishers were present. Dr. H. F. Parshall, who was in the chair, in proposing the toast of the guest, said that Mr. Parry had been closely associated with him for the last eighteen years, and that he deeply felt the severance of a connection which had always been extremely cordial and friendly throughout. He congratulated the New Zealand Government on having secured the services of a man so eminently qualified to carry through the schemes contemplated by them. The toast was supported by Mr. Mordey, Mr. Trotter, Mr. Hammond, Mr. Devonshire, and Mr. Tegetmaier (Chairman of the Auckland Tramways), all of whom spoke in eulogistic terms of Mr. Parry and his work. A presentation was made to Mr. Parry of a handsome silver cup, upon which the names of the hosts were inscribed.

Rating Appeals.—On Wednesday and Thursday last week, an appeal by the L.C.C. against the assessment of the Greenwich power station was heard by the Middlesex Quarter Sessions. The gross assessment appealed against was £60,000, but the L.C.C. claimed for gross assessment of £37,500, and a rateable value of £25,000. After hearing the case, the Court awarded a gross assessment of £55,000, and a rateable value of £31,400. During the hearing of the case one or two interesting points came out. For instance, it was stated that owing to the restrictions placed upon the working of the station by the Admiralty in consequence of interference with the Greenwich Observatory, the Musgrave reciprocating engines are only used in respect of 8 per cent. of the total output of the station, and it was therefore claimed that although the total capacity of the station was 50,000 kw., the actual working capacity was only 34,000 kw. The total cost of the land and buildings was put at £837,173, and the cost per kw. of reciprocating engines and generators was £8·36. For the turbines the cost per kw. works out at £3·86, and it was in view of the shorter life of the reciprocating engines, and the considerably less use made of them, that the L.C.C. based part of its claim for a reduction in the assessment. With regard to the lives of the various portions of the plant, the Assessment Committee put buildings at 90 years, whilst the L.C.C. adopted 80 years. For the reciprocating engines the L.C.C. took the figure of 20 years, whilst the Assessment Committee claimed 40 to 42 years; steam turbines and generators were put at 20 years by the L.C.C. against 30 years by the other side; and boilers and economisers 20 years, against 25 years. Both sides agreed upon 25 years for steam pipes, and 30 years exhaust pipes; 30 years for switchgear, and 20 years for conveyers.

Another rating appeal of some interest was also heard at the Middlesex Quarter Sessions last week, when the Metropolitan Electric Supply Co., appealed against the assessment of their mains and sub-stations, in the Paddington district, by the Paddington Assessment Committee. The works were originally rated at £26,675 gross, and £18,065 rateable. This was altered on objection to £24,064 gross, and £13,723 rateable, and it was against these latter figures that the appeal was made. In this case also the Quarter Sessions considerably reduced the assessment.

PHŒNIX
ASSURANCE COMPANY, LIMITED.
ESTABLISHED 1782.
Head Offices: 19 & 70, LOMBARD STREET, LONDON, E.C.
TOTAL FUNDS EXCEED £13,000,000 CLAIMS PAID EXCEED £70,000,000
CHAIRMAN: RT. HON. LORD GEORGE HAMILTON, G.C.S.I.
The Company transacts all the principal classes of Insurance business on advantageous terms, including
FIRE - LIFE - ACCIDENT
Loss of Profits following Fire, Workmen's Compensation, Fidelity Guarantee, Burglary; also undertakes the duties of Trustee and Executor.
ELECTRIC LIGHTING.
The Company has always encouraged the development of Electricity, and the well-known "Phœnix Fire Office" Rules for Electrical Installations are in use throughout the world. Copies will be supplied free on application to the Head Offices

Companies' Dividends, Reports, Meetings, &c.	271

SUMMARY

A Special Literary Supplement is included in this issue, containing notices and reviews of books, and a carefully revised list of selected works on electrical engineering and allied subjects.

A section of the Midi railway in the south of France is now being equipped for electric traction. The single-phase system with 12,000 volts trolley-line pressure and a frequency of 16⅔ cycles is to be employed. Some particulars of an A.E.G. locomotive for this line are given. (Page 265.)

The second annual report of the International Electrical Commission has been issued. (Page 265.)

An arrangement, known as the Bruston Automatic Electric Lighting System, in which the generating set is started up as soon as the lights are switched on, is described. (Page 266.)

Special arrangements are being made for the supply of large numbers of carbon lamps at special rates for Coronation illuminations. (Page 266.)

A short description is given of the principal features of the Jahns governor. (Page 266.)

There is a dispute between the National Telephone Co., Ltd., and the Post Office with regard to the interpretation of certain clauses in the agreement for the transfer of the telephone system to the Post Office at the end of this year. The points now being discussed are whether the notices given by the Postmaster-General of the plant which he proposes not to take over are in proper form, and whether he has a right to refuse to take over certain portions of the plant in competitive areas, which, although they may not be necessary for the new service, are acknowledged to be suitable for the technical point of view. (Page 267.)

The discussion of Mr. Collis's Paper on circuit breaking by the South Wales Institute of Engineers was concluded on April 20th. (Page 267.)

The National Electrical Manufacturers' Association have issued a set of proposed regulations for the hiring out of arc lamps. (Page 267.)

Amongst the specifications published by the Patent Office last Thursday was one by H. Gray, dealing with electric ovens. Another, by W. J. Reid, describes the manufacture of a new insulating material. J. Härden has introduced an electric furnace with a concave roof to reflect the heat from an arc between two inclined metal electrodes. Siemens Bros. Dynamo Works (Siemens Schuckertwerke Ges.) describe a simplified form of dynamical coupling. Opposition has been entered to the grant of a patent to the Murex Magnetic Co. and A. A. Lockwood, which deals with the magnetic preparation of ores, and a patent to W. E. Bullock and J. Calcott, for the treatment of iron and steel, has been granted in spite of opposition. (Page 268.)

A sum of £41,000 is to be handed over to relief of rates from the Birmingham tramway profits, and £15,000 from the electricity profits.—Satisfactory reports are made upon the use of tramcar meters at Bournemouth and Walthamstow.—The Hartlepool Corporation are contesting the arbitrator's award with regard to the purchase of the local tramways.—The Board of Trade have refused to grant the Bermondsey Council a lighting provisional order enabling it to compete with the London Electric Supply Corporation and the County of London Electric Supply Co.—The Manchester Tramways Committee are to pay £80,000 in

Hosted by Google

relief of rates, and the Electricity Committee £24,500. —The Norwich Tramways Co. are offering to sell their undertaking to the Corporation. (Page 269.)

A DIESEL engine plant is to be installed at Bath; an electric lighting scheme has been placed before the Ilkley Council; extensions are to be carried out as follows:—Poplar, £42,455; South Shields, £7,500; Wimbledon, £7,459; York, £15,000; Derby, £8,500; tramway extensions at an estimated cost of £17,600 and £99,805 are contemplated at Dundee and Birmingham respectively. (Page 270.)

L.C.C. Tramways Bill.—The consideration of the Tramways Bill of the London County Council was concluded last week by a House of Commons Committee presided over by Sir Luke White. The Bill included a number of new tramways and street improvements, although several lines originally projected have had to be abandoned owing to the opposition of the road authorities. The most important line before the committee was the one down the Edgware Road from Cricklewood to Marble Arch, to which there was considerable opposition. In the first place the Commissioner of Police reported against the advisability of having a tramway terminus at Marble Arch. Following on this report, fears were expressed in certain quarters that it was the intention of the County Council at some future date to attempt to extend the line down Park Lane. In addition, it was found that the cost of street widenings, originally put at about £75,000, would actually cost well over £250,000. When the committee deliberated upon the scheme, the voting was equal, without the Chairman's casting vote, and his advice that the scheme should be withdrawn was followed by the County Council.

The Turin Exhibition.—To the list of British exhibitors of electrical and allied apparatus should be added the name of Venner & Co., who are showing their well-known time switches.

Students' Section of the Institution of Electrical Engineers.—The annual report records the holding of 10 London meetings at which the average attendance was 52, in addition to the 10 students' meetings at Manchester, and 4 at Glasgow. A tour was made in the Birmingham district last July to visit objects of electrical engineering interest, and a tour in Sweden is arranged for the coming summer. Certain alterations in the rules have been made.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, MAY 18TH.

Institution of Electrical Engineers.

8 p.m. "Automatic Telephone Systems," by W. Aitken.

TUESDAY, MAY 23RD.

Faraday Society.

8 p.m. At Institution of Electrical Engineers, Victoria Embankment. Discussion on "High Temperatures."

THURSDAY, MAY 25TH.

Electro-Harmonic Society.

6.30 p.m. Annual general meeting at Institution of Electrical Engineers, Victoria Embankment.

National Telephone Co.

7 for 7.30 p.m. Annual Dinner at Hotel Cecil.

FRIDAY, MAY 26TH.

Physical Society.

3 p.m. Visit to National Physical Laboratory.

Institution of Electrical Engineers.

4.30 p.m. Annual General Meeting.

Institution of Electrical Engineers.

8 p.m. "The Heating of Cables with Current," by S. W. Melson and H. C. Booth.

The Railless Electric Traction Bills.—The prospects of the installation of trolley omnibus installations in Great Britain, which were so bright at the beginning of the Parliamentary session, have received a severe check. Three Bills have been voluntarily withdrawn by the promoters for various reasons, and that relating to Matlock was rejected by a House of Lords Committee last week. As a consequence the same promoters withdrew a Bill which they had deposited for Malvern. Subsequently, the same Committee passed the Brighton, Hove & District Railless Traction Bill, which was promoted by the Brighton, Hove & Preston Omnibus Co. as a counter-move to the promotion of the Brighton & District Tramways Bill, which has also since been withdrawn. The Brighton Railless Electric Traction Bill, however, was considerably reduced in scope. As deposited, the scheme of the Bill included the whole of the route from Rottingdean to Brighton, and on to Worthing, but as passed only the short portion between Brighton and Rottingdean is included.

Mr. Flecks instals a telephone.

LITERARY SUPPLEMENT

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Electric Crane Construction." By C. W. Hill. 313 pp. 9 in. by 6½ in. 337 figures. (London: Chas. Griffin & Co.) 25s. net; abroad, 25s. 10d.

Reid's Handy Colliery Guide and Directory for the Counties of Northumberland, Durham, and Yorkshire. 212 pp. 6½ in. by 4¼ in. (Newcastle-upon-Tyne: Andrew Reid & Co., Ltd.) 2s. 6d.; abroad, 2s. 8d.

"Arc Lamps and Accessory Apparatus." By J. H. Johnson. 132 pp. 6½ in. by 4¼ in. 20 figures. (London: A. Constable & Co.) 1s. 6d. net; by post, 1s. 7½d.

"Motors, Secondary Batteries, Measuring Instruments, and Switchgear." By S. K. Broadfoot. 96 pp. 6½ in. by 4¼ in. 16 figures. (London: A. Constable & Co.) 1s. net; by post, 1s. 1½d.

"Transformers," by Prof. H. Bohle and Prof. D. Robertson. 356 pp. 9 in. by 5½ in. About 330 figures and 17 plates. (London: Chas. Griffin & Co.) 21*s.* net; abroad, 22*s.* net.

"A Handbook of Testing Materials." By C. A. M. Smith. 284 pp. 9 in. by 5 in. 134 figures. (London: Constable & Co.) 6s. net; abroad, 6s. 8d. net.

"Testing of Electro-Magnetic Machinery and Other Apparatus." By B. V. Svenson and B. Frankenfield. Vol. II., "Alternating Currents." Pp. 324. 8¾ in. by 5½ in.; about 150 figures. (London: Macmillan & Co.) 11s. net; abroad, 11s. 9d.

"Electric Accumulators." Edited by B. E. Jones. 160 pp. 6¾ in. by 4¼ in. 57 figures. (London: Cassell & Co.) 1s. net; by post 1s. 2d.

"Electric Primary Batteries." Edited by B. E. Jones. 160 pp. 6¾ in. by 4¼ in. 91 figures. (London: Cassell & Co.) 1s. net; by post, 1s. 2d.

"A Handbook of Wireless Telegraphy." By Dr. J. Erskine-Murray. Third edition. 386 pp. 8¾ in. by 5¾ in. About 192 figures. (London: Crosby Lockwood & Son.) 10s. 6d. net; abroad 11s. 4d.

"Motion Study." By F. B. Gilbreth. 116 pp. 8 in. by 5½ in. 44 figures. (London: Constable & Co., Ltd.) 4s. 6d. net; abroad, 4s. 10d.

"Wiring Rules, with Extracts from the Board of Trade Regulations and the Home Office Rules for Factories and Workshops." The Institution of Electrical Engineers. 42 pp. 8½ in. by 5½ in. (London: E. and F. N. Spon.) 6d. net; abroad, 7d.

"Imperial Telegraphic Communication." By Charles Bright, F.R.S.E. 212 pp., 7¾ in. by 5 in. (London: P. S. King & Son.) 3s. 6d. net; abroad, 3s. 9d.

REVIEWS OF BOOKS

The Law Relating to the Generation, Distribution, and Use of Electricity, including Electric Traction. By C. M. Knowles. Part I.: Electric Lighting and Power, 447 pp.; Part II.: Electric Traction, 403 pp. 9¾ in. by 6¼ in. (London: Stevens & Sons.) Two vols., 42s.; abroad, 43s. 8d.

A SUPERFICIAL knowledge of the law relating to electricity supply and electric traction is essential to practically everybody who is connected with the electrical industry, but a mere superficial knowledge is not sufficient for the Borough Electrical Engineer and Manager, nor for his Chairman; and Town Clerks, as well as general managers of electricity supply companies, should be actual authorities on the subject. To all of these, Mr. Knowles' work will come as a veritable boon.

As is the case in the majority of legal books dealing with a particular Act or series of Acts, it is not written in the form of a treatise, but ranks rather as a work of reference. The law of electricity supply and traction is not expounded in a general manner, as would be done in an educational work; each Act is given *in extenso* (including the Electric Lighting Act of 1909), and is interspersed with notes and comments of cases helping to interpret the various clauses. An excellent feature is that clauses of other Acts which are cited in any of the Electric Lighting Acts or affect the law of electricity supply are given also, and their relevance explained when necessary, and a similar treatment is followed in the volume dealing with the law of electric traction. Further, the volumes contain Board of Trade Regulations, Model Orders, Bills and Clauses, and sections on Private Bill Procedure.

It is obviously impossible to include in such a work every fairly important case in which a decision has been given under one of the Acts in question, but a large number are included, although we certainly miss one or two old friends—at any rate, we have been unable to find them with the assistance of the index. Good indexing, we realise, is difficult, and there is certainly room for improvement in this respect in the volumes in question. More headings in the General Index would have been an assistance, and in the table of cases—even if it is contrary to recognised practice—entries should be made alphabetically in the name of the defendants as well as the plaintiffs. For instance, a reader may remember that an important judgment was given in an action brought by a consumer against a supply authority with regard to interruptions in supply or failure to maintain pressure, but unless he remembers the name of the firm or individual bringing the action he will have difficulty in finding the reference in the book, as the name of the defendant Corporation will not be given in the General Index or in its alphabetical place in the Table of Cases. There are few books, however, in which the indexing is above criticism, and this detail should not prevent Mr. Knowles' book from becoming a standard work of reference.

Just Published. In two parts, cloth £2 2s. for cash, £1 14s., postage 8d. Each part separately £1 5s., for cash £1, postage 6d.

KNOWLES'S LAW OF ELECTRICITY

The Law relating to the generation, distribution and use of Electricity, including Electric Traction.

By C. M. KNOWLES, Barrister-at-Law.

Part I. Electric Lighting and Power.
Part II. Electric Traction.

STEVENS & SONS, LTD.
119 & 120, Chancery Lane, London.

Hosted by Google

Electric Crane Construction. By C. W. Hill. 313 pp., 9 in. by 6½ in., 337 figures. (London: Chas. Griffin & Co.) 25s. net; abroad 25s. 10d.

A STRIKING feature of this work is the large collection of drawings of cranes and details which represent a valuable store of accumulated experience. The title of the book limits it to electric cranes, but now-a-days electric power is so universal in crane construction that it forms practically a general, and indeed, a very complete, handbook of crane design. The design of almost every known type of crane, transporter and cableway is treated of, and interesting chapters consider starting torque, acceleration and power required for crane driving. A due proportion of the space is devoted to electrical as well as mechanical details, and separate chapters are included on brake—magnets, motors and controllers. The vexed question of the rating of crane motors is gone into, and the author, after pointing out the futility of rating on the basis of one hour or even shorter runs at full load, sets forth the method of D. R. Pohl for calculating a loading and duration of test which shall be equivalent as regards temperature rise to running at the load and load-factor desired. Very useful formulæ are given for the design of controller resistances. An interesting but, as compared with the scale of the rest of the book, a rather brief chapter on electric crane installations follows. Here mention is made of equalisation of the load due to a group of cranes of a battery working in conjunction with a reversible booster, but the possibility of utilising flywheel power storage for the purpose is not discussed. The whole work is straightforward and may be recommended as being written from a thoroughly engineering point of view, preserving a nice balance between academic and rule-of-thumb methods of treatment. Not only are stores of data included, but they are in a form readily usable by designers of electric cranes and similar machinery.

Gas Engines. By W. J. Marshall and Captain H. R. Sankey, R.E. 278 pp. 8¼ in. by 5½ in. 127 figures. (London: Constable & Co.) 6s. net; abroad, 6s. 8d.

THE authors do not, in this book, set themselves to compete with the many excellent works on the internal-combustion engine which have been written for the use of those concerned in the manufacture of gas engines or for the use of students, but rather address themselves to purchasers or users who wish to know the principles underlying the use and construction of gas engines, the methods of diagnosing and remedying defects when they occur. Many useful hints may be gathered on running gas engines, and much practical information will be found as to the arrangement of a gas-engine installation. The outline scheme for gas-engine testing should also be very useful. The large gas engine is kept in view as much as machines of smaller size, and there are excellent illustrations of parts of engines of well-known makers. The book is clearly written, and should be useful to those who desire a working knowledge of the gas engine without making an exhaustive study of its many problems.

Electric Wiring, Fittings, Switches, and Lamps: Circuits. By W. P. Maycock. 4th edition. 628 pp. 7¼ in. by 5 in. 624 figures. (London: Whittaker & Co.) 6s. net; abroad 6s. 8d.

So far as it goes, this book is excellent, and it certainly contains a great deal of matter which will be of service to the wiring contractor and his foreman and also to the consultant. But the Author has imposed upon himself certain limitations as to the scope of the present volume, so that, although it contains over 600 pages and an equal number of illustrations, such details as particulars of the specification of wires, and the determination of the sizes required in any particular installation, are apparently reserved for a later volume, and while several accessories and earthing connections for conduit systems are described, the general treatment both of conduit and casing wiring is reserved. On the other hand, great trouble has been taken to collect descriptions of special types of switches, plugs and various accessories, in addition to those which are more familiar, and there are sections on electric signs, heating, surface wiring, bells, telephones, fire alarms, &c.

Electric Wiring Diagrams. By W. Perren Maycock. 146 pp. 5 in. by 7¾ in. 246 figures. (London: Whittaker & Co.) 2s. 6d. net; abroad 2s. 9d.

THE diagrams from the book reviewed above have been collected and republished separately in this small volume. Although some of them are very "special" arrangements, a large number will be found useful in everyday practice.

Transformers. By Prof. H. Bohle and Prof. D. Robertson. 356 pp. 9 in. by 5½ in.; about 330 figures and 17 plates. (London: Chas. Griffin & Co.) 21s. net; abroad, 22s. net.

AN immense amount of work has evidently been put into this book, which, though quite suitable as a text-book for students, is more of the nature of a treatise for the use of designers. The authors have gone to great trouble to evolve a new list of symbols for which the publishers prepared special type. The various values of an alternating function are expressed by the same letter with different signs worked into it to denote instantaneous, maximum or mean, while suffixes are used to distinguish between different quantities of the same kind. Another innovation is the use of the "volt-second" in place of the "line" as the unit of magnetic flux. The inconvenience in reading occasioned by the adoption of this new unit is remedied to some extent by the insertion, in curves and examples, of

Second Edition. ***Revised and Extended.***

THE PRINCIPLES OF ELECTRIC WAVE TELEGRAPHY AND TELEPHONY.

By J. A. FLEMING, M.A. D.Sc. F.R.S.

Pender Professor of Electrical Engineering in the University of London, etc.

With 7 Plates and Numerous other Illustrations. 8vo. **28s.** net (Inland postage **6d.**).

'There is no doubt that this book should be regarded as the standard work on the subject, for there is no other volume with anything like its completeness, or with as thorough a treatment of the theoretical side of the subject.'—ELECTRICAL ENGINEERING.

By the Same Author.

AN ELEMENTARY MANUAL OF RADIO-TELEGRAPHY AND RADIO-TELEPHONY FOR STUDENTS AND OPERATORS.

8vo. With 187 Illustrations. **7s. 6d.** net (Inland postage **5d.**).

LONGMANS, GREEN & CO., 39, Paternoster Row, London, E.C.

When corresponding with Advertisers, please mention "Electrical Engineering."

Hosted by Google

the corresponding values in the usual C.G.S. units, but the use of the "line" contributes in no small degree in assisting towards a useful physical conception of electromagnet phenomena, and, as it is adopted internationally, there seems every reason to regain it.

In spite of all this original treatment, the authors have by no means neglected the work of other investigators. The subject is treated with considerable completeness, and a special chapter is devoted to insulating materials, the particular advantages and drawbacks of each being clearly stated.

One of the authors, Mr. Robertson, has evolved an entirely new method of design which eliminates the customary series of trial designs, and leads at once to a good design. This method has been developed from some equations which showed that the efficiency of a transformer depends upon the value of an abstract quantity equal to the geometrical mean of the lengths obtained by dividing the total cross-sections of the iron and copper spaces by the respective lengths of the iron and copper. This figure and another abstract quantity, the "loss-length," are used as the basis for the design, which is carried through by reference to a number of curves and tables. The introduction of these abstract quantities causes the process and sequence of the design itself to be somewhat obscure, but doubtless the rapidity with which the desired result is obtained justifies the introduction of quantities with no real physical meaning.

Testing of Electromagnetic Machinery and other Apparatus. By B. V. Swenson and B. Frankenfield. Vol. II., Alternating Currents. 324 pp., 8¾ in. by 5½ in., about 150 figures. (London: Macmillan & Co.) 11s. net; abroad, 11s. 9d.

THIS is a comprehensive laboratory companion, consisting of instructions for carrying out over one hundred and twenty tests and experiments on alternating-current apparatus and machines, together with full notes on the theory and method of each test and useful diagrams. The work shows signs of careful preparation, and a valuable feature is the inclusion under each experiment of a list of references to books and articles in technical journals, American, British, and Continental, published between 1902 and 1908, and dealing with the particular subject or test in question. The work is sound, and appears to cover the ground pretty thoroughly. Five different methods of determining wave form, and five methods of analysing wave forms are given; the effect of frequency on meter readings is included; and notes on special machines, such as commutator motors and the split pole converter are also provided.

A Handbook of Testing Materials. By C. A. M. Smith. 284 pp. 9 in. by 5 in. 134 figures. (London: Constable & Co.) 6s. net; abroad, 6s. 8d.

IN the general description of laboratory testing machines and their uses, the author addresses himself principally to students at college laboratories, but there will probably be a somewhat wider circle to which the book will be of interest. The general principles rather than the mechanical details of the machines are treated of, and a considerable amount of space is devoted to strain measuring instruments, such as the Ewing extensometer and other varieties. Torsion, impact, and hardness tests and alternating stress tests are considered, as well as the testing of cements, stones, timber, &c. Another chapter gives hints on experiments in college laboratories. The results of tests are not dealt with at quite the same length as are the methods of testing, but a good deal of interesting matter is brought together, particularly in the appendices.

Installation Manuals for Electric Wiremen. (6½ in. by 4¼ in.) (London: A. Constable and Co.)

Arc Lamps and Accessory Apparatus. By J. H. Johnson. 132 pp. 20 figures. 1s. 6d. net; by post, 1s. 7½d.

CONSIDERING its size and price, this little book is remarkably complete, and it can be recommended to those requiring a general practical acquaintance with the construction and working of arc lamps and accessories with them. A number of fairly representative modern designs are described, and the aim and effect of the different mechanical and electrical devices special to certain makes are clearly explained. A good deal of useful practical information is scattered throughout the book, which is above the average quality of the usual cheap handbook.

AMPALL

From CONSTABLE'S List

PRACTICAL MANUALS FOR PRACTICAL MEN

INSTALLATION MANUALS FOR ELECTRIC WIREMEN.
Fully Illustrated and Indexed.

ARC LAMPS AND ACCESSORY APPARATUS.
By J. H. JOHNSON, A.M.Inst.E.E. 1s. 6d. net.
Hardware Trade Journal:—"A useful little primer. The book is an eminently practical one and should be of great assistance when considering the most useful and serviceable arc lamp to adopt under varying circumstances The author has touched upon the troubles which are usually met with and the best methods of overcoming them."

MOTORS, SECONDARY BATTERIES, MEASURING INSTRUMENTS AND SWITCHGEAR.
By S. K. BROADFOOT, A.M.Inst.E.E. 1s. net.

MILL AND FACTORY WIRING.
By R. G. DEVEY. 2s. net.
This work is kept free from all complicated technical matter and where the text calls for an illustration to make the work clear to the reader, numerous drawings have been inserted.
Layouts for the complete wiring installations in factories are given for both power and lighting purposes. Apply for Full List of Books in this Series.

ELECTRIC LAMPS.
By MAURICE SOLOMON, A.C.G.I., A.M.Inst.E.E. Illustrated. Extra crown 8vo. 6s. net.
PART CONTENTS.—The Principles of Artificial Illumination. The Production of Artificial Light. Photometry. Methods of Testing. Lamps of every type, &c., &c.

ELECTRICITY.
By H. M. HOBART. A Text-Book designed in particular for Engineering Students. 228 pages. With 43 Tables and 115 Illustrations. Demy 8vo. 6s. net.
Electrical Review:—"Power factor loses its difficulty completely under the author's treatment, and the relationship between resistance, inductance and impedence is made quite clear. The book is a very useful and instructive one, and ought to be of great service."

THE THEORY OF ELECTRIC CABLES AND NETWORKS.
By ALEXANDER RUSSELL, M.A., D.Sc. Illustrated. Demy 8vo. 8s. net.
A thoroughly trustworthy work concerning the network of cables connecting the dynamos with the lamps and motors of the consumer.

RADIO-TELEGRAPHY.
By C. C. F. MONCKTON, M.Inst.E.E. With 173 Diagrams and Illustrations. Extra crown 8vo. 6s. net.
This work attacks the subject of Wireless Telegraphy and the many difficulties arising from electric waves and magnetic currents.

INDUSTRIAL ELECTRICAL MEASURING INSTRUMENTS.
By KENELM EDGCUMBE, A.M.Inst.C.E., M.Inst.E.E. 126 Illustrations. Demy 8vo. 8s. net.
PART CONTENTS.—Introductory. Accuracy of Measurement. Constructional Details. Measurement of Resistance. Potentiometer. Galvanometers. Measurement of Current, &c., &c.

CONTINUOUS CURRENT ENGINEERING.
By ALFRED HAY, D.Sc., M.Inst.E.E. Fully Illustrated. Demy 8vo, 5s. net.
A simple account of the component parts of a continuous current lighting and power plant, dynamos, motors, secondary cells, measuring instruments, &c. An excellent text-book.

By R. E. MATHOT.
THE CONSTRUCTION AND WORKING OF INTERNAL COMBUSTION ENGINES.
Being a Practical Manual for Gas Engine Designers, Repairers and Users. Translated by W. A. TOOKEY. Medium 8vo. With over 350 Illustrations. 24s. net.
Mechanical World:—"A thoroughly satisfactory translation . . . there is no doubt as to the utility of the book, and we have much pleasure in specially commending it to the notice of designers of gas engines, and to students of the subject generally."

A SERIES OF TECHNICAL DICTIONARIES IN SIX LANGUAGES: English. Spanish. German. Russian. French. Italian.
Edited and compiled by Messrs. DEINHARDT and SCHLOMANN. With each word, term, or item, so far as it is possible, a diagram, formula, or symbol is given, so that error or inaccuracy is almost impossible. Already published:—
Just published. Vol. XI.: METALLURGY OF IRON. With about 1,600 Illustrations and numerous Formulæ. Cloth, 10s. 6d. net; leather, 14s. net.
Vol. II.: ELECTRICAL ENGINEERING, including Telegraphy and Telephony. Price 25s. net, cloth; 30s. net, leather.

London—10, ORANGE STREET, W.C.

WHITTAKER'S NEW BOOKS.

WHITTAKER'S ELECTRICAL ENGINEER'S POCKET-BOOK. Edited by KENELM EDGCUMBE, A.M.I.C.E., M.I.E.E. Third Edition entirely re-written and enlarged. With 180 illustrations. Leather, gilt edges. **5s.** net. (*Just published.*)

"The more we examine the book the more we like it. The book is unquestionably a valuable addition to electro-technical literature."—ELECTRICAL REVIEW.

ELECTRIC WIRING, FITTINGS, SWITCHES AND LAMPS (CIRCUITS). A practical Book for Electric Light Engineers and Contractors, Consulting Engineers, Wiremen and Students. By W. PERREN MAYCOCK, M.I.E.E. Fourth Edition, entirely re-written. With 600 Illustrations. **6s.** net.

ELECTRIC WIRING DIAGRAMS. Illustrating Circuit-Connections for Supply Mains, Distribution Boards, Transformers, Lamps, Heaters, Motors, Bells, Private Generating Plant, &c., &c. With brief explanation of the diagrams. By W. PERREN MAYCOCK, M.I.E.E. With 246 Illustrations. **2s. 6d.** net.

THE DYNAMO: Its Theory, Design, and Manufacture. By C. C. HAWKINS, M.I.E.E., and F. WALLIS, M.I.E.E. With 600 Illustrations. Fifth Edition, entirely re-written, revised and enlarged. In two volumes. Vol. I., with 311 Illustrations, **10s. 6d.** net; Vol. II., with 283 Illustrations, **10s. 6d.** net.

"The books are just right for students, for they give a correct view of the whole field, and are also good books for the designer and draughtsman who wants to refer quickly to up-to-date information on a particular detail."—ELECTRICAL REVIEW.

ELEMENTARY TELEGRAPHY. A Manual for Students. By H. W. PENDRY, Central Telegraph Office, London. With 178 Illustrations. **2s. 6d.** net.

This Book contains descriptions of the latest pattern instruments and a full account of the Central Battery Developments. It has been written specially to meet the requirements of the ordinary grades of the City and Guilds Examinations in Telegraphy.

STEAM TURBINES: Their Design and Construction. By RANKIN KENNEDY, C.E. With 62 Illustrations. **4s. 6d.** net.

ELECTRIC MOTORS: Continuous, Polyphase and Single-Phase Motors, Their Theory and Construction. By H. M. HOBART, M.I.C.E., M.I.E.E. Second Edition, entirely re-written. Revised and Enlarged. With 800 Illustrations. **18s.** net.

"A reliable and exhaustive treatise on the design of Electric Motors."—ELECTRICAL ENGINEERING.

ELECTRIC JOURNAL

Published monthly, price **6d.**, or 8/- per annum, post free.
May be obtained from all bookstalls and newsagents.

St. Stephen's House, Westminster, S.W.

Motors, Secondary Batteries, Measuring Instruments, and Switchgear. By S. K. Broadfoot. 96 pp. 16 figures. (London: A. Constable and Co.) 1s. net; by post, 1s. 1½d.

THIS handbook attempts to cover too much, and many of the earlier sections, although quite elementary in character, are too short to give much instruction as to the working of the apparatus referred to. On the other hand, it contains practical hints as to care and management of motors and batteries which should be useful to a certain class of electrician. Explanations of phase displacement, power factor, and power measurement seem to be out of place in a book of this character, and it is unfortunate that there is a mistake in the diagram of connections of a single-phase wattmeter used for measurement of the power in a balanced three-phase circuit.

Electric Accumulators. Edited by B. E. Jones. 160 pp. 6¾ in. by 4¼ in. 57 figures. (London: Cassell & Co.) 1s. net; by post, 1s. 2d.

THIS work appears to abound with useful information and illustrations, and should be received well by both practical and amateur electricians. The earlier chapters give, in very elementary form, full instructions how to construct, maintain, and charge accumulators, clearly illustrated with diagrams of connections. The author seems, however, to be somewhat out in his calculations, for a battery containing three positive plates, 7 in. × 7 in. × 3/16 in. will give a much larger output than 30 ampere-hours, the batteries on the market sold at 30 actual ampere-hours containing three positive plates of dimensions 4 in. × 4 in. × 3/16 in. The latter half of the book is more advanced, one chapter showing how alternating current, by means of a motor-generator or rectifier, can be converted to a direct current for charging purposes, and the closing chapter describes how to make pocket accumulators. Considering the low price of this book it is very well compiled, and should be found useful to those requiring a good knowledge of this branch of electricity.

Electric Primary Batteries. Edited by B. E. Jones. 160 pp. 6¾ in. by 4¼ in. 91 figures. (London: Cassell & Co.) 1s. net; by post, 1s. 2d.

THIS book is profusely illustrated, and contains much useful information which should be appreciated by amateur electricians, but apparently the author has misapplied his intention of helping the public by showing them the possibilities of batteries by his disparaging remarks in a later chapter on the failure of primary cells for electric lighting. The author evidently does not realise the very largely increased field which has been opened up for the primary battery by the metal filament lamp. The example given of carbon lamps and bichromate cells is not a good one as representing modern practice. No mention, except the mere name, appears to be made of the Dania dry cell, which is one of the best on the market, and which will completely recoup itself on being placed in a jar with salammoniac and water. Another very good cell left in the cold is the Economic battery for intermittent lighting, also the Boron cell.

Motion Study. By F. B. Gilbreth. 116 pp. 8 in. by 5½ in.; 44 figures. (London: Constable & Co., Ltd.) 4s. 6d. net; abroad, 4s. 10d.

ON glancing through the pages, which are profusely illustrated with photographs of the various movements of a bricklayer building a wall, one is inclined to jump to the conclusion that they are the work of a "crank." After reading some of the earlier pages, however, one realises the importance of the subject, which is simply the study of the sequence of movements and mental processes involved in any kind of labour, with a view of reducing the time and physical or mental work necessary to produce any required result. The book is highly suggestive, and an application of the systematic methods described, such as the proper placing in position of materials and tools, and the correct sequence of operations, can but result in a great saving of time. The methods may be applied to any kind of work from the stamping of circular office letters to heavy engineering, and bricklaying is merely used as a simple example.

The "Northampton Gazette."—We have received a copy of the April issue of the "Northampton Gazette," which is the official publication of the Northampton Past Day Students' Association and the Northampton Institute Engineering Society. This is the second number of a magazine intended to keep old students of the Northampton Institute in touch with each other. It is largely taken up with news and announcements relating to the Institute and those connected with it, but articles of technical interest are also included.

"ELECTRICAL ENGINEERING" LIST OF SELECTED TECHNICAL BOOKS.

We shall be pleased to send any of the following books to addresses in the United Kingdom at the *net* published prices named, unless otherwise stated. The increased price for sending abroad is also quoted after each book. All the books listed have been recommended by our editorial staff and reviewers.

Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-206 Temple Chambers, Temple Avenue, E.C., and should be accompanied by a remittance.

Electricity Supply and Distribution.

LEWIS'S CIRCULATING SCIENTIFIC LIBRARY

Comprises a large collection of Scientific and Technical works dealing with Electricity, Engineering (Electrical, Mechanical and Civil), Metallurgy, Chemistry, Geology, Physics, etc., etc.

The library is invaluable to Electrical Engineers desiring to consult works on their own or allied subjects.

Annual subscription Town or Country from one guinea.

Reading Room open daily to subscribers.

Lewis's Quarterly list of New Books and New Editions added to the Circulating Library, with nett prices and postages, will be sent post free on application.

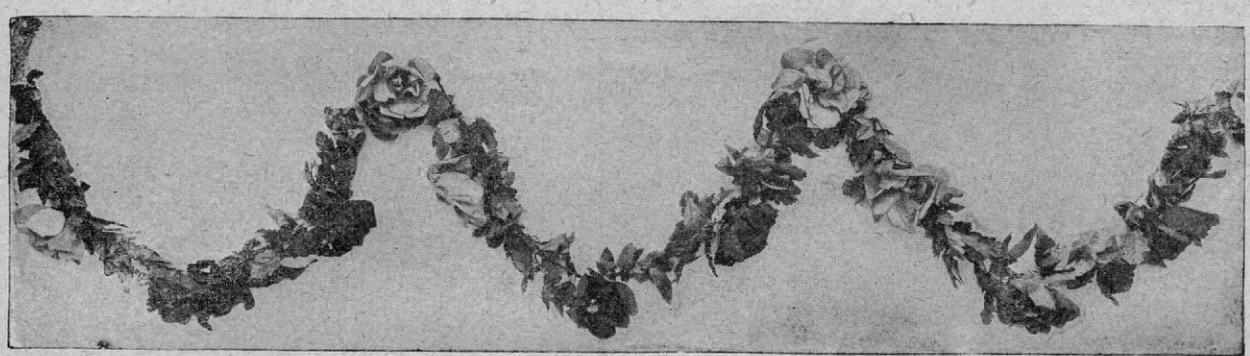
PIXIELITE

(PATENT No. 7593/08.)

ILLUMINATION STRIP FOR CORONATION DECORATIONS.

(Conforms to L.C.C. suggestions regarding temporary electrical illuminations.)



Absolutely Weatherproof.
Wonderfully Adaptable.

LARGE STOCKS.
IMMEDIATE DELIVERIES.
LIBERAL DISCOUNTS.

ORDER NOW!

Advertise Yourselves at Our Expense!

¶ To assist you in obtaining business for PIXIELITE we have published an attractive Advertising Folder; liberal quantities of same printed with your name and address supplied FREE OF CHARGE.

GARLAND, consisting of "PIXIELITE" Strip and Holders, Complete with Green Foliage and 10 inch Red, White, Pink, Yellow or Blue Roses. Two Lights per yard. Supplied in all lengths up to 30 yards (60 lights). List No. FA 1055. 7/22 twin cable. 2s. 10d. per light. Ditto, 7/20 twin cable, 3s. per light.

THE GENERAL ELECTRIC CO., LTD.,

HEAD OFFICE: 67, QUEEN VICTORIA STREET, LONDON, E.C.

Telephone: London Wall No. 3600 (19 lines). *Telegrams: "Electricity, London."*

BRANCHES AND AGENCIES:

MANCHESTER ...	Victoria Bridge.	DUBLIN	16, St. Andrew Street.
GLASGOW	71, Waterloo St.	BELFAST	13, Queen Street.
BIRMINGHAM	42, High St.	CARDIFF	Womanby Street.
NEWCASTLE-ON-TYNE	30, Gallowgate.		

Also at PARIS, MADRID, MILAN, CAPETOWN, JOHANNESBURG and SYDNEY, etc., etc.
WORKS:—London, Witton, Birmingham, Manchester.

ELECTRIC TRACTION ON THE FRENCH MIDI RAILWAY

IN 1908 the Compagnie des Chemins de Fer du Midi decided to introduce electric traction on a portion of its main line system, and equipped a ten-mile section of the branch line between Villefranche-Vernet les Bains and Perpignan (Villefranche-Marquixanes) for experimental purposes. The single-phase system with a trolley-line pressure of 12,000 volts, and a frequency of 16⅔ was decided upon. An order has already been placed with the Société Anonyme Westinghouse for the electrical equipment of the 70-mile main line section between Pau and Montrejean, together with branch lines. This comprises in all some 175 miles, of which the 70 miles between Pau and Montrejean is double track with gradients up to 3·3 per cent. and a minimum radius of curvature of 330 yards. For the supply of electrical energy to these lines, four large water power stations will be built, one of which is already in course of construction. These

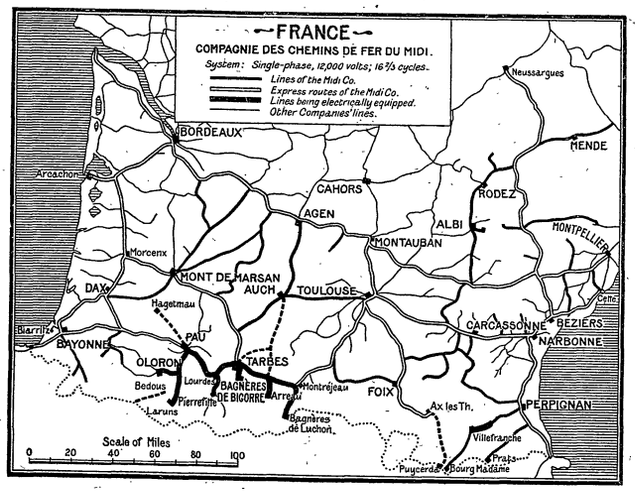

FIG. 1.—MAP OF THE MIDI RAILWAY SYSTEM.

will be at Soulon (12,000 h.p.), Eget (18,000 h.p.), Porta (10,000 h.p.), and at Ossau (10,000 h.p.). The current will be generated single-phase, 16⅔ cycles, and will be transmitted at 60,000 volts to sub-stations at Pau, Lourdes, Tarbes, Launemezan and Montrejean, where it will be transformed down to the trolley line pressure of 12,000 volts.

The express passenger trains will run at speeds up to 62 miles per hour, while the maximum speeds of the heavy passenger trains will be 40 miles per hour. The passenger and goods trains will be hauled by locomotives, while the single-track branch-line service will be dealt with by motor-coaches and trailing cars. The accompanying figure illustrates the locomotive supplied by the Allgemeine Elek-

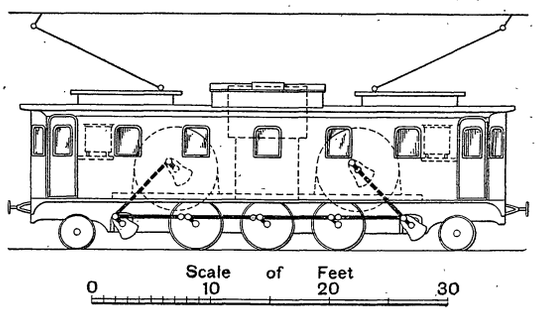

FIG. 2.—A.E.G. 1,600-H.P. LOCOMOTIVE FOR THE FRENCH MIDI RAILWAY.

tricitäts Gesellschaft. It is a 3/5 coupled locomotive of the 1-C-1 design with the three driving axles coupled together and to two jack-axles coupled in turn to two 800-h.p. Winter-Eichberg repulsion motors. The total weight of the locomotive is 85 tons, the adhesion weight 54 tons, and the weight per driving axle 18 tons. One transformer in the middle of the locomotive supplies both motors. The maximum draw-bar pull is 27,500 lbs., and the speed 47 miles per hour. A feature of the electrical control is that energy is returned to the line on down-grades at speeds between 18·5 and 34 miles per hour. The order placed with the Société Anonyme Westinghouse includes a batch of thirty double-bogie motor-coaches, each equipped with four Westinghouse motors of 125 h.p. These cars will have multiple-unit control, and will be employed, as stated above, on the branch lines. Each will weigh about 56 tons and will be capable of hauling four trailing cars.

THE INTERNATIONAL ELECTROTECHNICAL COMMISSION

THE second annual report of the International Electrotechnical Commission for the year ended Dec. 31st, 1910, has just come to hand. The report recapitulates the events leading up to the present situation, including the preliminary meeting in London in June, 1906, when the Commission was officially constituted, and the Council meeting in London in 1908. An unofficial conference was held in Brussels in August, 1910, under the presidency of M. Eric Gerard, but the full report of the proceedings is not yet available. The full meeting originally planned for Berlin this year has been abandoned in favour of Turin, on account of the International Electrical Congress arranged there by the Associazione Elettrotecnica Italiana. The date of the meeting is Sept. 11th to 16th, and the suggestions of the Brussels conference, at present before the various committees, will come up for ratification. Other questions will also be discussed.

Work has proceeded during the year under review. The subject of nomenclature is being studied by committees. The consideration of the terms in alphabetical order has been given up, as the division of the subjects into sections presented less difficulties, advanced in respect as to agreement on symbols and rating of electrical machinery. We understand, however, that in the near future a small international committee appointed at the Brussels conference, consisting of Dr. Budde (Germany), Dr. Silvanus Thompson (Great Britain), M. Brunswick (France), and M. Eric Gerard (Belgium), is to meet and discuss the work on nomenclature. This committee is to prepare a list of terms and definitions dealing with the one subject of electrical machinery, which list is to be ratified by the meeting at Turin in the beginning of September next.

There are now seventeen countries in which an Electrotechnical Committee has been formed, in the majority of cases with the assistance and co-operation of their respective Governments, the latest adherents being Holland and Switzerland. The British committee and its sub-committees have held twelve meetings during the year. The list of terms from A to E has been completed and sent to the central office. A French translation of the English list of terms (A–E) has been made, and an English translation of the French list of terms (A–E) was made by Mr. Robert Hammond, a member of the committee. The list of terms from F to J has been completed by the Sub-Committee on Nomenclature, and will shortly be submitted to the committee for approval. The Sub-Committee on Nomenclature has under consideration the German list of terms submitted at the Brussels Conference. A large number of the terms in the German list have already been dealt with in the English list of terms (A–J), and definitions are in course of preparation for other words requiring definition.

The Society of Engineers.—The annual dinner of the Society of Engineers (Incorporated) is to be held at the Criterion Restaurant on Saturday, the 27th inst., at 6.30 for 7 p.m. Mr. F. G. Bloyd, the President, will be in the chair. After the dinner there will be a conversazione and concert, the programme having been arranged by Mr. Chas. Capper.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—Members: A. Reyrolle, G. P. Robertson. Associate members: R. Brooks, H. G. Cakebread, C. Corbridge, E. Denton, A. O. Gibbon, F. Hersee, W. H. Hunstone, H. R. Legge, A. S. Markes, C. Munzel, E. S. Perrin, W. D. Ross, M. C. Timms, L. B. Turner, W. B. Turner. Associates: J. P. Forster, W. H. Lea, H. E. Mortimer, F. H. Ousey, H. P. Wiggins.

Faraday Society.—A general discussion on high temperatures is to be held on May 23rd at 8 p.m. at the Institution of Electrical Engineers. The following programme has been arranged: Dr. Arthur L. Day, of the Carnegie Institute, Washington, will read a Paper on "Recent Advances in Gas Thermometry"; Dr. J. A. Harker, F.R.S., will describe the high temperature equipment at the National Physical Laboratory; Mr. H. C. Greenwood, M.Sc., will read a Note on "Boiling Points of Metals," and Mr. A. Blackie will speak on "The Behaviour of Silica at High Temperatures." Contributions to the discussion have been promised by Prof. Bodenstein "On the Maintenance of Constant High Temperatures," M. Féry "On Stellar Pyrometry," and others. Dr. R. T. Glazebrook, F.R.S., Director of the National Physical Laboratory, will preside. During the afternoon of May 23rd the Society, by the kind invitation of the Director, will visit the National Physical Laboratory to inspect the high temperature equipment.

THE "BRUSTON" AUTOMATIC GENERATING SYSTEM

OWING to the courtesy of Messrs. R. A. Lister & Co. (47 Victoria Street, S.W.), we recently had an opportunity of inspecting an arrangement for the automatic supply of a lighting installation known as the "Bruston" system. This consists of a petrol or gas engine and a shunt-wound dynamo of the ordinary type, a small battery of accumulators of small size, and a relay which controls the starting and stopping of the plant. To start up, it is only necessary to switch on three or four lamps or more, depending on the state of the battery, which supplies the lamps in the first instance. As soon as the current required by the lamps is strong enough to actuate the relay the circuit is closed, and the current from the battery starts the machine as a motor by means of a solenoid starter. The engine, which is connected by belt to the motor, gets up speed, and then drives the motor as a dynamo, which now supplies the lamps direct and also charges the battery. In order to relieve the compression for easy starting, an exhaust-valve lifter is provided, in the form of a distance piece attached to a rod, which is also actuated by the solenoid. At starting the position of the rod is such that the distance piece is in contact with a projection on the valve stem, which keeps the valve open, but as soon as the solenoid has cut out all the motor starting resistance, it at the same time moves the distance piece, and allows the valve to travel freely up and down. In the event of only one lamp being required, it would be supplied by the battery until the volts were so low that the relay would again start up the set and recharge the battery. When the lamps are all switched off the plant automatically shuts down. With petrol the plant gets up speed in about 4 seconds, but with gas supplied direct from the mains the set will start up in about 2½ seconds. The engine runs under forced lubrication supplied by a small pump. There are no special foundations, the whole plant simply resting on two girders with felt placed at the corners to take up what little vibration there is.

CARBON LAMPS FOR ILLUMINATION

CARBON filament lamps will doubtless enjoy a spell of prosperity during the forthcoming Coronation celebrations, as owing to the temporary nature of the various installations, the higher price of metal filament lamps will be a consideration. Messrs. Siemens Brothers Dynamo Works, Ltd., Tyssen Street, Dalston, inform us that they are now holding large stocks of carbon lamps, which can be supplied immediately at remarkably low prices, which will only hold good until the present stocks are exhausted. As all orders will be executed in the strict rotation in which they are received it would be advisable to send orders or reserve sufficient quantities immediately. These types of lamps have been in great demand for illumination work, and we illustrate here some night effects which were

ILLUMINATIONS IN SOUTH AFRICA.

obtained during the Royal visit to South Africa on the occasion of the opening of the Imperial Parliament there. Many thousands of lamps were employed in these decorations, which were supplied by the South African branches of the above firm, and as will be seen, highly satisfactory results were obtained. Similar lamps will be used in the various Coronation schemes which Messrs. Siemens Brothers are catering for, and the actual fixing and erecting work will be placed in the hands of thoroughly competent electrical contractors. Messrs. Siemens Brothers will be pleased to forward a copy of their Coronation devices and accessories list to any who are interested in illumination schemes.

THE JAHNS GOVERNOR

AN illustrated booklet describing this form of governor has been issued by Jens Orten-Böving & Co. (9½ Union Court, Old Broad Street, E.C.). The Jahns governor is made in a great variety of forms for different circumstances, but in all of them the essential features are practically the same. The points specially aimed at in its design are maximum uniformity of action throughout the stroke, maximum sensitiveness, and maximum regulating force. The sensitiveness of the governor varies in inverse ratio to the internal friction, so that the less the friction the higher the sensitiveness. The insensitiveness (or sluggishness) due to the internal friction of a governor may be defined as the proportion which the change in speed necessary to produce motion in the sleeve bears to the total speed. If at any time the speed of the governor has been rising and comes to a steady value, n_1, and if it then begins to fall, the sleeve, owing to internal friction, will not begin to move downwards until the speed has fallen to a value less than n_1, which we may call n_2. Then the insensitiveness will be $\frac{n_1-n_2}{n_2}$. In the Jahns governor this quantity has a value of 0·00175, or 0·175 per cent., which is claimed to be considerably lower than in any other governor on the market. Exposed balls, swinging arms, &c., are replaced by a neat enclosed system with suitably formed and guided weights and balanced levers, powerful adjustable springs, ball or roller bearings at every friction point, and perfectly automatic lubrication throughout. The governor weights move absolutely radially in straight lines on steel rollers, which carry the weight as well as the side pressure, and the springs act directly on the weights themselves, without the intervention of any pins or levers. The straight-line movement of the weights ensures a straight-line law for the travel of the weights, and is a feature not possessed by any other governor.

The lever system connecting the weight with the sliding sleeve is of a very simple character, and runs in oil in the lower part of the case. Rollers are employed to diminish friction wherever possible, and the arrangement of the springs is such that both can be adjusted independently. A simple addition permits of speed adjustment while running.

Scottish Local Section of the Institution of Electrical Engineers.—The annual report of this section records the holding of six meetings and the conversazione. The section now embraces a larger area than formerly, as is indicated by its change of name, from the Glasgow section to the Scottish section. The membership amounts to 355, including 75 students. The following are the officers for the coming session:—*Chairman:* Mr. F. A. Newington. *Past Chairmen:* Mr. W. W. Lackie, Mr. E. George Tidd, and Mr. S. Mavor. *Vice-Chairman:* Mr. J. Lowson. *Chairman of Students' Section:* Mr. W. W. Lackie. *Hon. Secretary and Treasurer:* Mr. J. E. Sayers. *Ordinary Members of Committee:* Mr. W. M'Whirter, Mr. J. A. Robertson, Dr. Magnus Maclean, Mr. T. B. Murray, Mr. T. C. Parsons, Mr. J. Ferguson, Dr. J. T. Bottomley, Mr. D. A. Starr, and Mr. Lee L. Murray. The Glasgow Students' Section has held six meetings during the past session.

Conference on Engineering Training.—Arrangements have been made by the Institution of Civil Engineers to hold a conference on the education and training of engineers on June 28th and 29th. The subject matter will be divided into three groups, viz., general education, scientific training, and practical training. A large number of well-known men have consented to form the general committee. The President of the Conference will be Mr. Alex. Siemens, and the chairmen of the three sections will be Mr. A. G. Lyster, Prof. W. C. Unwin, F.R.S., and Mr. R. Elliott Cooper. The following subjects are to be introduced for consideration:—The extent to which mathematical and scientific subjects should share with other subjects of literate education the attention of schoolboys who intend to enter later the engineering profession. The question of specialised entrance examinations for University or College courses of study in Engineering Science with a view to the curricula to be followed, and also of the inclusion in the latter of courses in modern languages. The relation of practical training to college study; whether, or to what extent, before, sandwiched, or after its conclusion. The position and uses of engineering laboratories in relation to education at college. The value of a University Degree in Engineering Science in relation to professional competence. The requirements of practical training in works, with the necessary complement of scientific study. Practical training in workshops or on works of construction, with special reference to training in the engineer's office. The relation of engineering employers and colleges from the point of view of the practical training of college students. Workshop training as a preliminary to practical training in other branches of engineering.

THE TELEPHONE TRANSFER

Dispute between the Post Office and Telephone Co.

AS was briefly mentioned in our last issue, the Railway and Canal Commissioners are having to decide a dispute between the Post Office and the National Telephone Co., Ltd., as to what plant is to be taken over by the Post Office when the Company's licence expires at the end of this year.

Under the agreement made between the Government and the Company in 1905, the Post Office undertakes to buy all plant in use in non-competitive areas which was in use at that date, and also that which was erected subsequently, if it is in accordance with an agreed specification, which practically defined what was recognised as good practice at the time. In competitive areas, however—which includes London, Cardiff, Newcastle, Hull, Portsmouth, and Brighton—the Post Office is not compelled to buy any plant which is "unsuitable," and any dispute as to whether it is suitable or not is to be submitted to arbitration.

The Postmaster-General has given notice that he deems certain plant unsuitable, and this is disputed by the Company. The case has been proceeding since Tuesday last week, but up to the present the attention of the Railway and Canal Commissioners has been chiefly directed to two points, upon which a decision will probably first be given before the more technical part of the case is proceeded with.

The Company contend, in the first place, that the notices given as to the Postmaster-General's refusal to take over certain plant are invalid, owing to the want of proper definition of the plant which he desires to reject.

For instance, in the agreement, telegraph line or line is defined as including not only the wires, but also the posts, insulators, and other supports. The Postmaster-General objects to take over all iron wires which form a part of any telegraphic line, which according to the definition would include span-wires, and even the stay-wires holding up poles, to which not only these lines are attached, but also in many cases other lines which he wishes to take over. Further, he objects to lines along, upon, or across any railway worked *or about to be worked* by electric power, which definition, it is pointed out, might include not only all those cables and wires above or across the tube railways in London, where, of course, they are unaffected by the working of the line, but also others, the position of which it is impossible to determine without the gift of prophecy. The Company contend that the notice must not take the form of such general descriptions as this, but should be of sufficiently definite a nature to enable them to prepare a list of the actual plant and material objected to. The Postmaster-General also objects to taking over lines leading to the "Avenue" exchange in London (which will eventually be replaced by a new exchange in course of erection by the Post Office in Creechurch Lane, Fenchurch Street), but it is pointed out that both these junctions are in many cases contained in cables with other junction and private lines which the Post Office have not excluded. The Company claim that the material which the Post Office desires to reject must be of such a nature that it is easily separable from what is to be taken over and retained, and that for all these reasons the notices (given before January 1st last under the terms of the agreement) are invalid.

The second point which is now being discussed is the interpretation of the word "unsuitable." It appears that some of the plant and lines objected to in competitive areas is quite modern and efficient, and suitable for the service, but is not wanted because it duplicates existing plant or lines, and the Commissioners are asked to decide whether "unsuitable" includes what may be more accurately characterised as redundant. The complaint is also made that the Postmaster-General has even widened his interpretation of what is unsuitable to include plant that will shortly be replaced by new plant when the London exchange system is remodelled. For instance, the existing Avenue exchange, already mentioned, is one of the older ones in London that have not been re-equipped on the common battery system, and the new exchange in Creechurch Lane will, when ready, enable it to be dispensed with. But the Avenue exchange is at present necessary for the service, as the new exchange is not completed, and the Company maintain that the suitability of the Avenue exchange is therefore established.

Counsel for the National Telephone Co. are Sir Alfred Cripps, K.C., Mr. W. Danckwerts, K.C., Mr. Forbes Lankester, K.C., Mr. E. Morton, K.C., and Mr. H. H. Gaine; for the Post Office, the Attorney-General (Sir Rufus Isaacs, K.C.), the Solicitor-General (Sir John Simon, K.C.), and Mr. Branson.

A number of models have been prepared, and were exhibited in Court to assist in explaining to the Commissioners, Justice A. L. Lawrence, the Hon. A. E. Gathorne-Hardy, and Sir James Woodhouse, the various technical matters and the issues involved.

After Sir Alfred Cripps had opened the case for the National Telephone Co., and Mr. Danckwerts had followed, Sir A. B. W. Kennedy was called as the first witness. The Judge, however, said he would like to hear the other side on the two points mentioned above, and Sir Rufus Isaacs and Sir John Simon addressed the Court. It was agreed that, until these points were decided upon, the more technical question as to the suitability of the existing plant should not be discussed. Sir A. B. W. Kennedy and Major O'Meara then gave the Court a general description of the various systems of telephony. Sir Rufus Isaacs replied for the Crown on the points in question, and Sir Alfred Cripps was making his final speech when we went to press.

CIRCUIT BREAKING

THE discussion on Mr. A. G. Collis's Paper on Circuit Breaking, before the South Wales Institute of Engineers (see ELECTRICAL ENGINEERING, March 9th, p. 125) was concluded on Thursday, April 20th, at Cardiff, by the reading of a communication from Mr. A. M. Taylor.

Referring to Mr. Collis's remarks as to the action of a magnetic blow-out solenoid on an alternating current circuit, he remarked that although, over a number of phases, the direction of flux would be reversed, the period in which his switch acted, commencing from the point of zero current, was so short that the current was unidirectional. Under these conditions, the magnetic blow-out could quench the arc. Any deterioration of the oil due to the action of the arc from the magnetic blow-out was balanced by the rapid circulation of the oil due to the action of the switch blade. In some tests which he (Mr. Taylor) had made with two types of switches manufactured by leading makers, he had found that gaps of 1 in. and 1·5 in. respectively were made before the auxiliary contacts broke the circuit. Even if the loss of time due to the damping action of the oil and the friction of the parts were neglected, this corresponded to ·036 and ·042 second respectively, and these times would be increased if long rods and cranks were used for remote control. Hence Mr. Collis's time of ·01 second was inconceivable unless some special means of opening had been adopted. Regarding Mr. Collis's example of a rise of 9,300 volts on a 2,000 volt 200 yard feeder carrying 500 amperes, it was not stated whether the circuit was broken under its own self-induction only, or with a motor in circuit. Where a cable was short-circuited straight across, a voltage rise in excess of the alternator voltage could be produced, this rise depending on the rate of change of current at the instant of rupture. A resistance introduced into the circuit at the switch during circuit breaking operations would, by limiting this rate of change, reduce the reactance voltage of the generator.

HIRE OF ARC LAMPS

IN view of the diversity in practice regarding the hire of arc lamps, the National Electrical Manufacturers' Association have prepared a series of rules regarding the conditions on which arc lamps are to be supplied on approval or on hire, in the hope of promoting uniformity in such matters. These rules provide in arc lamps on approval that no charge is made for the use of lamps during the approval period, and each lamp will be provided with one trim of carbons. All further carbons used must be paid for. The lamps must be properly erected and burnt with the carbons supplied, and no larger current or higher voltage must be used beyond that stated on the instructions. The goods are to be returned properly packed within the time period agreed. Should they be detained longer, it will be considered that the lamps are definitely purchased. The lamps when returned will be inspected, and breakages or repairs necessary, other than those due to fair wear and tear, are to be paid for at the usual rates.

When arc lamps are on hire, except in the case of electrical exhibitions, all carbons are to be paid for. The total costs of freight and carriage from the works to the hirer and back again to be paid by the hirer, and from the time the lamps reach the hirer to the time of their return to the maker, they are held in trust by the hirer, who will be responsible for any loss or damage which may occur. The period of hire shall be reckoned from the time the goods leave the maker to the date they are received by him. The hiring prices do not include the cost of wiring for or fixing the lamps and resistances.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 11th, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

9,611/10. **Electric Ovens.** H. Gray. In this oven the air is heated by heating elements disposed within the lower portion of and near the sides of the cooking chamber of the oven. It is then conducted up through conduits to the upper part of the chamber, when it flows down evenly through the cooking space to the lower part of the oven, to be re-heated by the resistances, without passing out of the chamber, and so makes a continual circulation. Four figures.

9,858/10. **Insulating Material.** W. J. Reid. This patent relates to the manufacture of a material suitable for insulation, and consists in treating with paraffin wax a mixture of 40 to 60 parts of finely powdered cork, and 40 to 60 parts by weight of linseed oil, which has been subjected to a temperature usual in preparing boiled oil for painters' use for such a time that it becomes viscid, and will draw into threads when cool. This mass can be moulded while hot into any shape, and then hardened by exposure to the air at a temperature of 100° F.

9897/10. **Electric Furnace.** J. Härdén. This patent describes a furnace which has a concave roof for radiating and reflecting the heat from a long arc derived from two metal electrodes on to the surface of the charge. The electrodes, which are placed above the charge, each consist of a hollow metal tube with a dome-shaped cap adapted for the circulation of a cooling medium, and are inclined upward from a recess in the furnace wall. Four figures.

25,473/10. **Repulsion Motors Operating as Generators.** Akt.-Ges., Brown, Boveri et Cie. When repulsion motors are driven in a direction opposite to their torque, they act as generators, and large currents at a low periodicity are generated, which are liable to damage the windings of the stator and rotor. The object of the invention is to prevent this by connecting, in series with either or both the circuits, a non-inductive resistance, with which is supplied a switch for short-circuiting it. The resistances need only be put into circuit at high speeds, when dangerous currents are likely to flow, and then can be thrown in automatically at a certain speed. Four figures.

22,368/10. **Electric Time Switches.** W. C. Pugh and A. Gamblee. This covers an improvement in the type of time switches which are opened and closed by a clock-worked mechanism. A cam moves axially by means of a gear-wheel, and is controlled by an adjustable finger so as to actuate a lever to close the switch at a predetermined time, also a sleeve which is connected to, but is rotationally adjustable with relation to the cam, and a projection mounted on the sleeve to control the lever and permit a spring to actuate it to open the switch at a certain time. Six figures.

28,940/11. **Electro-dynamical Couplings.** Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke Ges.*) This invention describes a simplified form of coupling, and covers in particular that part of the power which is transmitted indirectly from one shaft to the other. An armature made up of two separate concentric iron cores, wound with a series of short-circuited conductors common to both cores, is mechanically coupled to one of the shafts. There is also provided a rotating field produced by supplying a stationary polyphase winding from an outside source, of such a phase that a motoring action is set up between the armature and the rotating field, and the inner conductors on the armature generate current for the outer motoring conductors. The other shaft is mechanically coupled to a direct-current field system. When the speeds of the two shafts are equal and in the same direction, there is no torque transmitted from one shaft to the other, but when the speed of the armature is less than that of the shaft coupled to the D.C. field, a torque is transmitted directly and partly indirectly. The armature need not have two separate iron cores; one common core will often prove satisfactory. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Martyn [Bonding cables] 9,921/10; Koopman and Pontelec Welding Patents, Ltd. [Conductor supports] 10,693/10; Mitchell and Dudgeon [Overhead section insulators] 25,369/10.

Dynamos, Motors, and Transformers: Siemens Bros. Dynamo Works (*Siemens Schuckertwerke Ges.*) [Regulation of A.C. generators in parallel] 29,549/10; Koopman and Pontelec Welding Patents [Transformers] 4,911/11; Siemens Schuckertwerke Ges. [Rotor cooling] 5,247/11; Schneider [Verifying the operation of distant transmission apparatus] 28,700/10.

Electric Ignition: Fletcher [Magneto-electric machines] 2,434/11.

Electrometallurgy and Electrochemistry: Härdén [Reduction of metals from their oxides and other compounds] 7,303/10; Henri, Helbronner, and Von Recklinghausen [Sterilisation of liquids] 12,947/10; Billon-Daguerre [Sterilisation of liquids] 2,735/11.

Heating and Cooking: Koopman and Pontelec Welding Patents, Ltd. [Heating-machines] 10,694/10; Veritys, Ltd., and Pipkin [Soldering-iron] 11,088/10.

Incandescent Lamps: Harrison [Manufacture of filaments] 10,871/10; Harrison [Exhaustion of] 10,872/10; Kitsee [Metallic filaments] 11,415/10; Roberts and Prescott [Lamp-shade attachments] 21,349/10; Ludecke and Imperial Lamp Works, 23,222/10.

Instruments and Meters: Harris [Moving coil measuring instruments] 10,048/10; Kretz [Coin-operated mechanism for supply] 10,334/10; Allgemeine Elektricitäts Ges. [Consumption meter] 1,930/11.

Storage Batteries: Pape [Storage cells], 906/11.

Switchgear, Fuses and Fittings: Torchio [Manufacture of insulated conductors] 10,160/10; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Motor starters] 10,191/10; Eversheed & Vignoles and Kilroy [Gun control] 10,356/10; Siemens Bros. Dynamo Works (*Siemens Schuckertwerke Ges.*) [Motor controllers] 17,235/10; Price [Switches for dynamos, accumulators, &c.] 18,869/10; Waterhouse [Ceiling roses] 20,156/10.

Telephony and Telegraphy: Johnson and Johnson [Telephonic apparatus] 21,359/10; Siemens Bros. & Co. (*Siemens and Halske Akt.-Ges.*) [Telephone exchange circuits] 29,672/10.

Traction: Electric & Ordnance Accessories Co. and Seal [Lighting of carriages and other vehicles] 2,088/10; Samaia [Railway and tramway points, control] 11,371/10; Buck [Trolley arms] 25,864/10.

Miscellaneous: Presser [Electric welding] 15,033/10; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Electromagnetic relays] 2,249/11; Siemens Bros. & Co. (*Siemens and Halske Akt.-Ges.*) [Electric order-signalling] 6,626/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Blondel, 27,989/10.

Telegraphy: Soc. des Établissements Gaumont [Phonic relay] 9,364/11.

Incandescent Lamps: Schaffer, 9,719/11; Schaller, 9,815/11; Schaller [Lamp with liquid incandescing body] 9,816/11.

Distribution Systems, &c.: Giles [Device for indicating earth on line] 9,745/11.

The following amended Specification can now be obtained.

L. D. Cibie [Arc lamps] 21,008/09; H. Hammarlund [Recording instruments] 27,380/09.

Opposition to Grant of Patents

13,009/10. **Separation of Ores.** Murex Magnetic Co. and A. A. Lockwood. Opposition has been entered to the grant of this patent, a process for the magnetic preparation of an ore, which consists in treating it with a magnetic substance, an oily liquid, and a solution of potassium sulphide.

16,300/09. **Treatment of Iron and Steel.** W. E. Bullock and J. Calcott. This patent has been granted by the Comptroller in spite of opposition. (See Electrical Engineering, January 5th, p. 7.)

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: G. Wilkinson [Electric joints and boxes] 2,084/02.

Dynamos, &c.: C. A. Parsons, G. G. Stoney, and A. H. Law [Dynamos] 2,151/06.

Electric Ignition: A. Herz [Explosion engines] 2,152/03; G. A. E. Edwards (*H. M. Reichenbach*) [Internal combustion engines] 1,759/06.

Electrometallurgy, &c.: J. Raschen and G. C. Clayton [Electrolysis] 2,152/04.

Heating and Cooking: J. Girlot [Apparatus for heating materials] 1,961/02.

Incandescent Lamps: P. H. Thomas [Vapour electric apparatus] 707/06; J. Neu [Apparatus for raising lamps] 2,153/06.

Instruments, &c.: W. Armour [Temperature recorder] 1,906/06.

Switchgear, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Switches] 2,065/06; H. E. Edwards [Switches] 2,196/06.

Telephony, &c.: W. L. Wise (*J. H. Peirce, U.S.A.*) [Telegraphs] 2,274/04.

Miscellaneous: H. Nehmer [Gas lighters] 2,063/04; S. O. Cowper-Coles [Electrotype for ornamenting] 2,071/06.

Hosted by Google

CATALOGUES AND PAMPHLETS RECEIVED

ELECTRIC WELDING.—An illustrated catalogue from the British Insulated & Helsby Cable Co., Prescot, Lancashire, describing the Prescot spot and seam welders, is before us. These are devices for electrically welding plates of iron or steel, and are claimed to give effects equal to riveting. They are provided with two suitably shaped electrodes, which make contact with the metals to be welded, and through which a heavy current is passed at a very low pressure, until the intervening metal is white-hot, when the current is cut off and the metal between the electrodes is compressed, forming a weld. The current being only in use during the actual heating operation, brings the consumption down very low. The welder is wound for a pressure of 200 volts at 50 periods single phase. The electrodes are made of copper, and in order to prevent undue wear under the extreme heat, it is arranged for water to flow through the handle of the electrodes to the welding point, this being so efficient that the noses of the electrodes can be touched by the hand immediately the weld is completed.

WATER SOFTENERS, &c.—New leaflets from the Harris Patent Water Feed Filter (1910), Ltd. (24 Grainger Street West, Newcastle-on-Tyne), call attention to the Harris-Anderson water softener and oil eliminators, and the Harris-Anderson patent anti-corrosion system for condensers. Effective photographs of the state of protected and unprotected tubes are reproduced, and a long list is given of installations where the system is in use.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ILLUMINATIONS.—Messrs. Caspar & Co. (33 King's Road, N.W.) send us a leaflet describing attractive signs and devices for Coronation illuminations, including excellent transparency portraits of the King and Queen for illumination.

ARC LAMPS.—A leaflet from the Allgemeine Elektricitäts Gesellschaft refers to a new high candle-power arc lamp used in conjunction with coloured screens which the company have specially designed for colour matching. Interesting three-colour reproductions of materials photographed by this lamp, by incandescent lamps, Nernst lamps, and gas give a striking illustration of its suitability.

BALLAST RESISTANCES.—The A.E.G. also send us a pamphlet relating to iron-wire resistances for automatic voltage equalisation on traction lighting circuits. The resistances are made up like incandescent lamps in glass bulbs with the ordinary lamp contacts.

TURBO-COMPRESSORS.—Another recent A.E.G. publication in German is a booklet on turbo-compressors and blowers, containing interesting particulars of this rapidly developing class of plant with illustrations of actual installations.

ENGINEERING SUPPLIES.—A new edition of this catalogue has reached us from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.). This list sets out clearly small motors, spares, and accessories in a manner which will be found useful to central station engineers for ready reference. A feature of this catalogue is the electric "Mary-Ann," a contrivance which should be of great utility as a domestic labour-saving appliance. From the same firm we have a copy of their mixed plant catalogue, which is well arranged, and should be a great help to engineers in getting out estimates for various lighting plants. The complete way in which the equipments listed have been standardised is not the least useful point about the list.

RESISTANCES.—Messrs. The M. & C. Manufacturing Co. (Conduit Place, Paddington, W.), have sent us a leaflet dealing with resistances for cinematograph work, which, with satisfactory ventilation, are guaranteed to withstand from 60 to 100 per cent. overload.

TELEPHONES.—We have received from the Western Electric Co. (Norfolk House, Victoria Embankment, W.C.), a copy of a revised catalogue, which deals with various types of interphones and "Westerphones," and all the necessary material for installing them. The same firm also send a booklet with details of the improved Blue Bell Dry Cell and other wet batteries, such as the Leclanché, Fuller, and Gravity, and describes a pocket telephone battery gauge for testing purposes.

MOTOR CONVERTERS.—A new pamphlet from Messrs. Bruce Peebles & Co., Ltd., of Edinburgh, gives a full description of the La Cour Motor Converters, and their various uses, together with important curves, showing characteristics of the traction and lighting types. Numerous orders and repeat orders are continually being received, and we understand that one company alone has ordered sixteen of these machines, each of 475 kw. capacity, for sub-station work.

LOCAL NOTES

Birmingham: *Tramway Receipts.*—The net profits from the tramways for the year 1910–11 amount to £65,516, an increase of £9,074 over the previous year. After placing £24,413 to reserve, bringing this to £132,150, the balance of £41,103 is to be transferred to relief of rates.

Electricity Accounts.—After meeting all charges, the accounts of the electricity undertaking show a net profit of £35,449. The sum of £20,000 is transferred to renewals fund, and the balance carried to relief of the rates.

Blackpool: *Electricity Profits.*—Last year 171 new consumers were connected to the mains, and the profit for the year was £5,300.

Bournemouth: *Tramway Receipts.*—The traffic receipts for 1910–11 show an increase of £3,213 on the previous twelve months. The tramway manager recommends the Council to retain the tramcar meters, which have been on trial for six months. He regards them now as an essential and indispensable part of the equipment.

Bridlington: *Electrical Fountains.*—The proposal of the Property Committee that a deputation should visit Berlin to inspect the working of electrical fountains with a view to having one installed on the parade, has been rejected by the Corporation.

Glasgow: *Tramway Assessment.*—The Tramway Committee are appealing to the Sheriff's Court against a decision of the Assessment Committee fixing the assessment of the tramways at the full value, instead of one-fourth, similar to the rating of railways.

Hartlepool: *Tramway Arbitration.*—In reference to the arbitrator's award of £12,963 for the purchase of certain tramway routes as mentioned in our last issue, there still remain certain legal points to be argued. These will be heard by Mr. Justice Bray on June 13th. The Corporation are advised that the arbitrator has no jurisdiction to make any award, on the ground that at the date upon which the value of the tramways was fixed by him, the Tramway Company were not the actual owners of the lines, they being then in the hands of the original promoters, Messrs. Sellon and Ashby, and that no deed of assignment had been executed. Consequently neither party could claim payment.

Hull: *Telephone Accounts.*—The telephone accounts for the year to March 31st, show a gross profit of £5,026, an increase of £203 over the previous year. The royalties paid to the Government amounted to £1,258. The cost per station now stands at £19·95 compared with the estimate of £20 given by Mr. A. R. Bennett, at the original Local Government Board inquiry.

Ipswich: *Electricity Profits.*—The total revenue from the electricity undertaking for the year to March 31st, was £14,495, and after meeting all charges, including sinking fund and interest, there is a net profit of £1,509 before making any provision for depreciation.

Tramway Profits.—The tramway accounts show a deficit of £2,230 compared with £1,733 in the previous year.

Johannesburg: *Strike of Tramway Employees.*—According to messages from Johannesburg, considerable disturbance is being caused by a strike of tramway employees. It seems that two men have been discharged, and their reinstatement is demanded, together with an assurance that the strikers will not be victimised later. Cars have been running with volunteer drivers accompanied by an armed policeman, and in this way the full service has been maintained. Nevertheless, the cars have been boarded by strikers, and in some cases stopped. The services of mounted police have helped to keep the way clear for the passage of the cars. An attack has been made upon the power station.

Leatherhead: *Street Lighting.*—The local Electricity & Gas Companies have been asked to tender for street lighting.

Leeds: *Electricity Profits.*—The Electricity Department is able to contribute £9,927 to relief of rates out of the profits for 1910–11, an increase of £1,062 over the previous year.

Hosted by Google

Bermondsey: *Electric Supply Competition.*—The Board of Trade, after holding an inquiry lasting for three days, has refused the Council's application for an electric lighting Provisional Order in the districts of Horsleydown, St. Olave and St. Thomas. In these districts the supply at present is in the hands of the County and London Electric Supply Co. and the London Electric Supply Corporation. The County Council opposed the application, on the ground that already the undertakings of the two Companies may have to be purchased, and that the granting of competing powers would place the County Council in competition with the Borough Council, should the companies be purchased by the former in 1931. It was also objected that in view of the indebtedness of the Borough Council, it was undesirable that it should incur any capital outlay upon electricity works on an area already served by two companies.

Stepney: *Wapping Sub-station.*—The London County Council are recommended to sanction a loan of £5,260 for sub-station buildings at Wapping, repayable in 50 years.

Manchester: *Electricity Profits.*—At the last meeting of the City Council, the Electricity Committee recommended that the sum of £19,496 should be handed over from their profits in relief of rates. An amendment was moved that this amount should be increased to £24,500, and in spite of the opposition of the Chairman of the Committee, the amendment was carried.

Tramway Profits.—At the same meeting the Tramway Committee's proposed contribution of £75,000 to relief of rates was raised to £80,000 by the Council, the Chairman of the Committee dissenting in this case also.

Nelson: *Electricity Profits.*—There has been a net profit of £826 upon the working of the electricity undertaking for 1910–11, instead of an estimated loss of £898.

Newark: *Lighting Order Revoked.*—The Board of Trade have revoked the Newark Electric Lighting Order granted in 1900.

Newcastle-on-Tyne: *Electric Signs.*—In an omnibus bill which was considered by the Local Legislation Committee of the House of Commons last week, the Newcastle Corporation sought powers to control electric street signs. The Newcastle-upon-Tyne Electric Supply Co. opposed, and as the Corporation had had to come to terms with the North-Eastern Railway Co., and allow their signs to remain without control, the Committee regarded the case for the charge as a weak one, and refused the powers asked for.

Norwich: *Tramway Purchase.*—Some negotiations for the purchase of the Norwich Tramways by the Corporation fell through a short while ago, the Company not then being willing to sell. The Company is controlled by the Imperial Tramways Co., which also owns the Coventry Tramways, and in the latter case the Corporation have availed themselves of their powers to give notice to purchase that undertaking. In these circumstances the Imperial Company have now expressed their willingness to enter into the negotiations for the sale of the Norwich Undertaking, and a proposition to this effect has been placed before the Council.

Walthamstow: *Tram Car Meters.*—The Tramway Manager has on trial 40 Chamberlain and Hookham traction meters. Although they have only been in use for a short time, there has been a marked decrease in the consumption of power.

Warrenpoint: *Electricity Supply.*—A Lancashire firm of electrical engineers have placed an electricity supply scheme before the Council.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bath.—The Electricity Committee propose to instal a Diesel engine and generator at the power station at an estimated cost of £7,580.

Derby.—The estimated capital expenditure for the year to March 31st, 1912, upon the electrical undertaking is £8,500.

Handsworth (Staffs).—The Council require a supply of cable for lighting and tramway purposes. Consulting engineers, Messrs. Kennedy & Jenkins, 17 Victoria Street, London.

Ilkley.—Mr. J. C. Speight, of St. Anne's-on-Sea, has placed a scheme of electric supply before the Council, the total cost of which is estimated at £6,324. This plant provides for the use of suction gas, but by laying mains only in the compulsory area and using town gas it is calculated that the cost could be reduced to £5,024.

Ireland.—The Tipperary Guardians have decided to proceed with their scheme for electrically lighting the workhouse buildings. It is expected that an annual saving of £277 will be made compared with the present gas lighting.

Italy.—Tenders are invited by June 2nd for the supply of electric cables and wires to the Italian naval authorities. Copy of specification and conditions may be seen at 73 Basinghall Street, E.C.

London: *Poplar.*—A scheme of extensions to the generating station and plant at a cost of £42,455 has been adopted by the Council.

South Shields.—A Local Government Board inquiry was held last week concerning a loan of £7,500 for additional generating plant. Mr. J. F. C. Snell gave evidence on behalf of the Council, and recommended the Borough Electrical Engineer's scheme for installing a 1,500 kw. turbine driving a 1,000 kw. direct current generator and a 1,100 kw. alternating current generator. Smith's Dock Co. still oppose the loan on the ground that the Council could obtain current more cheaply from the County of Durham Electric Supply Co. Evidence against the scheme was also given by the latter.

Wimbledon.—The Electric Lighting Committee recommend the installation of additional machinery and the laying of mains for supply to the Maldens and Coombe district at an estimated cost of £7,459.

York.—A Local Government Board inquiry was held last week concerning a loan of £15,000 for extension to the electricity works. There was no opposition. During the course of the inquiry the Inspector, Mr. H. R. Hooper, expressed the opinion that the Corporation would have been advised not to have taken £800, as they have done, from the reserve fund for the relief of rates, for by leaving profits to the credit of the undertaking was the only chance of getting it on a sound financial basis.

WIRING

Birmingham.—Alterations to Probationary block, at Infirmary, Dudley Road. Architect, W. H. Ward, Paradise Street.

Brighton.—New Brighton and Sussex Grammar School. Brighton Education Committee.

Cardiff.—Business premises for Messrs. Morgan & Co., The Hayes. Architects, James & Morgan, Charles Street Chambers.

Additions to Grange Town Schools. Education Committee.

Wiring of the Corporation Baths, Guildford Crescent. City Electrical Engineer.

Glasgow.—Extension to United Wire Works, Dale Street.

—Additions to Glasgow and West of Scotland College of Domestic Science.

Manchester.—Elementary School, Fairfield Road, Droylesden, Lancs. Education Committee.

New Art Gallery and Free Library.

Mexborough.—Tenders are invited for a country-house electrical installation complete. Apply 12 Milton Road, Mexborough.

Neath.—Additions to Council schools.

Perth.—New street between St. John's Place and King Edward Street.

MISCELLANEOUS

Birmingham.—An expenditure of £99,805 is contemplated by the Corporation upon the Bristol Road, Colmore Row, to Hockley Brook and Garrison Lane tramway routes.

Canada.—The Board of Control, City Hall, Toronto, invite tenders by June 6th, for pumps and electrical equipment. Copies of specification at 73 Basinghall Street, E.C.

Denmark.—The Copenhagen Corporation require 3,000 electric meters. Tenders by May 23rd, to "Direktören for Belysningsvaesenet, Raadhuset."

Dundee.—A recommendation by the Tramway Manager to double all the existing single tramway lines at an estimated cost of £17,600, has been adopted by the Tramways Committee.

Hosted by Google

Glasgow.—A special Sub-Committee on street lighting recommends that flame arc lamps be installed in a number of main streets before adopting a general sheme of improved lighting for the city.

Netherlands, East Indies.—The Board of Trade Commercial Intelligence Department have an address to which inquiries may be sent in connection with the proposed installation of electric cranes at Padang.

Oulton Broad.—The local Electricity Co. have offered to undertake street lighting by electricity.

Walsall.—Tenders are invited for electrical pumping plant at the new sewage disposal works. Borough Engineer.

TENDERS RECEIVED AND ACCEPTED

Colchester.—The tender of Messrs. W. T. Henley's Telegraph Works Co., Ltd., for the supply of low tension cables at £595 has been accepted.

Derby.—Contracts have been entered into with the British Insulated & Helsby Cables, Ltd., the British Thomson-Houston Co., and Messrs. Ferranti, Ltd.

Luton.—Application is to be made for a loan of £13,500 for electric extensions. Conditionally upon sanction being granted, the tender of the Brush Electrical Engineering Co. for a 50 kw. exhaust steam turbo-gererator at £2,495 10s., and a 400 kw. exhaust turbo-generator at £1,913 has been accepted. The complete scheme includes, in addition to the two generators, a cooling tower, switchgear and mains, the estimates for which are £7,039.

London: *L.C.C.*—The tender of Messrs. Walter Scott, Ltd., is recommended for acceptance for a supply of renewable guard rails for the tramways at £9,700. The rails are to be made by the Sandberg (high silicon) process at Leeds. A cheaper tender for the same process by Messrs. P. and W. Machellan, but for the rails to be made in Germany, has been put on one side.

The tender of the Rees Roturbo Pump Co., Ltd., for an electrically driven pump for draining water from cable manholes at £110 10s., is recommended for acceptance.

Marylebone.—The tender of Messrs. C. A. Parsons & Co., Ltd., has been accepted for the supply of commutator at £220, and that of the Electrical Power Storage Co., Ltd., for a 15- to 20-cwt. electric truck for the stores warehouses at £260.

Stockton.—The tender of Messrs. Richardson's, Westgarth & Co., for a 400 kw. turbo-generator at £2,293 has been accepted, subject to the sanction of the Local Government Board to the necessary loan.

The Halifax Corporation have placed an order for sixty Chamberlain & Hookham car meters for their trams. The same firm's tenders have also been accepted by Govan, Kirkcaldy, and Salford for ordinary meters.

The Mirrless Watson Co., Ltd., Glasgow, inform us that they have received, among others, the following orders:—Surface condensing plants: Two sets for Malta Dockyard; two sets for Stoke-on-Trent Electricity Works; two sets for Japanese Explosive Co.; one set for the Compania De Gas y Electricidad, Habana. For counter-current jet plants:—Two sets for the Golden Rook Sugar Factory, St. Kitts; one set for Formosa; one set for Pernambuco; and one set for San Domingo.

APPOINTMENTS AND PERSONAL NOTES

Mr. C. F. Edwin has been appointed Chief Electrical Engineer to the Chilian Navy. Mr. Edwin obtained his Diploma in Electrical Engineering in the Central Technical College in 1904. Since that date he has been with Messrs. Siemens Bros. Dynamo Works, Ltd., having held the position of Chief of Test House for nearly four years.

The salary of Mr. R. Marshall, Borough Electrical Engineer at Ayr, has been increased from £300 to £350 per annum.

The Birmingham Tramways Committee recommend that the salary of the traffic superintendent, Mr. J. McDonnell, be increased from £250 to £300 per annum.

A sub-committee of the Perth Tramway Committee recommends that the appointments of electrical engineer and tramway manager, now held by Mr. J. Lambert, be separated. It is recommended that Mr. Lambert shall continue as electrical engineer at his present salary of £275, plus £50 per annum for taking charge of the overhead equipment of the tramways. The Lighting Committee are to be asked to increase Mr. Lambert's salary by £25, thus making his total remuneration £350 per annum.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, net c.i.f. port of arrival, quoted on Tuesday night, was £55 15s. to £56 5s. per ton (last week £56 to £56 10s.)

Australian Agency.—An agent who already represents a number of British firms in Australia desires to obtain additional agencies of British manufacturers of electrical goods. Particulars may be obtained through the Commercial Intelligence Branch, Board of Trade, 73, Basinghall Street, E.C.

Patents for Sale.—The proprietor of patent No. 9023 of 1908 relating to improvements in the construction of condensers wishes to dispose of same. (See an advertisement on another page.)

"Tinol."—Messrs. Neville, Williams and Co. advise us that the "Tinol" branch of their business has been converted into a limited company. All communications relating to "Tinol" should be addressed to Bi-Metals, Limited, 80A Southwark Street, S.E. Messrs. Neville, Williams and Co. are continuing the electrical manufacturing business as before.

Bankruptcy.—A receiving order has been made against J. D. Carlmark, Electrical Engineer, 402 High Street, West Bromwich.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Colombo Electric Tramways & Lighting Co.—A dividend of 8 per cent. for 1910 is recommended, carrying forward £3,710, after transferring £8,300 to general reserve.

Shanghai Electric Traction Co.—There was a net profit of £7,584 for 1910, compared with a loss of about £1,000 in 1909. After writing off the debit balance the sum of £6,635 is carried forward.

Calcutta Electric Supply Co.—After placing £20,000 to depreciation and renewals and £7,500 to reserve, the directors recommend a final dividend on the ordinary shares for the December half year, making 8½ per cent. for the year. The amount carried forward is £5,621.

Rangoon Electric Tramways Supply Co.—Dividend of 4 per cent. on the ordinary shares for 1910.

Auckland Electric Tramways Co.—Interim dividend at the rate of 6 per cent per annum on the ordinary shares for the December half-year.

Cascade Water, Power & Light Co.—Subscriptions have been invited during the week for $285,500 first mortgage 4½ per cent. bonds of $500 each. This company is an amalgamation of a number of electric supply companies in British Columbia, and for the year ending August 31st, 1910, after meeting all interest and sinking fund charges, there was a net surplus of $82,399.

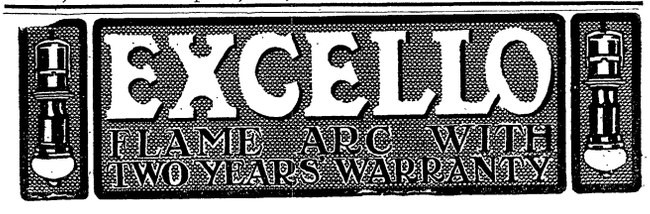
Adelaide Electric Supply Co.—Meetings were held last week authorising the raising of an additional £150,000 debenture stock.

Companies to be Struck off Register.—The undermentioned will be struck off the Register of Joint Stock Companies at the expiration of three months:—Aberdare Electric Lighting Co.; Buenos Ayres Electric Light Co.; Heswall District Power Co.; Private Wire and Telephone Installation Co.

NEW COMPANIES

MERSEY POWER CO., Colonial House, Water Street, Liverpool. Capital, £250,000. To acquire from G. H. Cox and H. J. Falk the Runcorn Urban and Rural Electric Lighting Provisional Orders and the Widnes Electric Lighting Provisional Order.

RESISTO ELECTRICAL ENGINEERING CO. Registered by R. Warner & Co., 10 Walbrook, E.C. Capital, £7,500. Manufacturers of and dealers in electrical apparatus.



ARGENTINE ELECTROLYTIC SYNDICATE. Registered by Jordan & Sons, 116 Chancery Lane, W.C. Capital, £2,500.

ELECTRIC FITTINGS CO. (1911), 38 Conduit Street, London, W. Capital £5,000. To take over the existing business carried on at the above address, and to adopt an agreement with W. R. Sutton and A. W. Mills.

BAXTER & CAUNTER, 1 Trentishoe Mansions, Charing Cross Road, London. Capital, £50,000 (10,000 preference). To take over the existing business carried on at the above address.

TELEPHONE DEVELOPMENT CO., 36 Whitefriars Street, E.C. Capital, £25,000. To take over a concession granted or to be granted by the Imperial Ottoman Government to the Consortium Anglo-Franco-American for the construction of a telephone system in Constantinople.

SOUTH-EAST KENT ELECTRIC POWER CO., Castle-hill House, Dover. Capital, £1,000.

SUMMARY

A special article by Mr. Frank Broadbent, discusses the advantages of electric power and lighting in printing establishments on the score of economy and convenience, and describes the special facilities which electric driving offers in the way of easy and accurate control of printing machines. (Page 275.)

A long and fully illustrated article describes the new printing works of our printers, Messrs. Richard Clay & Sons, Ltd., at Brunswick Street, Stamford Street, S.E. This works consists of a large four-floored ferro-concrete building, with special features as regards heating, ventilating, and fire-protection, containing a full equipment of up-to-date electrically-driven machinery, including a large number of rotary and flat-bed presses in great variety of size and design, special folding, gathering, stitching, wrappering, and cutting machinery, complete electrotyping and stereotyping plant, comprising machines and all the paraphernalia of a modern printing house. Electric drive by individual continuous-current motors is employed throughout, and the lighting is entirely by means of metal filament lamps. (Page 279.)

At the Institution of Electrical Engineers last Thursday, Mr. W. Aitken read a Paper on automatic telephone exchanges. He dealt with the subject in considerable detail, and expressed himself strongly in favour of the automatic switchboard, quoting American results to show its efficiency and economy. In the discussion, Messrs. J. E. Kingsbury, F. Gill, and M. S. Connor all considered that sufficient cause had not been shown for the abandonment of the manual board in favour of the automatic; Mr. A. W. Whalley, however, thought that, whatever the expense, the saving in time in obtaining connections and clearing should justify the erection of an automatic exchange system in London, and Mr. R. Scruby related the favourable impressions he had obtained from his examination of automatic exchanges in America. In the first part of his Paper, Mr. Aitken also described the recent adoption of keyless ringing on the incoming junction boards of ordinary C.B. exchanges, and explained an arrangement for automatic clearing which the British Insulated & Helsby Cables, Ltd., have recently introduced for private branch exchanges too small to have a regular operator. (Page 293.)

We publish a brief description of a new A.-C. motor suitable for driving printing machinery and already largely used on the Continent. Speed regulation over a wide range is carried out by shifting the brushes. (Page 259.)

In a Paper read in Dublin, Mr. G. L. Drury discussed the construction and maintenance of the motor bogies of electric railway coaches, pointing out the most frequent causes of failure and commenting upon the effect of worn gears, extra weight, &c., on the current consumption. (Page 296.)

Mr. J. Faithfull Begg gave an address at a meeting of the London Chamber of Commerce last Thurs-

Hosted by Google

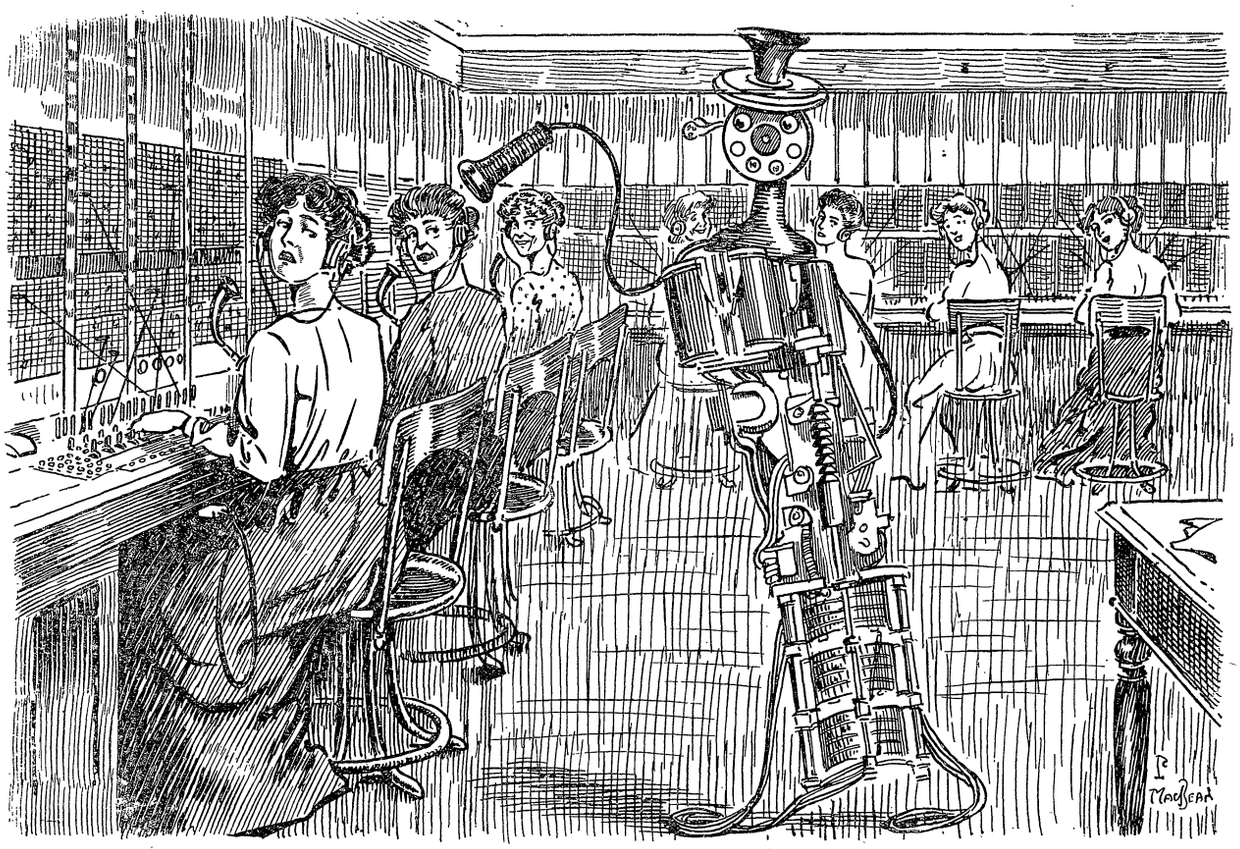
day, objecting to the transfer of the telephone service to the Post Office, and endorsing Mr. Laws Webb's proposal to establish a Public Telephone Authority, representing all interests, popularly controlled, and free from political interference. (Page 296.)

Mr. R. W. Paul has recently designed an instrument known as the Ampall, for measuring direct currents up to any amount, and also conductivities of contacts, fuses, carbons, and materials generally. It comprises a millivoltmeter, contact block with potential points and adjustable straps, and a pair of plug flexibles. In addition a copper standard resistance of twenty microhms, and a pair of spikes are supplied for conductivity tests. A resistance coil, which will increase the range tenfold, is also provided. (Page 297.)

Some new electric portable tools are described in a short article. (Page 297.)

Among the specifications published by the Patent Office on Thursday last was one by C. H. Johnson and A. S. Johnson to prevent damage by water to telephonic apparatus on board ship.—A switch to open or close a circuit at predetermined speeds of a generator is described by S. L. Price.—An improvement in electro-magnetic relays is covered by the Adams Manufacturing Co., and another by E. B. Koopman and Pontelec Welding Patents, Ltd., relates to an improved construction in the secondaries of welding transformers.—A patent, dealing with a process to prevent the oxidation of tungsten powder, has been granted to C. H. Weber in spite of appeal, but no amendment has been allowed. (Page 298.)

A note supplementing the articles we have published with regard to the electrification of the L.B. & S.C. Railway, and the supply of energy to the line, appears on p. 299.



In his annual statement to Parliament, the Postmaster-General outlined a scheme for cheap telephones in farming districts, with five-party lines with a subscription for unlimited service of £3 per annum. (Page 299.)

Mr. A. J. New read a paper recently on the electric lighting of motor-cars, in which he advocated the use of automatically regulated dynamos to keep the accumulators charged. (Page 299.)

The Hastings Tramway Co. propose the promotion of a Bill authorising the abandonment of the Dolter surface-contact system.—The L.C.C. have revised their rules for meter testing.—The Marylebone Council have passed a resolution that the Sales Department must not undertake the wiring of buildings in course of erection without sanction from the Electricity Committee.—A London firm propose to convert the Glasgow subway to electric traction.—There is an estimated profit of £187,844 upon the L.C.C. tramways for the year 1911–12. In presenting their estimates, the Highways Committee comment upon the favourable conditions under which motor omnibuses are allowed to compete. (Page 300.)

Local Government Board inquiries regarding extensions to electricity works have been held as follows:—Derby, £8,500; Heckmondwike, £4,159; Mansfield, £4,000; Rotherham, £27,837. A loan of £5,000 has been granted for free wiring extensions at Beckenham. Electric lighting schemes are under consideration at Oulton Broad, Greetland, and Wood Green. Meters and cables are required at Devonport, and meters, time switches, &c., at Stepney. (Page 301.)

The recent successful patent action by the "Z" Electric Lamp Co. against the agents of the Bergmann Co., of Berlin, cost the latter 150,000 marks.—Messrs. Johnson & Phillips made a net profit of £24,117 last year.—New capital is being offered for subscription by the Torquay Tramways Co., and the Waste Heat and Electrical Generating Stations, Ltd. (Page 302.)

The incursion of the automatic telephone spectre into a London exchange is regarded with slightly contemptuous interest by the operators.

THE EQUIPMENT OF AN UP-TO-DATE PRINTING WORKS

ELECTRICITY IN THE PRINTING OFFICE

By Frank Broadbent, M.I.E.E.

(*Consulting Electrical Engineer to Messrs. Richard Clay & Sons, "The Illustrated London News and Sketch," Cassells, Ltd., and other important printing houses.*)

PRINTERS were among the first to recognise the great advantages of electricity for lighting and power, and the sign "Electric Printers" adopted by one large London firm when they electrified their new works almost 15 years ago, has been copied by several other printing offices, from which it may be inferred that, in the eyes of the master-printer, electrification is the hall-mark of up-to-dateness.

But a printer does not electrify his works merely to be considered up to date. Like every other shrewd business man, he looks upon all money spent on improvements as an investment which should yield a satisfactory return. The return on the capital sunk in an electric installation is shown in various ways, such as economy in power costs, convenience of working, increased output, cleanliness, &c.

Economy.—The economy of electric driving is most marked in those cases where the machines were originally driven through long lengths of shafting and countershafting, and situated on several floors. Yet, strange as it may appear at first sight, this is one of the conditions under which it is difficult to demonstrate the economy by means of a small trial installation.

A case comes to mind of a printing office where the coal bill for steam driving was about £20 a week; and, in order to test the advantages of the electric drive, two flat bed machines taking about five horse-power each were electrically equipped, current being taken from a public supply. The result of this experiment showed no saving at all in the coal bill, and, as the electricity for the two motors had to be paid for, the cost of running was of course more than before. On the strength of this the owners decided that there was absolutely no economy to be gained by electrical driving, a conclusion which is, perhaps, quite understandable, but was, nevertheless, a wrong deduction. The fact that the removal of two machines out of about twenty made no appreciable effect on the coal consumption proves really that *the bulk of the power was being used to drive shafting and belting rather than to drive the printing machines themselves.* It has been shown by repeated tests that in a works of this character, where considerable amounts of shafting and belting are used, that more than half the total consumption of coal, gas, or other fuel used is run to waste. The works referred to have recently been fully electrified under the writer's supervision, with the result that instead of about £30 a week being spent for coal and gas, the cost of electricity is little more than half this figure; considerable savings have also been effected in labour owing to the shutting down of boilers and engines; and the general appearance of the offices has been improved out of all recognition by the elimination of shafting and belting.

Instances of this kind might easily be multiplied, and it is a simple matter for any printer to get a rough idea of his losses by running his works light for an hour (that is to say, without any printing machines at work), when he will be surprised at the cost of thus running his works idle. By multiplying this cost by the annual hours of running, it will be appreciated what a very large proportion of the total running cost this amounts to. It must be remembered that the dead loss on shafting, belting, engines, &c., is a practically constant loss, whether the machines are running or not, and, in a printing works, machines run very intermittently, and are shut down for considerable periods during making-ready, &c. The all-round losses are, therefore, much more than might be supposed from a comparison of indicator diagrams taken from the engine during working hours and meal times.

Convenience.—The convenience of electrical driving is almost, if not quite, as important as the economies which are effected in the cost of power. The facility with which machines can be started and stopped, and run singly or in groups, quite independently of other portions of the machinery, is an advantage which can only be fully realised by those who have actually adopted individual motor driving. This ability to run machines singly is not only a great convenience, but is a considerable factor in economy also, because there is no need to run a large engine and long lengths of shafting and belting for the sake of one or two machines, which have to be kept going after regular working hours. The cost of doing this is such that work which might be done *to-day* by running one or two machines a few hours' overtime, is oftentimes put off till *to-morrow* because of the necessity under ordinary conditions of running the bulk of the shafting in a works, and keeping a man to attend to the engine. The electric drive, therefore, permits of work being got out more expeditiously than is possible by any other means.

With electrical driving, too, there is no need to consider the position of shafting in fixing the machines. They can be placed in positions which are most convenient for getting through the work, and when new machinery is introduced the electrical system is so flexible that rearrangements of existing machinery are possible which would be difficult, if not quite impracticable, when one is tied down to a hard and fast system of driving by straight lines of shafting.

Another very great convenience is the ease with which the speed of a machine driven by electric motor can be varied to suit the class of work in hand. The nature of the forme, the quality of the paper, and other features, often make it desirable to run at a lower speed than usual, or make it possible to run at higher speeds; but when driven from overhead shafting in the ordinary way it is not possible to get a fine adjustment of speed, and it is generally the case that the machine is run somewhat below its possible speed.

With the most modern system of electric driving, a machine can be started and stopped by means of a push button, and any man who has once got accustomed to the perfect control which is given by such a system would consider it a hardship to have to revert to the old-fashioned method. In making-ready this is

Hosted by Google

an immense advantage, as it permits of a fineness of adjustment which is quite impossible by the ordinary belt striker.

Increased Output.—The facility with which the speed of the electric motor may be varied, and the fine gradations of speed which it is possible to obtain, have a marked effect on the output of the presses. It has been found that the adoption of electrical driving has in some instances given an increase of upwards of 25 per cent. in the output of the machines. This is due to the higher average speed which it is possible to maintain with the electric motor, owing to the steady nature of the drive, also to the ability to run each machine at its best speed for the particular job in hand. The steadiness of the drive also has a marked effect on the class of work turned out, and it is recognised by those who have adopted electric driving that they can run their machines at faster speeds than was possible when driven from gas or steam power. This is largely due to the fact that with the latter system of driving the variation in speed, particularly when the machines are at a distance from the engine, and driven through several shafts, is such that accurate register cannot be maintained unless the machines are worked considerably below their maximum. When it is possible to bring up the speed, say, by 25, or 50 copies an hour, the change is so gradual as to be almost unnoticed by the layer-on, and he finds that he can keep better register at the higher and regular speeds than he could maintain formerly at the lower and variable speeds.

The increase in output due to the ease of control, and to the higher speeds at which electrically driven machines may be run, is often more important to the printer than is the actual economy in the cost of power; because it means that the ratio of standing charges to total costs of production is reduced as the output is increased.

Cleanliness.—Every printer knows what an amount of dust is collected on overhead shafts and belts, and what the effect of this is upon his work. With a complete system of electric driving there is an entire absence of overhead gear, and the troubles due to falling dust are completely eliminated. The absence of overhead belts has other advantages, namely, in giving an entirely clear space above the machine, and a continuous view from end to end of the offices, a point which overseers are not slow to appreciate. The improved light on the work due to the absence of shadows from belting and shafting, is also a feature which must not be overlooked. These various points, although small in themselves, mean a great deal in the aggregate, and without doubt tend to better supervision and improved quality of work.

Methods of Driving.—There are two general methods of electrically driving a printing office, namely, the individual system, in which each machine is driven by a separate motor, and the grouping system, in which small groups of machines are driven by one motor. In many cases a combination of both these systems is adopted, the printing machines and the larger of the warehouse machines being driven individually by motor, and the smaller machinery grouped and driven from short line shafts. Whilst no hard and fast line can be laid down, there is no doubt that in order to get the maximum advantage from electrical driving, that the printing machines, at any rate, should be driven individually. An exception might be made in the case of small machines, such as platens, but in some cases it pays to drive even these by separate motors.

Each case has, of course, to be considered on its merits, giving full consideration to the local conditions; the question of capital cost generally enters largely into the consideration of the general scheme, as there is a tendency to keep down the initial cost, even at the expense of increasing the running costs. In an entirely new works, where there is no existing shafting, it pays to drive quite small machines individually, machines, for example, such as stitching and sewing machines, and linotype machines. Take, for instance, the case of a group of sewing or stitching machines. With a small shaft accurately lined up so as to run with a minimum of friction, one horse-power would be sufficient to drive a group of, say, four to six machines. It will be found, however, that the actual power taken by the motor is almost constant, whether the stitchers are at work or not; that is to say, if an ammeter be placed in the circuit of the motor it will be difficult to detect any difference in power whether the machines are running light or stitching. We must agree then, seeing that the machines are run so intermittently, that the bulk of the power taken by such a motor is wasted. If we reckon the cost of a horse-power-year, that is to say, one h.p. running for 50 hours a week and 52 weeks a year, to be £10, we may be quite sure that from £5 to £7 of this is absorbed in running the small shafting idly. The cost can be minimised by switching off the motor when the whole group of machines are idle, but one cannot guarantee that this will be done. If we capitalise this it may be found more economical to put down a small motor to each stitcher, and in doing so, obtain the very great advantages which even in these small machines are gained by individual driving. It is only by considering each set of conditions in this way that one can decide what is the best and most economical method of driving any particular works.

As to the actual method of driving printing machines, belting and spur-gearing are the two chief alternatives, and chain driving is sometimes a convenient method. A few years ago the method of driving by means of spur-gearing was very popular, but there is a tendency nowadays to revert to belt-driving, it being considered that the elasticity given by a belt is better both for the motor and for the machine, and repairs are more quickly effected in the event of a breakdown. Machines such as the Miehle and Century, Furnival two-revolution presses and machines of this character, lend themselves to belt driving, the motor being conveniently fixed under the feeder board. Some other machines, however, such as Wharfedales and litho presses, are more conveniently driven by a spur gear from a motor bracketed to the frame. The driving shaft is fixed at the back of the machine, and to put the motor at the delivery end and drive by belt along the side of the machine takes up more space than can sometimes be spared, and partially blocks up the side of the machine.

Motors can, of course, be fixed on the ceiling, and drive down by belt to such machines, but this renders the motor somewhat inaccessible, a remark which applies also to tucking the motor inside the machine frame and driving by short belt and jockey pulley, as is sometimes done with machines of the Miehle class. This makes, no doubt, a very compact arrangement from the printer's point of view, but from the point of view of the engineer who has to look after the machinery it has its disadvantages, and it must not be overlooked that a machine which is difficult of access is not likely to get the attention of one which is more conveniently situated. Regular inspection and cleaning down is essential to electric motors if they are to run with a minimum of trouble, and it is highly desirable therefore that the motors should be placed where they can be easily inspected and attended to. In the case of some perfectors and most rotary machines, it is generally most convenient to place the motor in a pit below the machine, and drive direct by spur gear. The pit should be roomy so as to allow the engineer to get all round the motor, and a trap door should be

Hosted by Google

provided outside the machine frame for convenient access to the pit.

Control.—The method of control may be by hand or by automatic switchgear, as best suits the local circumstances. When there is much "inching" and making-ready, an ordinary hand starting switch is quite unsuitable, unless the motor drives on to the fast and loose pulleys of the machine. This is an uneconomical method, as the motor is generally left running the whole time of making ready, although the machine may not run many revolutions during the day. The machine is struck on in the old way by means of the belt striker, and for "inching," the lever is seesawed to and fro, an operation which is very severe on the motor.

On the other hand, to start and stop the motor each time the machine is moved necessitates special switchgear, of which the most perfect is the automatic type, which is operated by means of push-buttons or a master-switch fixed near the layer-on's platform. This reduces the work of the operator to a minimum, and permits him to concentrate his attention on his proper work. The speed is fixed by the position of the regulator handle, which is set for the most suitable speed for the job in hand. A range of 20 to 30 speeds may be obtained, advancing in movements of say, 25 copies an hour. Automatic switchgear is more expensive than the ordinary kinds, and requires more skilful attention, but the ease of manipulation and time saved in operating the machines are important assets.

The driving of web rotary presses presents a special problem of its own. It is a simple matter to run a press when once it has been started and got up to speed, but it is in starting up slowly enough to permit of the web being threaded between the various rollers and then bringing it gradually to full speed without breaking the web that the difficulty arises. This, in large presses, cannot be accomplished satisfactorily with a single motor and simple starting switch. The starting torque (or turning effort necessary to start the machine from rest) is considerably more than that required to run the press when once it is started; and this starting torque varies very considerably with the temperature and other atmospheric conditions, and is very different, say, on a Monday morning after a cold week-end than it is after the machine has been running a few hours and got thoroughly warmed up to its work. If we attempt to start such a machine with a plain motor we find that it requires an excessive starting current, and then as soon as the machine has once got away the torque goes down and the machine may speed up so quickly as to break the web. If the paper were being led in there would be risk of accident under these conditions. For leading-in purposes it is essential to be able to start up dead slow and to run the press at, say, 5 per cent. of its normal running speed, and this leading-in speed must be quite constant with no tendency for the motor to run away. Various devices have been introduced to accomplish this. In some systems two motors are used, one for the slow speeds necessary for leading in, and a larger motor for bringing the press up to speed and printing. This small motor performs practically the same functions as the so-called "barring engine" used in cotton factories, steamships, &c., for slowly turning round the main engine. In other systems a bye-pass is used on the motor to divert a portion of the current when leading in the web. This has the effect of keeping the speed steady. Such systems are somewhat complicated and expensive, but the ease of control and the fine adjustment of speed which they give are factors which have a large monetary value, more particularly in newspaper work, where every second which can be gained in getting out an edition is of importance.

Electrotyping Work.—Considerable advances have recently been made in electrotyping, and it is possible that the method of nickel-plating the copper shell to produce a hard surface will before long be largely displaced by the process in which a nickel-steel deposit is put directly upon the wax mould. It is clear that whatever is put on the copper face after it leaves the mould, whilst it may harden the surface, cannot add to the sharpness, but rather the reverse. By reversing the process and depositing a nickel-steel film directly on the wax mould, and then backing this with a copper deposit, it is possible to get hardness and sharpness combined. The process has made more headway in America than in this country, and now that the difficulties inseparable from a new system have been satisfactorily overcome, there seems no reason to doubt that the process will become more popular over here in the near future.

For ordinary copper deposition the current density, as is well known, can be considerably increased by agitating the solution. Every plater has his own ideas as to the best methods of agitation, and whilst some stick to the mechanical stirrer, and others prefer to circulate the solution by means of a small pump, there is no doubt that the method which permits of the most rapid rate of deposition is aëration by means of an air compressor which delivers air under pressure to a series of perforated pipes laid gridiron fashion along the bottom of the plating vats. It will be remembered that this system of agitation was used in the Zedenburg zinc-lead accumulator, in which electrically deposited zinc was used as one pole.

The efficiency of low-voltage plating dynamos of the self-exciting type is astonishingly low, the voltage regulation being often obtained by means of a magnetic shunt which short-circuits a portion of the magnetic flux. Such a machine, giving $1\frac{1}{2}$ volts, and, say, 1,000 amperes, may take as much as seven horse-power to drive it, whereas a modern separately excited dynamo should give this output when absorbing about $2\frac{1}{2}$ horse-power. It is clear, therefore, that an old-fashioned plating dynamo may quite easily consume as much energy in a year or two as would pay for a new and efficient machine; or, put in another way, a modern separately excited dynamo would turn out two or three times as much as an old self-exciter for the same consumption of power.

Electric Lighting.—Before the advent of the metallic filament lamp it was difficult to light a printing office satisfactorily on lines of reasonable economy. One sixteen candle-power lamp over the feeder board and another over the delivery was the usual allowance for a flat-bed machine. When new, these lamps certainly lighted the top of the machine if placed fairly close down to the work, so low, in fact, that the light was on a level with the eyes of the layer-on, who generally stuck a piece of paper around the edge of the shade to screen the lamp from his eyes. The general lighting, however, left much to be desired. As enamelled iron shades are generally used, the upper portions of the room are in shadow, and present a most gloomy appearance when this method is adopted. Enclosed arc lamps, whilst very suitable for the warehouse floor, are not so suitable in the machine rooms unless supplemented by incandescents to break up the shadows and to give a localised light over the feeder-boards, so that the layer-on can see his register marks.

Reflected arc lighting was boomed a few years ago for printing offices, a method tried and abandoned in textile factories about twenty years ago. Its chief feature is that it is practically shadowless, and its advocates claimed that it was the nearest approach to ordinary daylight conditions. It is no doubt a very beautiful and uniform light, but the entire absence of shadow is not necessarily an advantage, nor does this characteristic simulate the conditions of natural lighting, which is very far from shadowless. As a matter of fact, to work in a shadowless light for any length of

time is very trying, as the eye can get no relief by turning to a shaded portion of the room, as is possible in daylight. The same remark applies to mercury vapour lighting, which has been tried in composing rooms with a certain amount of success. The peculiar tint of this light is said to be restful and to relieve eye-strain, but this must depend to some extent on the character of the lighting the eye has been accustomed to. Moreover, a certain amount of shadow is an advantage on the type cases.

Very good lighting effects can now be economically obtained, both in machine-rooms and in the warehouse, by means of a carefully thought-out scheme using metallic filament lamps, and the soft shadows produced are a distinct advantage both in the case-room and elsewhere.

Recently, very strenuous efforts have been made to popularise high-pressure inverted gas lighting for printing offices, and a few important offices have given it a trial. In one large office, equipped with electric power under the writer's supervision, an extensive installation of high-pressure gas has recently been put in. The engineers complain because of the constant attention necessary to the mantles, fittings, &c., and the writer has frequently seen the wire guards red hot within a few inches of stacks of paper, due to the fine jets of flame which issue, practically invisibly, through holes or cracks in the mantles. One of the first results was that the excessive heat melted the rollers on one of the web rotaries, and the men complained so much about the heat, that electric light had to be substituted in this department. Then the men in another department complained of this apparent favouritism, and practically insisted on electric light being installed in their room also, and others will, no doubt, follow suit.

THE NEW PRINTING WORKS OF RICHARD CLAY & SONS LTD. AT BRUNSWICK STREET, STAMFORD STREET, S.E.

IN addition to its interest as a fully-up-to-date printing works housed in a fully-up-to-date building, and taking every possible advantage of the latest available methods of electric driving and lighting, the large new works established by the well-known printing firm of Messrs. Richard Clay & Sons will, we hope, be also of some interest to our readers as the place where ELECTRICAL ENGINEERING is printed every week. The building is a fine example of a modern ferro-concrete structure, the lighting, heating, and fire-protection appliances also deserve admiration, and we do not think a better or more complete example of electrical driving of printing and allied machinery could be found.

The firm of Richard Clay & Sons was founded in 1827, and their London works has for many years been in Bread Street Hill, on the south side of Queen Victoria Street. For some time, however, the firm have felt that the works at Bread Street Hill, works employing some four hundred hands (where, up to a few weeks ago, ELECTRICAL ENGINEERING has always been printed), were inadequate to the needs of their growing business, and the decision was come to recently to establish an entirely new works on the south side of the river, the present magnificent establishment being the result.

Messrs. Clay & Sons have also a large works at Bungay, Suffolk, employing some three hundred hands, which was purchased in 1878 from the famous firm of Childs & Son, and was founded by the late Mr. John Childs in the early part of the last century.

The move to the new premises, which involved the transfer of a large amount of heavy machinery and the adaptation of much of it to electrical driving as it was put down in its new home, is now practically complete, and has been carried out with remarkable expedition and without any interruption in the ordinary course of business.

Some idea of the size and the imposing nature of the building itself is obtained in Fig. 1, but the narrowness of the street has prevented the photograph doing it full justice. As we have already said, the structure is entirely of ferro-concrete, and the architectural features of the exterior show how pleasing an effect can be obtained in skilled hands by the development of a style strictly suitable to the material and system of construction.

The architect was Mr. G. F. Collinson, F.R.I.B.A., and Mr. Alexander Drew, M.Inst.C.E., acted as consulting engineer for the ferro-concrete construction, and supervised its erection. The main contractors for the building were Messrs. N. Coles & Co., of Plymouth. Messrs. D. G. Somerville & Co. were the sub-contractors for the ferro-concrete. The latter was designed by the Trussed Concrete Steel Co., Ltd., Caxton House, and is on the well-known Kahn system. Approximately 500 tons of steel bars were employed on the

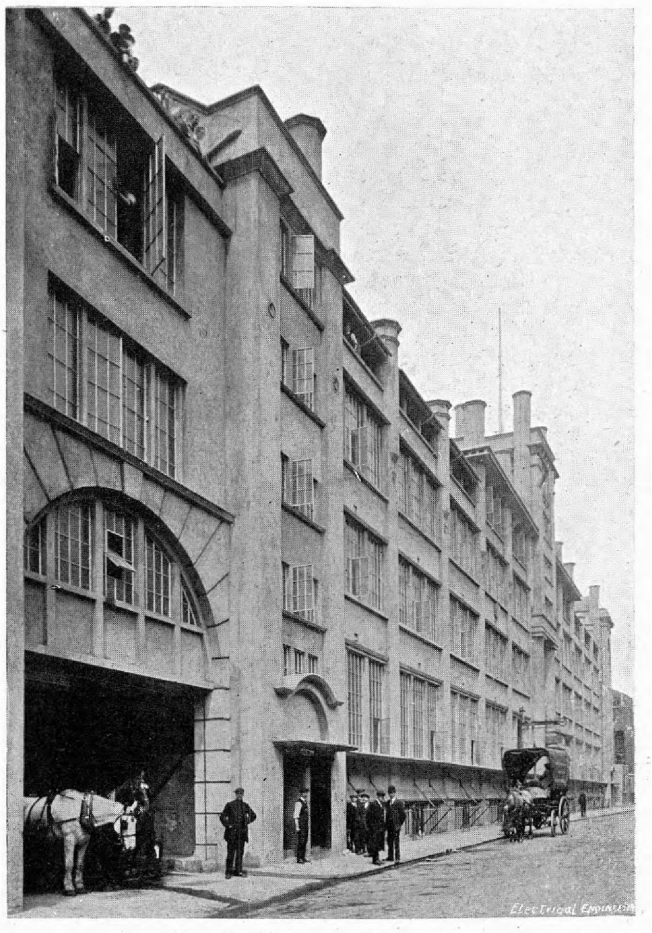

FIG. 1.—FRONT OF BUILDING.

building; 1,050 tons of cement, 2,300 tons of sand, and 5,000 tons of Thames ballast.

The total length of frontage is about 260 ft., and the depth at side at the north end is 96 ft. and at the south end 41 ft. There are, including the basement, four floors all on the same general plan, of which an idea can be obtained from Fig. 2, with rows of bays,

Hosted by Google

each about 20 by 26 ft., divided by pillars, and a wedge-shape central space partly used for lifts, offices, &c., near the north end. There are, generally speaking, no main partitions; the main machine-room, for example, is one large shop 250 ft. long, occupying the whole of the ground floor. The London County Council building regulations usually impose limitations in the size of the rooms in such establishments, but in the present case, owing to the completeness of the precautions taken to render the building fireproof, these requirements were modified. The basement is used principally for stores, but a rotary machine-room is also included; the main machine-room, as already stated, occupies the ground floor; the first floor contains what is known as the warehouse, with machines for folding, stitching, cutting, wrappering, &c., and also a considerable number of presses of smaller size than those on the floor below. On the second floor we find the spacious composing room, the linotype machines, the foundry and electrotyping departments, and the general offices.

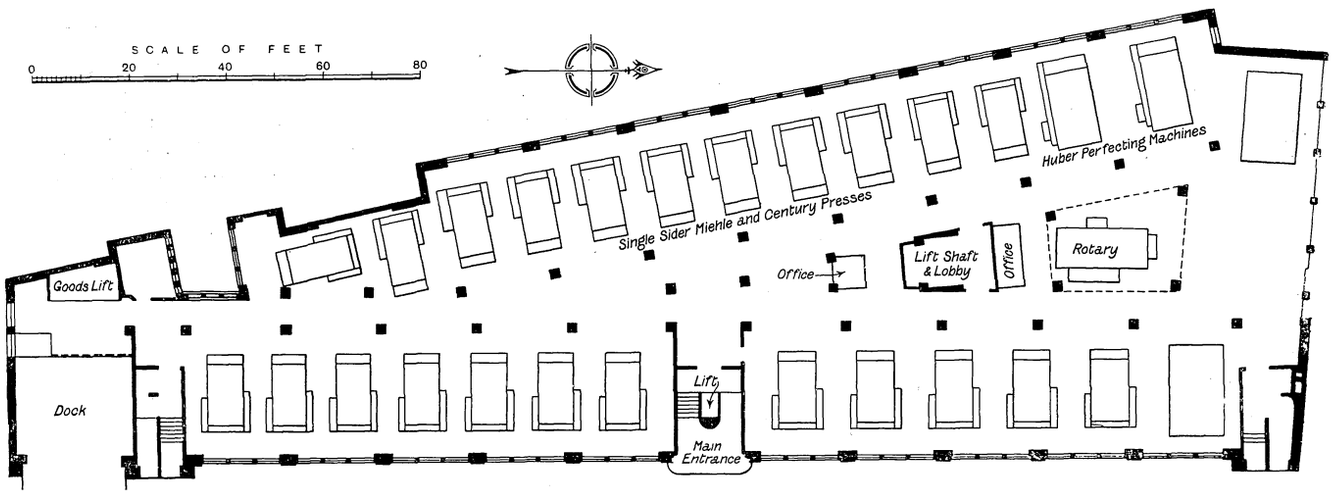

FIG. 2.—SKETCH PLAN OF MAIN MACHINE ROOM.

The sprinkler installation, on the Grinnell system, was installed by Messrs. Mather & Platt, of Manchester. No fewer than 1,100 sprinkler leads are placed at various points in the building. The total length of feed piping, which varies in diameter from $\frac{3}{4}$ in. to 6 in., is about two miles. There are three sources of water supply, viz., a 6-in. connection from the high pressure main of the Metropolitan Water Board, giving over 40 lbs. per sq. in., a 6-in. connection from the low pressure main, and a reserve supply from a tank on the roof, in which an air-pressure of 90 lb. per square inch is maintained by electrically driven pumps. As soon as the action of one or more sprinklers causes a leakage of water from the system, an Ellington ejector, actuated by a jet of water at a pressure of 700 lbs. per square inch from the mains of the London Hydraulic Power Co., comes into action automatically, and maintains the pressure and supply of water, being capable of forcing large quantities of water into the system. This part of the plant was supplied by the Hydraulic Engineering Co., of Chester. The control valve which starts the ejector also starts an alarm gong on the front of the building. Messrs. Mather & Platt also supplied the automatic fireproof sliding doors all over the building. These are of wood, entirely covered with tinned sheet iron. In addition to the sprinkler system, there are hydrants with hoses ready for coupling up, and fire buckets on every floor, and over each wire-glass window at the back of the premises (which face another large works only a few feet away) are automatic external drenchers, fed by a 4-in. direct and separate supply from the high pressure main. Special fire brigade hose connections are arranged, so that the fire engines can pump direct into these drenchers. With a view to preventing risk of frost, the drencher system is arranged on what is called the "dry pipe," or "air" system. A differential air valve is fixed upon the supply pipe, and the piping to the drenchers from this valve are charged with air at low pressure. The differential air valve keeps back the water supply, and in the event of the drenchers being exposed to heat, from a fire in the adjoining premises, the drenchers affected by the heat would open in the same manner as automatic sprinklers open. The air pressure is released from the pipes, and water flows to the particular drenchers which have opened.

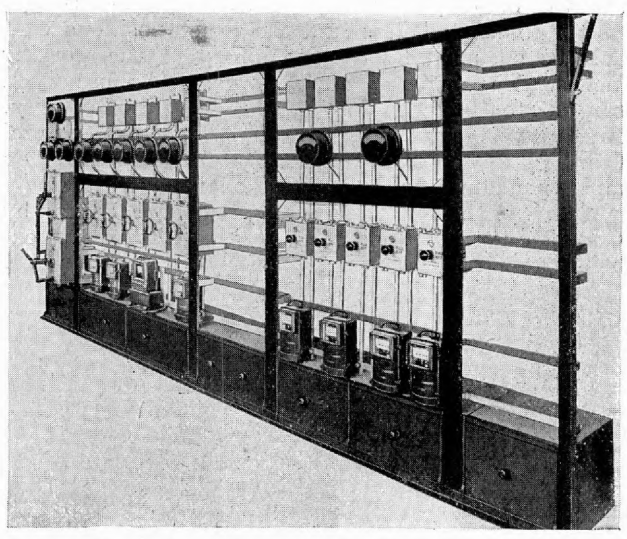
A few words may also be said here on the heating and ventilating arrangements before passing on to the printing and electrical equipment. This part of the work was done by Messrs. C. Kite & Co. (132 Euston Road, N.W.) to the designs of their engineer, Mr. M. H. Skelt, M.I.H.V.E.

The installation is capable of delivering into the building 50,000 cubic feet of filtered, cold or warmed, fresh air per minute, and maintaining the temperature at 65° F. during the coldest of weather. The heater, air washer or filter, and an arrangement for moistening the air are placed centrally on the first floor at the base of the light-well; fresh air is drawn from the light-well through the filter and heater by means of two pairs of electric fans, one above and the other under the heater, supplying the top floors and the two lower floors respectively. The air is distributed about the building through galvanised steel shafting having outlets at suitable points fitted with valves. The supply of fresh cold filtered air is controlled by means of louvre valves at the back of the filter, and return air flues are arranged to permit of the air from each floor being re-used if desired. The supply of air to each floor and the temperature can be regulated separately, and the apparatus can be used for one or more outlets, or the whole of any floor; by-pass valves are arranged on each side of the heater to allow of the passage, if necessary, of cold air to the fan chambers for mixing with the heated air or modifying the temperature. The boiler is placed in the basement at the north end of the building, and consists of a new type of cast-iron sectional independent boiler made up of fifty-six sections, fitted together with push nipples and bolts; it has four fires, either of which can be used separately or the whole together, as required. Steam at from 7 to 10 lbs. pressure is conveyed by a line of pipes from the boiler to the heater, and the water of condensation returned automatically to the boiler. Coke is used for fuel.

The lifts are entirely electrical and were put in by the firm of J. Stannah (Skin Market Place, Bankside, S.E.). There are at present three goods lifts and one passenger lift. Two of the goods lifts, as shown in Fig. 2, are in the triangular central space, and the other is at the extreme south end of the building, where space is also left for a fourth lift should this be required in the future. The passenger lift is near the centre of the building by the main doorway and staircase to the offices.

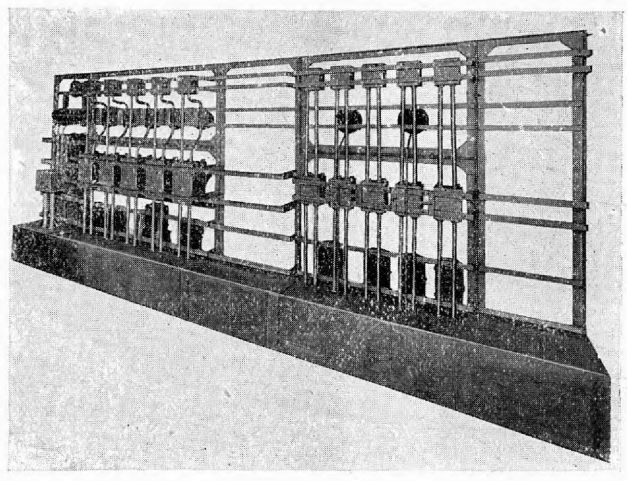
All the lifts are constructed entirely without wood, except for a little hardwood in the cabin of the passenger lift. The cages are of steel, with steel chequer plate floors, and steel guides are used. The entrances to the two north goods lifts are on every floor in a sort of lobby, which can be closed on both sides by sliding fireproof doors completely isolating the lifts. There are also steel roller shutters immediately in front of the actual lift gates, which close automatically in case of fire. Sliding collapsible gates are used to the lifts themselves, and these are interlocked with the control circuit, so that the lift cannot be started unless all the gates are closed, and *vice versâ* no gate can be opened unless the car is at rest opposite it. The control is by a car switch. The passenger lift from the main entrance to the

Hosted by Google



general offices on the top floor is provided with push-button control. Anyone entering the lift can, by pressing a conspicuous push-button, travel to the office entrance, but additional pushes are also supplied by which authorised members of the staff can stop the car at any floor.

Considering the equipment of the building more in detail, and particularly with the electrical features in view, we will draw attention first to the intake or meter room in the basement, whence the electrical supply is distributed. Current is supplied at a special flat rate for both power and lighting by the City of London Electric Lighting Co., Ltd., and a duplicate supply is given over separate feeders connected respectively to the two independent halves into which the Company's Bankside station is divided. Each service affords a three-wire continuous-current supply with 430 volts across the outers. The service cables entering the building are 0·5 sq. in. for the outer and 0·25 sq. in. for the middle wire. Each service has its own main fuses and meters.



The main contractors for the whole of the electric power equipment were Electromotors, Ltd. (Openshaw, Manchester), who carried out the scheme to the specifications of Mr. Frank Broadbent, M.I.E.E., consulting electrical engineer.

Two independent main switchboards, facing each other on either side of the room, are provided, one for the northern and one for the southern section of the building, and a pair of main D.P. switches is provided on each, so that either supply can be connected to the bus-bars. The switches are so interlocked that it is impossible to put both supplies on at once. Fig. 3 is a view of one of the two boards. They consist of iron frames, on which are mounted the necessary switches, junction boxes, &c. They were manufactured by Messrs. Berry, Skinner & Co. (78 Upper Thames Street, E.C.), and the switches are of their push-in enclosed pattern with fuses inside the cases. The boards were erected by Messrs. Pinching & Walton (52 Cannon Street), who contracted for the whole of the erection of both the power and lighting circuits. The bus-bars run along the bottom of each board in closed chambers, to which access may be had by sliding doors. The end of each board nearest the main switch is occupied by the power panels, connected to the outers only. Each circuit is provided with a Chamberlain and Hookham meter, and generally represents the north or south half of a department, so that each department has its own meter on both boards. There are five of these power circuits on each board, all nominally for 100 amperes. An ammeter is provided on each above the circuit switch, and above this is a connection-box filled up solid with compound, from which run the cables to the power distribution boards; all the conductors on the board itself are enclosed in iron pipes. There is space for further power panels, and beyond this on each board is a group of five lighting panels, arranged alternately on each side of the three-wire system. Two ammeters are provided for the lighting circuit on each board, one on each side of the system, and the total capacity of the lighting circuits on each board is about 150 amperes.

The feeders from the main boards to the various power distribution boards about the works are all 19/14 paper-insulated, lead-covered, steel-sheathed braided cables, and are supported on special racks usually near the ceiling. There are power-distribution boards on each floor. These are of a special pattern, designed by Mr. F. Broadbent and made by Messrs. Spagnoletti, Ltd., as sub-contractors to Electromotors, Ltd. They have cast-iron cases, with sheet steel panels in the doors. Porcelain handle switch fuses of Messrs. Spagnoletti's cartridge type are used, mounted on slate bases and placed horizontally in vertical rows for each pole behind separate doors. The hinge side of each door is in the centre of the case, and an ingenious arrangement of straps prevents both doors being open at once. Below each box is an enclosed double-pole switch, also of Messrs. Spagnoletti's make. There is also a sealing chamber below each board, into which the paper cables from the main board are brought. A very convenient arrangement is provided for reading the current in any sub-circuit at any time. Each fuse has mounted under it, behind the slate panel, an ammeter shunt, and a multiple contact switch below the case enables an edge-wise

Front view.

Back view.

FIG. 3.—ONE OF THE TWO MAIN SWITCHBOARDS.

pattern ammeter mounted above the distribution board to be connected to any one sub-circuit. It is thus possible to ascertain the power any particular machine is taking. As a general rule, the sub-circuits are limited to 25 amperes. The arrangement of boards is practically the same on every floor.

Messrs. Pinching & Walton were the main contractors for the whole of the lighting installation, in addition to acting as sub-contractors to Electromotors, Ltd., for the erection of the power circuits. The wiring of the lighting circuits, including the leads from the main board in the basement, with the various distribution boards, is throughout in solid drawn screwed conduit with special joint boxes of Messrs. Pinching & Walton's own manufacture. The lighting distribution boards were supplied by Messrs. Spagnoletti, Ltd., and are in wood cases with glass fronts. The upper part contains fuses of the ordinary bridge type arranged horizontally, and in the lower part, accessible by a separate door, are the

Hosted by Google

switches, all of the tumbler type. The switches to each circuit are on the live side of the fuses, so that the fuse contacts can be made dead for renewal of the fuses.

A few particulars of the lighting arrangements may be given before proceeding to the consideration of the various parts of the works in detail. An important consideration in the scheming of the system to be employed was the provision for obtaining light at practically any point where it is required, as naturally while the building was in progress it was not always possible to know beforehand the exact positions that would be occupied by the machinery or the working benches. The scheme adopted has therefore been arranged to provide for a considerable flexibility. Roughly speaking, the lighting is divided into general lighting by means of 100 c.p. metal filament lamps on simple pendants, with 15-inch opal shades, within about 2 ft. of the roof in each bay, and local lighting by 50 or 32 c.p. metal filament lamps on travelling extensible pendants, designed specially for the purpose,

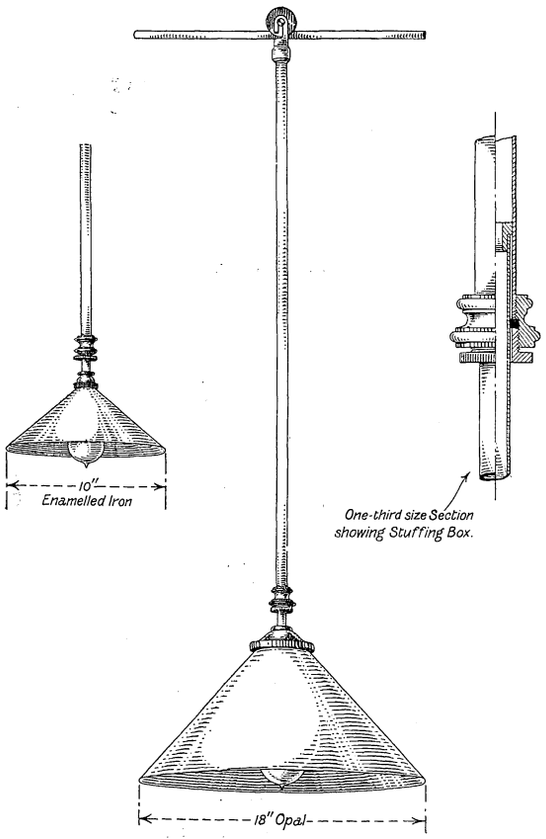


FIG. 4.—TRAVELLING EXTENSIBLE PENDANT.

some with opal and some with enamelled iron shades. Details of these pendants are shown in Fig. 4. Not only are they hung from trolleys running on the actual conduit tubes, which are specially mounted clear of the beams, but as they are telescopic, a vertical as well as a horizontal adjustment of the position of the light is obtained. The leads are brought in by flexible wires from ceiling roses at convenient points in the run of conduit. The 100 c.p. lamps are in some cases also on travelling pendants, but they are quite short, and are not telescopic, nor have as much range of horizontal movement as those for the local lighting. The different nature of the operations in different parts of the works causes variations in the proportion of the general and local lighting required; thus in the warehouse there is little else than general lighting by the 100 c.p. lamps referred to, while in the composing room several travelling pendants are provided in each bay. The wiring is simply and systematically arranged; tubes are run along the beams in every bay in an east and west direction, special connection boxes are used at every junction, and the wiring is entirely without looping in. There are two bays to every circuit from the distribution board, and the switches as a general rule are mounted in groups in iron switchboxes placed on the pillars. We noticed that most of the 100 c.p. lamps were of the "Z" type, but that Tantalum lamps were largely employed on the travelling pendants, work for which the robustness of their filaments renders them particularly suitable. The lighting in practically the whole works is on the system just outlined. Special arrangements here and there will be noticed as we deal with each department in detail.

Returning now to the basement, we find the greater part devoted to stores of various descriptions, and a complete system of runways are provided in connection with the paper stores. The bales of paper are lifted direct from the carts, which back into a sort of dock on the road level, by hand-hoisting tackle, carried on similar runways on the ground floor, and are lowered to the basement, where they are taken up by the trolleys of the basement runway system, carried along the main line running along the centre of the building, and switched on to the branch serving any particular bay. The runways were provided by Messrs. Herbert Morris & Bastert.

The most important feature of the basement stores is the extensive series of steel racks for stereos, blocks, type, &c.

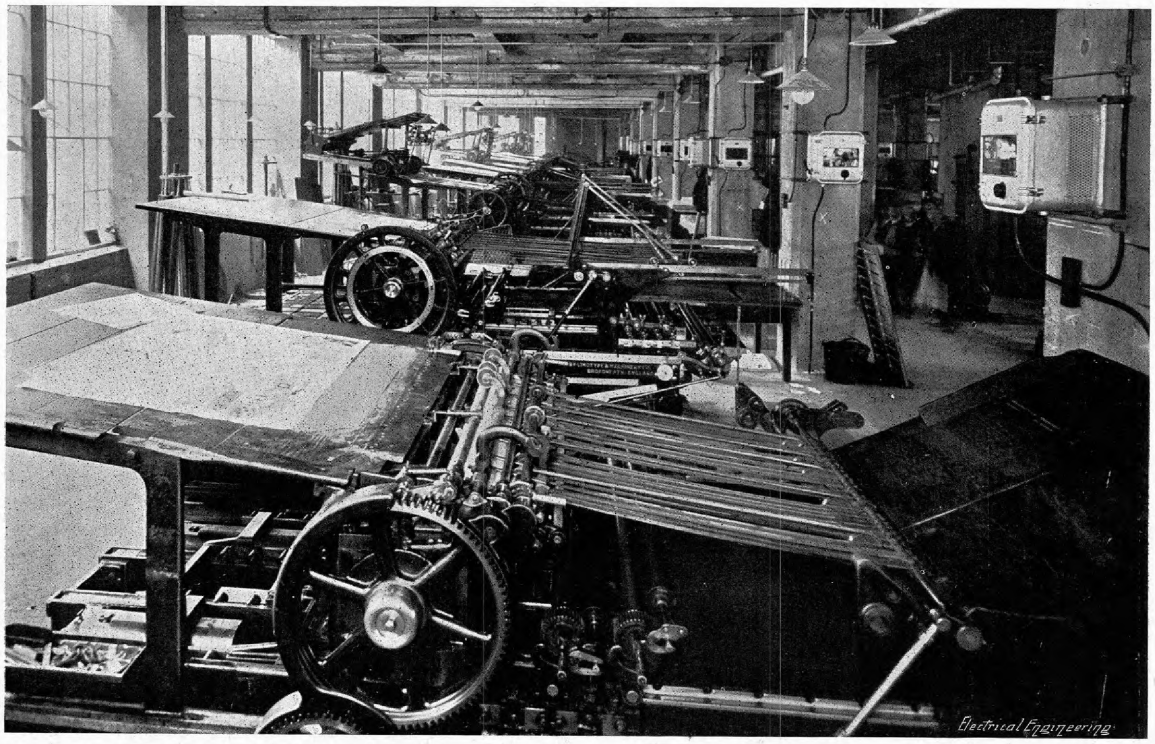
They are constructed with steel lattice uprights, cross-bars or steel rods, and sheet steel shelves folded over the front rods to avoid sharp edges. They were supplied by Messrs. Farrow & Jackson, Ltd. (16 Great Tower Street, E.C.). The six main stereo double racks are each 16 ft. 6 in. long, 2 ft. 4 in. deep, and 10 ft. in height. There are 15 rows of openings, and a total of 1,050 openings. There are also small racks, aggregating 1,239 openings. The four double racks for blocks are 17 ft. long by 10 ft. high, with 336 openings.

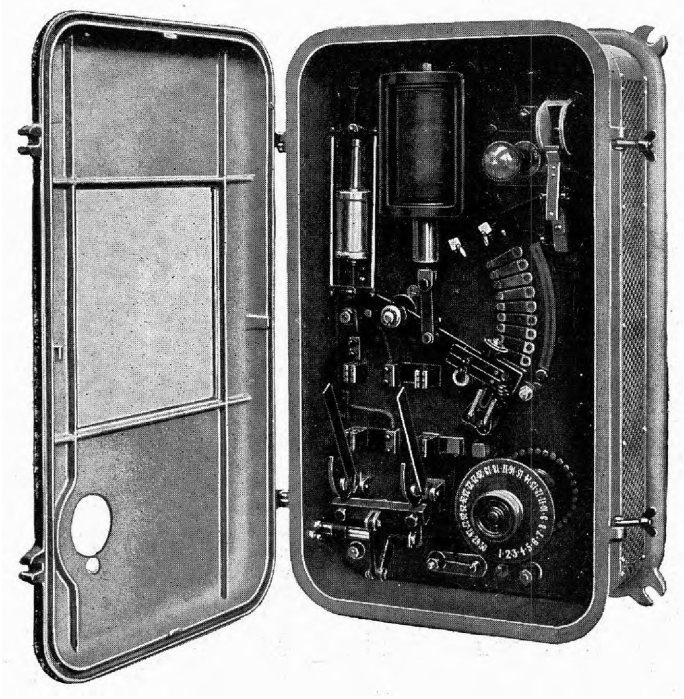
One room in the basement has been set apart as a rotary machine room, and will contain two art rotaries for special work, and two web rotaries. These machines are not yet in place, and at the time of our visit the room was being used as a carpenters' shop for the manufacture of racks, compositors' frames, &c. These rotary machines, which are being moved from elsewhere, will be driven on the Holmes-Clatworthy system (see ELECTRICAL ENGINEERING, Vol. V., page 981), and are equipped with 200 volt motors, so a special middle wire will be brought into this room. The hydraulic apparatus mentioned already in connection with the sprinkler system is placed in a corner of this room. Another department at present housed in the basement is the overlay department, where advantage is taken of the latest methods of "mechanical" overlay making by the bichromate process, but considerations of space prevent a full description of this interesting and important work.

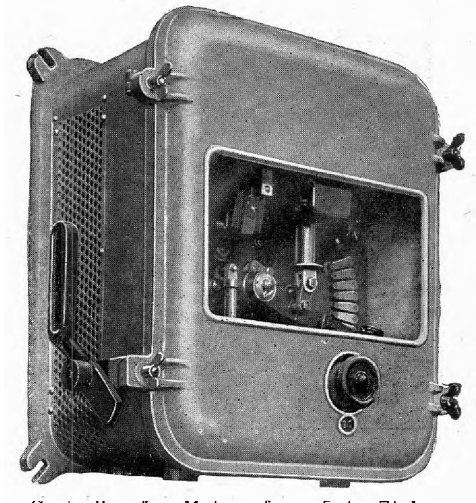
To the lay visitor probably the main machine room occupying the whole of the ground floor without partition is the most striking part of the establishment. A ground plan has already been given in Fig. 2., but slight modifications have been made in the arrangement of machines, &c., since this was drawn. A good idea of the appearance of the imposing rows of machines is obtained from the general view in Fig. 5. Every machine is driven by its own motor, and in the case of machines moved from the old works, where they were steam driven, such slight alterations as were required for electric driving were made at the time the machines were erected. There is no shafting whatever, and every machine is driven by a continuous-current motor by a belt of moderate length, and every motor has its base bolted right up to a substantial bracket carried on the frame of the machine. Although at first sight the motors appear to be fixed to the floor, neither they nor the machines are bolted down at all,

Hosted by Google

but simply form a self-contained mass standing on the floor, and capable of being moved with comparative ease. In most cases slide bases have been employed for







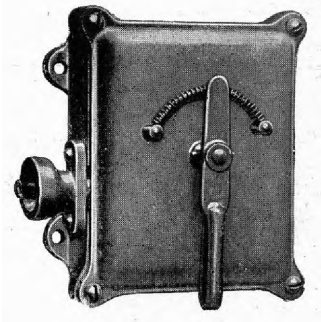


FIG. 5.—GENERAL VIEW OF WESTERN PORTION OF MAIN MACHINE ROOM, SHOWING CENTURY AND MIEHLE MACHINES, AND CONTROLLERS ATTACHED TO PILLARS.

Master Control Switch Box Mounted on Machine.

FIG. 6.—CONTROLLING APPARATUS FOR LARGE PRESSES.

employed throughout the room, reckoned to give 5 h.p. continuously, with a peak load rising to 7½ h.p. once in each cycle of operation, and occurring as each copy is printed, or, in most of the machines, about 1,200 times per hour. The motors all over the works were manufactured by Electromotors, Ltd. (Openshaw, Manchester), who, as already stated, were the main

the motors, but in some of the machines where the position of the motors for convenience in bolting up necessitated very short belts, jockey pulleys have been adopted. As far as possible a standard size of motor is

Hosted by Google

contractors for the electrical power equipment. The motors driving these presses run at the moderate speed of 600 to 900 r.p.m., and are compound wound with commutating poles. They are of the enclosed ventilated pattern, with expanded metal covers, and are provided with special terminal boxes containing six terminals for the armature, shunt field, and series field respectively. The excellent provision is made of a diagram of connections on the inside of the lid. This standardisation of size enables a spare motor to be put down in case of necessity with the minimum of trouble. A few of the machines, however, require larger motors, such as the large "Marinoni" all-size rotary machine, which prints sheets 48 in. by 35 in., driven by a 12 h.p. motor, and the new Huber perfecting machines, referred to in greater detail below, which employ motors rated at 12 h.p. continuously, and a peak up to 20 h.p.

Current is taken from the power distribution boards to the motor controllers by twin, rubber insulated, galvanised wire-armoured cables. The leads to the actual controllers themselves are brought up through the floor right into a cast-iron box on the floor, from which iron pipes carry the wires to the motors with a short length of flexible metallic tubing leading to the terminal box on the motor frame to allow for movement on the slide rails.

The method of controlling the motors is a special feature of the installation, and is on a system devised by Mr. F. Broadbent. The machine-minder has a small box with a little lever fixed ready to his hand, and starts the motor simply by pressing the button, when it automatically gathers speed. To stop he turns the little lever aside. For inching round during cleaning or making-ready he keeps his thumb on the starting button and stops and restarts by deflecting and releasing the lever with his finger. In addition to this, push-buttons are placed at various parts of the machine, by which it can be stopped in case of emergency, but it can only be started from the one point. The controllers themselves, which are fixed on the pillars, were manufactured by the Adams Manufacturing Co., Ltd. (106 New Bond Street, W.). Some are seen in place in Fig. 5, and more detailed representations are given in Fig. 6, where two sizes of controller and a control box are illustrated. One of the control boxes can also be made out in Fig. 7.

Each controller consists essentially of a lever type starter, actuated by a solenoid in conjunction with a dash-pot, and interlocked with an electro-magnetically operated circuit-breaker, with powerful magnetic blow-out. A hand-operated shunt speed control switch is also contained in the same case, as well as a main D.P. knife-switch worked by a handle outside the case. The case at the back, where the resistance is installed, is provided with a perforated sheet covering for ventilation purposes. It may, however, be noted that the perforation does not extend over the top of the case, which protects the interior from dust and dirt which may fall on the top. The general principle of the action is as follows:—When the machines are standing, the main circuit is broken by the circuit-breaker, but the starter arm is in its lowest or running position with all resistance cut out. When the starting button on the machine is closed, the solenoid is energised and draws up the starter arm, the circuit-breaker still remaining open. It is only when the starter arm reaches the top position with all resistance in that the control contacts of the circuit-breaker magnet become closed. The circuit is then made, and the motor starts up with all resistance in. The starting button being then released, the solenoid no longer holds up the starter arm, and it descends slowly as permitted by the dash-pot, cutting out the starting resistance in the ordinary way. The stopping lever simply trips the circuit-breaker, leaving all ready to start again. Should the machine minder keep his thumb on the button, the solenoid holds the arm up in the position with all resistance in, so that the motor runs dead slow, and can be started and stopped for inching round simply by opening and closing the circuit-breaker by the small lever. The speed regulator has from 20 to 30 steps, according to the requirements of the particular machine, and gives speeds corresponding from 800 to 1,200, or 1,000 to 1,500 impressions per hour.

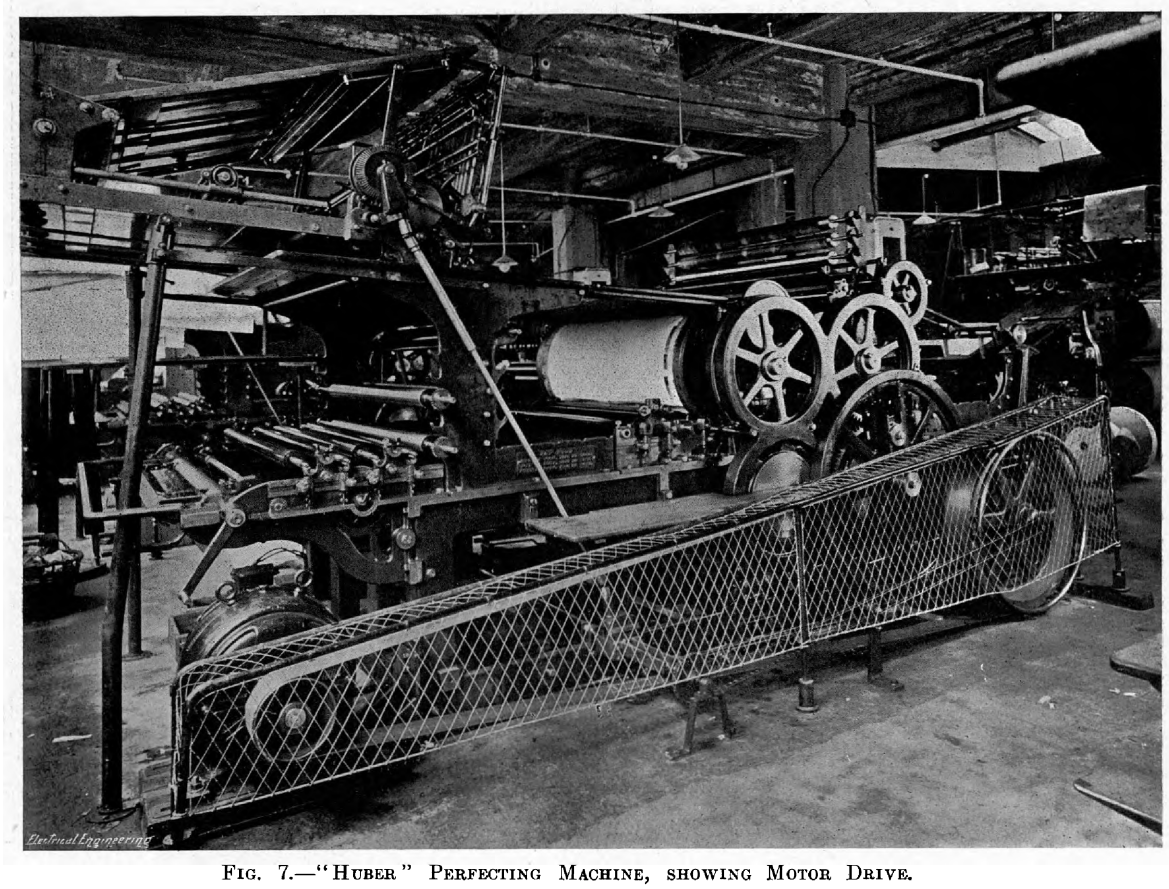

FIG. 7.—"HUBER" PERFECTING MACHINE, SHOWING MOTOR DRIVE.

Taking the printing machines themselves more in detail, we find on this floor only one rotary machine, the Marinoni machine already mentioned. The others are all flat bed machines of various patterns, some new, and some removed from the old works. Particular attention should be called to the two Huber perfecting machines at the north end, one of which is illustrated in Fig. 7. Three of these machines are now in place.

Hosted by Google

These were supplied by the P. Lawrence Printing Machinery Co. (57 Shoe Lane, E.C.), and are of American manufacture, embodying to a high degree the perfection of detail attained by the methods of manufacture principally developed in the United States. These are in no way a cheap class of machine, in fact we are informed that the prices are actually higher than those of similar machinery made in this country. Machines of the same design are in use in larger numbers by many other large British printing firms. Messrs. Richard Clay & Sons themselves have also six machines of this pattern at their Bungay works. Machines known as perfecting machines, as is well known, print both sides of a sheet at one operation by means of two cylinders, and the chief difficulties which confronted the early designers were inaccuracy of register of the two sides, and the offsetting of the ink from the side first printed on to the second roller, with consequent spoiling of the work during its passage over the second cylinder. In the Huber perfecting machine, extremely accurate register is obtained owing to the fact that the sheet is positively held during the whole of its travel, and is not released by the first cylinder until it is secured by the second; thus for $\frac{3}{4}$ in. of its travel it is held by both cylinders. Another point is the specially arranged eccentric link drive, which slows down the cylinder speed just at the moment of transfer. The offsetting arrangements with a special arrangement of plush covered rollers, which clean the second cylinder at every revolution by means of a continuously-fed special solution, are particularly effective in avoiding the second difficulty mentioned above. The ample rolling surface of the ink rollers and the reciprocating drive of the bed by a horizontal crank are also special features of the machines. The highest class of illustrated work can be done on these machines, and their capacity is 1,300 impressions per hour with sheets of 60 in. by 40 in. These machines are fitted with automatic feed apparatus by the Cross Feed Paper Co.

A very large proportion of the long lines of other presses on this floor, all of which are "two revolution" or "single-side" machines, were supplied by the Linotype and Machinery Co. (188–9 Fleet Street, E.C.). Among those already in place we counted on the west side six of their 60 in. by 40 in. Miehle machines and two Century machines, while on the east side there were four Miehles and three Centuries. Three of the Miehle machines, which are manufactured throughout by the Linotype Co., are new. We understand that Messrs. Clay & Sons installed their first machine of this type in 1901, and that including the London and Bungay works they have now no less than eighteen. As we shall see later, the Linotype Co. have also some smaller presses of their Centurette type on another floor. A group of Miehle machines is shown in Fig. 8, in which the arrangement of the motors and control apparatus, as well as one of the power distribution boards, can also be seen.

The Miehle machine is chiefly interesting on account of the method of driving the bed. The driving pinion is so arranged that the type bed is out of gear with the other parts of the machine during reverse, but in gear while printing, so that all shock on the gearing at the time of reversal of the travel of the bed and jar to the machine generally is avoided. Another point is the easy accessibility of all parts of the machine during making-ready, whereby great saving of time and trouble is effected. The clamping devices for the overlays are particularly strong and quick to adjust. Attention should also be drawn to the provision of the ink supply at any point while running by a series of thumbscrews at the end of the machine, by which slight irregularities in the rollers can be compensated for. The method of delivery which deposits the sheets printed side uppermost is also a special feature, and an alternative fly delivery is fitted, to which the change can easily be made if it is desired to deliver the sheets the other way up.

A view of one of the Century presses also supplied by the Linotype Co. is seen, as well as a Miehle machine, in Fig. 9, which is reproduced from a flashlight photograph taken while the pages of last week's ELECTRICAL ENGINEERING were being machined on these two presses. We understand that further plant yet to be installed on this floor includes three stop-cylinder presses supplied by Messrs. R. Hoe and Co., and two machines of the Wharfedale type.

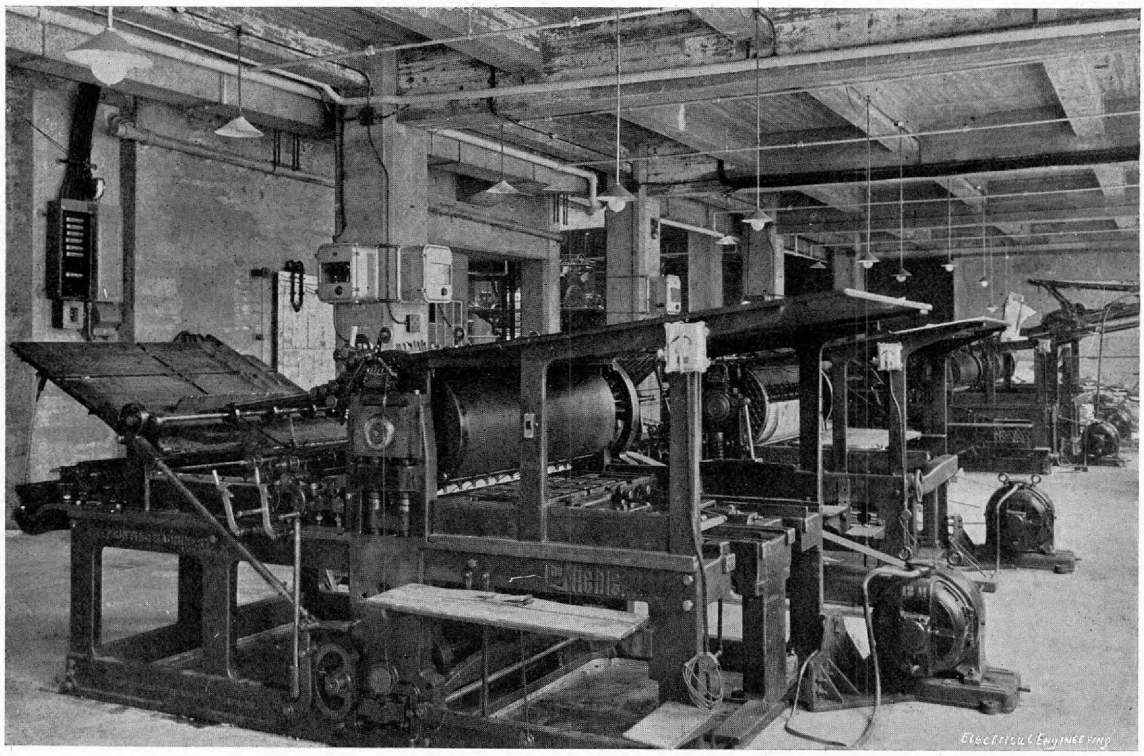

FIG. 8.—ANOTHER VIEW OF MACHINE ROOM, WITH MIEHLE PRESSES IN FOREGROUND.

A subject of almost as much importance as the methods of printing is the consideration of the materials employed, and in this connection a few words on the subject of ink may not be out of place. The whole of the ink with which ELECTRICAL ENGINEERING is printed every week, is supplied by the firm of B. Winstone & Sons, Ltd. (100 and 101 Shoe Lane, E.C.), who are a very old-established ink manufacturing firm, and have long been noted for black ink for book and magazine work, as well as special inks for half-tone illustrations. The firm have also extensive plant for roller casting.

Messrs. Lorilleux (2 McLean's Buildings, New Street Square, E.C.) manufacture very intense black ink for half-tone printing, and also supply a demand which exists for low-priced blacks with rich colouring power. This firm also specialises in coloured ink for the three-colour process, and for posters, and amongst their other special products are copying inks and bookbinders' inks. Their works at Puteaux and Nanterre cover 15 and 25 acres respectively, and they also have smaller works at Dergano and Badalona.

Another firm who supply ink in large quantities to Messrs.

Hosted by Google

Clay & Sons are Messrs. Mason & Mason (16 Whitefriars Street), who are, we believe, the oldest firm of ink manufacturers in the country.

Recent developments in the matter of ink have enabled some wonderful effects to be produced, as, for example, the double tone inks, invented and manufactured by the Sigmund Ullman Co., of which Messrs. Borne & Co. (165 Wool Exchange, E.C.) are agents. The double tone inks, which derive their name from the fact that they give two distinct tones in one printing, have the effect of showing the high and medium lights of a half-tone to a very much greater extent than is possible with ordinary printing inks. A further advantage, and one which is immediately apparent, even to a layman, is the richness of tone imparted to the printing by these inks, and their enormous intensity, which combined give the most artistic and beautiful results.

We have already referred to the dock for unloading paper on this floor and the runways in connection therewith, but it should be mentioned here that a complete runway system is also being installed to serve the various machines, with a main line running down the centre of the machine room.

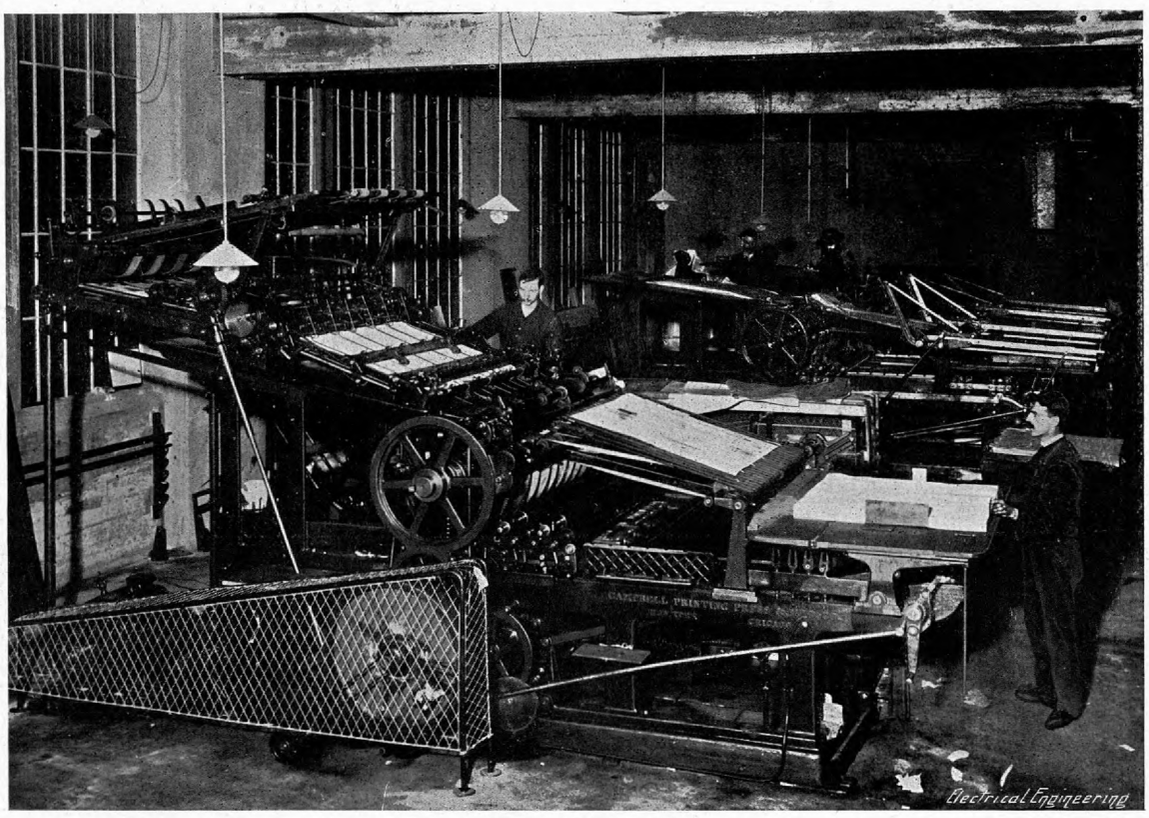

Fig. 9.—Century and Miehle Machines in Main Machine Room Printing "Electrical Engineering."

The greater part of the first floor above the main machine room is taken up by what is known in printing parlance as the warehouse, where the printed sheets are converted into the final form they are to assume when published. There are, however, also quite a number of printing machines of moderate size on this floor.

The warehouse machinery is varied and extensive. All is electrically driven, and individual drive, involving motors from ¼ to 3 h.p., is employed throughout. The motors, like those on the ground floor, are not bolted down to the concrete, but in the case of many are fixed to wooden frames upon which the machines stand. The starting arrangements are particularly worthy of notice. A starter is used which may be described as semi-automatic, and roughly speaking, it is on the same general principle as the automatic solenoid starters used for the large presses, except that the starter lever is raised by hand instead of by the solenoid. Thus, before starting, the handle is in its lowest position, with all resistance out, and, as in the automatic system, the circuit-breaker within the same case is open. The man or girl in charge of the machine draws the handle up when desirous of starting, and, as before, the circuit-breaker closes only when all the resistance is in circuit. The handle is then left to itself, and descends under the influence of the dash pot cutting out the resistance gradually while the motor gets up speed. A small push-button is provided on the top of the case to stop the motor by tripping the circuit-breaker. A small enclosed main switch is provided in each case immediately below the starter. One of the starters is seen in Fig. 10, which is a view of one of the folding machines. These starters, like the larger ones, were made by The Adams Manufacturing Co., Ltd., to Mr. Broadbent's designs. They are all fitted with no-voltage releases, and in the case of the rotary gatherer an overload release is also fitted, as this machine is somewhat liable to be pulled up if overloaded. Owing to the smaller size and greater number of these machines the power circuits are further sub-divided than they are downstairs, and sub-sectional distribution boards are used as well as the regular distribution boards similar to those already described.

The general plan of the warehouse is arranged so that the magazine and newspaper departments are separate, and the machines are arranged in each case so that the sheets can follow the operations in regular sequence. In the magazine department, which is in the east and north portions of this floor, the operations, speaking generally, consist of folding, gathering, thread sewing, wrapping, and trimming. Machines for all these operations are arranged in a regular order, except that the trimming machines are at a greater distance away, owing to considerations of the disposal of the cuttings. Other machines are the wire stitchers. In the newspaper department much of the machinery is similar, except that, owing to the different arrangement of the sheets, there is more handwork in the gathering operation, which is done by the aid of the circular revolving table spoken of above as the rotary gatherer.

Among the various types of folding machines, special attention should be called to the Dexter folders supplied

Hosted by Google

by Messrs. T. W. & C. B. Sheridan & Co. (65 to 69 Mount Pleasant, E.C.). Fig. 10 shows one of these machines in use, folding part of the last issue of Electrical Engineering.

The largest of these machines receives a full sheet of 32 pages, made up for two 16's or one 32, cutting it (in folding) into two sections, each section receiving three folds, delivering the

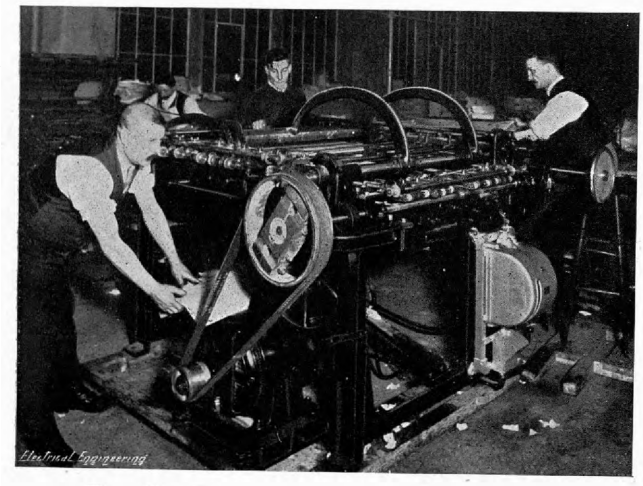

Fig. 10.—Dexter Folding Machine Folding "Electrical Engineering."

two 16's in separate packing-boxes, or one 16 may be inserted within the other, thus delivering a single 32-page signature. A double 32 attachment can be added to this type of machine, which will enable the turning out of two signatures of 32 pages from the one sheet. Other machines in this department supplied by Messrs. Sheridan include a fine book and pamphlet machine, working entirely automatically and capable of placing the paper covers on magazines, pamphlets, &c., at the rate of forty per minute. Messrs. Sheridan have also supplied to Messrs. Richard Clay and Sons a Mercer automatic gathering machine and a number of their new model cutters.

In the N.E. corner of the room is a group of nine thread sewing machines supplied by Messrs. Smyth-Horne, Ltd. (19 Cursitor Street, E.C.) A similar machine to one of these is illustrated in Fig. 11. They are the only type of thread sewer with four-arm feed, and are very much safer to the operator at high speeds than are those of the more usual pattern. These are the smallest machines, from the power point of view, in the works, but they are all belt driven by separate motors without any shafting. Each has a ¼ h.p. motor running at 850/500 r.p.m., started and stopped by an enclosed D.P. switch, but controlled as to speed by a series regulator. The motors are kept running all the time the

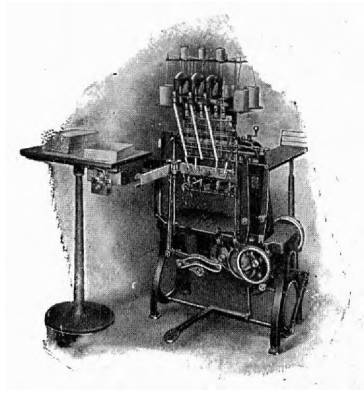

Fig. 11.—Thread Sewing Machine.

machine is in use, and the actual operations are controlled by a mechanical clutch put in action by a pedal. The motors and switches are conveniently mounted under the machines, and slide rails permit of adjustment of the belt. The drive of the wire stitching machines is similarly arranged.

There are several guillotines, each driven by a 3 h.p. motor, and two remarkably fine trimming machines, which trim the three sides of a paper or magazine without moving it in the machine. One of these is the book and magazine trimmer shown in Fig. 12, which was supplied by Messrs. Smyth-Horne & Co.

This machine is the first of its kind to be erected in England. It is a departure from earlier methods in that the bench of work is of considerable length and is moved against the knives while cutting is being effected. The operator's duties are simply to keep the machine in operation, and at the proper intervals to feed a handful of work three to four inches thick to the gate. The machine automatically releases this gate, and the books drop into a work-holder of special design, which supports them at an angle of forty-five degrees. The bench of work is then subjected to a pressure of from three to four thousand pounds, and as a whole moved rearward some seven inches or more against the three knives which are carried by a stationary trimming plate. While this travel and

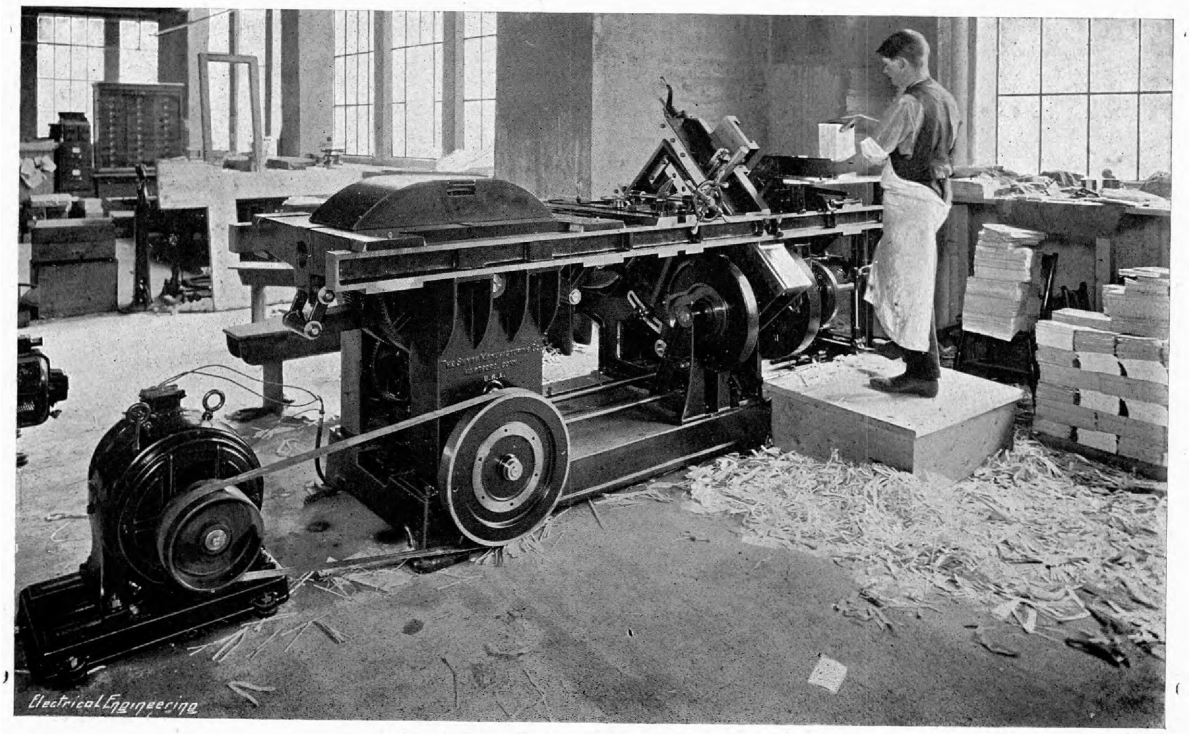

Fig. 12.—Magazine Trimmer at Work.

Hosted by Google

cutting is taking place, there is a shearing motion given to all three knives about equal to the travel of the bench of books. The plungers then unclamp and retire, a handful of trimmed work from the rear end of the bench of books is automatically discharged into the receiving trough, the gate released, a new handful of untrimmed work is automatically dropped into place, and the operation is repeated.

The other trimmer to which we wish to call attention is the Krause machine, which can be used for larger-sized pages than that just mentioned, and is the actual machine on which ELECTRICAL ENGINEERING is cut.

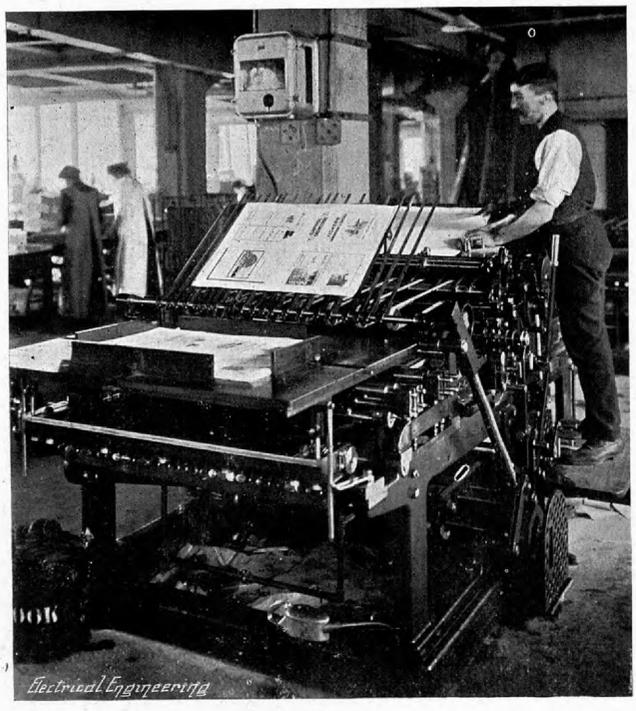

FIG. 13.—MACHINING THE WRAPPER OF "ELECTRICAL ENGINEERING" ON "CENTURETTE" MACHINE.

This machine was supplied by Messrs. Kampe & Co., 2 Sandland Street, W.C., and is adjustable for pages from $2\frac{3}{4}$ in. by $4\frac{1}{8}$ in., to $19\frac{5}{8}$ in. by $22\frac{3}{4}$ in. It will cut up to a height of $6\frac{7}{8}$ in., and as many as six piles can be completely cut on all three sides in one minute, including laying-on and taking away. A powerful automatic clamp holds the work during cutting, and an adjustable back and side gauge, which automatically recedes when the machine starts, facilitates laying on. The motor is conveniently mounted on the top of the machine, and drives through a vertical belt. It runs continuously, and a friction clutch is used to set the machine in action.

An electrically driven travelling band is about to be installed alongside these trimming machines to collect the trimmings and convey them to a chute leading to the basement, where a bundling machine for making them up into bales will be provided.

In the north end of this floor a number of moderate sized printing machines are being put down. Those in place at the time of our visit included a fine full automatic Falcon platen press supplied by Messrs. J. Salmon & Co. This is fitted with a pneumatic paper feed arrangement, which is of considerable ingenuity.

There are also several high-speed flat-bed machines, prominent among which are a group of three Centurettes with a speed of 2,000 to 3,000 impressions per hour. These were manufactured and supplied by the Linotype and Machinery Co. One is shown in Fig. 13 machining the cover of ELECTRICAL ENGINEERING.

The "Centurette" is a small-size high-speed two revolution machine, founded on the experience of the large Miehle and Century machines, and will take a sheet $22\frac{1}{2}$ in. by 35 in., and is of simple and rigid construction. These machines have a short belt drive and spring jockey pulley by 3-h.p. motor.

The only machines with a gear drive are some small machines of the Wharfedale type on this floor, driven through paper pinions. This was chiefly on account of lack of space, and belt drive is used everywhere else. We understand, however, that the result is perfectly satisfactory.

The top floor contains the foundry, with its stereotyping and electrotyping departments; the linotype machines, the hand-composing departments, the readers' offices, and the general offices, board room, &c., of the firm.

At the extreme south end we find the "black shop" of the electrotyping department, with various machines, such as black-leading machines, wax shaver, &c., all driven by separate motors. There is also a fine electrically driven hydraulic moulding press by Messrs. R. Hoe & Co. (Borough Road, S.E.), which is quite self-contained, with its pump and motor mounted on the machine itself. The motor is of Messrs. Crompton & Co.'s manufacture, and was supplied as part of this equipment by Messrs. Hoe. In a separate room in the corner are the electrotyping vats, the dynamo supplying these is belt driven by a 6 h.p. motor mounted on a bracket on the wall above it, and is a machine made many years ago by Messrs. Siemens Brothers & Co. It is a self-exciting shunt machine giving current up to 1,500 amperes at $1\frac{1}{2}$ volts. The regulation of this machine is effected entirely by means of an adjustable magnetic shunt, and naturally the efficiency of the machine does not reach a very high figure. The "black shop" is separated by the stairs from the main portion of the top floor, but otherwise the whole of the western half is without partitions. At the north end is the foundry proper.

The foundry machinery is of varied nature, and need not be described here in detail. Individual drive with motors belted to the machines is adopted, as in the other parts of the works we have been considering, but in view of the wood and metal dust flying about, solid instead of expanded metal covers will be provided to the motors. The controllers, with one exception, are of the semi-automatic pattern already described. The one exception is a horizontal boring machine, which has a special controller, as it requires to run the motor in either direction. This is the only reversing motor in the establishment, and a very neatly designed pattern of rheostatic reversing controller is employed. This machine was formerly driven by fast and loose pulley, and the simplification of the drive by a small motor bolted up to machine, doing away with the countershafts, &c., is most striking. Among other machines are a flat router, driven by a neatly arranged half-crossed belt drive from a $1\frac{1}{2}$ h.p. motor; a "nibbler," for planing the backs of the plates to make them exactly type high; a jig saw, a plane, a rotary "bowler," and several circular saws, all driven by motors from 1 to 2 h.p., of which more than a dozen were in place

FIG. 14.—GROUP OF LINOTYPE MACHINES.

Hosted by Google

at one time of our visit. At the end are the gas-heated melting pots, two of which are of the 7 cwt. size and one of the 14 cwt. size. These were supplied by Messrs. R. Hoe & Co., and are heated by a special pressure gas system, employing a small electrically driven rotary blower. They are capable of starting up from cold to their full heat in 25 minutes. Messrs. Hoe also supplied the gas-heated steam drying press in this department.

Passing on to the composing department we are at once struck by the group of 12 linotype machines, some of which are shown in Fig. 14, and it should be mentioned that the columns of ELECTRICAL ENGINEERING are set up entirely on these machines. The whole of these machines were removed from the old works, and the transfer was effected in remarkably quick time. Dismantling was only commenced at Bread Street Hill on a Thursday evening, but the machines were at work on their new site on the Friday night. The linotype machines form the only example of group drive throughout the works. They are divided into two groups of six, in two rows back to back, each driven from a shaft on the floor level under the platform running behind the machines by a 1¼ h.p. motor belted to the end of the shaft.

FIG. 15.—GENERAL VIEW OF COMPOSING ROOM.

It is impossible to describe the Linotype composing machine in detail in the space available. Briefly, it may be said that instead of separate type being used for every letter, each line is cast automatically by the machine in a mould made up of a series of matrices which have been set up by means of a key-board resembling that of a typewriter. The keys control magazines of matrices, and allow the right one to drop out and to be carried by the machine to its proper place in the row which is to form the mould. The details of the methods by which the sequence of operations are obtained, especially the way in which the matrices are distributed, are extraordinarily ingenious. The speed obtainable on these machines is from 6,000 to 10,000 ens per hour.

A departure is made from the usual method of lighting throughout the works in the case of the linotype machines, as it is necessary to throw light into particular parts of the machines. Lamps are therefore provided on flexible leads from ceiling roses, and these can be put anywhere on the machines where they are required.

The hand composing department is beyond, and extensive use is made of the travelling pendants already illustrated, over the compositors' frames, racks, stones, &c. In this case, however, they are provided with key holders so that each single light can be controlled independently. There is also a certain amount of general lighting by 100 c.p. lamps placed high up. In the readers' compartments, which are at the extreme north end, the 32 c.p. tantalum lamps, with enamelled iron shades, are suspended by flexible wires from short brackets of simple design. A view of part of the composing room is given in Fig. 15.

Other machines found in various parts of the establishment include hand-worked proof presses of the "Lightning" type, supplied by Messrs. Soldan & Co. (72-75 Turnmill Street, E.C.) of which there are altogether eight in use. These machines can be used for the finest class of register work, as well as for proofing galleys, and have special provision adjusting the height of the bed with great accuracy. The underbed is fixed, and a series of wedges, actuated simultaneously by turning a handle, raise or lower the overbed. Very even inking is obtained by geared inkers. A steel table and hand roller are provided for proofing in colour without the necessity for cleaning the rollers.

The general offices are, as has already been mentioned, also on this floor, and they occupy a good deal more than half the length of the building. The finest room is the board room, which is handsomely panelled, and has an arched ceiling in three bays of very fine appearance. The whole of the furniture and fittings of this artistically decorated room were designed and supplied by Messrs. F. Collinson & Co. (24 Grafton Street, W.), who, it may be said, make a speciality of high-class furniture for houses, yachts, &c., rather than ordinary office furniture. There are various private offices for the directors, managers, and other members of the staff, all excellently lighted rooms with large windows. The wiring is partly surface pipework and partly concealed. Various special fittings will be made use of, but unfortunately at the time of our visit these were not yet in place. The large counting house is also here, and this is lighted by the same design of travelling pendants as most of the rest of the building.

There is also a pleasantly decorated staff luncheon room, which is connected by a hand service lift with the kitchen on the roof level. This lift, as well as the kitchen ranges and other fittings, was supplied by Messrs. Farrow & Jackson, Ltd., to whose racks in the basement we have already made reference. The principal strong room on the floor is fitted with a special range of racks for the books, fireproof card index boxes, &c., also supplied by Messrs. Farrow & Jackson, Ltd. They are entirely constructed of channel and T steel, and have 19 in. openings for the ledgers, and 16 in. openings for the filing cases. This firm specialise in steel card index and filing cases, and have recently executed an order for 1,400 sets for the Commercial Union Assurance Co. There is also a smaller strong room communicating with the board room, and the offices include a special post room.

The telephone arrangements are very complete, and merit detailed description. There are ten lines from the City Exchange (City 526), and a private branch exchange board is installed dealing with these and 20 extensions to various parts of the building. The board is in charge during the day time of a female operator, formerly in the employ of the National Telephone Co., but at night the lines are plugged through to the gate-keeper and some of the departments.

At present a board is being employed which has been installed temporarily, but it is to be replaced by a larger board with an ultimate capacity of 20 exchange lines and 120 extensions, and entirely automatic signalling. A feature of this board will be that not only is the current for the transmitters and automatic signalling supplied by special leads from the City exchange, but the alternating current for ringing the extensions is supplied in a similar manner. A hand magneto is fitted as a spare. The extension instruments are all worked on the usual C.B. system, with "eye-ball" indicators, which are automatically restored on the insertion of a plug into the corresponding jack. When an extension is through to the main exchange, the current for speaking is supplied direct from that exchange, the energising of a 350-ohm relay in the cord circuit cutting off the local supply. When, however, one extension is through to another, both points are supplied from the Private Branch Exchange switchboard, the 350-ohm relay in this case not being energised, owing to the absence of a socket connection on the extension jacks. We are enabled to give these particulars through the courtesy of Mr. G. F. Preston, manager of the Post Office Metropolitan Exchange System.

In addition to the main telephone system a very complete system of inter-communication telephones, with 25 stations, has been installed by the British Home and Office Telephone Co. (15 and 17, City Road, E.C.).

Hosted by Google

This comprises 18 wall sets and seven table sets in the various departments and offices. The instruments are of the 30-line type, so that there is provision for five more stations later. These sets are of simple construction, without outside terminals, and well finished. The handle of the dial switch is turned to the number wanted, the hand combination set is then removed from the cradle, and a push button is pressed in. This connects the battery to the line wanted, and, on releasing the button, the instrument is through to the line. There is no speaking key to depress in the handle of the instrument. On replacing the hand-set the instrument is automatically connected to the "home" line, no matter what position the dial switch occupies. The system is a central battery one, and the battery consists of two sets of four "sack" type Leclanché cells connected in parallel. These have flat glass covers in which are holes for the passage of the carbon rod and the strip attached to the zinc cylinder, and the carbon rod passes through the sack and rests in a depression in the centre of the bottom of the cell, so that both elements are held in their proper positions without the usual tendency to slip about as in the ordinary Leclanché. The multiple cable connecting the stations is rubber and cotton insulated, and braided overall. Wires of 22-gauge copper are employed for the lines, and two No. 18 wires for the battery leads. It is drawn into ¾ in steel barrel fixed to the surface of the concrete walls with clips screwed into hardwood plugs.

The greater part of the roof is flat, and makes a pleasant promenade, but on the roof are also situated the men's dining rooms and kitchens, and covered ways lead to these from the top of the stairs. The water tanks for the sprinklers are also on this level.

In speaking of the building in general, mention must not be omitted of the ranges of lavatory basins along the wall at the south end of each floor adjoining the men's staircase. The basins themselves were supplied by J. Tylor & Co., the sub-contractors to Messrs. Jennings & Co., who were the main contractors and carried out the plumbing work in this connection. Above each basin is a spherical pivoted container or dispenser containing a special form of liquid soap, which pours into the hand when the container is inverted. This soap is supplied by the Horton Liquid Soap Co. (245 Shaftesbury Avenue), and two varieties, one of the nature of a toilet soap, and one specially intended for the removal of grease, are in use. About 40 of these liquid soap containers are fixed in various parts of the establishment. The supply of liquid soap for factory purposes is quite a new development, so far as we know. It is estimated that each container holds a supply of soap for 200 or 300 people, and the soap can be used up to the last drop.

We have endeavoured in the above description to give some idea of the magnitude, the up-to-dateness, and the completeness of the works and its plant. It now only remains to add that both the quality and the quantity of the work carried out there are equally worthy of note. It may be mentioned that in addition to ELECTRICAL ENGINEERING, Messrs. Richard Clay & Sons carry on at Brunswick Street the printing of such well-known journals as *The Lady's Pictorial*, *The Illustrated Sporting and Dramatic News*, *Nature*, *The Musical News*, *The Nursing Times*, *The Boot and Shoe Trades' Journal*, *The Shooting Times*, *T.P.'s Magazine*, *The Woman at Home*, *The Fortnightly Review*, *The School World*, *The Journal of the Chemical Society*, *The Journal of Hellenic Studies*, *The Economic Journal*, *The Journal of the Board of Agriculture*, *The Journal of the African Society*, *The Journal of the British School at Athens*, *The Journal of the British School at Rome*, and *The Statesman's Year Book*. Messrs. R. Clay & Sons also printed a considerable portion of the new edition of the *Encyclopædia Britannica*.

To change over the whole of this work from its old to its new quarters without any interruption was no light task, but we are pleased to say that, judging by our experience with ELECTRICAL ENGINEERING, the success of the arrangement, were perfect. No one outside Messrs. Clay's own staff was put to the slightest inconvenience, no hitch occurred, and ELECTRICAL ENGINEERING on the week of the move was turned out with all the smoothness and punctuality which have always characterised the work that Messrs. Clay & Sons have done for us.

Before concluding we wish to express our appreciation of the courtesy shown us by the directors in connection with the preparation of this description, particularly by Mr. Cecil Clay, who at a time of great pressure of work took considerable personal trouble in the matter, and spared much of his valuable time. We also wish to thank Mr. Frank Broadbent, consulting electrical engineer to the firm, for explaining to our representative the electrical features of the establishment, and the various contractors who afforded us facilities for obtaining information regarding the plant which they supplied.

ELECTRIC POWER PLANT AT MESSRS. RICHARD CLAY & SONS' COUNTRY WORKS

THE works of Messrs. Richard Clay & Sons, at Bungay, have been driven by electric motors for some years past, but the extensions that have been made from time to time in the works have outstripped the capacity of the original generating plant. A new power house is now being put down to the designs and specifications of the firm's consulting engineer, Mr. Frank Broadbent, M.I.E.E.

The power house will adjoin the old gas engine house, and will contain two 24 ft. Lancashire boilers, made by Danks and Co., of Oldbury, fitted throughout with corrugated flues. Mechanical stokers of the Underfeed type will also be provided, and the fan for the forced draught will draw its air through an air heater placed in the flues so that hot air will be delivered to the furnaces. Superheaters of the Furguson sectional type will be fitted at the back of the boilers, and the piping will be so arranged that either saturated or superheated steam may be delivered to the engines. The feed water which is pumped direct from the river will pass through a water softener and oil eliminator of the Paterson type, the feed water being heated and partially softened by means of a branch from the exhaust steam pipe. Some further particulars of this plant are given on another page. In winter the exhaust steam will be used to heat the works.

The power plant will consist of two Belliss & Morcom enclosed compound engines, each of 150 h.p. capacity when supplied with superheated steam at 140 lbs. pressure. These will be fitted with automatic expansion governors in order to work with maximum economy under the fluctuating loads to which they will be subjected. Specially heavy fly-wheels are also being fitted to ensure steady running. Multipolar continuous-current, compound-wound dynamos made at the Witton Works of the General Electric Co., who are sub-contractors to Belliss & Morcom, will be coupled direct to the engines. The main switchboard forming an extension of the switchboard used in connection with the gas driven dynamo, is being made by J. H. Holmes & Co., of Newcastle-on-Tyne, and will be fitted with overload and return circuit-breakers for the dynamos which will work in parallel, and will contain separate panels dealing with the power and lighting loads.

A new brick chimney is being built by the Alphons Custodis Co. Mr. Broadbent, the consulting engineer, went very carefully into the merits and comparative costs of brick and steel for the chimney, and considered that for this particular case a steel chimney offered no advantages, either in the first cost or otherwise.

It is confidently anticipated that very great economies will be effected by the use of such an up-to-date installation.

Supply Station Engineers and others requiring copies of this issue of "Electrical Engineering" for distribution in quantities should apply at once to the Publishers, the Kilowatt Publishing Co., Ltd., 203, Temple Chambers, Temple Avenue, E.C. Price 1d. per copy (carriage free, 1½d.).

Hosted by Google

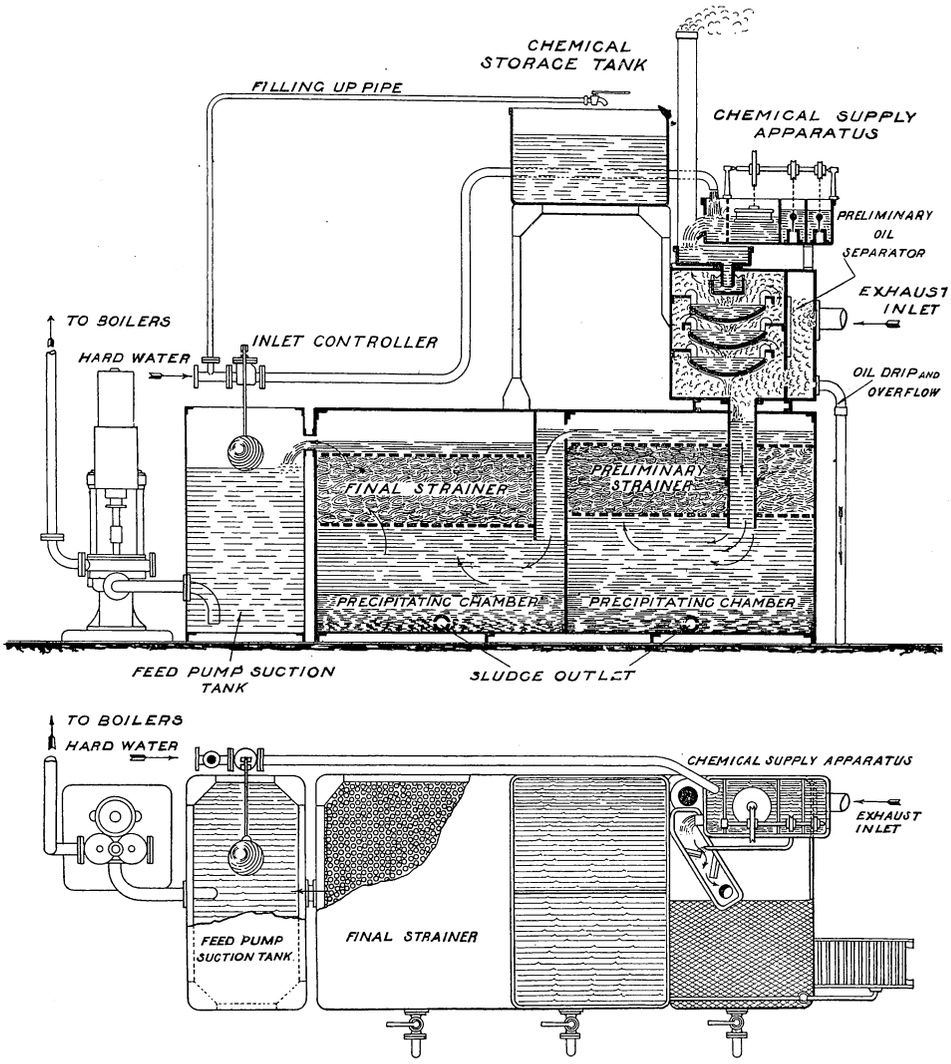
WATER PURIFICATION PLANT AT MESSRS. R. CLAY & SONS' WORKS AT BUNGAY

BRIEF reference is made on another page to the combined exhaust heater, softening and oil eliminating plant, which the Paterson Engineering Co., Ltd. (Amberley House, Norfolk Street, Strand, W.C.), have in hand for Messrs. R. Clay & Sons' works at Bungay. We are able to give here an illustration of the general arrangement of the plant.

The hard water supply, controlled by a float in the feed-pump suction tank, enters the chemical regulating apparatus, which measures in continuously in its passage through a narrow vertical discharge weir. A large float controls the position of two long tapered valves, discharging the softening reagents. The level of these is kept constant by ball-cocks connected to the chemical storage tanks. The hard water and reagents are well mixed before passing through a water seal into the heating chamber.

The exhaust steam enters a preliminary grease separator, for the removal of the black oil; then the heating chamber, passing through the trays in a counter-flow direction, finally escaping to atmosphere. The heating trays, constructed of light sheet steel, can readily be withdrawn for cleansing purposes.

The water from the distributing box falls into the centre of the top tray. Owing to its great length, the water overflows the edges in exceedingly thin films, which cling to the underside, dropping from the centre into the middle of that immediately below. After working its way to the edges of No. 2 tray, it again overflows on the underside and drops into the middle of No. 3, and so on. By this means the exhaust steam comes into film contact with the water, and removes the temporary hardness without the aid of chemicals, by driving off the carbonic acid gas and precipitating the lime salts.



The reaction is as follows :—

Bicarbonate of lime		Carbonate of lime	Carbonic acid	Water
$CaH_2(CO_3)_2$	=	$CaCO_3$	CO_2	H_2O
Soluble		Insoluble	Gas	Water

For the removal of the permanent hardness sodium carbonate is necessary, and by means of the Paterson Patent Chemical Supply Gear this is added in accurate proportion to the amount of water passing. The reaction then is :—

Sulphate of lime		Carbonate of soda		Carbonate of lime		Sulphate of soda
$CaSO_4$	+	Na_2CO_3	=	$CaCO_3$	+	Na_2SO_4
Soluble		Soluble		Insoluble		Soluble

The heated and softened water passes into the precipitating chamber, where the bulk of the impurities settle. Final purification is effected by double filtration through wood fibre. The purified water flows into the feed-pump suction tank.

GENERAL ARRANGEMENT OF PATERSON COMBINED EXHAUST HEATER, WATER SOFTENING AND OIL ELIMINATING PLANT.

The Vogtlandische Maschinen Fabrik, of Plauen, whose advertisement appears on another page, is one of the largest builders of rotary machines on the Continent. The firm specialises principally in rotary machines for newspapers and illustrated magazines, and claims to be the first house to have developed and put into practical working a process for printing newspaper illustrations direct from half-tone blocks. The Vogtlandische Maschinen Fabrik has also invented the "Rotoplate," a machine for automatically casting and finishing plates for rotary machines. Two of these, we understand, have already been installed in German newspaper offices.

AUTOMATIC v. MANUAL TELEPHONE EXCHANGES

LAST Thursday, Mr. W. Aitken (of the British Insulated and Helsby Cables, Ltd.) read a exceedingly interesting Paper before the Institution of Electrical Engineers on "Automatic Telephone Exchange Switchboards." He commenced by alluding briefly to the increase in the automatic features employed on manual boards, and then explained in detail one of the most recent of these, namely, the keyless ringing junctions, by which the ringing key on the incoming junction board is rendered unnecessary, and the actual insertion of the plug in the wanted subscribers jack causes a relay to connect up the ringing circuit, and again to interrupt it (as with the ordinary automatic ringing key) when the wanted subscriber takes down his receiver. This enables the number of incoming junction per operator to be increased from 27 to 36.

On small private branch exchanges with too few extension lines to render the employment of a permanent operator necessary, trouble is frequently experienced by the office boy or clerk responsible for the manipulation of the board omitting to clear the extension at the conclusion of the conversation, so that the exchange line is left connected to the extension instead of to the switchboard or the service instrument. The British Insulated and Helsby Cables, Ltd., have lately introduced small cordless switchboards of Mr. Aitken's design in which the connections are made manually by a rotating multi-contact switch, which is held electrically and is automatically released when the extension subscriber hangs up. In a modification of this, the switch is released through a slow acting relay, so that the extension is not disconnected by the subscriber pumping his switch-hook to call the exchange.

Mr. Aitken then proceeded to the main part of the Paper, on the full automatic switchboard. Most of the leading telephone manufacturers are now busy developing automatic systems, but, practically, there is only one system in common everyday use—that of the Automatic Electric Company, of Chicago. It is claimed by this Company that there are 300,000 telephones working on their system, San Francisco, Oaklands, Los Angeles, Columbus, Grand Rapids, and Chicago, being among their largest installations. San Francisco and Los Angeles are both laid out on a basis of 100,000 lines. The former has already four exchanges with three at Oaklands, across the bay, most of them of 10,000-line capacity. Los Angeles has six main and four branch exchanges equipped for 25,700 lines. These exchanges are on the common battery system. The Chicago system just being brought into use, is to be suitable for 1,000,000 lines.

The greater number of exchanges are on what is known as the 3-wire system, the signalling being over the two wires alternately with earth return, but in San Francisco, and other later exchanges, all signalling is effected by the intermittent opening of the circuit at the subscriber's instrument. This has greatly simplified the subscriber's instrument.

All the facilities given on a manual exchange are now repeated on the automatic, and in some instances with a greater degree of flexibility. Junction working is practically eliminated. The ringing of the called subscriber is automatic. Calls are metered or registered (the system, however, gives free or unregistered calls when talking to officials, etc.). Party lines are efficiently dealt with, and also private branch exchanges.

Fig. 1 shows a subscriber's instrument with the small circular switch for opening the line only. Under each of the finger holes is placed a figure, 1 to 9, then 0, and any number is made up by inserting the finger successively over the figures that go to make up the number wanted and pulling the dial round until the finger comes against a stop. In the 3-wire system this dial, as it revolves, intermittently earths one or other of the wires, and thus completing a circuit from a central battery causes step by step electromagnetic mechanism to perform certain functions. In the later system these functions are now performed by the dial simply intermittently opening the circuit which has been completed by lifting the receiver.

Fig. 2 shows a general view of a "connector" (the essential piece of mechanism of an automatic exchange). A small exchange might be composed only of connectors, one being provided for each line. On a frame of non-magnetic material a vertical shaft is mounted, free to lift upwards and revolve. The upper part of the shaft has teeth cut round it, and below this are other teeth in the line of shaft, 10 teeth in each case. The shaft is raised and rotated by electro-magnets. One called the vertical magnet, acts on the teeth surounding the shaft, and lifts the shaft to a height corresponding to the number of impulses sent, and the number of impulses depends on the second last figure of the number required, *e.g.*, if the number were 67, then the shaft would be raised to the height of 6 teeth. Another magnet would then be switched into action and it would act on the teeth in the line of the shaft and rotate it, the distance depending again on the number of impulses sent; in the case of the number 67 the shaft would be rotated a distance of 7 teeth. The shaft at the bottom has attached to it, and insulated from it, and from each other, contact springs or wipers, which, brush fashion, wipe over contacts associated with the lines to be called. These banks of contacts are arranged in an arc of a circle, and each line bank has ten pairs of springs

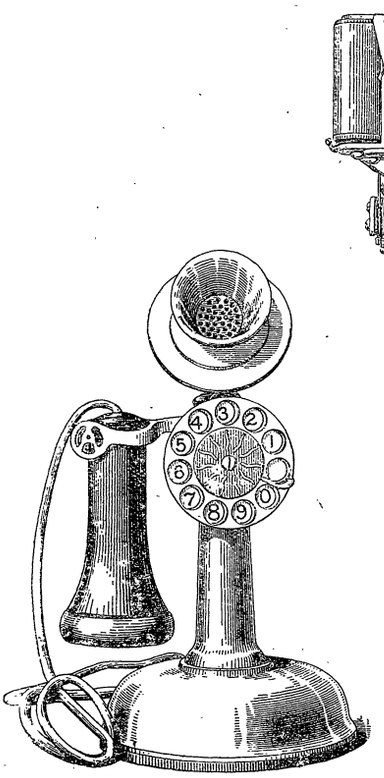

FIG. 1.—TABLE PATTERN INSTRUMENT.

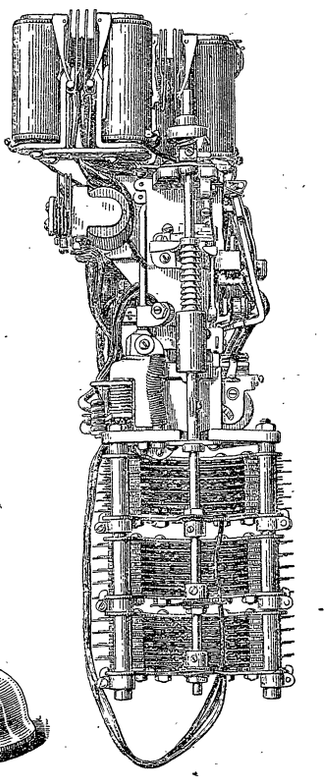

FIG. 2.—COMMON BATTERY CONNECTOR.

in the height, usually in two groups, and 10 contacts horizontally in the arc, wiped over by two twin contact arms. In these contacts are terminated 100 lines. A second bank is placed above this having 10 contacts in the height and 10 in the arc. These are connected to the tests, or line engaging circuits which are purely local and correspond to the wires connecting the jack bushes together in a manual exchange. As the shaft rises vertically step by step, the wipers come to rest in line with the contact levels, so that when the shaft is rotated the wipers brush over the intervening contacts in the arc, until the wipers come to rest on contacts of the line required. When the receiver is replaced after a conversation, both lines are earthed simultaneously, or the circuit is opened, allowing a release magnet to operate on the "dogs" (which maintained the shaft in the position brought about by the electromagnets already described), when the shaft is rotated in the reverse direction by a coiled spring until it is free to fall by gravity to the normal position.

The Author then described the complicated mechanism and connections in considerable detail, explaining the methods employed for giving the "engaged" signal automatically, the automatic connection of the junction circuits, etc.

On the question of cost, he claimed that although in small exchanges it is much more with automatic than manual, as they increase in size they approach nearer until at about 10,000 lines they are equal in cost.

For operating, repairs, and maintenance, Mr. Aitken quoted figures showing £1 5s. per line per annum for a 5,000-line

Hosted by Google

manual exchange, as against 8s. 10d. for an automatic exchange of similar size; and for a 10,000-line exchange £1 13s. 6d. and 9s. 4d. respectively. He also stated that the Automatic Electric Company have lately published a certificate over the signature of the President of the Citizens Telephone Company, Grand Rapids, that the cost of replacing parts, due to defective workmanship, or material, or ordinary wear and tear, during seven years, amounted to $962·62, an average of $137·52 per annum, or 1·8 cents per line per annum, for the average of 7,500 lines in service. This sum included central equipment, except power plant, and also the dial switches in the telephones.

DISCUSSION.

Mr. J. E. KINGSBURY first referred to the question of nomenclature, and suggested that the modern C.B. manual board, sometimes called automatic, should be called "machine switching," and that full automatic systems should be described as "machine calling and machine switching." Mr. Aitken might be right in his belief that anything else than the full automatic could be other than transitory, but there was no material put forward, based upon accomplished facts to permit of a judgment yet. Telephone engineers must not be led away by the enthusiasm of inventors or manufacturers. It was the duty of all responsible for the management of a telephone service to see that it was a perfect one, and not to seek to evade any responsibility themselves by putting it on to the subscriber.

Mr. F. GILL (Chief Engineer, National Telephone Co.), said that the National Company had always felt that the function of the private branch exchange operator was very important indeed, and that this operator could not be got rid of by any automatic gear. Mr. Aitken had taken 22½ calls per junction per busy hour, but this American figure would not apply in London, where the duration of the conversation was very much longer. Another figure, upon which maintenance costs were erroneously based, was that of one man per thousand lines; and he investigated this in the States, and had found that it meant one man continuously working, so that, assuming eight-hour shifts, three men per thousand lines must be taken. No general conclusion could be come to as to the application of automatic telephony, but it was necessary to study each area separately.

Mr. A. W. WHALLEY said he had studied five different systems in the United States, and they had filled him with astonishment and admiration at the results accomplished. When a system had been evolved, after 10 or 15 years hard work and in connection with which 300,000 telephones were in use, there must be something in it. Mr. Whalley pointed to the saving of time by the fact that the disconnection of exchange lines was practically instantaneous on the automatic exchange, whereas in a manual system most conversations were carried through two exchanges, and each operator had 17 pairs of cords, and had to attend to between 100 and 200 subscribers, so that there must be a delay in disconnection after the completion of a conversation. Another claim for the automatic system was that it took less time on the average for the calls made by subscribers to get through to the man wanted. Mr. Whalley also complained that in this country telephone engineers had been brought up in the catechism of the best and standard American practice, and, apparently, if any new thing had not been proved in America, it was quite impossible for it to be tried here and developed on our own lines. On the other hand, he said that it should not be considered sufficient to send an engineer every two or three years to America to report on developments there, but a man should be sent actually to live in one of the cities where the system is in use.

Mr. M. S. CONNER said that although he had not yet made a very extensive investigation into the matter, he believed the automatic system was a successful one for giving telephonic service, and after having interviewed several hundred subscribers, he had come to the conclusion that they liked it. It resolved itself into a financial question. Whilst the expense of operators was less than that of an ordinary telephone system, the cost of maintenance with the automatic system was more, owing to the number of parts. He could hardly accept the figure of maintenance given in the paper of two cents per line per annum. The audited balance sheet of an automatic system did not show a greater earning power than a manually operated system. At the same time, whilst the expenses were small, there were large additions to the capital expenditure, and the capital value per station increased each year. Taking this into consideration, it was evident that an automtic system had not yet been devised to give a reliable telephone service at the same expense that a corresponding service could be given by a manual equipment. The question of depreciation also had a bearing on the matter. He disagreed with the author that the life of a manual switchboard was only 10 years, nor with the assumption that 12 years would be the life of an automatic exchange. There were a large number of common battery switchboards in use to-day that had been in operation for more than 15 years, and he believed that the Postmaster-General was expected to acquire a large number of National exchanges in London which had been in operation for more than 10 years. With the manual system, the life for springs, jacks, plugs, &c., had been greatly prolonged by improved material during the past few years, and he did not think he was far wrong in saying that a multiple switchboard could now be obtained in which the plugs, cords, &c., had a life of 25 years. On the other hand, there was no experience to show the real life of an automatic system. Systems installed 14 years ago had passed away long since. In the later systems, the switching mechanism underwent considerable wear, owing to its cycle of operations, and he imagined that the vertical shaft would have to be replaced fairly frequently. There might be hopes for the automatic system if the number of parts could be reduced, and the remaining ones made in a more robust and scientific manner, so that the cost of maintenance would be decreased. But when it was considered that the original Strowger patents were taken out in 1888, and that in 25 years enormous sums of money had been spent to bring that device to perfection, they must get a little discouraged as to any advantageous outcome.

Mr. R. SCRUBY expressed his opinion that the Automatic Electric Co. of the United States had certainly shown that entirely automatic telephone systems are feasible and economic. About sevn years ago he went to Albuquerque, New Mexico, to see one of the first automatic telephone exchanges which had been put in. This was of about 200 lines, had been working six years, was giving entire satisfaction to the users, and was a financial success. At Grand Rapids a 10,000 line exchange was installed, and was giving thorough satisfaction to the subscribers, and was also paying good dividends even before the advent of the Keith line switch and the common battery two metallic line instruments. The Keith line switch opened up greater possibilities, and allowed much greater economy in the automatic telephone system, and he was sure that the system in Chicago would show that there was practically no limit to the number of lines which can be used on the automatic telephone exchange system. About eight years ago in Los Angeles there was the finest independent manual exchange in the States, but only a year or two after that date all extensions were on the automatic system, and now one of the largest automatic exchanges in the world exists there. At Dayton, Ohio, where there was a manual exchange and a 10,000 line automatic exchange, the public were very much in favour of the latter. The cost would be reduced when more firms were employed in the manufacture of automatic exchanges, and when repetition orders were placed on the scale as that of orders for manual exchanges at the present time. Although England, as compared with the United States, was not manufacturing an enormous number of telephones, nevertheless, there were one or two telephone manufacturing companies in England turning out better work than any of the foreign works, and these would be a considerable help to the English telephone system when they decided to commit themselves to automatic telephony.

Mr. AITKEN, in reply, said he had no idea of doing away with the operator in private branch exchanges. It was due to these that the number of operators of automatic systems was recorded in statistics as so large. Contrary to Mr. Conner, he felt quite encouraged with the progress and prospects of automatic telephony, especially when an independent company could go into competition with a manual system in a great place like Chicago. On the question of maintenance, he contended that there were very few wearing parts in the automatic system, and said that the wipers were the only parts which had to be renewed at all frequently.

Course of Lectures.—A course of five lectures on the application of hyperbolic functions to electrical engineering problems is to be given under the auspices of the University of London at the Institution of Electrical Engineers by Dr. A. E. Kennelly. The lectures are addressed to advanced students and others, and admission will be by ticket, obtainable on application to the Secretary of the Institution of Electrical Engineers. The lectures will commence at 5.30 on the following dates:—May 29th and 30th, June 1st and 2nd.

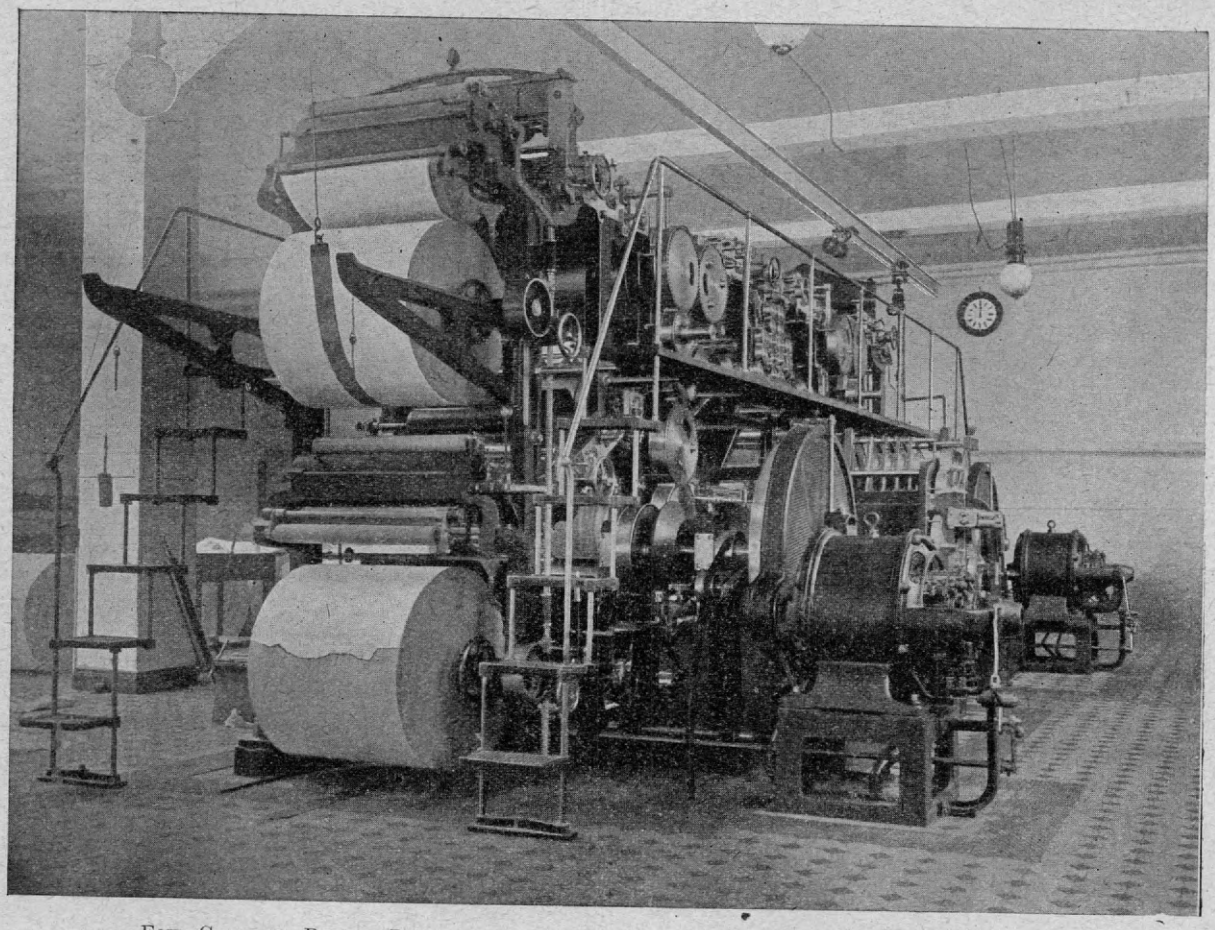
Parliamentary Intelligence.—The South Lancashire Tramways Bill was read a third time in the House of Commons on Thursday.

A House of Commons Committee last week passed the Metropolitan Electric Tramways Bill, the main object of which is to construct a new bridge over the River Lea, and to join up the tramways of the Walthamstow Council and the Middlesex County Council.

The Metropolitan District Railway Bill has been passed by the Unopposed Committee of the House of Commons. It provides for certain widenings of the Company's railways, the construction of a new station in Farringdon Road, and a subway for foot passengers at Edgware Road.

The Unopposed Committee of the House of Lords last week passed the Bill of the London Electric Railway Co., which provides for the transfer of the Lots Road power station of the Underground Electric Railways Co. of London to a joint committee consisting of representatives of Metropolitan District Railway Co., and the London Electric Railway Co.

Middlesbrough, Stockton, and Thornaby Tramways Bill, and the London Electric Railway Bill were read a third time and passed in the House of Lords on Tuesday.



The Macclesfield & District Railless Traction & Electric Supply Bill has been read a second time in the House of Lords.

A NEW A.C. MOTOR FOR DRIVING PRINTING MACHINERY

ALTERNATING-CURRENT motors of the ordinary induction type cannot be adapted in the same way as direct-current motors to the exceedingly severe conditions which the driving of modern printing presses entails. Messrs. Brown, Boveri & Co., however, have sent us some particulars of a new type of alternating-current motor, which, they claim, fully meets the requirements of printing work, and for this purpose it has largely been employed on the Continent. It is a single-phase motor of a special repulsion type, the stator of which carries a simple single-phase winding, while the rotor is wound in a similar manner to a direct-current aramature, and is fitted with a commutator. The rotor, however, is not electrically connected in any way with the stator, and the pressure across the brushes is so low that perfect commutation and entire safety in handling are ensured. For each pair of poles there are two sets of brushes, one of which is fixed and one movable. The whole control of the motor is effected by varying the position of the movable brushes on the commutator, no starting or regulating resistances being required; in fact, the only accessories to the motor are a double-pole switch and fuses. The makers inform us that any speed can be obtained between the slowest possible speed for "inching" and the speed of synchronism, and that the direction of the motor can be reversed simply by altering the position of the movable brushes. The starting torque is about 2·5 to 3 times the normal, while the running characteristic of the motor is similar to that of a direct-current series machine. The motors, which are made in sizes from 2 to 80 h.p., can also be arranged for either mechanical or push-button control, without any complication of apparatus, and they can be adapted for three-phase supply by connecting them across the phases.

The accompanying illustration shows a four-cylinder rotary press with a capacity of 10,000 32-page sheets per hour, driven by two single-phase commutator motors, each rated at 25 h.p. The press can either be run as one machine or as two separate machines, which can be run at different speeds independently of each other. The movement of the brushes to control the speed is done by means of small hand levers, which are situated at five different points on the machine, and connected together by means of rods, so that the motor can be stopped, started or regulated from practically any part of the machine. The main switch for each motor is fitted on the stator frame, and is operated by means of rods in the manner previously indicated. The normal working speed of the motor can be varied between 600 and 1,050 r.p.m., no starting or regulating resistances whatever being used. Messrs. Brown, Boveri & Co. inform us that up to the present time they have delivered, or received orders, for over 22,000 h.p. of motors of the above type for driving printing and other types of variable-speed machinery.

FOUR-CYLINDER ROTARY PRESS DRIVEN BY TWO 25 H.P. SINGLE-PHASE COMMUTATOR MOTORS.

Turin International Exhibition.—The British Section of the International Exhibition at Turin was informally opened to the public on Friday, May 19th. The official inauguration of the section will take place later.

Trolley Omnibuses.—The Bill of the Aberdare Council, which proposes to use trolley omnibuses on certain routes feeding the tramway system, has been under consideration by a House of Lords Committee during the past week. Mr. Stephen Sellon gave evidence on behalf of the Corporation, and estimated the cost of overhead equipment for the trolley omnibuses at £13,420. Mr. J. B. Hamilton, General Manager of the Leeds Corporation Tramways, and Mr. I. E. Winslow, both gave evidence in support of the proposal, and regarded a district like Aberdare as admirably suited to the use of railless electric traction. The scheme was strongly opposed by the Taff Vale Railway Co., for whom Mr. R. Hammond gave evidence to the effect that in his opinion the receipts from these lines had been largely over-estimated, and the expenditure under-estimated. He did not think trolley omnibuses could possibly be made to pay in a place like Aberdare. The opposition of the Taff Vale Railway Co. was mainly from the point of view of competition, but objection was also taken to the trolley omnibuses using certain level crossings, which, it was argued, would be dangerous to the public. For the Council, however, it was suggested that arrangements could be easily made by which the shutting of the level crossing gates would cut off the current from the overhead line. Eventually the Committee decided to allow the Bill to proceed.

MOTOR BOGIES

A PAPER by Mr. G. L. Drury on the construction and maintenance of the motor bogies of electric railway coaches was read before the Dublin Section of the Institution of Electrical Engineers on April 6th. After commenting upon the unusually severe stresses to which the frames are subjected on account of the high acceleration, &c., of electric trains, the author describes the three more usual types of motor bogies. The cast-steel pattern represents American practice, and has been adopted on many lines in this country. Those made up of pressed steel of channel section are slightly heavier. Bogies constructed of steel plate and angles are heavier still, and are suitable for the most severe service. The two large rectangular spaces without cross members give a bogie a tendency to twist, which is shown by the gusset plates and rivets becoming slack. Springing of the axle-box guides caused by the thrust of the motors is prevented by bringing the side frame down to a point below the centre of the guides and by tying both pairs of guides together. The most suitable wheelbase appears to be 8 feet, as any further increase reduces the angle of skew between the rail and the bogie very little. The addition of a third rubbing casting in the centre to transmit the thrust of the motor through the nose bracket directly to the centre bearing of the bogie considerably reduces the stresses on the transom. The bogie centres should be larger than is usual for carriage stock, and full provision should be made for oiling them. Axle-box guides should have detachable brass liners. The stress in axles should not exceed 7 tons per sq. in. In a certain case the stress was seldom less than 8½ tons per sq. in., due to overcrowding of the coaches, and after about 100,000 miles the axles started to fail regularly, and all had to be replaced. These axles were subjected to an additional torsional stress of over one ton per sq. in. Referring to axle-boxes, the author emphasises the importance of an oil-tight construction, stating that an axle box with an oil-well capacity of a quart should run without examination for at least two months, and for four months without oiling. Wheel centres of the solid-disc type are less noisy than spoked wheels, which are also liable to fracture. A motor tyre should not be permitted to wear down so thin as a trailer tyre. The tyre on the gear side always wears faster than that on the other side, due, probably, to the reaction of the gears driving the axle on the skew. The double gears sometimes adopted for tramway work to overcome this cannot be used in railway work, owing to the larger motors employed. Nickel-steel studs with nuts at each end are more satisfactory than bolts for split-gear wheels. An oil-tempered pinion recently introduced is said to give a life equal to that of the gear-wheel. Worn gearing does not appear to raise the current consumption appreciably, and the life is thus only limited by mechanical strength.

Turning to the motors, Mr. Drury states that the frames should be of the box type in preference to the split pattern, as the latter are difficult to keep tight together at the bearing ends. The breaking of binding wire is a serious difficulty, and the maximum coasting speed of the motors should be specified, as this is often greater than the maximum working speed. A special No. 15 S.W.G. tinned steel binding wire broke at 1,070 lb., or 118 tons per sq. in., and gave a torsion test of 30 turns on 8 miles. Flashing over at the commutator has been known to be caused by a deformation of the commutator at high speeds, which resulted in the brushes being jerked up by a projecting bar. Tightening up of the commutator will prevent this.

Finally, the author points out that reduction of the weight of the bogies is highly important. For example, a line running 3,000,000 coach miles per annum at a current consumption of 80 watt-hours per ton mile, with current at 0·5d. per unit, every hundredweight per coach of extra weight added will cost for haulage £25 per annum. Tests made to determine the difference in current consumption between a coach with a worn motor bogie and another with one newly overhauled and fitted with new bearing liners, gears, and pinions, showed that the latter resulted in a saving of 17·5 per cent. in current consumption.

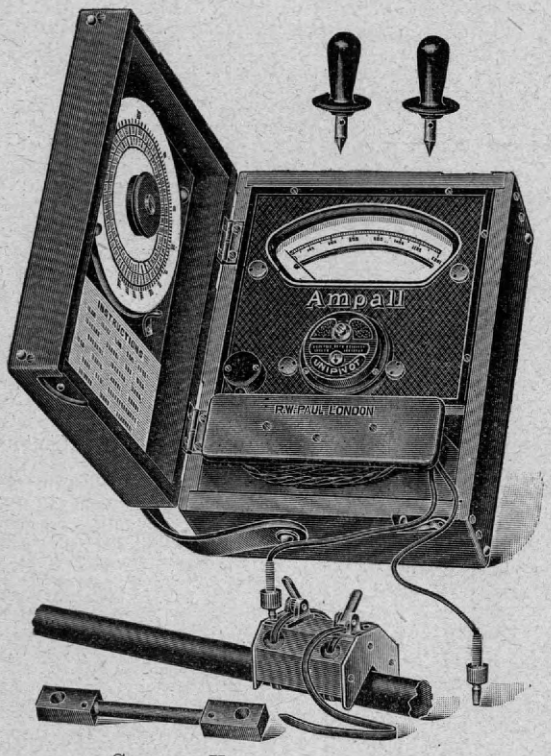
DISCUSSION.

Mr. WM. TATLOW (Chairman) asked whether leakage of oil from the bearings was due to porosity of the metal. He had come across cases where leakage was not due to cracks in the casting, but to percolation through the metal. He suggested that trucks could well be built of some of the new light steels or of a new alloy of aluminium. The specific gravity of the latter was 2·8 as against 2·7 for ordinary aluminium, but it compared well with steel for strength.

Mr. P. S. SHEARDOWN (Chief Electrical Engineer, Dublin United Tramways Co.) said that heavy railway work was quite different from ordinary street tramway work, but on the latter systems they had considerable trouble due to the heavy shocks rolling stock received. On some of their American trucks they had had the rivets pull and shear off, and had found it advantageous to replace them by ordinary bolts and nuts, even though these had to be tightened up periodically. He had noticed leakage of insulating oil through the casing of transformers. The cost of energy for the working of tramway systems was an important matter. In many towns the consumption was on the increase, due to heavier cars and higher speeds. Heavy trucks tended to greater wear and tear, both of rolling stock and permanent way.

THE TELEPHONE TRANSFER

LORD DESBOROUGH was in the chair at a meeting of the London Chamber of Commerce last Thursday, when Mr. F. Faithful Begg gave an address on the coming transfer of the telephone service. The object of the address was to support the views of Mr. H. Laws Webb referred to in ELECTRICAL ENGINEERING of February 23rd, p. 98, that a public telephone authority should be established, composed of experts in the telephone business, who would be responsible for the financial result, and at the same time financially independent of the Treasury, which should be governed by representatives of the Government, stockholders, municipal authorities, and Chambers of Commerce. This would free the service from political control. He was anxious that there should be no confusion between the telegraph and telephone accounts as had occurred in the past in the Post Office Department, or that the present annual loss on telegraphs should not be put upon the telephone revenue. The telephone, he said, had never had fair play; the Post Office in its action always being governed by fear of injury to the telegraph revenue. It was pointed out that the working cost per telegram, in spite of all the improvements in telegraphy, was more now than it was 40 years ago. The ratio of the expenditure to gross revenue in the case of the Post Office telephone system was 74·4 per cent., against 58 per cent. in the case of the National Telephone Co., and, further, the Post Office only earned 3½ per cent. on capital employed, whereas the National Telephone Co. earned 8·9 per cent. Comparison was made with the working of the United States of America, and it was shown that the recent development of trunk wires in the States was nearly double that in the United Kingdom; and in regard to the telegraph stations the United Kingdom was in arrears to the extent of 2,554,000 stations. It is suggested that this difference is due to the more efficient working in the States. Considering the recent rate of progress in America, it is estimated that in the next ten years a million pounds will be required to develop the telephone in Great Britain, and this, the author contends, is far too great an undertaking for the Government in view of the provisions which would also have to be made for telegraphs, letter post, &c. In conclusion, he said the question was of the utmost importance, and unless some plan were devised other than that of transferring the whole system over to the Post Office, all development would be hindered, commercial interests vitally affected, and there would be no facilities for business and rapid communication, which were of vital importance, and the only solution to the problem is to avoid the paralysing influence of a state monopoly and to establish a telephone authority representing all interests and controlled as advocated by the London Chamber of Commerce.



"The Central."—The May issue of the magazine of the Old Students' Association of the City and Guilds of London Central Technical College is largely devoted to Indian matters, containing articles on Indian industrial problems, life in India, and Indian railways. Other articles deal with engineering work in Mexico and South America, and there are the usual features of news regarding the college and those connected with it, and reviews of books.

Fire Protection.—Messrs. Merryweather & Sons (Greenwich) have recently put in a very complete fire protection plant at Lincoln Cathedral, consisting of one of their electrically-driven "Hatfield" pumps, with upwards of thirty new hydrants of their improved Metropole pattern. With the pump in operation sufficient pressure can be secured to enable powerful jets to be thrown from any of the hydrants, which are so distributed that a fire can be attacked in any part of the Cathedral where it may break out, whether inside or outside. The pump also gives pressure to feed a system of sprinklers which have been fixed in the south-west tower above the bells. The installation is fed from a large tank in which is stored rain water collected from the cathedral roofs. This holds some 10,000 gallons, a quantity which would supply the pump for about an hour. When the supply is exhausted the mechanism can be almost instantaneously switched on to the town mains. The pump is designed to deliver 200 gallons per minute at a pressure of 140 lbs. During official tests of the equipment, a jet of water was thrown well over the apex of the roof from the ground, and at the roof of the central tower there was sufficient pressure to reach the highest pinnacle.

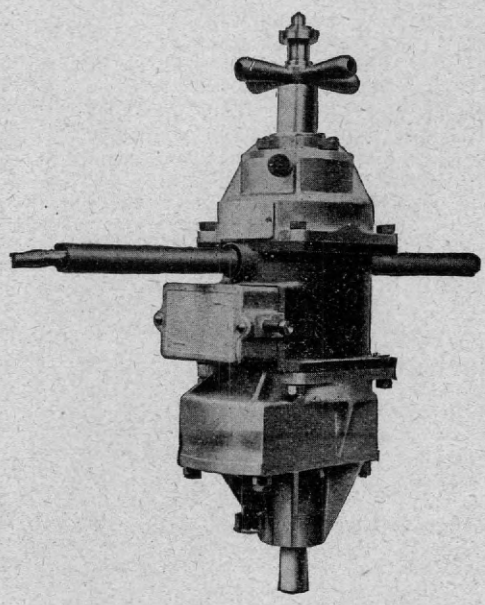
THE AMPALL

We recently had an opportunity of inspecting this instrument, designed by Mr. Robert W. Paul (33 Leicester Square, W.C.), to measure direct currents up to any value met with in practice. It comprises a millivoltmeter, a contact block with potential points and adjustable straps, and plug leads for connecting up the millivoltmeter. The latter is adjusted to read 1,000 divisions on the scale for two millivolts, and the potential points of the contact block are so spaced as to give a drop of two millivolts along a conductor carrying 1,000 amperes per square inch, so that the current density is measured directly by the deflection. To make a test the contact block is strapped to a clean part of the conductor of any shape, and connected to the instrument, then the product of the reading and the cross section (square inches) will give the current in amperes. This can be done on the round slide rule which is provided, the fixed scale corresponding to that of the millivoltmeter, and the movable disc is graduated in cross sections from 0·01 to 1 sq. in., and is also marked with the sizes of stranded cables. Low resistances, such as conductors, carbons, joints, or switch

General View of Instrument.



contacts, can also be measured. For this purpose, a copper resistance of 20 microhms is used as a standard, and a pair of spikes are supplied. The copper resistance is connected in series with the unknown resistance, and a steady current of about 20 amperes is passed through both. The current is then adjusted by means of a rheostat until the scale reading is 200, when the flexibles are transferred to the steel spikes which are pressed on the ends of the resistance to be measured, and the reading, divided by 10, gives the value of the resistance in microhms up to 0·00015 ohms. Should the resistance be greater, or the current unadjustable, the spikes must be pressed first on the copper resistance, and then on the unknown resistance, and multiply the ratio of the deflections by 20 and the result will give the resistance in microhms. This method is very useful for quickly testing the conductivities of contacts, joints, fuses, etc., on a switchboard. A certain length of copper on the board is taken as a standard, and the ratio of this deflection to that at the contact, joint, etc., multiplied by 20 gives the result in microhms. To extend the range tenfold, a resistance coil is provided, which can be plugged in the millivoltmeter leads.

Forthcoming Books.—The Cambridge University Press are shortly bringing out two books belonging to the series of Cambridge Manuals of Science and Literature, entitled, "Aerial Locomotion," by E. H. Harper and Allan Ferguson, and "Electricity in Locomotion," by A. C. Whyte. Both books will be published at the price of 1s. net.

ELECTRIC PORTABLE TOOLS

Amongst a list of Witton-Kramer portable tools, which has just been issued by the General Electric Co. (67 Queen Victoria Street, E.C.) is the "Runthru" drilling machine, shown in the accompanying illustration. It is a thoroughly well designed piece of apparatus, and the utility of this tool is shown by the following performance obtained under test by a $1\frac{1}{4}$ in. direct current drill.

A hole of diameter $1\frac{1}{4}$ in. and depth 1 in., was drilled in steel in two minutes, and in cast iron in half this time. Another of diameter 1 in. and depth $1\frac{1}{4}$ in. was drilled in steel in one minute twenty-five seconds, and in cast iron in one minute, and a $\frac{7}{8}$ in. diameter hole $1\frac{1}{4}$ in. deep was drilled in steel in one minute, and in cast iron in the same time. The time given is that taken to drill holes from start

"Runthru" Electric Drill.

to finish, and it will be seen that results will be more favourable in proportion as the depth is increased.

Many other drills with the single or double pillar are included for working in mines. Amongst the grinders dealt with are a tool post grinder, and a long snout grinder for external or internal work, and for commutators of large generators, and is supplied with a cross and longitudinal traverse. Various transportable equipments for grinding and drilling are also shown, and also one for tube cleaning, which provides a motor, flexible shaft, and a tube cleaning head of special design, consisting of three sets of cutters, with teeth of uneven pitch, and the head is of conical shape. The scale is attacked gradually along the conical surface, and all the cutters perform an equal amount of work. By means of springs, the cutters are enabled to pass easily round curves, and so clean the tube thoroughly. The majority of these tools can be had for an alternating supply of from 40 to 60 cycles or for direct current.

Wireless Telegraph Notes.—The Wireless Telegraph Ordinance, 1910, of British Guiana, provides that no wireless telegraph apparatus shall be worked in any place or on any British ship registered in the Colony except under licence granted by the Governor-in-Council. The wireless telegraph station at Slangkop, near Cape Town, is now working, and messages have been exchanged with vessels 1,500 miles at sea.

Electric Furnaces and the Law of Copyright.—At the Sheffield County Court on Friday, Mr. T. Scott Anderson, an electrical engineer, of Sheffield, claimed £100 damages against Verdon Cutts and Ernest Hoult for the publication of a pamphlet entitled "The Electrical Manufacture of Steel in the Verdon Cutts and Hoult Electro-Bessemer Furnace." It appears that Cutts was, until recently, in the employ of Anderson, and it was admitted that much of the information contained in the pamphlet complained of had been obtained whilst he was with Anderson, and was paraphrased from pamphlets issued by him. This fact was admitted, and Cutts and Hoult, after consultation with their legal advisers, did not defend their position. It was agreed that all remaining copies of the pamphlet should be destroyed, and £10 paid as damages, together with costs.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 18th, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

18,869/10. **Dynamo and Accumulator Switches.** S. L. PRICE. A switch of the type in which a rotatable insulated disc is provided with a contact plate in combination with an arm rotating thereon, and carrying a contact member adapted to slide over the disc contact plate radially by centrifugal force against springs, is covered by this invention, which provides the arm with two contact carriers and two springs, one contact for cutting in the circuit at a predetermined minimum speed of the generator, and one to cut out the circuit when the speed exceeds a certain maximum. The arm is adjustable on the rotary member for adjusting the tension of the springs. Five figures.

21,359/10. **Telephonic Apparatus.** C. H. JOHNSON and A. S. JOHNSON. This invention relates to telephonic apparatus for use chiefly on board ship, where it is likely to be damaged by water. The transmitter and receiver, placed side by side, or one above the other, are each made with a front flare-ended cone in the inner end of which is inserted a plug valve for controlling the openings communicating with the diaphragms of the instruments. The valve spindle is fitted with an operating handle the rotation of which is limited by stops. The handle is spring controlled, so that nominally the valve is kept in a position, closing, and thus protecting, the openings to the diaphragms from injury from water. The apparatus can be arranged so that when the valve is closed the instruments are out of circuit. When the instruments are required a movement of the handle opens the valve and puts the transmitter and receiver in circuit. Four figures.

1,930/11. **Electricity Meters.** ALLGEMEINE ELEKTRICITÄTS GES. This relates to meters where the consumption above a certain energy is registered by means of parts which rotate in the same direction, and being driven respectively by the meter and by a constant force corresponding to a determined maximum energy, in the improved meter two registering counting mechanisms are provided, one of which continually registers by an amount corresponding to the determined maximum energy, whilst the second only increases by this amount when the consumption is below the maximum energy, whereas on exceeding this the total consumption is registered, so that the difference of the results of the counting mechanisms shows the amount in excess of the determined maximum energy. One figure.

2,249/11. **Electro-magnetic Relays.** ADAMS MANUFACTURING CO., LTD. (*Cutler Hammer Manufacturing Co., Ltd.*) In alternating-current relays, the windings, which attract a number of cores in a longitudinal direction to actuate a pivoted switch member, are by this invention made to actuate a pivoted member which carries a switch and also a number of cores. The windings are arranged on a frame of conducting material to which one terminal is connected, the other end being taken to the supply, so that each winding is connected in a different phase of the polyphase supply which energises the relay. When an abnormal current flows in the circuit the pivoted arm is actuated to open or close the switch to control the required apparatus. The pivoted member may be normally held in this position, so that its contact switch engages with the stationary contacts by a tension device adjustable to vary the conditions under which the pivoted arm is actuated by the windings. Two figures.

4,911/11. **Electric Transformers.** E. B. KOOPMAN and PONTELEC WELDING PATENTS, LTD. This patent deals with the construction of the secondary of transformers of the **U** type, for heating and welding purposes, and instead of effecting the movement of the parts by removing material from the bend and thus securing a springing action at the free ends, the secondary is formed in separate parts, each being provided with a work-holder and arranged to move in relation to the other, and so move the work-holders to and away from one another. Six figures.

5,247/11. **Cooling of Rotors.** SIEMENS SCHUCKERTWERKE GES. In providing for the cooling of cylindrical slotted rotors the conditions for effective cooling require that the air shall be brought into as intimate contact as possible with the windings to be cooled, and also that the amount of cooling air passing shall bear some relation to the heat generated at that point. Now the heat generated in these kind of rotors is a minimum about the magnetic axis, and a maximum about the axis at right angles to this, and this patent provides ventilating ducts in close proximity to the slots, which are near the axis at right angles to the magnetic axis. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: WALTERS [Stage arc lamps] 11,559/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: WESTERN ELECTRIC CO. (*Western Electric Co.*) [Hygroscopic shield for suspended conductors] 24,123/10; PAUL [Overhead transmission] 28,687/10.

Dynamos, Motors, and Transformers: VON ZWEIGBERGK [Dynamos] 10,970/10; ALLGEMEINE ELEKTRICITÄTS GES. [Compensation of polyphase commutating machines] 26,685/10; HOLT [Dynamo machines] 26,880/10; SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckertwerke Ges.*) [Power factor of repulsion motors] 27,170/10.

Electric Ignition: PRESTWICH [Electric ignition of miners' lamps] 26,892/10; FLETCHER [Magneto machines] 2,436/11.

Electrometallurgy and Electrochemistry: SEWARD, VON KUGELGEN and VON BIDDER [Electrolytic production of light metals, particularly sodium] 11,175/10; FUSS [Ozonising apparatus] 2,618/11; BRAUN and SCHNEIDER [Galvanic gas cells] 25,879/10.

Heating and Cooking: MURRAY [Electric radiators] 11,013/10.

Incandescent Lamps: HARRISON [Manufacture of] 10,869/10; CARANGELO, 21,740/10.

Instruments and Meters: H. ARON ELEKTRIZITÄTSZAHLERFABRIK GES. [Prepayment electric meters] 3,450/11.

Switchgear, Fuses, and Fittings: ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Circuit controllers] 10,772/10; KESSLER and KESSLER [Magnetic separators] 18,253/10; JAHDE [Lamp reflectors] 13,931/10; CROSSLEY and HAMER [Cord grips for lamp-holders] 11,385/10; WIDMER [Waterproof protector for electric lamps] 24,909/10; CROMPTON & CO., MACFARLANE, BURGE and WILLIAMS [Regulating electric driving systems] 29,728/10; BROWN and TRAPAGNA [Switches for lamps of illuminated signs] 1,370/11.

Telephony and Telegraphy: MARCHANT [Telephonic transmitters] 24,390/10; SIEMENS and HALSKE AKT.-GES. [Automatic exchange circuits] 2,733/11.

Traction: MUNRO and RAILLESS ELECTRIC TRACTION CO. [Trolley poles] 11,157/10; [Electric traction systems] 17,874/10; HEISSE and SCHULTE [Elevated cable traction] 355/11.

Miscellaneous: LEMMENS [Thermopiles] 8,559/10; LIDDLE [Motor-driven capstans] 10,748/10; BOULT (*Rumely*) [Carburetters] 20,421/10; ELEKTROMECHANISCHE WERKE GES. [Rectifiers] 27,060/10; GODFREE [Electro-mechanical selector] 10,706/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: MENDIZABAL and BERTRAND [Motors] 20,143/11.

Electric Ignition: MAHER [Spark plugs] 7,108/11.

Telephony, &c.: TELEPHON APPARAT FABRIK, E. ZWICTUSCH & CO. GES. [Automatic telephone exchanges] 10,238/11.

Electrochemistry, &c.: PÖRSCKE and ACHENBACH [Secondary cells] 9,944/11.

Miscellaneous: ALLGEMEINE ELEKTRICITÄTS GES. [Coin feed mechanism] 9,942/11.

Opposition to Grant of Patents

16,328/09. **Tungsten Filaments.** C. H. WEBER. This patent has been granted in spite of the appeal referred to in ELECTRICAL ENGINEERING, Sept. 8th, 1910, p. 582, but no amendment is allowed. An abstract of this patent appeared in ELECTRICAL ENGINEERING, Jan. 6th, 1910, p. 16.

28,274/09. **Electrical Fans.** A. H. MIDGLEY and C. A. VANDERVELL. This patent has been granted in spite of opposition, and covers an economical method of constructing the blades to give a high propelling efficiency uniformly over the area traversed by the fan.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: F. M. LEWIS, 2,609/03; D. BALLARDIE [Lamps burning solid hydrocarbons] 2,050/05.

Distribution Systems, &c.: H. H. LAKE (*C. A. Gould*) [Electric distribution] 2,403/03.

Dynamos, &c.: W. A. JOHNSON [Electric dynamos] 2,339/05; M. W. W. MACKIE [Electric dynamos] 2,364/06.

Instruments, &c.: BRITISH THOMSON-HOUSTON CO., LTD., and F. HOLDEN [Electricity meters] 2,039/05.

Switchgear, &c.: W. E. GROVES [Electric junction boxes: couplings: and cut-outs] 2,512/04; A. W. TURNER, H. J. PEERS and H. J. W. RIDLEY [Relays for wireless telegraphy] 2,485/06; E. G. ANNESS and C. W. DENNY [Electric cut-outs] 2,777/06.

Telephony, &c.: SIEMENS BROS. & CO. (*Siemens and Halske Akt.-Ges.*) [Telephone systems] 2,266/05.

ELECTRIFICATION OF THE CRYSTAL PALACE SECTION OF THE LONDON BRIGHTON AND SOUTH COAST RAILWAY

DURING the past fortnight the Press has published many articles with regard to the extension of the L.B. and S.C. Rly. to the Crystal Palace, all couched in strong language of approval and appreciation of the action of the Directors, the eminently successful work of the Company's Electrical Adviser, Mr. Philip Dawson, and the thoroughness of the overhead construction, &c., carried out by Messrs. R. W. Blackwell & Co., and the good working of the Winter Eichberg motors. We heartily endorse all that has been said, and the praise is none the less sincere for the fact that the articles in question are all based on a pamphlet issued by the Railway Co. and written in such a way as to show that the Company are thoroughly satisfied with the work of their advisers and contractors. But there seems to have been practically no reference to one of the most important factors which has contributed to the success of the whole scheme, viz., the supply of current by the London Electric Supply Corporation. We recently published two long articles by the Company's engineer-in-chief, Mr. G. W. Partridge, describing the system of generation and supply, and those who have read these articles will agree that this part of the work is by no means negligible. The variations of load are considerable, as may be gathered from inspection of the diagram in Mr. Partridge's article, and on a system such as this there are always a certain number of heavy short circuits, which have caused considerable trouble in the generating stations of single-phase railways abroad. The Brighton Company, however, have had the benefit of the London Electric Supply Corporation's twenty years' experience to assist and to guide them, and the result has not only been an immunity from breakdown, but also a constancy of pressure, which has had a great deal to do with the success of the system and the proper working of the motors. Any variations of load called for by the Brighton Company (and they have not been inconsiderable) have always been coped with by the boiler plant at the supply station.

We feel compelled to put in a word for the Supply Company, as this is, with the exception of the Heysham line, in which the conditions were comparatively simple, the first large electric installation for supplying single-phase current for traction purposes in this country; and we think that the excellent results obtained by the Company, which have spared no expense in bringing their plant to perfection, should be accorded more than passing recognition.

ELECTRIC LIGHTING FOR MOTOR CARS

A PAPER entitled "The Electric Lighting of a Motor-car" was read by Mr. A. G. New at the Royal Automobile Club on May 10th last. The author emphasised the advantages of electrical over other methods of lighting for motor-cars. For a complete equipment, two lamps of from 16 c.p. to 32 c.p. were needed for the headlights, with two side lamps of 4 c.p. to 9 c.p., and interior and back lamps of 4 c.p. each. It was, however, seldom necessary to have head lamps and side lamps on at the same time. Thus for travelling in open country some 72 c.p. is necessary, and for standing idle about 16 c.p. These outputs are rather large for batteries of moderate size to maintain for any great length of time, and the author regards a self-containing means for charging the battery as practically essential. Quite a small battery can then be carried. The various dynamos which have been designed and put on the market were then considered. Some are merely modified from the constant speed form of construction by having permanent field magnets. These make no direct attempt to obtain any very close approximation to a constant rate of charge at all speeds, though they reduce the degree of deviation sufficiently to permit of full range use. Others still retain the old constant speed characteristics, but are furnished with mechanical-governor contrivances of one sort or another which either control the speed of the dynamo (friction-clutch fashion) so that it does not attain a high speed, whatever the engine may do that drives it, or which cut it out of action when its speed exceeds that which can safely be used. Others, again, are so constructed electrically that they automatically tend to keep down their powers of generation and thus aim at constant current production irrespective of speed. Just as there are numerous methods in vogue for regulating the output of the dynamo to prevent overrunning and to give it variable speed characteristics, so quite a number of different principles have been adopted to cut the dynamo in and out of circuit at minimum speed. Some are mechanical, taking the form of switches, operated by a governor mounted upon the revolving shaft; others are electrical in their action, controlled by the current itself passing through electromagnets that actuate the necessary contact-making arm; and there is one well-known system in which the use of any automatic cut-out at all is dispensed with by the employment of a free wheel clutch which permits the dynamo to continue revolving as an electric motor driven by the battery when otherwise it would be brought to rest while still in circuit, and so caused to consume a very undesirable amount of current. The author was in favour of the control being as automatic as possible. Further points dealt with included the method of fitting these dynamos to existing cars, and very satisfactory experience with some of these car lighting systems was recorded.

THE POST OFFICE AND THE TELEPHONE SYSTEM

IN asking the House of Commons on Thursday to vote £21,082,445 for the purposes of the Post Office during the coming financial year, an increase of 1¼ millions over last year, the Postmaster-General pointed out that this large growth was chiefly due to the taking over of the National Telephone Co. at the end of the present year. The working expenses of the company's system for the first quarter of 1912 would amount to £480,000, whilst the preliminary expenses in relation to the purchase of the plant would bring this sum up to £798,000. The remainder was accounted for by an enormous increase in Post Office work.

Speaking of the future of the telephone system, Mr. Samuel said he proposed to introduce within the next few weeks a Telephone Transfer Bill, which would give an opportunity for the whole policy regarding the telephone system of the country to be discussed. After pointing out that the number of Post Office telephones had increased by 13 per cent. during the past year, and the number of trunk conversations by 13 per cent., and referring to the laying of the new cable between England and France in which loading coils were made use of (ELECTRICAL ENGINEERING, Vol. VI., March 17th, 1910, p. 179), the Postmaster-General alluded to a scheme for promoting the use of the telephone among farmers. He is offering to instal telephones in farming districts upon an unlimited rate of £3 per annum on the party line system, where there are not less than five subscribers to each line. A large number of agricultural societies heartily support this reform, and there is every prospect of a big development in this direction.

Dealing with wireless telegraphy, a word of praise was given for the wisdom of Mr. Samuel's predecessor in purchasing the coast stations from the Marconi Co. and Lloyd's. During the past year the number of British ships equipped with wireless telegraphy has increased from 130 to 290. It is proposed to establish a new station near Newcastle to deal with the North Sea, and another on the Isle of Valentia in connection with the increasing traffic in the south-west of Ireland.

ARRANGEMENTS FOR THE WEEK

(TO-DAY), THURSDAY, MAY 25TH.

Electro-Harmonic Society.

6.30 p.m. Annual general meeting at Institution of Electrical Engineers, Victoria Embankment.

National Telephone Co.

7 for 7.30 p.m. Annual Dinner at Hotel Cecil.

Institution of Electrical Engineers.

8 p.m. "The Heating of Cables with Current," by S. W. Melson and H. C. Booth.

FRIDAY, MAY 26TH.

Physical Society.

3 p.m. Visit to National Physical Laboratory.

Institution of Electrical Engineers.

4.30 p.m. Annual General Meeting.

SATURDAY, MAY 27TH.

Association of Mining Engineers.

3.30 p.m. *Notts and Derbyshire Branch.* Annual meeting at University College, Nottingham. "Some Notes on the Use of Turbine Pumps in Collieries," by R. H. Willis.

5.30 p.m. *Warwickshire and S. Staffs. Branch.* At Imperial Hotel, Birmingham. Discussion on the New Rules relating to Electricity in Mines.

MONDAY, MAY 29TH.

University of London.

5.30 p.m. At Institution of Electrical Engineers. Lecture I. :—"The Application of Hyperbolic Functions to Electrical Engineering Problems," by Dr. A. E. Kennelly.

Hosted by Google

CATALOGUES AND PAMPHLETS RECEIVED

INSTALLATION MATERIAL.—A pamphlet in German from the Allgemeine Elektricitäts-Gesellschaft gives an interesting account of the principal features of the installation material supplied by the firm from the point of view of safety, convenience, and economy.

BOOKS.—Messrs. W. & G. Foyle (135 Charing Cross Road, W.C.) send us a copy of their catalogue of technical and other literature and reference books, nearly all of which are duplicated with second-hand copies.

CARBON FILAMENT LAMPS.—We have received from the British Thomson-Houston Co., Ltd. (Rugby), a pamphlet giving the prices per dozen of their surplus stock of carbon filament incandescent lamps. They are fitted with E.S. or C.C. terminals, but they can be re-capped with standard bayonet caps without extra charge. A reduction of ¼d. per lamp is made for 500 lots in one delivery, or ½d. per lamp for 1,000 lots in one delivery, and for minimum lots of 25 in one delivery, any of the lamps can be frosted and artificially coloured red, blue, green, amber, or opal. All orders will be treated in rotation. The same firm send an illustrated list of electric illuminated devices for the Coronation.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

MOTORS AND DYNAMOS.—We have received from Messrs. Wright & Wood (Century Works, Halifax) their latest price sheets relating to D.C. motors and dynamos, and two or three phase induction motors. In many cases, owing to improved design and the large quantity manufactured, the prices have been reduced.

ALUMINIUM.—The British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), have sent us a leaflet with instructions for polishing, satin finishing, and frosting aluminium.

PRIMARY BATTERIES.—A fully illustrated booklet has been issued by The India-rubber, Gutta-percha & Telegraph Works (Silvertown, London, E.) dealing with Leclanché cells chiefly of the agglomerate type, which they have improved by using six agglomerate blocks. The usual types of Poggendorf, Bichromate, Bunsen, Minotti, Grove, and Daniell cells are shown, and also the Bleeck-Love battery, which has an E.M.F. of 2·7 volts, a low internal resistance, great current capacity, and is very constant under varying loads. Two of the cells on one charge will run a 7-in. fan for 36 hours, or will light a 4-volt 4-c.p. lamp for 18 hours, or charge a 20-ampere hour 4-volt accumulator in 16 hours.

GUTTA-PERCHA, INDIA-RUBBER, WIRES, &c.—The same firm also sent a price list of gutta-percha, india-rubber, silk, and cotton-covered wires, jointing tools, and materials.

SWITCHBOARDS.—A copy of a catalogue of the Witton switchboards is to hand from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), describing and illustrating their standard switchboards, and also a number of separate panels. Customers can therefore purchase either a complete switchboard, or the panels, which can be assembled to form the switchboard, or in conjunction with the firm's meter (m) and switchgear (x and y) sections of catalogues, the switchboard can be built up.

TRANSFORMERS.—The Foster Engineering Co. (Morden Road, Wimbledon, S.W.), who were so successful some years ago with the small type of "Foster" transformer, have issued a leaflet illustrating the larger units which they are now making a special feature of. A 35 kw. three phase, 40 cycles, primary 2,500 volts, secondary 220 volts, also a 50 kw. single phase, 50 cycles, primary 2,000 volts, secondary 100, 200, or 400 volts, both being air cooled and double wound, are shown. The types made are step-up or down, single or poly-phase (air, water, or oil cooled), stationary or portable, either to the firm's design or to the specification of their clients.

SOLDERING MATERIALS.—A pamphlet from Bi-metals, Ltd. (30A Southwark Street, S.E.), contains a reprint of an article by Mr. A. H. Hiorns on solders, which calls special attention to the combined solder and flux known as "Tinol."

SUPPLY ADVERTISING.—Several new circulars are to hand from the Electric Supply Publicity Committee. These include a series of leaflets on electric service for printers, bakers, electroplaters, sawmills and woodworking shops, and engineers' workshops respectively. Other leaflets are addressed to builders, landlords, and property owners. Further pamphlets are entitled "Electric Light: The Safe Light," and "Electricity in the Nursery."

LOCAL NOTES

Bradford: *Tramway Accounts.*—The Corporation's tramways accounts for the year to March 31st show a net profit of £39,374, an increase of £7,010 over the previous year, which was itself a record. The sum of £22,000 is to be paid over to relief of rates.

Brighton: *Trolley Omnibuses.*—Although the Brighton Corporation were refused permission by the House of Lords Committee to oppose the preamble of the Brighton Railless Electric Traction Bill, which has passed, authorising the Brighton, Preston and Hove Omnibus Co. to run trolley omnibuses between Brighton and Rottingdean, a petition is to be presented in Parliament in opposition to the Bill when it comes before the House of Commons Committee.

Canada: *Toronto Power Scheme.*—The Toronto municipal electric light and power scheme was inaugurated last week. The municipality take current from the Ontario Government power plant at Niagara. It is stated that one effect of the municipal competition has been to force the Toronto Electric Light Co. to discontinue charging meter rates.

Utilisation of River St. Lawrence.—It is stated that the Canadian Light and Power Co. propose to dam the River St. Lawrence in order to utilise the water for the generation of electrical energy. The proposed spot for the dam is at the head of the river at the rapids, and the works contemplated involve an expenditure of between £3,000,000 to £4,000,000. A Government Commission is to be appointed to investigate the scheme.

Ceylon: *Electric Supply.*—The Government technical advisers have been investigating the possibilities of the Elfindale Falls in the Lower Maskeliya district, with a view to their utilisation for supplying electric power for all Government purposes in Colombo.

Clitheroe: *Lighting Order Revoked.*—The Board of Trade have revoked the Clitheroe electric lighting Provisional Order granted in 1904.

Coventry: *New Plant.*—A new 3,330 k.v.a. two-phase fifty-period turbo-alternator, with direct-coupled exciter, which has been supplied by the British Thomson-Houston Co., Ltd., of Rugby, has been put into operation. An additional set of the same capacity will be installed by September.

Dundee: *Tramway Accounts.*—The gross revenue from the tramways for the year ended May 15th was £61,522, which is an increase of £213 over the receipts for the previous year. The number of passengers carried, viz., 17,032,500, was an increase of 188,591. The Tramway Manager has been requested by those hitherto using the workmen's cars to reconsider the decision for a universal penny fare, but as this new system has been fixed for one year, he is unable to open the matter.

Exeter: *Electricity Accounts.*—There is a net surplus from the past year's working of the electricity department of £2,333 after meeting capital charges. The Electric Lighting Committee recommend that the charge for current for lighting to private consumers be reduced from 4½d. to 4d. per unit.

Meters on Tramcars.—The Tramway Manager calculates a saving of £467 last year by the use of meters on the cars.

Glasgow: *Electrification of Subway.*—It is stated that a London company is negotiating for acquiring the Glasgow Subway with the view of converting it to electric traction, and at the same time constructing two additional tubes.

Grimsby: *Electricity Accounts.*—The net profit from the electricity undertaking for 1910 amounts to £4,586, an increase of £700. The works' cost per unit have been reduced to 0·871d., which is the lowest yet achieved since the opening of the works. The Electricity Committee recommend that £500 be contributed to the rates and the balance transferred to reserve fund. There was an increase in the supply of energy for power purposes during the year of over 30 per cent., the motors connected to the mains now amounting to 1,298 h.p.

Hastings: *Dolter System.*—The Hastings and District Electric Tramways Co. have been petitioned by four thousand ratepayers to substitute the overhead trolley system for the Dolter surface contact system along the sea-front. The Company have written to the Corporation stating their willingness to promote a Bill with this object in view, but before doing so they ask for the Corporation's comments upon the proposal.

India: *Electric Lighting.*—A scheme for the electric lighting of Lahore is under consideration. The proposal comes from a private company.

Leicester: *Extension of Electric Lighting Area.*—The Corporation Electricity Department is canvassing all the outlying districts with a view to extending their mains.

London: *Meter Testing.*—In January, 1907, the London

Hosted by Google

County Council made new rules and fixed a scale of fees with regard to the testing of electricity meters. These rules have not yet been approved by the Board of Trade, and the Highways Committee have therefore taken the opportunity of revising them with a view to enabling the Council to charge reduced fees in respect of meters submitted in batches at the same time by an owner or firm, or in other exceptional circumstances. In connection with the general question of testing, in October, 1910, a new order was proposed by the Board of Trade in pursuance of section 11 of the Electric Lighting Act, 1909, and of the substituted section 50 of the schedule of the Electric Lighting (Clauses) Act, 1899, defining the limits of error to be allowed for electricity meters. A conference, at which the County Council was represented, was subsequently convened by the Board for the purpose of discussing the proposed order. As an outcome of this conference and subsequent consideration of the matter, the Board on March 8th, 1911, forwarded a copy of the rules and scales of fees submitted by the Council in January, 1907, as amended, including the provision of the Board's proposed new order, and several smaller points which had arisen during the course of the discussion, and the Council are now asked to approve of these.

L.C.C. Trams.—In presenting their estimates with regard to the tramway system for 1911–12, the Highways Committee call attention to the competition of motor omnibuses and the favourable conditions under which these companies are able to carry on their business compared with tramways. Whereas the omnibus companies pay nothing for the use of the roads nor for their upkeep, it is calculated that the rating of the tramways in London represents an average relief to the rates of over ½d. in the £. Again, the cost of maintaining the whole of the track by electric tramway authorities is regarded as inequitable, in view of the fact that, unlike the old horse-cars, in connection with which this system first came into use, electric cars entail no wear and tear except upon the rails, nor any expense in cleansing. Neither do the omnibus companies grant cheap workmen's fares. Whilst no definite suggestion is made in this connection, the Highways Committee ask the Council to bear these facts in mind when making comparisons. The net profit on the Council's undertaking for 1911–12 is estimated at £187,844 after meeting capital charges and interest, and after transferring the full allowance to renewals fund, a balance of £49,574 is added to general reserve. The total capital expenditure to date is £11,600,000, and it is estimated that a further sum of £2,400,000 will be required to complete the work of electrification and the construction of authorised lines.

Marylebone: Sales Department.—At last Thursday's meeting of the Marylebone Council, Councillor Duncan Watson complained that the Electricity Department had undertaken the wiring of a building in course of construction in Portland Place, and that as the building would have had to be wired in any case, the work should have been left to an electrical contractor. In the course of the discussion Councillor Hopkins, Chairman of the Electricity Committee, stated that the cost of wiring would be about £2 per point. A motion, prposed by Councillor Fettes, that the Electricity Committee should direct their officers not to undertake installation work in buildings in course of construction without the express approval of the committee, was accepted by the Chairman of the Electricity Committee and agreed to.

Norwich: *Proposed Purchase of Tramways.*—A committee has been appointed to consider the offer of the Norwich Electric Tramways Co. to sell their undertaking to the Corporation.

Truro: *Electric Lighting.*—The Town Clerk has been instructed to inform Mr. Swarbrick, of Leigh (Lancs), that the Council are not prepared to allow him to submit a scheme for supplying electricity in the district. Messrs. J. B. Saunders & Co., who have the scheme in hand, have asked the Council to guarantee them the public lighting for a term of years.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Derby.—A Local Government Board inquiry was held on Thursday concerning a loan of £8,500 for electrical extensions.

Devonport.—Tenders are invited for a twelve months' supply of direct-current meters, paper insulated cables, rubber-covered wires, and general engine-room stores.

Greetland.—The Council, which is being advised by Mr. W. Emmott, has a scheme of electric supply under consideration. It is possible that a supply will be given by the Yorkshire Electric Power Co.

Heckmondwike.—A Local Government Board inquiry was held last week concerning a loan of £4,159 for electrical extensions. This amount is made up as follows, condensing plant £3,000, cables £1,013 10s., service and mains £200.

In putting the Council's case before Mr. H. R. Hooper, the inspector, the Town Clerk stated that although £40,000 had been spent upon the undertaking, only half that sum had been authorised. The inspector expressed his dissatisfaction with the method of carrying on the undertaking, and, in going through the items of excess expenditure, took exception to a large number of them, and struck off £2,950.

Hemsworth.—An electric lighting installation is required for the new Hippodrome. Architect, W. E. Richardson, Rothwell, Leeds.

London: *Hackney.*—Mains extensions, at an estimated cost of £267, are recommended.

Loughborough.—A Local Government Board inquiry was held last week concerning a loan of £2,310 for extensions at the generating station. The Town Clerk asked for the loan to be repaid in thirty years, but Mr. T. C. Ekin, the Inspector, refused to recommend such a long period. Attention was called by the Inspector to the fact that the Borough Electrical Engineer, a salaried officer, was to receive consulting engineer's commission at the rate of 5 per cent. on the capital outlay, but he was informed that the Council's view was that the engineer could not be expected to design extensions at his ordinary salary.

Mansfield.—A Local Government Board inquiry was held last week concerning a loan of £4,000 for electrical extensions. The extensions include an additional generating set.

Oulton Broad—The Council have had a report prepared by a consulting engineer upon the proposal of the East Anglian Ice Co., to supply electricity in the district from a generating plant on the company's premises. It had been proposed to apply to the Local Government Board for a loan of £4,000, but at the last meeting it was decided to refer the matter back to the Electric Lighting Committee for further consideration.

Rotherham—An inquiry was held last week into an application by the Corporation for sanction to borrow £27,837 for electric extensions.

Russia.—According to the *Board of Trade Journal*, a British electrical engineer has applied for permission to promote a scheme for utilising some of the river and lake waters of the Highland districts of the Caucasus for the generation of electricity. A Technical Commission appointed by the Russian Government have approved of an undertaking of this character, and have prepared conditions under which a concession should be granted. The name of the engineer and the London address of the firm of which he is a member may be obtained by British manufacturers at 73 Basinghall Street, E.C.

Uruguay.—A Bill has been promoted by the Government for an expenditure of 115,000 pesos upon an electric light and power installation at the Monte Video harbour.

Wood Green.—An electric lighting scheme at an estimated cost of £20,000 is under consideration. A poll of the ratepayers is being taken to ascertain what support the scheme is likely to receive.

WIRING

Belfast.—Offices and stores for the Belfast Mineral Water Co. Architects, Moore & Flannigan, 35 Royal Avenue, Belfast.

Electric lighting of two villas on Purdysburn Estate. Asylum Committee. Tenders to Town Clerk by June 12th.

Falkirk.—Re-erection of premises for the Camelon Co-operative Society.—Considerable additions to Camelon fever hospital.

Glasgow.—Granary for Clyde Navigation Trust at Partick.

Leith.—Proposed elementary school at North Junction Street.

London.—New County Council fire station at Shooter's Hill.

Hosted by Google

It is stated that the London County Council will invite tenders from selected firms for the wiring and fitting of the new County Hall, and will not invite open tenders.

Maidstone.—Tenders have been accepted for the erection of new county offices.

Southampton.—Electric lighting of Great Hall at County Council Offices.

Swansea.—Three new elementary schools.

MISCELLANEOUS

Beckenham.—The Local Government Board have sanctioned a further loan of £5,000 for free wiring.

Grimsby.—The Council invite tenders for the electric lighting of all public streets not lighted by electricity. Particulars from the Borough Surveyor.

Stepney.—The Electricity Supply Committee invite tenders for meters, demand indicators, timeswitches and carbons. (See an advertisement on another page.)

TENDERS RECEIVED AND ACCEPTED

Argentine.—Messrs. Drummond Brothers, Ltd., of Guildford, are supplying the State railways with one of their universal machines for turning, boring, drilling, screw-cutting, milling, and gear-cutting, known as the "Drummond-Barreto."

Greenock.—The Electricity Department have placed the following contracts in connection with the extension to Dellingburn power station: 2 water-tube boilers with chain-grate stokers, also coal and ash bunkers and conveying plant, Babcock and Wilcox; one 2,000-kw. turbo-alternator with condensing plant, and 500-kw. rotary converters, British Westinghouse Co.

Gloucester.—The following tenders are recommended for acceptance. Steam turbo-generator, Willans & Robinson, £3,498; motor-generator, Phœnix Dynamo Manufacturing Co., £394; switchgear, British Westinghouse Co., £138.

Hindhead.—The D. P. Battery Co. have secured the contract for a new battery at the power station of the Hindhead and District Electric Light Co., Ltd.

Leek.—The tender of Messrs. Crompton & Co. has been accepted for the extensions of the switchboard at £65.

London.—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained the contract for the illumination of the Piccadilly Hotel. The wiring will be carried out by Messrs. Duncan Watson and Co.

London: *L.C.C.*—The following tenders have been received for the supply of electrical fittings for the second section of the Bow car-shed and the third section of the Hammersmith car-shed:—Brecknell, Munro & Rodgers, £76 18s. and (alternative) £83 6s.; Estler Bros., £81 7s.; W. Wood & Co., £90 6s.; A. Wiseman, £91 3s.; Dick, Kerr & Co., £95 19s.; British Insulated and Helsby Cables, £108 16s. The first tender has been accepted.

APPOINTMENTS AND PERSONAL NOTES

Mr. George Tate, who has fulfilled the position of Works Manager to Messrs. Arc Lamps, Ltd., for the ten years since the Company's formation, has now severed his connection with them. Communications for Mr. Tate should be addressed to 3 Blenheim Road, St. Albans.

Mr. H. W. Butler has resigned his position as Chief Engineer to the Electrical Power Storage Co., Ltd.

Automatic Electric Fire Alarm Systems.—An amalgamation is to be effected between the Pearson Fire Alarm, Ltd., and the May-Oatway Appliances, Ltd., and for this purpose both companies are to be wound up voluntarily.

Osram Lamps.—We are informed by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) that the ironclad *Verité*, upon which the President of the French Republic shortly starts upon his voyage, is entirely illuminated by Osram lamps.

Yorkshire Local Section of the Institution of Electrical Engineers.—At the annual general meeting of the Yorkshire Local Section of the Institution of Electrical Engineers, held last week, the following gentlemen were elected for the ensuing session. *Chairman:* Mr. T. Harding Churton (second year of office); *Vice-Chairmen:* Wilson Hartnell (second year of office), and Walter Emmott; *Honorary Secretary:* H. Dickinson; *New Members of the Committee:* Messrs. G. D. A. Parr, H. Visger, W. N. Y. King, and E. S. Rayner. At the meeting sympathetic reference was made by the chairman to the death of Sir Nathan Bodington, Vice-Chancellor of the Leeds University, and a vote of condolence passed to Lady Bodington in her bereavement.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, net c.i.f. port of arrival, quoted on Tuesday night, was £56 15s. to £57 5s. per ton (last week £55 15s. to £56 5s.).

Westinghouse Turbo-Plant.—The British Westinghouse Electric and Manufacturing Co. (Trafford Park, Manchester) call our attention to the fact that they are now fully equipped for supplying complete lines of turbo-generators, turbo-compressers, blower pumps and auxiliaries, without the necessity for subcontracting.

Carbon Lamps for Illuminations.—The Electrical Co., Ltd. (122–124 Charing Cross Road), are making a special offer of large quantities of standard quality of carbon lamps at 3s. 4d. per dozen.

Canadian Agency.—A well-known firm, manufacturing electrical insulators in stone-ware and porcelain, also conduits, cable racks, etc., for electric power stations, requires the names of Canadian importers. Further particulars can be obtained from the Board of Trade Intelligence Department, 73, Basinghall Street, E.C.

Liquidation.—A meeting of creditors of the Australian Electrical Co., Ltd., will be held at 20 Copthall Avenue, London, E.C., on May 29th, at 3 p.m. Notices of claims should be sent to E. Pears at the above address not later than June 20th.

Bankruptcies.—The first meeting of creditors in the bankruptcy of J. D. Carlmark, electrical engineer, 402 High Street, West Bromwich, will be held on Friday next, at 191 Corporation Street, Birmingham, at 11.30 a.m. The public examination will be held on June 2nd, at the Law Courts, West Bromwich, at 10.30 a.m.

The last day for receiving proofs in the bankruptcy of W. H. Illingworth, trading as the Yorkshire Metal Filament Lamp Co., Halifax and Leeds, is May 31st. The trustee is W. Durrance, 12 Duke Street, Bradford.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Hastings & District Electric Tramway Co.—The scheme for reducing the capital of this company by writing down £4 10s. each on the ordinary shares has been sanctioned by the courts.

Bergmann Electrical Co.—At the annual meeting of this company, which was recently held in Berlin, it was stated that the patent action with the "Z" Lamp Co. had cost them 150,000 marks. It will be remembered that the "Z" Lamp Co. proceeded against Messrs. Marples, Leach & Co. (now the Adnil Electric Co.), as agents of the Bergmann Co., for infringement of certain of their metal filament lamp patents, and succeeded.

Johnson & Phillips.—The accounts for 1910, after charging £5,337 for maintenance of buildings, plant, &c., show a net profit of £24,117. After writing off sums for depreciation, &c., the balance of £2,154 is carried forward. The net profit shows an increase of £7,815 over the previous year.

Waste Heat and Gas Electrical Generating Stations.—An issue is being made of 160,000 £1 shares at 21s. per share. The new capital is required in connection with the construction of the new power stations which the company's expanding business have rendered it necessary to erect.

Torquay Tramways Co.—An issue is being made of 60,000 5 per cent. prior lien debentures at 95. This capital is required in connection with the reconstruction of the tramways for the overhead traction, and also for the extensions to Paignton.

The Lots Road Turbines.—Before a Divisional Court yesterday, consisting of Mr. Justice Pickford and Mr. Justice Lush, the British Westinghouse Manufacturing & Electric Co., Ltd., sought to have set aside the award of the Hon. Alfred Lyttelton, K.C., in the arbitration between the company and the Underground Electric Railways Co. of London, Ltd. It will be remembered that the original Westinghouse turbines installed in the Lots Road power station did not fulfil the contract conditions, and it was agreed that they should be displaced by Parsons machines. Arbitration was resorted to in order to determine the basis upon which the Underground Co. should be paid. After a direction from a Court consisting of the Lord Chief Justice, Mr. Justice Hamilton, and Mr. Justice Avory, the arbitrator decided that the Underground Railways Co. should be paid the full price of the Parsons machines, plus the cost of the difference between the actual steam consumption of the Westinghouse machines and the contract figures during the time these turbines were running. The Westinghouse Co. contest this on the ground that it is a misconstruction of the Arbitration Acts. When the case came on yesterday, their Lordships intimated that they would feel bound to adopt similar views to those expressed by the Lord Chief Justice and Justices Hamilton and Avory, and in the circumstances it was agreed to take the case direct to the Appeal Court.

SUMMARY

Our monthly Supplement on Electrical Engineering in Mines is included in this issue. It opens with a report of a Paper by Mr. H. J. S. Heather on the driving of winding engines by induction motors, discussed at a recent meeting of the Institution of Electrical Engineers. Notes are given of the principal patents relating to electrical mining work published during May, and attention is drawn to some of the exhibits at the recent mining exhibition in Manchester. A publication on modern mining switchgear is reviewed, and a short article deals with a new system of electric winding. Notes are also given on some recent accidents. An illustrated article gives particulars of some new mining switches, and a report is included of a meeting of one of the Scottish branches of the Association of Mining Electrical Engineers.

The annual meeting of the Institution of Electrical Engineers was held last Friday, when the premiums &c., awarded were announced. The Council have under consideration the holding of informal meetings and of provincial summer meetings, and arrangements for the giving of special lectures at ordinary meetings. The holding of examinations for associate membership has been decided upon, and increases in the subscriptions and entrance fees are contemplated. (Page 305.)

The next action brought by the Osram Lamp Works, Ltd., for alleged infringement of their patents, will be against the "Z" Electric Lamp Manufacturing Co., Ltd., and may be expected to come on after the long vacation. An application in the Chancery Court on Friday showed that the latter Company is anxious that the action should be brought against the Company itself, and not against its agents or customers. (Page 305.)

Among the specifications published by the Patent Office on Thursday last was one by W. Walters, for a means for rendering stage arc lamps independent of one another in the circuit, and one by W. J. Marchant relating to an improved telephonic transmitter to increase the efficiency of the receiver in combination with it. The following patents expire after a full life of fourteen years: C. O. Bastian, dealing with electrolytic meters; G. Page, describing electric switches; two by the British Thomson-Houston Co. (E. D. Priest, New York), on motor controllers and open-circuit controllers, and another by the same firm covering an induction motor meter. (Page 306.)

Judgment was given on Monday on the two preliminary points raised in connection with the transfer of the National Telephone Co.'s business to the State. Two members of the Railway and Canal Commissioners gave judgment in favour of the Company in regard to the meaning of the word "unsuitable," holding that it only related to the character and quality of the plant and not to the quantity. The same two Commissioners also held that part of the notices of objection to plant given by the Postmaster-General was good and part bad. The third Commissioner, however, dissented on all points, holding that the whole of the notices were good, and that the word "unsuitable" had a quantitative as well as a qualitative meaning. As the majority of the Commissioners gave judgment in favour of the Company on all matters except one set of notices, the Postmaster-General is appealing against their decision. (Page 307.)

A correspondent refers to the origin of the governors referred to in Mr. Partridge's recent article on the single-phase plant supplying the L.B. & S.C. Railway. (Page 307.)

At the seventeenth annual staff dinner of the National Telephone Co., the Rt. Hon. Herbert Samuel, Postmaster-General, spoke of one or two new clauses to be shortly introduced by him in the Telephone Transfer Bill in the House of Commons. (Page 308.)

Hosted by Google

THE Brighton tramway accounts show a net profit of £137, and the electricity accounts a net profit of £4,751. —Owing to a pickaxe being driven into a cable at Aberdeen, it was found necessary to shut down the electricity works for a short time.—The Blackburn tramway manager is not prepared to recommend the adoption of meters on tramcars.—There was a net profit on the Stepney electricity undertaking last year of £1,760. (Page 308.)

NEW generating plant is required at Accrington, and boiler extensions at Hammersmith.—Local Government Board inquiries have been held at Barnstaple, £1,442; Hull, £99,000; Loughborough, £9,143; St. Helens, £10,800.—The Salisbury (S. A.) Council propose to borrow £120,000 for electricity purposes.—Time switches for public lamps are required at Hammersmith, and a new boiler at Shrewsbury. (Page 308.)

A 10 PER CENT. dividend is recommended by the Chloride Electrical Storage Co., Ltd., and a similar dividend, with a bonus of 5s. per share, by Callender's Cable & Construction Co.—A receiver for the debenture holders of Messrs. Cowans, Ltd., has been appointed.—The Brush Electrical Engineering Co.'s accounts for 1910 show a loss of £10,780. (Page 310.)

Guard Wires on Electric Tramways.—The revised regulations and memorandum of the Board of Trade regarding guard wires on electric tramways and light railways laid on public roads, dated March, 1911, are given in the June number of the *Journal of the Tramways and Light Railways Association*. There are a few alterations since the last edition. The regulation is now worded to include "telegraph, telephone, or *other* wires, unprotected with a permanent insulating covering," and applies now to "railways" as well as "tramways." The most important alteration in the memorandum is the provision that "each guard wire erected after the date of this memorandum should be well earthed at each end, and at intervals of not more than five spans." Short guard wires were formerly only required to be earthed at one point.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JUNE 1ST.

National Electrical Manufacturers' Association.

2.30 p.m. Council Meeting at Balfour House, Finsbury Pavement, E.C.

THURSDAY, JUNE 8TH.

Royal Institution.

3 p.m. Afternoon Lecture on "Practical Progress in Wireless Telegraphy," by T. Thorne Baker.

ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to the Editor, ELECTRICAL ENGINEERING, *203-6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.*

G. F. C. (Paignton).—This is usually a matter of arrangement. The prevailing custom is to charge at power rates, but the supply authority has the power to charge at lighting rates.

New Ventilation Scheme for the Central London Railway.—It has been decided to apply the Ozonair system of ventilation to the whole of the stations and tunnels of the Central London Railway, and an order for a complete ventilating and air-purification installation has been given to Ozonair, Ltd. (96 Victoria Street, S.W.). In the Ozonair system of ventilation the air passes into an inlet chamber, where it can be heated or cooled, and is then drawn through a filter, which removes all smuts and at the same time absorbs deleterious gases such as ammonia and sulphurous acid. It then passes through the ozone generator to a distribution fan and mixing chamber, and is delivered where required in a clean and sterilised condition at a suitable temperature. The ozone is produced electrically, and the proportion mixed with the air can be regulated. A complete plant will be fixed in each of the thirteen stations of the railway, and the total capacity of the thirteen plants will be ninety million cubic feet of air per day. Over two miles of ducts will be employed.

Mr. Flecks tests the electric miner's lamp which he was proposing to submit for the Home Office competition.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

THE DRIVING OF WINDING ENGINES BY INDUCTION MOTORS

A PAPER on the use of induction motors for winding purposes was read at a meeting of the Institution of Electrical Engineers on Thursday, May 18th, by H. J. S. Heather. Hoisting and winding, he said, is usually done by continuous-current motors, either on the Ward-Leonard control system, with or without the Ilgner flywheel. In these the winding motor with a constant field is electrically connected to a direct-current separately-excited generator, which is driven by a motor, the latter motor being connected to the mains, and the torque exerted by the winding motor is proportional to the current flowing in its armature, and a reversal of one causes a reversal in the other. If the torque is in the direction of the motion of the motor, mechanical work is given out, but if they are opposed the winding motor becomes a generator and drives the machine that was formerly a generator as a motor, and the motor which was connected to the supply mains also generates and supplies current to the line, so that the control is regenerative. The separately-excited machine is controlled by a starting lever, which can be moved backwards and forwards, the former reducing or reversing the torque.

The only simple method of speed control in an induction motor is to insert resistance in the rotor circuit, and this is comparable to the rheostatic control of the separately-excited field of the generator in the Ward-Leonard system, and power is absorbed in resistances in each case, and the two systems are therefore similarly wasteful. Regenerative control is also a feature of the induction motor. When lowering above synchronous speed, the machine acts as a generator and supplies current to the mains.

Fig. 1 shows three torque-slip curves: Curve 1 with no resistance in the rotor circuit; Curve 2 shows the effect of

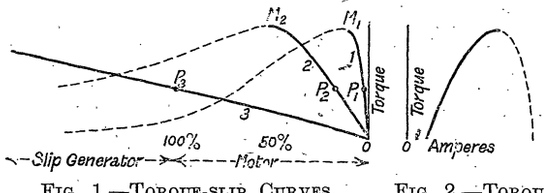

FIG. 1.—TORQUE-SLIP CURVES.

FIG. 2.—TORQUE-AMPERE CURVE.

inserting resistance in the rotor, viz., spreading out the curve and obtaining the normal full-load torque at a much higher slip; finally, if further resistance be added, Curve 3 is obtained, and the full-load torque (P_3) is seen to occur at standstill or 100 per cent. slip. Curve 3 also shows that there is no limit of speed at which the braking action can take place, since any torque up to the maximum can be secured at 100 per cent. slip.

Having shown that it is equally possible to use either system, the author next considered the question of power taken from the mains. When lifting, the current derived from the mains is got by dividing each ordinate above the zero line of the working diagram by an efficiency factor, and when regeneration takes place by multiplying each ordinate by a corresponding factor to get the power returned to the mains. The full consumption diagram for the Ward-Leonard system is shown in Fig. 3. In the case of the induction motor, the action of the motor under a reverse current at speeds below full speed must be remembered. The power taken from the mains for a given torque is now independent of the speed and also of the direction of the torque, and is determined by dividing the power put into

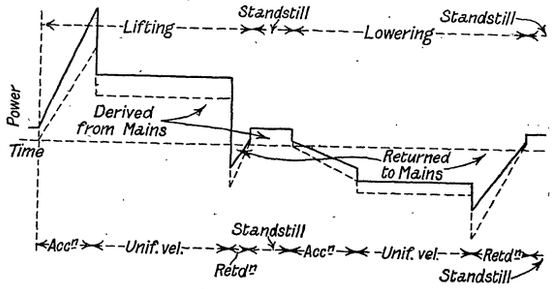

FIG. 3.—POWER CONSUMPTION CURVE FOR THE WARD-LEONARD SYSTEM.

the winding drums at full speed by the efficiency of the motor, and adding to this, for the lowering trip, the product of the power given out by the drums and the corresponding efficiency factor. This is shown in the power-consumption diagram, Fig. 4, derived from the torque-time diagram. In each case the full line represents the power consumed, the dotted lines showing the power given into and coming out of the drums.

It is easy for the driver to know when to increase or decrease the rotor resistance by using an ammeter as a torque indicator.

Returning to Fig. 1, it will be seen that so long as the full portion of the curve is worked on, an increase of resistance always reduces the torque, and a decrease of resistance always raises it. Again, there is only one torque ampere curve to all torque speed curves, and Fig. 2 shows that the amperes increase from zero torque to a maximum torque, and reach a maximum when the slip is infinite. The dotted part of Fig. 2 corresponds

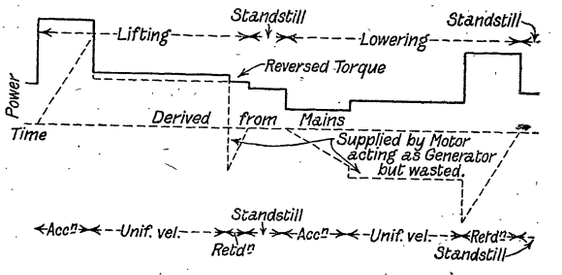

FIG. 4.—POWER CONSUMPTION CURVE FOR INDUCTION MOTOR DRIVE.

to those in Fig. 1, so that as long as the amperes are kept within a certain maximum value, which can be fixed for any motor, it can be ensured that the full live portion of the curve is being worked on. In conclusion, the author points out that although the power-consumption is much higher, where much lowering has to be done, the arrangements for the induction motor are simpler and safer, besides being cheaper, and where large plants are available for obtaining cheap power, the induction motor-drive would be advantageous.

DISCUSSION.

Mr. W. H. PATCHELL, who read the Paper in the absence of the author, who is in South Africa, also read a letter from Mr. Heather, in which he stated that his firm, Messrs. Eckstein, were putting down induction motors for driving winding engines to the number of 160, ranging from 400 h.p. to 1,500 h.p., several of which are already running with satisfactory results. The difference in capital cost as compared with the Ward-Leonard system had not been worked out, but the total cost of the induction motor system would not be less than £50,000. Electrical energy is purchased at a fairly low rate. Mr. Patchell then showed some slides of the winding plant at the Ferndale Colliery, which is on the Ward-Leonard system. The flywheel weighs 30 tons, and has a diameter of 12 ft. and a width of 2 ft. 6 in. The normal speed is 500 r.p.m., and it is allowed during winding to vary 15 per cent. There is enough energy in the flywheel to do four complete winds should the supply fail, and there is a battery in the power station to look after the excitation. Incidentally, Mr. Patchell mentioned that a particularly efficient mechanical safety appliance was used on this winding plant, and it was of the type in connection with which the Prussian Government allowed higher speeds when lifting men than when steam winding is used.

Mr. W. C. MOUNTAIN (Messrs. Ernest Scott & Mountain) said that if winding could be done by means of a direct-coupled motor, and the complications of the Ilgner system dispensed with, it would be a distinct step forward, owing to the very considerable reduction in cost. He believed that small winders with helical gearing between the motor and the drum would find very considerable favour for small collieries; they were less expensive, and the helical gearing was very efficient. On the other hand, even at the Carville power station they felt the effect of a particular winder having a 700-h.p. induction motor, which required 1,700 h.p. at the moment of acceleration. The figures he had recently taken out were for a shaft 780 ft. deep, the weight of coal to be wound was 2 tons 4 cwt., the main rope was 4 inches diameter, and the balance rope was slightly larger. The time allowed for winding was 40 seconds, and for banking or change, 15 seconds. The acceleration was 2·73 ft. per sec. per sec., the maximum velocity 23·2 ft. per sec., and the rate of retardation was 5·8 ft. per sec. per sec. With the induction motor system the horse-power required for acceleration was 440, whilst on the Ilgner system the mean horse-power required, or input into the motor driving the generator, was 210, or about half. With the induction motor, however, there was a complete stoppage between each wind, and hence with this system only 2·3 units per wind were required, as against 2·7 with the Ilgner system. In these estimates he had assumed an over-all efficiency of 70 per cent. for the Ilgner system. There was also an objection to the complication of the Ilgner system. It had occasionally happened in the North of England that the plant was laid up for six weeks entirely through the motor on the Ilgner set failing. Finally, Mr. Mountain mentioned that motors should be wound in such a way that they can be simply and quickly repaired in case of accident. He advocated that a winding engine motor should be wound at low voltage, with plain copper bars in the stator, running in mica tubes, with the simplest possible connections at the end, and that a transformer should be used to reduce the line voltage.

Mr. G. STJERNBERG (Lahmeyer Electrical Co., Ltd.) said that the efficiency of any system should be calculated upon the rapidity of the wind as measured by the ratio between the average speed of winding and the time allowed for the wind, and not by the average speed or the maximum speed alone. This ratio varied very considerably in various mining districts. In England it reached about 0·3 metres per sec. On the Westphalian coalfields it rarely exceeded 0·25, and in South Africa it was rarely more than 0·15; 0·06 was quite a usual figure. He put the over-all efficiency of the Ward-Leonard system at about 73 per cent., and for the resistance control system 88 per cent., but as the ratio of the average speed to the total time increased, the efficiency dropped off at a different rate. For the Ward-Leonard system it dropped off slightly, whilst with the resistance control it dropped off quickly. The lower limit of efficiency for the Ward-Leonard control he put at 55 per cent., excluding shaft losses and mechanical losses. With winders driven by induction motors and resistance control as advocated by the author, the corresponding lower limit of over-all efficiency would be 35 per cent. These figures referred to winders with balance ropes, which, as a matter of fact, were not used on the Rand, and without balance ropes the limits within which the induction motor drive was efficient would be narrower still. On the Rand they had reduced the rope weight to the smallest possible value, working with a factor of safety of 7 against 9 to 12 in this country. Further, they did not wind coal on the Rand, but ore with a higher specific gravity, which made the rope weigh relatively less as compared with the weight of the load. In other words, the conditions on the Rand were exceptionally favourable for the use of induction motors with resistance control, and he thought Mr. Heather was to be congratulated on having adopted it under those conditions. He thought more might have been said on the question of the simplicity of the two plants as regards switching connections during winding. With the Ward-Leonard system there was no connection at all in the main circuit; no circuits transmitting energy were broken, but with the resistance control method there were a number of contacts. He preferred mechanical braking designed to allow of any degree of adjustment, with perhaps electrical braking with counter-current as an extra safeguard. If one relied entirely on electrical braking, the winder was entirely without control, when the supply failed.

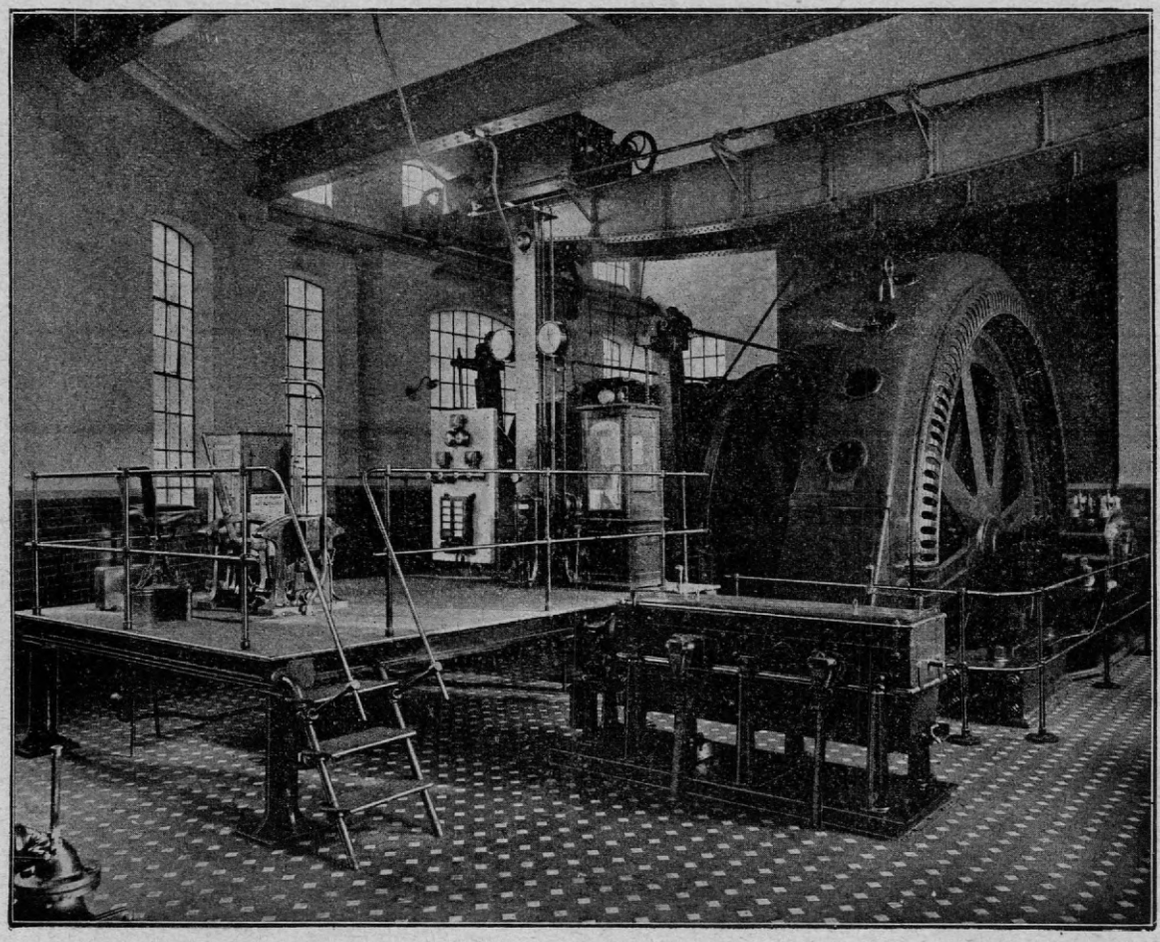
Mr. GERALD STONEY referred to the Harton winder, the first one mentioned by Mr. Mountain. The maximum demand of 1,700 h.p. distinctly affected the Carville power station, in spite of its 30,000-kw. capacity. He had never been able to ascertain whether this load came on and went off at a good power factor or a bad one, so that part of the drop in voltage was due to part of the load coming on with a rather poor power factor. Winders in any numbers were the source of considerable fluctuations upon a power station, and he did not think that the induction motor system was likely to come into use with public power stations supplying both lighting and power, for, as Mr. Mountain had pointed out, it would be necessary for the stations to be capable of dealing with about double the load compared with the Ward-Leonard system. At the same time he understood that the cost of the induction motor system in a certain case would be £1,150, against £1,600 for the Ward-Leonard. In conclusion, he suggested that instead of having two cages in the shaft going up and down, there should be four. On the average, the time of retardation and stoppage at the top or bottom of the shaft was equal to the time accelerating. Therefore, if two loads were superimposed, one over the other alternately, they would get a very fairly uniform load on the generating station, when the induction motor system was used.

Mr. C. H. GADSBY asked what was the rope velocity in the Ferndale installation, and what was the number of revolutions per minute of the induction motor. He had been going into the question, and had come to the conclusion that with a large winding drum there was an enormous rope velocity with any ordinary speed of induction motor.

Mr. W. H. PATCHELL, in closing the discussion, said that there were not many cases in which one would care to put down a private supply station big enough to supply a big winder on an induction motor. Mr. Heather purchased his power from the Victoria Falls Power Co. Stage winding, so much used in South Africa, introduced different conditions to those common in this country, as it involved the use of two or three separate engines to wind from the bottom to the surface, and, on account of the space which was available for the engine-house, the induction motor presented considerable advantages as compared with the larger space taken up by Ilgner sets. Mr. Heather had mentioned that the balance rope was not used very much in South Africa. In England also its use had been somewhat restricted, due, to a very large extent, to the irregularity of the driving of the steam winding engines. But electric driving got over the whole of this difficulty, and the balance rope would come more into use with the gradual extension of electric winding. In reply to Mr. Gadsby, he said that the diameter of the Ferndale drum was 16 ft. on the tread. The maximum speed was 63 feet per second, and it was winding from a depth of 516 yards, 3 tons per wind. The output in the day of 9 hours was 1,800 tons. It was a new plant, and at the present time there was not space enough at the bottom of the pit to handle this quantity, but the plant had been tested at rather over 200 tons an hour, and it operated with the greatest steadiness.

ELECTRICAL MINING PATENTS OF MAY

AMONG the patents published during the past month of interest to electrical mining engineers, was one (No. 2382 of 1910), by H. W. LEE, and G. H. WEEDMAN, of Mount Morgan, Queensland, Australia, relating to mine alarm instruments, which are constructed of a wire circuit and several telescopic jointed pipes of size and description to suit drives, where there is likely to be danger from the roof creeping. The slightest movement can be immediately signalled by alarm bells or electric lights, or by both, to various parts of the mine.



Specification No. 25974 of 1910, by W. E. LAKE, of London, covers certain improvements in mining machinery, consisting of a conveyor for transferring material, and a supplementary conveyor mounted upon a truck for transferring material from the mining machine conveyor to a certain point. The supplementary conveyor is so mounted that it can slide laterally on the truck, and can also be brought into or out of alignment with the mining machine conveyor.

Specification No. 26892 of 1910, by J. PRESTWICK, of Eccles, Lancashire, describes a means of electrically igniting miners' safety lamps of the class in which a low voltage current causes platinum or other material to incandesce, so that any authorised person in any part of the mine can light the lamp from an ordinary portable storage battery.

THE COLLIERY EXHIBITION AT MANCHESTER

THE colliery and general mining exhibition which was open at the City Exhibition Hall, Manchester, for a fortnight during last month and closed its doors last Saturday, was not so rich in exhibits of electrical plant as that of more general nature, and perhaps this is not to be wondered at considering the forthcoming electrical exhibition this year at Olympia. Reference may be made here, however, to one or two items of interest to mining electrical engineers.

Arc lamps were represented by the regenerative flame lamp of the Jandus Arc Lamp and Electric Co., Ltd., various forms of which have been described in ELECTRICAL ENGINEERING from time to time, and the only exhibit of incandescent lamps was by the British Westinghouse Co., whose "Auriga" metal filament lamp also illuminated the exhibitors' club.

Turning to more purely mining matters, we find a display and good show of electric coal long wall coal cutters, both for three-phase and continuous currents. Another exhibitor of coal cutters were A. Hirst & Son, of Dewsbury, makers of the "Crescent" coal cutters, drills, &c.; both disc and chain-type machines are made with continuous- or alternative-current motors, but examples of the disc-type only were shown. These cutters were also shown in operation on the stand of the Harland Engineering Co. (196 Deansgate, Manchester), together with an electrically-driven turbine pump and a number of ironclad fuseboards, joint boxes, and accessories, designed to meet the new Home Office rules. Electrically-driven pumping plant also figured in the exhibits of Tickle Brothers (Wigan), Mather & Platt (Manchester), and W. H. Baily & Co. (Salford). The last mentioned also showed electrically-driven air-compressors of the "Köster" two-stage type, and air-compressing machinery was also conspicuous on the stands of John Wood & Sons (Wigan), Matthews & Yates (Manchester), and Tilghman's Patent Sand Blast Co. (Manchester). An interesting demonstration of the Pittler rotary air-compressor was also given, and a display of electric fans was given by Musgrave & Co. (Manchester).

Electric safety lamps were shown by Ackroyd & Best. Their lamps were fitted with Hailwood's patent magnetic lock and lens in top so as to give good roof light, also with water protector to prevent flame from communicating from burst bulb with gases of the mine if the outside glass is improperly fastened. This firm also exhibited safety underground relighting apparatus for oil-lamps, constructed in such a manner that the lamp must be enclosed in flame proof, fool proof chamber before the current can be switched through the lamp and same lighted. Special care has been taken to see that in this machine all the joints are such that they cannot be left improperly fastened, and cannot get out of order. Magnetic unlocking machines were also shown. Another firm showing electric lighting and locking appliances for safety lamps was The Protector Lamp and Lighting Co. (Eccles).

Electric shot firers were shown by the Cotton Powder Co., and electric shot firing was also represented on the stand of the British Electric Detonator Co.

Among the more general exhibits attention may be directed to that of the Lea Recorder Co., whose newest "Midget" design of well-known integrating recorder, with capacity up to 20,000 lbs. per hour, was on view, as well as other patterns. This is a self-contained instrument, which can be set down anywhere and coupled up for boiler and engine testing. Two well-known systems of water softening plant were represented on the stands of Messrs. Lassen & Hjorth and W. Boby.

MODERN MINING SWITCHGEAR

THE British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester), have issued a pamphlet entitled "Electricity in Mines," which should be of use to mining electrical engineers. It opens with a reprint in convenient form of the report of the Departmental Committee on the special rules for the use of Electricity in Mines, with an appendix including the new regulations, the various forms of notice, model daily log sheet, and the "memorandum" containing the comments and recommendations of the committee on practical points arising in connection with the rules as regards constructional and technical details. In the centre of the pamphlet is an illustrated supplement dealing with some of the latest forms of switchgear, specially designed for the company in accordance with mining requirements, and known as type S. & S.R. ironclad switchgear. The automatic features of the gear are first explained, including the loose-handle control, no-voltage and overload releases, and time-limit attachments. Other special features which can be applied are a "no-volt no-close" device, remote mechanical or electrical trips, and a leakage current trip. Somes notes follow on instruments for use with this switchgear, including ammeter voltmeters and ground detectors, the last mentioned consisting of an instrument of the milliammeter type for pressures up to 750 volts; or, again, an electrostatic instrument where the voltage is higher. In the case of three-phase circuits this has a single moving part which is attracted to any one of the three fixed shields connected to the three phases. A copious series of illustrations are given of the various forms in which these switches, &c., can be made up. The switches can be arranged for mounting on the wall or on pillars, with or without isolating boxes interlocked with the switches, and in all cases the working parts, although normally most securely enclosed, are easily accessible for inspection. The whole switch case can in many cases be withdrawn bodily, being fitted with knife plug contacts, and a useful feature is a door for enclosing these contacts after the switch has been removed. These main oil switches and pillars are standardised up to 6,000 volts, and at this pressure have additional oil tanks for the shunt transformer and its fuses. Special motor control pillars are made up in a similar way with enclosed star-delta, auto and other forms of starter, or full oil-immersed controllers. Indeed, the gear can be arranged in almost any combination. Typical illustrations of other patterns of colliery switchgear, main, switchboards, &c., are also included in this interesting pamphlet.

THE C.M.B. AUTO-CONVERTER FOR WINDING PLANTS

A NEW pamphlet from Messrs. Crompton & Co., Ltd. (Salisbury House, London Wall, E.C.) deals with the various uses to which their "C.M.B. Auto-converter" can be put. This apparatus, which is a machine with a single revolving armature, practically does for continuous current circuits, what the auto-transformer does for alternating current circuits and renders available currents much heavier than that drawn from the line at reduced voltages. The principle of working was fully explained in ELECTRICAL ENGINEERING, Vol. V. page 629, July 8th, 1909, and the machine can be used to give a secondary voltage practically constant for any value of the secondary current, for automatically converting from constant potential to constant current or for balancing a three-wire system. The principal features of the machine have also been applied to the control of motors requiring to run at varying speeds and to give a varying torque in order to meet special working conditions such as colliery winding gears, rolling mills, pumps and air compressors, printing presses, electric railways and tramways, and electric omnibuses with portable storage batteries.

An example of a winding gear of this nature is that supplied to South Kenmuir Colliery, near Glasgow. In this case, as the supply is three-phase (from the mains of the Clyde Valley Electrical Power Company), the machine takes the form of a motor generator on the C.M.B.-system which delivers continuous current to the main winding motor at varying pressure. It gives the large currents required for starting without drawing undue power from the line, and dispenses with any resistances in the motor circuit. Control is effected of a regulator in the field circuit of the converter properly interlocked with the reversing switch. The winder in question is designed for a depth of 160 fathoms, but is at present only working from the 70 fathoms level. Each cage carries 17 cwt. of coal, and 55 tons of coal per hour can be dealt with. Tests have shown that the maximum demand does not exceed 120 kw., and the consumption during an hours of 65 winds works out at 1·4 units per ton raised.

ELECTRICAL MINING ACCIDENTS

AT the end of February an inquest was held at Ystradgynlais on a motor-man named David Jones, employed at the Ynyscedwyn Colliery, who died from the effects of an ignition of firedamp in an underground motor-house. The accumulation of gas was due to the air current having been reversed by the leaving open of a door communicating with old workings, but the ignition was directly due to sparks from the motor or its starter.

A young miner named McPherson was found dead at Lumly Colliery, Durham, on May 13th, near the starter of a conveyor motor. He had previously complained of shocks from the switch handle. The inquest was adjourned pending the results of a post mortem.

An accident occurred on May 17th, on one of the 3,000 volt transmission lines of the Powell Duffryn Co., near Abercwmboi. Two men at work on the line were found dead near a pole which has just been set on fire by an arc caused by a broken insulator. It is presumed that the line came in contact with a stay wire not making a good earth, which was touched by the men. The leakage was not, however, sufficient to operate the relays in the power station.

ELECTRIC LAMPS FOR MINERS

THE Secretary of State for the Home Department announces that in order to encourage the production of safe and efficient types of electric lamps for miners, a colliery proprieter has placed at his disposal the sum of £1,000, to be offered as a prize for the best lamp or lamps fulfilling the requirements specified below. In our issue of May 4th an article appeared on electric safety lamps. It was the general opinion that an ordinary oil safety lamp was the cause of the explosion and fire in the Wellington Pit of the Whitehaven Colliery, and a more extensive use of electric safety lamps was recommended. We also quoted a note by Mr. R. Nelson (H.M. Electrical Inspector of Mines), which should be valuable information to those entering for the above competition. The conditions of the competition are as follows :—

The competition will be open to persons of any nationality. It will be in the discretion of the judges to award the whole of the prize for the lamp which they consider to be the best; or to divide the prize; or to make no award if no lamp appears to them to be of sufficient merit. Lamps must be addressed care of C. Rhodes, Esq., at the Home Office Testing Station, Rotherham, and must reach the testing station not later than December 31st next; a spare globe should accompany each lamp.

The following are among the requirements which should be fulfilled by lamps submitted :—

The lamps should be constructed so as to withstand rough usage, to be easy to maintain in good order and repair, and to render impossible the ignition of gas either within or without the lamp. The battery should be so constructed that liquid cannot be spilled, and means should be provided for dealing with gas generated by the battery. The materials should not be liable to corrosion. The lamp should be effectively locked, and should be capable of giving not less than 2-candle power continuously for 10 hours. The light should be well distributed, and a movable reflector may be provided.

The subject of electric mining lamps is also dealt with in the report of Prof. Redmayne (H.M. Chief Inspector of Mines) on the Hulton Colliery explosion, just published. The explosion is attributed to the overheating of or damage to an ordinary safety lamp, and Prof. Redmayne suggests that the time may have come when the ordinary Davy lamp should be wholly or partially replaced by the safer electric lamp. There are, he says, already some 2,155 in use. We shall deal at greater length with this report next month.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during May.

May 4th.—Monthly supplement on ELECTRICAL ENGINEERING IN MINES, opening with an article on electric safety lamps for mines. Some amendments proposed to the new Coal Mines Bill are given, and the most important electrical mining patents published in April are dealt with. Some new motor switch pillars are also described and illustrated.

May 11th.—Continuation of description of generating plant at a large London power-house. Article on an automatic starter for squirrel-cage motors.

May 18th.—Literary supplement, with reviews and list of recommended books in all branches of electrical engineering. Conclusion of the discussion on Mr. Collis's Paper on "Circuit Breaking."

May 25th.—Description of a water-purification plant, and short articles on a new testing instrument and some electric portable tools.

A Dust Extractor for Coal Mines.—Messrs. Mavor & Coulson have recently introduced a new appliance for extracting dust in mines. The apparatus in its electrically-worked form consists essentially of a bell-shaped mouthpiece, close to the mouth of which is fixed a nozzle carrying a jet of pressure air, which impinges upon the surface to be cleaned, searching the crevices of rough surfaces, and raising the dust from them. Suction is connected to the bell mouthpiece and withdraws the dust-laden air. The jet of air is produced by a small pressure fan driven by the same motor that drives the suction fan. A filter or separator is provided to retain the dust when collected, and permit of the escape of the air.

THE ASSOCIATION OF MINING ELECTRICAL ENGINEERS—WEST OF SCOTLAND BRANCH

THE general meeting of the West of Scotland Branch of the Association of Mining Electrical Engineers was held in the Technical College, Glasgow, on Friday the 19th inst., when the President, Mr. Alex. Anderson, presided. It was intimated that the annual meeting of the parent Institution would be held in Glasgow in October. With the exception of Mr. James E. Sayers, M.I.E.E., who had resigned, the retiring Council were re-elected, and Mr. William Brown, Banknock Coal Co., elected to fill the vacancy. Mr. John W. Case afterwards read a Paper on "The Uses of Electricity in Gaseous Mines." Electricity, he said, was a power by which the owner wished to work the coal at a cheaper rate. Compressed air was not suitable, or, at least, not economical for large collieries. It had been stated before the Departmental Committee on Electricity in Mines that the limits of medium pressure should not exceed 250 volts. If that were done it would certainly force colliery owners to instal a higher class of switchgear and cables. It was greatly to be regretted, he said, that some electrical installations in mines were working on the limits of safety. Coal dust was the principal medium by which electricity could cause damage. It was advisable, he said, to have all cables and other electrical apparatus regularly brushed to clear them of coal dust. Every encouragement should be given to the motor attendants to keep clean motor houses and electrical apparatus. In dusty mines it was advisable to keep the floor damp immediately round the apparatus to prevent any dust from rising that might possibly have accumulated between the hours of sweeping,

NEW MINING SWITCHES

MESSRS. Berry, Skinner & Co. (78 Upper Thames Street) have added to their range of well-known substantial enclosed fused switches by producing special patterns for mining work. In the "Firimine" fused switch, illustrated in Fig. 1, the requirements laid down in the Home Office Report on the

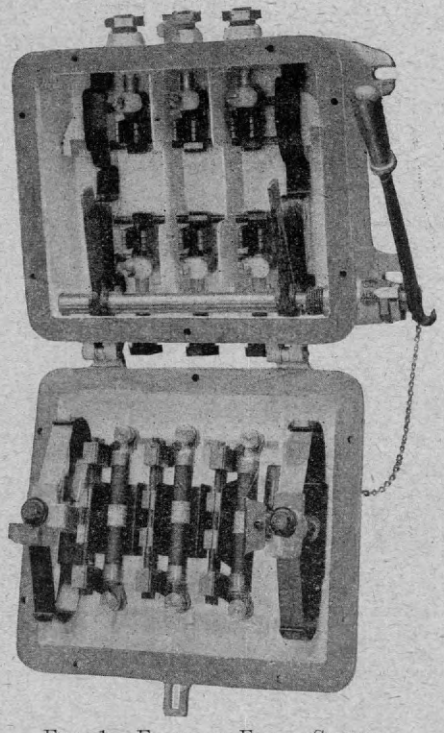

FIG. 1.—FIRIMINE FUSED SWITCH.

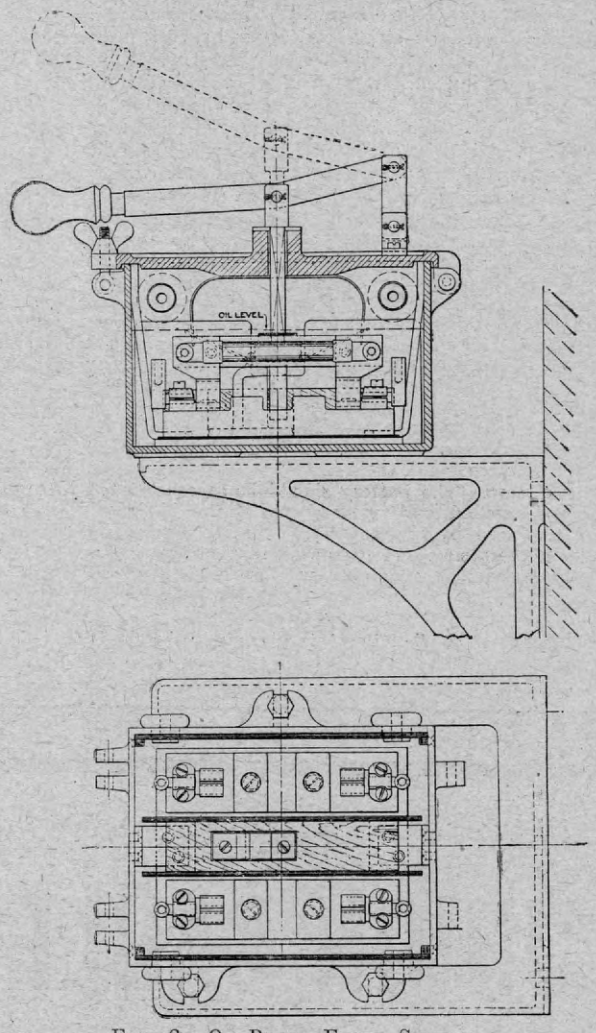
special rules have been carefully studied. The switch is of the heavy ironclad type, and the cases are automatically interlocked. The cover and the body of the case are provided with wide metal to metal machined faced flanges with fixing bolts sufficiently closely spaced for clamping the cover and the body of the box closely together. The cover is provided with adjustable hinges. Owing to the compactness of the design, it is claimed that for a given current capacity less internal space is required than is generally the case. The switch case is provided with well-fitted cable glands. The construction is entirely of metal, and mica only is used for insulating purposes. A large creeping surface is provided, in order to provide against the lodgment of coal dust, dirt or moisture. The apparatus is capable of operation by an unskilled workman, and, owing to to its fool-proof qualities, the fuses can be examined and replaced without proximity to live parts. The price compares most favourably with that of other forms of



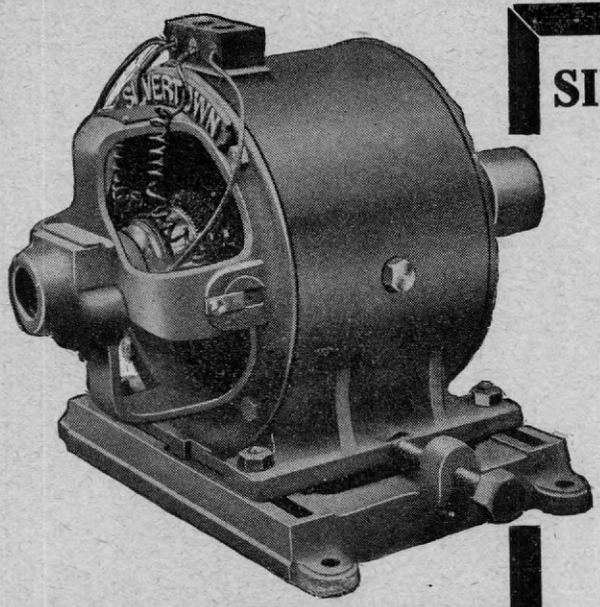


FIG. 2.—OIL-BREAK FUSED SWITCH.

switchgear. The switch is automatically locked "on" and "off" for intermediate positions. It is impossible to tamper with the contact to any degree. The switch is clearly marked "on" and "off." Our apparatus is designed with a generous margin of safety as regards carrying capacity. Our fuses can only be replaced after the current has been automatically switched "off." It is impossible to obtain a shock, as all fuse carrying parts are dead when the switchbox is opened. An oil break form of the switch is shown in Fig. 2.

Visit to the Westinghouse Works.—In view of the annual meeting of the National Association of Colliery Managers, which was held in Manchester on May 18th, 19th, and 20th, the British Westinghouse Electric & Manufacturing Co., Ltd., extended to the members of this Association a cordial invitation to pay a visit to their works, and inspect some of their apparatus particularly suitable for mines. A fairly large number of members availed themselves of this offer, and made a tour of the shops under the guidance of several Westinghouse engineers. A special exhibition of mining switchgear had been arranged, including a complete line of 750, 3,300, and 6,600 volt mining switch pillars, also examples of type "S" gate-end switch boxes specially designed for use in shallow headings, oil switches, circuit-breakers, auto-starters, liquid starters, controllers, rheostats, &c. A large variety of switchboards of all types were going through the shops, and full access to all the details of manufacture was freely given. There were also on view steam turbines, condensers, with Leblanc air pumps, turbo-blowers, R. T. Moore turbine-driven high-lift pump for 400 gallons per minute against 827 ft. running at 3,300 r.p.m., large and small gas engines, motors, generators, and other apparatus, including two-speed motors, 180 h.p. 400-volt D.C., driving a Worthington hydraulic pump 250 gallons per minute, 800 lb. per sq. in., for L. & N.W. Railway London Road station. The visitors were afterwards entertained to tea by the company.

REPORT AND ANNUAL MEETING OF THE INSTITUTION OF ELECTRICAL ENGINEERS

AT the annual general meeting of the Institution of Electrical Engineers on Friday last, the following awards were announced:—

The *Institution Premium* (£25) to Sir R. A. Hadfield, F.R.S., and Professor B. Hopkinson, F.R.S., for their paper, "The Magnetic Properties of Iron and its Alloys in Intense Fields." The *Ayrton Premium* (£10) to Mr. H. T. Harrison, for his paper, "Street Lighting by Modern Electric Lamps." The *Fahie Premium* (£10) to Mr. Donald Murray, for his paper, "Practical Aspects of Printing Telegraphy." The *John Hopkinson Premium* (£10) to Messrs. A. P. M. Fleming and R. Johnson, for their paper, "Chemical Action in Winding of High-voltage Machines." The *Paris Premium* (£10) to Mr. W. T. Taylor, for his paper, "Modern Long-distance Transmission of Electrical Energy." An *Extra Premium* (£5) to Dr. E. Rosenberg, for his paper, "Control of Electric Winding and Hoisting Engines," and a *Premium* (£5) to Mr. C. C. Hawkins, for his paper, "The Theory of the Static Balancer."

Students' Premiums of £10 each were awarded to Messrs. G. W. P. Page and G. J. Scott, for their paper, "Single-phase Commutator Motors, especially the Latour Winter Eichberg Type," and to Mr. H. C. May, for his paper, "Notes on the Design and Construction of Dry-core Lead-covered Telephone Cables," and students' premiums of £5 each were awarded to Mr. A. Monkhouse, for his paper, "Recent Electric Locomotive Practice and the High-tension Direct-current Railway System," Messrs. R. C. Plowman and E. F. Hetherington, for their paper, "Exhaust Steam Turbines," and to Mr. A. R. Stelling, for his paper, "Organisation and the Reduction of Manufacturing Costs."

The Council have awarded Salomons Scholarships of the value of £50 each to Richard Michael Clark, of University College, and to Edward M. Teare, of the Finsbury Technical College, and a David Hughes Scholarship of the value of £50 to Francis Lewes Otter, of the Central Technical College.

One or two new features were announced in the report. The Council have decided to hold examinations of candidates for election and transfer to the class of Associate Members after January 1st, 1913. The complete details are under consideration with a view to publication at an early date. The Council have decided that from January 1st, 1913, candidates for election as Students shall be required to pass or to have passed either the Matriculation Examination of one of the British Universities or some other equivalent examination. The Council deemed it wise not to conduct a special examination.

Other changes under consideration are the publication of the Journal at shorter intervals, the giving of special lectures at meetings of the Institution, and the holding from time to time of informal meetings, at which only short papers serving as openings for discussion would be read, and of provincial summer meetings of these on four days. The Council have also under consideration increases in the subscription and entrance fees.

The report deals also with the growth of the institution, now numbering 6,370 members of all classes, and records considerable activity in all sections. Work in connection with "Science Abstracts," the new edition of the wiring rules, the revision of the model general conditions, and the committees on electricity in textile mills, and on street-lighting specifications is referred to, and the announcement is made that the third Kelvin lecture will be delivered next autumn by Dr. R. T. Glazebrook, C.B., F.R.S. The subject will be Lord Kelvin's work in connection with fundamental units.

The work of the British Electrotechnical Committee (see ELECTRICAL ENGINEERING, May 18th, page 265) is now carried on in connection with the Institution. This committee is now constituted as follows:—Mr. A. Siemens (President), Col. R. E. Crompton, Mr. W. Duddell, Mr. K. Edgcumbe, Mr. S. Z. de Ferranti, Sir John Gavey, Dr. R. T. Glazebrook, Mr. R. Kaye Gray, Mr. R. Hammond, Mr. W. R. Hammond, Mr. C. LeMaistre, Prof. T. Mather, Mr. W. M. Mordey, Mr. H. W. Miller, Major W. A. J. O'Meara, Mr. W. H. Patchell, Sir W. H. Preece, Lord Rayleigh, Dr. A. Russell, Mr. J. F. C. Snell, Dr. S. P. Thompson, Mr. A. P. Trotter, Mr. E. B. Vignoles, Mr. C. H. Wordingham, and Mr. P. F. Rowell (Secretary).

A report on the accounts is included, showing an excess of income of expenditure for the year of £3,053. The balance-sheet shows net assets of £59,835, which is almost entirely locked up in the acquisition of the lease of the Institution building, in the structural alterations, and in the expenses incurred prior to occupation.

The Benevolent Fund shows a satisfactory increase. The capital account now stands at £3,700, and grants amounting to £51 were made during the year. The Wilde Benevolent Trust Fund stands at £1,846.

At the meeting the report and accounts were adopted, and the officers and council whose names were given in ELECTRICAL ENGINEERING, April 27th, page 219, were declared elected, as no further nominations had been received. Messrs. S. Sharp and H. Alabaster were also re-elected honorary auditors.

THE METAL FILAMENT LAMP PATENT CASE

A PRELIMINARY encounter in connection with the impending metal filament lamp patent fight took place in the Chancery Court before Mr. Justice Neville on Friday. This was an application made by the "Z" Electric Lamp Manufacturing Co., Ltd., to restrain the Osram Lamp Works, Ltd., "from threatening by circulars, letters, or otherwise, the plaintiffs, or any other person or persons, whereby the plaintiffs might be aggrieved, with legal proceedings or liability in respect of any alleged infringements of the defendants' letters patent in respect of the manufacture, use, sale, or purchase of incandescent electric lamps manufactured or sold by the plaintiffs."

Mr. T. Terrell, K.C., and Mr. R. Frost appeared for the "Z" Lamp Co., and asked for an interim injunction, explaining that the application was made under Section 36 of the Patents Act, which reads as follows:—

Where any person claiming to be the patentee of an invention, by circulars, advertisements, or otherwise, threatens any other person with any legal proceedings or liability in respect of any alleged infringement of the patent, any person aggrieved thereby may bring an action against him, and may obtain an injunction against the continuance of such threats, and may recover such damage (if any) as he has sustained thereby, if the alleged infringement to which the threats related was not in fact an infringement of any legal rights of the person making such threats:

Provided that this section shall not apply if the person making such threats with due diligence commences and prosecutes an action for infringement of his patent.

It appears that the Osram Lamp Works, Ltd., had commenced actions against Messrs. Baxter & Caunter, who are agents for "Z" lamps, and also against others, and it was contended that the action should be brought against the "Z" Electric Lamp Manufacturing Co., Ltd., themselves, who are ready and willing to fight such an action.

For the Osram Lamps, Ltd. (for whom Mr. Astbury, K.C., Mr. Walter, K.C., and Mr. Colefax appeared), it was contended that the actions were being prosecuted with "due diligence," and that there was no foundation for any suggestion of *mala fides*. It was also mentioned that there was a dispute as to the "retainer of counsel," and that if the "Z" Co. would waive the question of retainer of counsel, the Osram Lamp Works would be willing to issue a writ for infringement against them.

Lord Justice Neville, in giving judgment, said that the matter did not come within Section 36 of the Patents Act, and he saw no ground for supposing that the actions in question were not *bona fide* actions. He added that he had nothing to do with the question as to the retainer of counsel, and dismissed the motion with costs.

The dispute as to the retainer of counsel appears to be with regard to Mr. Walter, K.C. Mr. Walter was originally retained by the "Z" Lamp Co. in their successful action against Messrs. Marples, Leach, in what is known as the "Phospham" case, and apparently they had retained him to act for them in all subsequent patent cases. The General Electric Co., Ltd., also retained him, however, for the action against

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 25th, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

11,175/10. **Electrolytic Production of Light Metals.** G. O. SEWARD, FRANZ VON KUGELGEN, and FRITZ VON BIDDER. Relates to the production of metals, and particularly of sodium, lighter than their fused salts by electrolysis. The current is passed through the salt between an outer anode and an inner cathode. The anolyte and catholyte are separated by a chilled salt incrusted curtain, which closely approaches the cathode, which is of large mass, to avoid undue heating, so that the heat generated in the adjacent electrolyte limits the thickness of the salt crust on the curtain. The metal collecting inside the curtain is discharged into a receptacle beneath. The discharge passage has a lip at the top, and is enlarged below to allow the metal to fall free of the lower walls of the passage. Two figures.

11,559/10. **Stage Arc Lamps.** W. WALTERS. In stage arc lamps burning two in series, in order to obviate the trouble, through bad adjustment of the carbons, of one lamp going out and breaking the circuit for the other lamp, a series-wound solenoid is attached to the rear of the carbon bracket-holder. In the forward end of the solenoid a solid iron core is placed and linked to the back end of the bottom carbon-holder, and at the rear end of the solenoid an adjustable spindle is placed to act as an electromagnet. When the switch in circuit with the solenoid is closed, the iron core is attracted to the spindle, and the carbons are parted to burning distance, which can be regulated by the spindle. If one lamp only is required, the switch is opened and the carbons fall together, shunting the current through a resistance to the other lamp. Five figures.

24,390/10. **Telephonic Transmitter.** W. J. MARCHANT. This is a means of increasing the efficiency of a transmitter and receiver in combination. A mouthpiece or horn, parabolic in section, is fixed to the transmitter in such a way that the diaphragm of the transmitter occupies the focal plane of the horn. The sound-waves collected in the horn are concentrated by reflection on the diaphragm, thus increasing the loudness in the receiver associated with the transmitter.

24,909/10. **Arc Lamp Waterproof Protector.** E. WIDMER. The case ring of this device is of insulating material, with a thread which can be screwed into or out of the case. Washers are placed between the adjoining faces of the case and ring and the ring and the globe to keep the moisture out. The ring is also provided with an annular rib to prevent any connection between the conducting parts of the lamp. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: BRITISH THOMSON-HOUSTON CO. (*Allgemeine Elektricitäts Ges.*) [Devices for securing conductors] 18,867/10.

Dynamos, Motors and Transformers: ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Motor plant] 11,439/10; KLOOS [Single-acting motors] 6,152/11; AYERS [Wave motors] 9,231/11.

Electrometallurgy and Electrochemistry: RUTHENBURG [Electrolytic production of antimony] 19,772/10; REID [Electroplating apparatus] 580/11.

Heating and Cooking: REID [Electric furnaces] 19,804/10.

Instruments and Meters: BECK [Telemeters] 25,014/10.

Switchgear, Fuses, and Fittings: ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Motor starting devices] 11,186/10; SAMAIA [Point-controlling mechanism] 11,372/10; IDE [Lamp holder device] 11,747/10; BRYAN [Electrical communication between approaching engines] 13,583/10; PENROSE [Electric switches] 1,037/11; MEHNE [Electric time-switches] 2,259/11; SUN ELECTRICAL CO., RAWLINGS and SWEETSER [Electric switches] 3,705/11.

Telephony and Telegraphy: BOULT (*International Telechronometer Co.*) [Telephone apparatus] 11,048/10; AMERICAN AUTOMATIC TELEPHONE CO. and GOODRUM [Automatic telephone systems] 12,614/10; GIRARDEAU [Radio-telegraphic plant] 3,947/11.

Traction: MUNRO and RAILLESS ELECTRIC TRACTION CO. [Trolley-bases] 7,198/11.

Miscellaneous: SMITH [Winding condenser bobbins] 11,655/10; BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Arc light electrodes] 13,518/10; SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckertwerke Ges.*) [Electric condensers] 14,092/10; STEWART and WESTMINSTER TOOL & ELECTRIC CO. [Electric drills] 14,505/10; GINESTES [Sparking-plugs] 27,991/10; POWERS and EUREKA CLOCK CO. [Self-winding clocks] 4,711/11; BARRET and GAIFFE [X-ray bulbs and tubes] 6,833/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: KÖRTING and MATHIESEN AKT.-GES. [For alternating currents] 10,290/11.

Heating, &c.: POPP [Electric furnaces] 30,390/10.

Instruments and Meters: COMPAGNIE POUR LA FABRICATION DES COMPTEURS ET MATERIEL D'USINES À GAZ [Electricity motor meters] 30,297/10.

Fittings, &c.: KÖRTING and MATHIESEN AKT.-GES. [Rainproof ventilator for arc lamps] 10,886/11.

Miscellaneous, &c.: ZICKEL [Electric-shutter indicators] 24,495/10 and 10,545/11; LUX [Sparking plugs] 325/11; MACKU [Production of electric oscillations] 8,524/11.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

13,594 of June 2nd, 1897. **Electricity Meters.** C. O. BASTIAN. This patent covers an electricity meter in which the current is measured by electrolysis, the amount of reduction of the electrolyte being a measure of the amount of current passing. In conjunction with this is a prepayment mechanism, comprising a float mounted in the vessel containing the electrolyte, to which is attached a bent arm to form contact outside of the vessel with a suspended contact device in the local circuit, which by means of coin-freed devices is lowered a certain distance to break the local circuit. The coin-freed devices also actuate the main circuit-closer, which is engaged in this position by a spring-actuated catch controlled by a magnet.

13,838 of June 5th, 1897. **Electric Switches.** G. PAGE. Describes a method of securing an equal and more efficient contact between the switch bar and contacts by forming the bar or the contacts in two or more parts, which move independently, and are adapted to be pressed apart or together under spring action.

13,971 of June 8th, 1897. **Motor Controllers.** THE BRITISH THOMSON-HOUSTON CO. (*E. D. Priest, Schenectady, New York*). Substitutes a number of separately actuated contact devices for the commutating and resistance cylinders hitherto used, and provides means for reducing the arcing between intermediate contacts to a minimum; for moving the handle operating the controlling valves continuously in one direction, or by a backward movement to the off position; for a single handle to actuate the valves supplying air to the contact cylinder; for automatically returning the contacts to the off position should the air-supply fail. The invention also relates to the construction of the blow-out magnet, and certain other details.

13,973 of June 8th, 1897. **Open Circuit Controllers.** THE BRITISH THOMSON-HOUSTON CO. (*E. D. Priest and F. A. Merrick, Schenectady, New York*). This patent relates to pneumatically-actuated series-parallel controllers adapted to connect the motors, in series with a number of resistances in parallel for starting, when they are short-circuited, leaving the motors connected in series. The resistances are then reinserted, the circuit interrupted, and the motor connections changed from series to parallel.

13,976 of June 8th, 1897. **Induction Motor Meter.** THE BRITISH THOMSON-HOUSTON CO. (*P. Steinmetz, Schenectady, New York*). This meter comprises a drum of good conducting material, inducing coils co-operating to induce current in and rotate the drum. The coils are energised by a single-phase current, one of them having an induction device in circuit with it for displacing the phase of current exactly 90°. The device consists of coils of different numbers of turns upon a common core, and an auxiliary starting coil to overcome the friction of the meter.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: A. B. UPHAM [Electric trolleys] 3036/11.

Electrometallurgy, &c.: E. KREUSER [Electromagnetic separators] 2849/99.

Instruments, &c.: EVERSHED & VIGNOLES and S. EVERSHED [Electricity meters] 3507/98.

Switchgear, &c.: A. J. BOULT (*Continental Hall Signal Co., Brussels, Belgium*) [Railway signals and points] 3176/99; WESTINGHOUSE BRAKE CO. and J. W. CROSS [Brakes] 2702/05; C. W. ATKINSON [Electric switches] 2919/05; J. A. KENNEDY-MCGREGOR [Electric switches] 3164/06.

Telephony, &c.: D. MURRAY [Telegraphs] 3385/04; C. E. LJUNGMAN, R. O. P. BERGLUM, and W. A. W. E. HJORTH [Telephones] 3224/06.

Hosted by Google

Messrs. G. M. Boddy & Co. (which, it will be remembered, was subsequently withdrawn by agreement between the parties), and had also retained him to act for them in actions with regard to the Osram patents. As the action in respect of which the present application was made was against Messrs. Baxter & Caunter, and not against the "Z" Company, Mr. Walter was enabled to act for the General Electric Co.

We have reason to believe that, after Mr. Justice Neville's judgment, a consultation took place between the parties, and it was agreed that Mr. Walter should be left free to act for the General Electric Co., but that the action should be brought against the "Z" Lamp Company, instead of against their agents. The case may be expected to come on for hearing after the long vacation.

THE TELEPHONE TRANSFER

Judgment on Preliminary Points

THE Railway and Canal Commissioners gave judgment on Monday upon the preliminary legal points raised in connection with the transfer of the National Telephone Company's undertaking to the Post Office. We dealt with the arguments on page 267 of our issue for May 18th. As pointed out there, the parties differ as to the definition of the word "suitable," the Post Office contending that it covers the case in which both the Company and the Post Office have plant in the same area, and where the former is unnecessary for the purpose of the Post Office, whereas the Company's argument was that the word refers only to plant which is technically unsuitable as telephone material. The other point dealt with by the Commissioners was in relation to the notices of objection given by the Postmaster-General regarding the plant which he wishes to be relieved from purchasing. It was claimed by the Company that these were invalid, for the reason that they were not specific as to the plant to be so excluded.

Mr. JUSTICE A. T. LAWRENCE said that the first thing that struck him with regard to the meaning of the word "unsuitable" was that it related to quality and not quantity; because otherwise it would exclude a large amount of the Company's property, even from "tramway terms," which were the basis of the purchase. The agreement provided in very clear language against excessive plant being imposed upon the Postmaster-General, but the effect of what was suggested by the Post Office would be to scrap the existing plant of the Company in all competing areas. This did not seem just, and it would require clear words to convince him that such powers were conferred upon one party to the agreement to the detriment of the others. The words of the agreement, "suitable to the actual requirements of the service," might very well apply to the quality and character of the particular plant, and not to the sufficiency of it. It had seemed to be assumed by the Post Office that "requirements" meant "needs," and that the test of these needs was what the Postmaster-General would want, and that any of the Company's plant could be refused if the Postmaster-General became possessed of any plant in a competing area sufficient for his purpose, no matter how modern the Company's plant might be. This did not seem to be a likely bargain to be made even by a licencee whose licence expired at the end of seven years from the date of the agreement. In the London agreement it was clear that "suitable" referred to "quality," and not "quantity," and no satisfactory explanation had been given for reading a different meaning into the term as used in the agreement of 1905.

With regard to the Company's objection to the Postmaster-General's notices of the plant he wished to reject, Part I. of these notices specified certain lands, building, and plant, and he regarded these as quite good notices. Part II. stated the Postmaster-General's objection to taking over lines not on the metallic circuit system, and lines along, upon, or across any railway worked or about to be worked by electric power, but he regarded this part of the notice as not specific enough and consequently bad.

The Hon. A. E. Gathorne Hardy concurred with the above judgment.

Sir James Woodhouse dissented. In London the Postmaster-General objected to taking over the Bank, Westminster, and Avenue exchanges, and also to eighteen exchanges outside London, and in all cases he regarded both parts of the notices of objection given by the Postmaster-General as sufficient for the purpose intended by the agreement.

With regard to the word "unsuitable," he thought it must be held to have a quantitative as well as a qualitative meaning, taken in conjunction with the general text of the agreement. In the competitive areas, the Postmaster-General had installed exchanges on the central battery system, with the avowed object of carrying on the system in competition with the Company. The "requirements" of the Postmaster-General meant his "needs," and an exchange, in his opinion, became unsuitable for the "needs" of the Postmaster-General if it could be shown that he had no need for it. "Suitable" meant, not only "fitting," but "adequacy," and this was a quantitative expression. The position was demonstrated by the Avenue exchange of the Company, which had 4,000 subscribers. Not far away the Post Office had an exchange in Carter Lane with 19,000 subscribers, and facilities for 25,000. A new Post Office exchange was also being erected in Creechurch Lane, dealing with the same district, and the Avenue exchange of the Company was therefore "unsuitable" for the needs of the Post Office.

In the course of a discussion at the close of the judgments, during which notice of appeal was given on behalf of the Postmaster-General, it was agreed to commence the arbitration proceedings on July 5th, the Court of Appeal meanwhile being asked to take the appeal in the present case on the first or second day of the next sittings.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

CONDUIT FITTINGS.—A leaflet from the Sun Electrical Co. (118-120 Charing Cross Road, W.C.) announces reductions in prices for Sun screw tube fittings, including the Kalkos iron box with adjustment ring.

ARC LAMP CARBONS.—A price list from W. Geipel & Co. (72A St. Thomas's Street, S.E.) gives particulars of carbons manufactured by the firm of Fabius Henrion for ordinary and flame arc lamps, cinematographs, projectors, and welding.

MECHANICAL VENTILATION SPECIALITIES.—John Gibbs & Son (72-76 Duke Street, Liverpool) have issued a catalogue illustrating and describing fans for dust removal, forced and induced draughts, ventilating, &c., and also their Peerless blowers, to which several aditions have been made, one with water-cooled bearings for hot gases being a feature of the catalogue.

ELECTRIC GENERATING SETS.—A pamphlet from Fyfe, Wilson & Co. (145 Bath Street, Glasgow) deals with the "Kelvin" petrol and paraffin-driven electric generating sets for lighting country houses, hotels, &c. They are of British manufacture throughout.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

FANS.—The General Electric Co. (67 Queen Victoria Street, E.C.) send us a copy of their revised catalogue relating to "Freezor" fans. Various types are illustrated and described, including an oscillating ceiling fan, which is useful for large rooms; it revolves in a complete circle. The firm announce that they are making substantial reductions in the prices of their fans owing to the increased demand, and are also printing very large quantities of an attractive advertisement folder, which they will supply in quantities to any contractors who will undertake to push this line.

CORRESPONDENCE

THE SINGLE-PHASE PLANT SUPPLYING THE LONDON, BRIGHTON AND SOUTH COAST RAILWAY.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I note in your issue of May 11th, in Part II. of the article on the Single-phase Plant for the L.B. & S.C. Railway, that it is stated the Chorlton-Whitehead governors were specially designed by Mr. Whitehead. Mr. Partridge is evidently under a misapprehension on this point, as while the arrangement of the governing gear, &c., is rightly due to Mr. Whitehead, the Chorlton-Whitehead governors are designed and patented exclusively by myself, and the governors in question are the largest standard size produced by my firm, Messrs. Ashworth & Parker, Bury, Lancashire, by whom they were supplied to Mr. Whitehead. It may be of interest to know that they weigh, apart from any driving gear, no less than half a ton each.

I am, yours faithfully,

Bury, *May 24th*, 1911. F. O. L. CHORLTON.

Hosted by Google

THE NATIONAL TELEPHONE COMPANY

THE seventeenth annual dinner of the National Telephone Co. took place at the Hotel Cecil on Thursday, May 25th. Albert Anns, Esq., Secretary of the Company, was in the chair. Amongst those present were the Rt. Hon. Herbert Samuel, Postmaster-General, the Rt. Hon. Lord Harris, Mr. George Franklin, President of the Company, Mr. S. H. Sands, Vice-president of the Company, Major W. A. J. O'Meara (Engineer-in-Chief to the Post Office), Sir Robert Hunter (Solicitor to the Post Office), Mr. S. Z. De Ferranti, President of the Institute of Electrical Engineers, Mr. S. J. Goddard, General Superintendent, National Telephone Co., Mr. F. Gill (Chief Engineer to the National Telephone Co.), and the principal officers representing between 17,000 and 18,000 members of the staff. The Postmaster-General replying for the guests, said the proceedings between the Post Office and the Company had been, and would be, conducted without any bitterness, and he hoped for a decision, that would cause no ill feeling on either side. The staff of the Company had been fully considered, and all the heads of his department were with him in his desire, that full justice should be done to one and all of the Company's members, when the transfer takes place at the end of the year, and he promised that with the exception of a very few cases, the whole of the staff would be taken over regardless of the time they had served with the Company, and without the usual medical and literary examination. He would propose shortly in the House of Commons, that an option should be allowed to those members, who were now contributing to the Company's Pension Fund, to assign their share to the Postmaster-General, if they so desired, when the fund was wound up, and in return they should be allowed to count all their previous years of service, as if they had been served in the interests of the State, for pension and superannuation purposes, also those who had been original members of the fund, and who were in the Companys' service before that fund was established should be allowed to count all those years as if they were years spent in the service of the state.

The Telephone work was to be kept distinctly free from the other post-office work, and a wide discretion was still to be allowed to local offices. Promotion would not be determined by mere routine rules of seniority, and merit and scientific and technical attainments would be considered.

LOCAL NOTES

Aberdeen: *Breakdown at the Electricity Works.*—A fortnight ago there was a breakdown at the electricity works which resulted in bringing all the tramcars to a standstill and placing the town in darkness for about half an hour. Mr. J. A. Bell, electrical engineer, was in Rugby at the time, but he has now presented an official report with regard to the occurrence. It appears that a pick-axe was driven into a cable in Union Street, which resulted in overloading one of the sets to such an extent that the steam supply was reduced to a point at which it was necessary to shut down the station.

Blackburn: *Tramcar Meters.*—Mr. J. H. Cowell, Corporation Tramway Manager, reporting upon the tests which he has made with meters on the tramcars, states that no reliable meter has yet been put on the market, and for the present he is not prepared to recommend their adoption upon all tramcars.

Bolton: *Electricity Accounts.*—The accounts of the electricity department for 1910-11 show a net profit of £6,857 after meeting capital charges, compared with £7,119 in the previous year. There has been a decrease in revenue and units by the loss of large power users presumably owing to the price offered not being low enough, and it is to be regretted that the Council did not see its way to accept the advice of their electrical engineer to reduce the charges for power purposes. Power users so lost had an aggegrate load of 1,500 kw. The works costs for 1911 were 0·456d. compared with 0·426d. in the previous year, and the total costs 1·173d. per unit against 1·125d. per unit the previous year. This increase marks a break in a long series of steady decrease in works costs which Mr. Day is justified in thinking would not have taken place had his advice in relation to power charges been taken.

Brighton: *Tramway Accounts.*—The Corporation tramway accounts for the year to March 31 show a net profit of £137 compared with £1,190 in the preceding twelve months. The principal cause of the diminution is the expenditure of £5,554 upon permanent way compared with £4,005 in 1909–10, the whole of which has been paid for out of revenue. Sinking fund and interest charges absorb £12,939. The difficulty with the permanent way, the manager points out, is that it was originally paved with a very inferior quality of wood paving. Although the price for electrical energy has been reduced from 1·35d. to 1·2d. per unit, this is still regarded as unduly high.

Electricity Accounts.—The accounts of the Corporation electricity department for the year to March 31st show a net profit of £4,751 (after allowing for the £100 commission to Mr. Arthur Wright), as against £6,251 in the previous year. The number of units sold increased by 13¾ per cent., and in spite of an increase of 11d. per ton in the cost of coal, the coal cost per unit has fallen from 0·4d. to 0·38d. Repairs and maintenance show the considerable increase of £3,510 due to alterations in the high-tension switch gear, oil-cooling, hot-well and circulating water-pipe systems and repairs to sea defences. The Lighting Committee recommend that £4,626 of the net profit be carried to reserve fund and the balance of £125 to relief of rates.

Chester: *Electricity Undertaking.*—A special Committee appointed by the Council has recommended that an independent expert should be called in to advise the Council upon certain matters in connection with the electricity undertaking. Objection is being taken to this on the ground that it is a serious reflection upon the electrical engineer, who has from time to time acted in the capacity of consulting engineer in connection with the undertaking.

Coventry: *Electricity Profits.*—There was a net surplus of £16,414 upon the electricity undertaking for 1910–11 compared with £10,070 in the previous year. It is proposed to transfer £3,500 to relief of rates.

Hull: *Electricity Extensions.*—The Electricity Committee are being urged to arrange for a supply of electrical energy in the St. Andrews Dock district.

London: *Hammersmith: Street Lighting.*—The cost of converting the first 396 street lamps exceeded the amount borrowed, viz., £2,000, by £206. Additional lamps are to be converted at an estimated cost of £544, and a loan of £750 is to be taken up.

Stepney: Electricity Accounts.—The accounts of the municipal electric supply department for the year to March 31st show a net profit of £1,760. The number of consumers has been increased by 300 during the year.

Widnes: *Transporter Bridge.*—The Corporation will shortly shut down their power station which supplies current for working the transporter bridge, and will take the power from the Mersey Power Co.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Accrington.—The Borough Electrical Engineer is preparing a report upon the installation of additional generating plant.

Barnstaple.—The Local Government Board have sanctioned a loan of £1,442 for electric lighting extensions.

Hull.—A Local Government Board inquiry was held yesterday concerning a loan of £99,000 for extensions at the electricity works.

London: *Hammersmith.*—Tenders are to be invited for extensions to the boiler house.

Poplar.—A loan of £4,537 is recommended for sanction by the L.C.C. Finance Committee for mains and machinery.

Stepney.—The L.C.C. Finance Committee recommend sanction to a loan of £15,700 for mains.

Loughboro'.—A Local Government Board inquiry was held last week concerning a loan of £9,143 for extensions at the generating station.

Pembroke (Dublin).—Tenders are invited by June 7th for coal conveying apparatus at the electricity works. Particulars from the Borough Electrical Engineer.

St. Helens.—A Local Government Board inquiry was held last week into an application for sanction to borrow £10,800 for electrical extensions.

Hosted by Google

Shrewsbury.—A new boiler is to be installed at the power house at an estimated cost of £1,148.

South Africa.—The Salisbury Council have been authorised to borrow £120,000 for electricity supply and other purposes.

WIRING

Bolton.—Hardcastle Memorial Hall, St. Augustine's. Architect, E. W. Dyson, 17 Lee-lane, Horwich.

Edinburgh.—New school at Fountain Bridge. Architect, Mr. J. A. Carfrae, 3 Queen Street. Training College for Teachers, J. King, 16 Chamber Street.

Glasgow.—Extensions to head post office. H.M. Office of Works.

Harrogate.—New ward at infirmary.

Isle of Man.—Concert Hall, Douglas. Town Clerk.

Letchworth.—New fire station.

London.—New buildings for H.M. Stationery Office, and Office of Works' Stores, Waterloo Road, S.E. Architect, Mr. R. J. Allison, H.M. Office of Works.

Macclesfield.—Elementary school in Athey Street. Architects, Whittaker & Bradburn, 19 King Edward Street.

Russia.—According to the *Board of Trade Journal*, the municipal authorities of Chernikov propose to expend £10,500 upon an electrical installation.

Swansea.—Ragged school in Pleasant Street.

Wakefield.—Additions to Handsworth Council School.

MISCELLANEOUS

Canada.—The Winnipeg Board of Control require tenders for a police patrol telegraph system by July 3rd.

Doncaster.—The Local Government Board have approved of a scheme of sewerage and sewage disposal prepared by Messrs. D. Balfour & Son for the parish of Adwick-le-Street. Electrically driven pumps will be employed.

Hitchin.—The electric light and gas companies are to be asked to submit tenders for street lighting.

London: *Hammersmith.*—Tenders are to be invited for the supply of time switches for public lamps.

Spain.—The Sociedad Anonima Iberia Concessionaria has applied for a concession for the construction of electric tramways in the province of Pontevedra. Particulars from Direccion General de Obras Publicas.

TENDERS RECEIVED AND ACCEPTED

Aldershot.—The D.P. Battery Co., Ltd., of Bakewell, have secured the contract for the new storage battery.

Blackpool.—The tender for the wiring of the new Carnegie library has been given to Messrs. J. W. Fielding & Co., 31 Birley Street, Blackpool.

London: *L.C.C.*—The following firms tendered for the electric wiring of the Kennington fire station: W. Leonard & Co., £205 (recommended for acceptance); Tilley Bros., £276 10s.; J. Bryden & Sons, £340.

Hammersmith.—The following tenders have been received for an additional switchboard panel in connection with the new 3,000 kw. turbo-alternator:—B.T.H. Co., £145; Siemens Bros. & Co., £146; Ferranti, £180; Electric & Ordnance Accessories Co., £180; Westinghouse Co., £198; Reyrolle & Co., £200; Bertram Thomas, £203 10s.; Electric Construction Co., £213; General Electric Co., £225; Spagnoletti, £237; Johnson & Phillips, £240. The tender of Messrs. Ferranti is recommended for acceptance. The tender of the B.T.H. Co. for a Tirrell regulator has been accepted at £105.

The following tenders have been received for lanterns in connection with the conversion of public arc lamps to metal filament lamps:—E.M.F. Co. (Wardle lantern), £240 10s.; Wardle Engineering Co., £245; Drake & Gorham, £259; Pontifex & Co., £268; Haydn Harrison, £263, £277 and £323 15s.; General Electric Co., £302 18s.; Falk Stadelmann & Co., £312; Lucy & Co., £323 15s.; Reason Manufacturing Co., £360 15s. The tender of Messrs. Pontifex & Co. is recommended for acceptance.

Rochdale.—The Tramways Committee have placed an order with Messrs. Siemens Bros. Dynamo Works, Ltd., for a twelve months supply of tantalum traction lamps.

Southend-on-Sea.—The tender of Messrs. J. Stone & Co., of London, has been accepted for driving wheel tyres at £15 9s. per ton. and pony wheel tyres at £18 9s. 6d. per ton.

OSRAM·LAMPS

The electrical engineer has been authorised to purchase an apparatus for the electrical control of points by the tramcar driver at £45.

Stoke-on-Trent.—The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., for two 600 kw. induction-type motor-generators at £2,385 has been accepted, subject to the sanction of the Local Government Board to the necessary loan. The tender of Messrs. Callenders Cable Construction Co., Ltd., for mains and feeders amounting to £14,185 has been accepted under the same conditions.

Messrs. Siemens Brothers Dynamo Works, Ltd., have secured an order for the electrical equipment of the new works of the Carlyle Trading and Investments Trust, Ltd., at Bromley, Bow, including the supply of generators, motors, switchboards, and electric lighting. The wiring has been sublet to Messrs. Walter Mossop & Co. They have also secured an order for a country house lighting installation at Chudleigh, Devonshire. The wiring is being carried out with Stannos wires on the concentric system, and has been sublet to Messrs. A. H. Brooking & Co., Electrical Contractors, Exeter. They have also obtained many large orders for Coronation illumination and decoration schemes. The following are a few premises in London which will be dealt with:—Woolland Brothers, Mann, Crossmann and Paulin, The R.M.S.P. Co., *The Statist*, Pimms, The Commonwealth of Australia, "The Blind Beggar," Gramophone, Ltd., Brown, Shipley & Co., "The Britannia," Cox's Bank, Williams, Deacons Bank, Shoreditch Town Hall, and Drews. All installation work will be sublet to electrical contractors, and the buildings will be decorated with crystal glass and wooden devices, garlands, festoons, and bro-ite strip, shields and emblems, flags and trophies.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. G. McLean has resigned the position of engineer and manager to the Woking Electric Supply Co., Ltd., which he has held for over ten years, having been connected with the company for over fourteen years. Future communications for Mr. McLean should be addressed to Dunblane, Woking, Surrey.

Mr. F. Monkhouse, who for the past seven years has fulfilled the duties of assistant manager to Arc Lamps, Ltd., has terminated his connection with the firm. Communications may be addressed to 17 Blandford Road, St. Albans.

Messrs. W. T. Glover & Co., Ltd. (Trafford Park, Manchester), inform us that on the resignation of Mr. Scott, of Glasgow, Mr. McEwan has been appointed sole representative for Scotland, instead of only for the East of Scotland.

Osram Lamps.—We are informed by the General Electric Co. that at the recent funeral of the late King of Siam, the entire illumination effect was produced by means of Osram lamps. The total number used for this purpose represented more than 100,000 candle power.

The Tramways and Light Railways Association.—The following Papers are down for reading at the Congress of the Association at Edinburgh on July 13th and 14th:—Transfer Fares, by Mr. C. W. Shepherd (General Manager, Edinburgh Tramways); A few reasons why Electric Traction in England remains Stationary, by Mr. G. H. J. Hooghwinkel; Notes on Tramway Problems, by Mr. C. W. Mallins (General Manager, Liverpool Tramways), and Tramways and Light Railways Legislation of the Future, by Alderman W. Ivey, West Ham Tramways Committee.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—*Member*: W. E. Robson; *Associate Members*: T. E. Alger, P. F. Anley, S. Bates, R. A. Broad, L. G. Caunter, R. G. Deveyr, F. J. Gellion, C. H. Grindrod, P. S. Hawkins, T. Hayes, H. F. Johnson, C. Jones, J. C. Jones, C. H. Klyne, J. Lingard, F. W. Parsons, H. Pilling, R. D. Runcie, W. Travis, G. P. Turner, R. C. Wallroth; *Associates*: W. G. Barnett, W. Bell, D. N. Dunlop, W. Heap, A. W. Tait; *Students*: C. G. Abbey, V. O. Haddock, L. T. Mansell.

At the annual general meeting on Friday, the following were elected:—*Members:* B. N. Dadge, H. M. Leaf, S. G. Redman, F. J. Walker, J. H. Woodward. *Associate Members:* H. S. Affleck, S. C. Batstone, A. E. Brewerton, F. B. Brown, W. E. Burnand, A. Bursill, A. A. Collie, W. F. Drayson, E. H. Edwardes, A. Gibbs, J. Gray, W. F. Horne, W. Horsfall, R. Hudson, F. Husband, J. Kerr, S. S. King, R. A. Lower, R. E. Meade, K. Menon, S. Monkhouse, P. Motteram, W. R. Pepper, A. J. Pitt, G. F. Pratt, A. C. Smith, J. E. Storr, R. F. Trotter, F. Wright. *Associates:* W. Brown, J. E. Devlin, O. P. Hoskyns, H. S. Ingleby, A. E. Lee, J. F. North, W. L. Palmer, R. E. Stace, Capt. R.E. *Students*: W. B. Davies, R. A. Gray, C. Orpin, W. Rintoul.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars, net c.i.f. port of arrival, quoted on Tuesday night, was £56 15s. to £57 5s. per ton (last week the same).

Messrs. Drummond Brothers' Agents.—We are asked by Mr. W. G. Handcock, 423 Wellington Street, Clifton Hill, Melbourne, and 15 Moore Street, Sydney, Chief Distributing Representative for Australasia of Messrs. Drummond Bros., Ltd., Ryde's Hill, near Guildford, Surrey, to state that the following are his Company's agents:—Queensland: Paul & Gray, Ltd., Eagle Street, Brisbane. New South Wales: T. M. Goodall & Co., Ltd., 303-5 Kent Street, Sydney. Victoria: G. Leach, 233 Elizabeth Street, Melbourne. South Australia: G. P. Harris, Scarfe & Co., Ltd., Gawler Place, Adelaide. Tasmania, Southern District: C. Davis, Elizabeth Street, Hobart; Northern District: W. Hart & Sons, Charles Street, Launceston. New Zealand, North Island and West Coast of South Island: Cruickshank, Miller & Co., Queen and Wellesley Streets, Auckland; South Island—Canterbury, Otago, and Southland Districts—Laidlaw & Gray, Ltd., 155-7 Rattray Street, Dunedin.

General Electric (U.S.A.) and Westinghouse Patents.—It is officially announced that the agreement relating to overlapping patents between the General Electric Co., New York, and the Westinghouse Electric & Manufacturing Co., of Pittsburg, has expired, and, by agreement, will not be renewed.

Dublin Section of the Institution of Electrical Engineers.—At the annual general meeting on May 11th, the following officers and committee were elected for the coming session:—*Chairman:* Mr. S. L. R. Price. *Vice-Chairman:* Major Roberts. *Committee:* Messrs. S. T. Land, M. Ruddle, R. M. Tweedy, G. F. Pilditch, P. H. Steward, Prof. W. Brown, and Mr. L. J. Kettle. *Hon. Secretary:* Mr. T. Tomlinson.

Electrical Trades' Benevolent Institution.—The following subscriptions and donations have been received since those given on our list on May 11th:—*Subscriptions*: John Lawton & Sons, £1; A. P. Lundberg & Sons, £2 2s.; W. S. Shield, £1 1s.; General Accessories Co., £1 1s.; Davidson & Co., £1 1s.; F. Chard, 10s. 6d.; C. Wilson, 10s. 6d.; W. A. S. Benson & Co., 10s. 6d.; H. W. Butler, £1; E. Clarke & Co., £1 1s.; Electrical Press, Ltd., £2 2s. *Donations*: Crompton & Co., £5; J. Bourne & Son, £1 1s.; Clarke, Forde & Taylor, £3 3s.; P. Ormiston & Sons, £3 3s.; Alfred Graham & Co., £3 3s.; F. Wiggins & Sons, £1 1s.; H. T. May, £1 1s.; J. Gerson, £1 1s.; Johnson, Matthey & Co., £10 10s.; A. A. Campbell Swinton, £1 1s.; Lee Murray, £2 2s.

Parliamentary Intelligence.—The Widnes & Runcorn Bridge (Transfer) Bill was read for the second time in the House of Lords last week.

The Unopposed Committee of the House of Commons last week passed the Bill authorising the Winchester Corporation to purchase the undertaking of the Winchester Electric Lighting Power Co.

The promoters of the Macclesfield & District Railless Traction & Electric Supply Bill were recently granted permission by the Standing Orders Committee to add an additional route to the list originally specified in the Bill. Notice has been given by Mr. Ashton to refer this back to the Committee to further inquire into the circumstances.

"Onewatt" Lamps.—Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston), inform us that they are now placing on the market a range of 55-watt "Onewatt" drawn Tungsten lamps for high- and low-voltage circuits. These lamps, which will be of a similar nature to the other types of "Onewatt" lamps which are at present being supplied, and are specially suitable for street lighting owing to the robust nature of the filament. They may be used for either alternating or direct current, and will be supplied in bulbs of the same size as "Tantalum" lamps of the corresponding voltage candle-powers. The price for 100- to 130-volt lamps, in pear-shaped bulbs, will be 2s. 9d. each, and for 200- to 250-volt lamps 3s. 9d. each. For round bulbs price will be 3d. each extra. The discounts and selling conditions will be exactly as those at present in force on "Tantalum" and "Onewatt" lamps. These lamps can be supplied with either B.C. or Edison screw caps at the same price, and can be supplied to special order. Large stocks are to hand, and customers' orders can therefore be promptly attended to. Price lists dealing with the subject will shortly be issued, and notification of same will be given to the trade.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Electric Supply Corporation.—There was a net profit of £3,960 for 1910, which is distributed as follows:—£500 to renewals account; £1,248 to writing off expenditure on temporary plant and cost of transferring Hendon undertaking; £2,212 to be carried forward. At the annual meeting on Monday attention was particularly called to the disappearance from the balance-sheet of the temporary loans which have embarrassed the company for some time past, and that during the year the lamp connections have increased by 19 per cent. The Chairman expressed the opinion that the shareholders should receive a dividend as the result of this year's writing.

Swansea Tramways & Improvements Co.—The tramways portion of the company's undertaking shows a net profit for 1910 of £11,265, after setting aside £6,000 for renewals. The sum of £3,000 is placed to depreciation account, and a 4½ per cent. dividend declared upon the ordinary shares, carrying forward £1,048. During the year the sum of £2,000 has been repaid to the British Electric Traction Co. in reduction of the liability in respect of advances for reconstruction purposes. Six additional single-deck bogie cars to be purchased. Negiotiations are proceeding with the Corporation for the sale of certain lines, the lease for which will fall in shortly.

Cowans.—The *Financial News* states that Messrs. Cowans, Ltd., have gone into voluntary liquidation following the appointment of a receiver for the debenture holders. The assets of the company figure in the books at £22,957, but our contemporary states they are only estimated to realise about £4,500.

Electric Supply Corporation.—Subscriptions have been invited for £60,000 5 per cent. debenture stock.

Chloride Electrical Storage Co.—A dividend of 10 per cent. is recommended on the ordinary shares for the year to March 31st, placing £5,000 to reserve fund and carrying £8,543 forward.

Johnson & Phillips.—The annual general meeting was held in London last week, when the report and accounts, given in our last issue, were adopted. Mr. R. W. Blackwell, who presided, said that the balance-sheet showed a very distinct advance over the position to which the company had been brought owing to bad business in previous years. He thought the corner had been safely turned now, and they could look forward to substantial business in the future. There were at present in hand uncompleted orders to the value of £77,508. Mr. T. Dence, who seconded the motion for the adoption of the report, said that during the first three months of 1911 the work done by the company constituted a record, and there were sufficient contracts in hand to keep all their departments employed for another six months.

Birmingham & Midland Tramways.—The accounts for 1910 show a net profit of £8,306, and after meeting a dividend of 2 per cent. on the preferred ordinary shares and transferring £1,000 to depreciation, a balance of £306 is carried forward.

Uxbridge & District Electric Supply Co.—An issue of £75,000 5 per cent. first mortgage debenture stock at par is being made. Messrs. Callenders Cable Construction Co., Ltd., guarantee a sinking fund which will redeem the stock in thirty-six years. The issue is to pay off existing debentures and other liabilities of the Company, and will also provide a considerable sum of money for extensions to plant.

Lancashire Power Construction Co.—Subscriptions are being invited to an issue of £50,000 5 per cent. prior lien bonds.

Callender's Cable and Construction Co.—After meeting debenture interest, preference dividend, and depreciation, there is a net profit for 1910 of £66,323. A dividend at the rate of 10 per cent. per annum is recommended, and a bonus of 5s. per share, carrying forward £40,973. The report calls attention to the fact that the increase in trade which manifested itself in the early part of 1910 was not maintained, and the year was characterised by the absence of new enterprises. In the early part of 1911 also there were distinct evidences of improvement in the electrical industry, but this also seemed for the present to have disappeared. On the other hand the use of electrical energy for power purposes is extending in many parts of the United Kingdom, with a consequent increase in the amount of cable orders. Considerable contracts have been secured in the Colonies, especially in South Africa. The business of the Anchor Cable Co. in house wires and rubber cables has again been highly satisfactory.

Brush Electrical Engineering Co.—The accounts for last year show a loss of £10,780, after providing debenture interest and maintenance of plant and buildings, &c., but not depreciation, increasing the debt balance brought forward to £61,139. A scheme of capital reorganisation is under consideration.

SUMMARY

An article by Mr. E. Parry gives some useful tables and formulæ for the determination of tension and sag in overhead wires. (Page 313.)

Results of tests of a 5,000 kw. Westinghouse turbo-alternator at the Motherwell power house of the Clyde Valley Electrical Power Co. show steam consumption down to 13 lbs. per kw.-hour. (Page 314.)

Our monthly article on new electrical supplies and accessories contains illustrated descriptions of a new alternating-current hot wire arc lamp for low frequencies, special metal filament lamps for motor-car headlights, and some small motor starters. Notes are also given on metal filament lamps for tubolite reflectors and cinematograph equipments. (Page 315.)

A new pattern of tramway controller in which rheostatic braking is possible when the car is running backward is described. (Page 316.)

A Paper by S. W. Melsom and H. C. Booth was read at last Thursday's meeting of the Institution of Electrical Engineers, giving the results obtained at the National Physical Laboratory on the heating of cables with current, which were carried out at the request of the Wiring Rules Committee. (Page 317.)

Mr. Marconi, in a lecture on "Radiotelegraphy" at the Royal Institution, spoke of many curious results that had been obtained, and which still required a satisfactory explanation. He also said that with properly equipped stations mutual interference could be eliminated. (Page 319.)

An article on Municipal Wiring reviews the situation in Marylebone, Sheffield, and Sunderland. In the last-mentioned case, the Newcastle Branch of the Electrical Contractors' Association are proposing to issue a writ against the Sunderland Corporation, alleging that the Corporation are doing electric light wiring in contravention of their statutory powers. (Page 319.)

Among the specifications published by the Patent Office on Thursday last was one by A. J. Boult dealing with a telephone meter to register the number of calls, and also the length of time the line is in use. G. H. Ide describes a method of locking lamps in their holders, and A. Stewart and the Westminster Tool & Electric Co. have patented certain improvements in electric drills. The appeal which was made against the patent by E. Von Lepel, covering a disc discharger of the Lepel system, has been withdrawn. Leave has been granted to T. Ferguson to correct certain figures in the drawings of his patent describing a switch for controlling train lighting circuits. (Page 320.)

The Hampstead Borough Council have opened new showrooms at 283, Finchley Road, N.W., where every kind of electrical appliance for household use can be seen in actual operation, and an experienced engineer is at the service of visitors requiring information or advice. (Page 321.)

The Electric Supply Publicity Committee held their first annual conference last week. (Page 322.)

A party of telephone engineers has left for Constantinople to make preliminary surveys for the telephone system. (Page 322.)

It is stated that a scheme for the construction of tube railways in Manchester is under consideration.—The appeal of the Glasgow Tramways Committee

Hosted by Google

against the assessment of their undertaking has been dismissed.—There was a loss upon the Kingston-on-Thames electricity undertaking last year of £1,192.—The Maidstone Electricity Committee report that they have approached the I.M.E.A. with regard to the introduction of a municipal wiring bill.—The Blackpool Corporation propose to supply electric energy free for Coronation illuminations.—There was a profit of £6,798 upon the Croydon electricity undertaking last year. (Page 322.)

SCHEMES for extensions of municipal electrical power stations are contemplated as follows:—Hull, £99,322; Ilford, £8,070; Bermondsey, £18,563; Loughborough, £3,210; Bradford, £60,000; Barking, £11,400. An electric pumping plant is required in Egypt; Poplar Council requires a 3,000 turbo-alternator; an oil-eliminating plant is required at Kettering; battery, reversible booster, and switchgear at Swindon; telephones in Australia; accumulators in Turkey; and a 10,000-h.p. turbo-generator plant in Canada. An electric lighting scheme is being prepared for Pontardawe, and a street lighting scheme is under consideration in Eccles. (Page 323.)

THE first year's work of the Peel-Conner Telephone Works resulted in a net profit of £7,276, after meeting debenture interest. The Adelaide Electric Supply Co. are issuing £100,000 debentures. (Page 324.)

The Johannesburg Gas Engine Station.—In Edinburgh, on Tuesday, an action was commenced in which the Johannesburg (South Africa) Corporation claim about £400,000 damages from Messrs. D. Stewart & Co. (1902), Ltd., for breach of contract in connection with the gas producer plant and gas engines supplied to the Johannesburg Council for their electricity supply works in 1906–7. It will be remembered that the plant worked unsatisfactorily and was ultimately replaced by steam plant. A claim is also being made for the representatives of the late Mr. Joseph Beardmore, of Glasgow, as guarantor for £115,000.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JUNE 8TH.

Royal Institution.

3 p.m. Afternoon Lecture on "Practical Progress in Wireless Telegraphy," by T. Thorne Baker.

WEDNESDAY, JUNE 14TH.

Royal Meteorological Society.

4.30 p.m. At 70 Victoria Street, S.W. "Investigation of the Electrical State of the Upper Atmosphere, August, 1910," by A. J. and Dr. W. Makower, W. M. Gregory, and H. Robinson.

CORRESPONDENCE

THE METAL FILAMENT LAMP PATENT ACTION.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Our attention has been called to the article in your issue of to-day's date in reference to proceedings before Mr. Justice Neville on Friday last in connection with the litigation between this Company and the "Z" Electric Lamp Manufacturing Co., Ltd. In such article it is stated that after Mr. Justice Neville had given judgment dismissing the "Z" Company's application with costs, a consultation took place between the parties, when it was agreed that an action should be brought against the "Z" Company instead of against their agents.

I think it right to point out at once that this statement is incorrect. This Company is quite willing to attack the "Z" Company for infringement of its patents now that the question of the retainers to counsel is settled, but any such action brought against that company will be in addition to, and not in substitution for, the actions already pending against other infringers who have sold or used "Z" lamps, which will be pressed on as rapidly as possible.

Yours faithfully,

OSRAM LAMP WORKS, LTD.

Brook Green, Hammersmith, W. (C. Wilson.)
June 1st, 1911.

The Secretary of the Electrical Contractors' Association is refusing, on behalf of the Central Board, to allow any of the "fighting fund" (collected to meet the expense of a possible fight against the municipalities in Parliament) to be used for an action with which the Newcastle Branch of the Association is threatening the Sunderland Corporation. (See page 319.)

THE DETERMINATION OF TENSION AND SAG IN OVERHEAD WIRES

By Evan Parry

(Electrical Adviser to the Government of New Zealand).

THE extension of wires suspended in spans under the combined influence of gravity and temperature has received considerable attention since the introduction of long spans of wire for the transmission of electrical energy at extra high tension, and formulæ and diagrams have been evolved for calculating the dip or sag of the wire for a given span and given range of temperature.

The following development after several eliminations results in an equation of the third degree, which is the simplest form to which the equation can be reduced consistent with accuracy. As far as I am aware, no tables have yet been published of dip and tension of wires with varying temperature differences based on being near enough for practical purposes and substituting for c, we have :—

$$s = x(1+\frac{x^2w^2}{6T^2}) \text{ and } y = c+\frac{x^2w}{2T}.$$

The sag or dip $d = y - c = \frac{x^2w}{2T}$.

Let a wire whose length is $2s'$, and cross section A be subject to a tension T under which it stretches to a length $2s$, then :—

$$\frac{T}{A}\Big/\frac{s-s'}{s'} = E = \text{the modulus of elasticity of the material ;}$$

also $$\frac{s-s'}{s'} = \frac{T}{EA}.$$

But EA is the modulus of elasticity of the wire whose area is A. Let this be denoted by λ, then :—$\frac{s}{s'} - 1 = \frac{T}{\lambda}$.

If $2s_o$ and $2s'_o$ be the stretched and unstretched length of wire at some temperature considered as a datum, and $2s_t$ and $2s'_t$ the stretched and unstretched lengths of the same wire at some temperature t above the datum temperature, the following relations hold good :—$\frac{s_o}{s'_o} = 1 + \frac{T_o}{\lambda}$ and $\frac{s_t}{s'_t} = 1 + \frac{T_t}{\lambda}$, where T_o and T_t are the tensions in the wire at the lower and upper limit of temperature.

If α be the coefficient of expansion with temperature $s'_t = s'_o(1+\alpha t)$

and therefore $$s_t/(1+\frac{T_t}{\lambda}) = s_o(1+\alpha t)/(1+\frac{T_o}{\lambda})$$

or $$\frac{s_t}{1+\frac{T_t}{\lambda}} \times \frac{1+\frac{T_o}{\lambda}}{s_o} = (1+\alpha t).$$

Substituting for s_t and s_o their values in terms of the half span x we have :—

$$\frac{1+x^2w^2/6T_t^2}{1+T_t/\lambda} \times \frac{1+T_o/\lambda}{1+x^2w^2/6T_o^2} = 1+\alpha t.$$

Board of Trade regulations, and a beginning is here made with solid copper wire in four sizes. Perhaps others will follow with stranded copper wires and aluminium wires, so that in course of time a series of tables covering a wide range will become available.

Let a wire or cable, uniform in section, whose weight is w per unit length, be stretched between two supports distance $2x$ apart. The wire, if inextensible and subject to its own weight only, takes up a position known as a catenary, the fundamental equations of which curve are

$$s = c\ sinh\ \frac{x}{c} \text{ and } y = c\ cosh\ \frac{x}{c}$$

where $2s$ is the length of the wire, c is a length of wire whose weight is equal to the horizontal component, T of the tension in the wire which is also the tension at the lowest point of the wire), so that $T = wc$.

Expanding $sinh\ \frac{x}{c}$ and $cosh\ \frac{x}{c}$, using two terms of the series as

Hosted by Google

Multiplying up and neglecting the last term of each product we have:—

$$\frac{1+x^2w^2/6T_t^2+T_o/\lambda}{1+x^2w^2/6T_o^2+T_t/\lambda}=1+\alpha t.$$

Multiplying up again and neglecting the smaller orders of magnitude, the equation reduces to:—

$$T_t^3+T_t^2(\alpha\lambda t+\frac{x^2w^2\lambda}{6T_o^2}-T_o)-\frac{x^2w^2\lambda}{6}=0 \qquad (1).$$

This is the simplest form to which the equation can be reduced, and its solution presents no difficulty.

As an example, let a copper wire equivalent to No. 2/0 S.W.G. be stretched between supports 600 ft. apart, the diameter of the wire is 0·348 inches, and area 0·095 square inches, and weight per foot 0·367 lbs.

Take the modulus of elasticity of copper at 16×10^6, the modulus of the wire is $16\times10^6\times0\cdot095=1\cdot52\times10^6$. Take the elastic limit of copper at 28,000 lbs. per sq. inch the corresponding limit in the wire is $28{,}000\times0\cdot095=2660$ lbs. per sq. inch. If the maximum wind pressure be taken as 50 lbs. per sq. foot of plane surface the pressure per foot of wire is $\frac{50}{2}\times\frac{0\cdot348}{12}=0\cdot725$ lbs. As provision must be made against the contingency of the maximum wind pressure occurring when the temperature is at its lower limit, the allowable tension in the wire in still air at the lower limit must be less than the elastic limit in the ratio 0·367 to $\sqrt{(0\cdot367^2+0\cdot725^2)}$ or 0·367 to 0·81, viz., $2500\times0\cdot367\div0\cdot81=1134$ lbs. Take the coefficient of expansion with temperature at 9×10^{-6} per degree Fahrenheit and let the range of temperature be 105 degrees F., we have:—

$$\alpha=9\times10^{-6}\quad\lambda=1\cdot52\times10^6\quad t=105.$$

$$\alpha\lambda t=9\times10^{-6}\times1\cdot52\times10^6\times105=1435.$$

$$x=\frac{600}{2}=300.\quad x^2=90{,}000.\quad w=0\cdot367.\quad w^2=0\cdot1345.\quad T_o=1134.$$

$$T_o^2=1\cdot29\times10^6.$$

$$\frac{x^2w^2\lambda}{6T_o^2}=\frac{9\times10^4\times0\cdot1345\times1\cdot52\times10^6}{6\times1\cdot29\times10^6}=2375.$$

$$\alpha\lambda t+\frac{x^2w^2\lambda}{6T_o^2}-T_o=1435+2375-1134=2676.$$

$$\frac{x^2w^2\lambda}{6}=\frac{9\times10^4\times0\cdot1345\times1\cdot52\times10^6}{6}=3070\times10^6.$$

$$T_t^3+2676T_t^2-3070\times10^6=0.$$

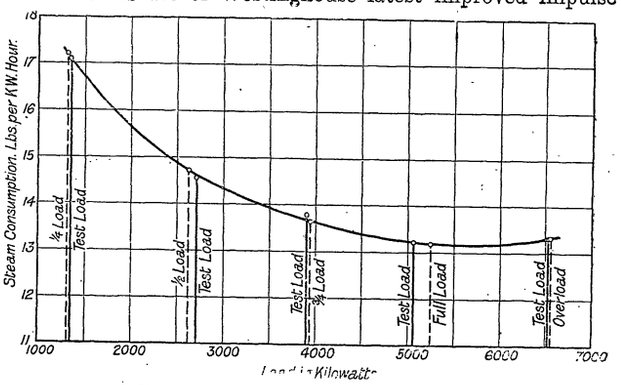
By trial T_t is found to be 920 lbs.

The dip or sag is obtained directly from this from the equation

$$d_t=\frac{x^2w}{2T_t}=\frac{9\times10^4\times0\cdot367}{2\times920}=17\cdot9 \text{ feet.}$$

The table on page 313 has been calculated on the basis of the Board of Trade requirements issued under the Electric Lighting Acts of 1882–1890 in the form of a model description, paragraph 5 of which states, "Wind pressure will be taken at 30 lbs. per sq. ft., and the effective area of the wire will be taken as 0·6 of the diameter multiplied into the length."

"Water Wireless Telegraphy."—We have received a copy of an interesting pamphlet with the above title by Habibur Rahman Khan, Deputy Superintendent of Telegraphs, Allahabad, India, describing a system of wireless communication more of the nature of earth (or water) conduction telegraphy than true Hertzian-wave telegraphy, but utilising to obtain sensitivity the full advantages of resonance between the impulses sent and the natural period of the receiving apparatus. The system has been used with success in India for communication between different points on a river. Full diagrams of the system are given, and the actual description is prefaced by some general notes on wireless telegraphy, with a delightful note of originality in the expression of the ideas.



Inspection of Turbo-blower.—At the invitation of the British Westinghouse Electric & Manufacturing Co., Ltd., a large number of managers of iron and steel works, and others interested, paid a visit to the Westinghouse Works, Trafford Park, on Monday and Tuesday, May 29th and 30th, to inspect the test of a mixed-pressure turbo-blower for operating in connection with blast furnaces. The blower has a capacity of 25,000 cu. ft. of free air per minute against 8 to 10 pressure. Considerable interest was shown by the visitors in the test, and every facility for inspection was afforded by the company, the visitors being accompanied in their tour by several Westinghouse engineers.

Petrol-Electric Car on the Great Central Railway.—The Great Central Railway Company have recently placed an order with the British Westinghouse Electric & Manufacturing Company, Limited, for one of their "petrol-electric" cars, which will shortly be put on the tracks in the London district for its trials under the direct observation of Mr. Sam Fay, the General Manager of the Railway, preparatory to going into service on a branch line. The car in question, which is of the general type developed so successfully by the Westinghouse Companies on the Continent, particularly in Hungary (see ELECTRICAL ENGINEERING, Vol. IV., page 510), will seat 50 persons, and be capable of hauling two trailers, seating 50 more, at an average speed of 30 miles per hour on the level.

TEST OF A 5,000-KW. TURBO-ALTERNATOR

THE tests of the new 5,000-kw. steam turbo-generator, one of two which the British Westinghouse Electric and Manufacturing Co., Ltd. is supplying to the Clyde Valley Electrical Power Co., Glasgow, show even better results than those recently obtained on the 3,000-kw. turbo-alternator, supplied by the same company for the Bristol Corporation (see ELECTRICAL ENGINEERING, May 4th, page 235). The tests were carried out at the Motherwell power house on April 8th and 9th, 1911, in the presence of Mr. B. A. Starr, the General Manager of the company, Messrs. Strain and Robertson, the consulting engineers, and other officials.

The turbines are of Westinghouse latest improved impulse

type, arranged for working with high pressure steam supplied direct from the boilers at 175 lbs. per sq. in. pressure, and 150° F. superheat, both being measured at the stop valve.

The conditions specified for carrying out the tests were as follows:—

The normal output is 5,000-kw. 3-phase at 11,000 volts 25 cycles. The tests included runs at 25 per cent. overload for six hours, full load for six hours, three-quarter load for two hours, one-half load for two hours, one-quarter load for two hours.

The tests work out as follows:—

We understand that Mr. Starr, the General Manager of the company, the Consulting Engineers and the Directors have expressed their gratification at the results obtained, and at the reduction of the generating costs as shown by their records since the turbo-generator was put in commission.

A High-tension Electrostatic Wattmeter.—An instrument of this nature was described in a Paper by Prof. E. Wilson at a meeting of the Physical Society on April 28th. When the electrometer is used as a wattmeter it is necessary that the voltage impressed upon the quadrants shall not be less than a certain minimum depending upon the voltage to be impressed upon the moving system. When the latter voltage is of the order 10,000, the quadrants require a voltage larger than can economically be provided by a shunt, and intensifying devices have to be used. The current transformer, whose secondary winding is closed on a non-inductive resistance, can be used to give fairly good results, but it is not accurate at all frequencies, and is dependent upon wave form. The author's method employs a generator with an air-cored magnetic circuit. The mains current is passed through the field coil of the generator and produces a magnetic field proportional to the current; the armature is driven at known speed in this field, and is provided with a commutator and brushes. The brushes when set accurately have a voltage between them proportional to, and having the same wave form as, the mains current. Another device depending upon the charging of condensers in parallel and the placing of them in series has also been used for multiplying a small voltage produced by the passage of the mains current through a low-resistance shunt.

NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Arc Lamps.

AN arc lamp has been designed by the Foster Engineering Co., Morden Road, Wimbledon, to work with frequencies from 25 to 40. This has been found possible by constructing on the hot wire principle; a strip of special alloy being used to operate the chief working parts. Figure 1 shows the operation of the mechanism; the circuit of the current starts at terminal T_1 and flows down L_1 to the strip S, from which it passes to the top carbon holder by the flexible F_L. The action of the

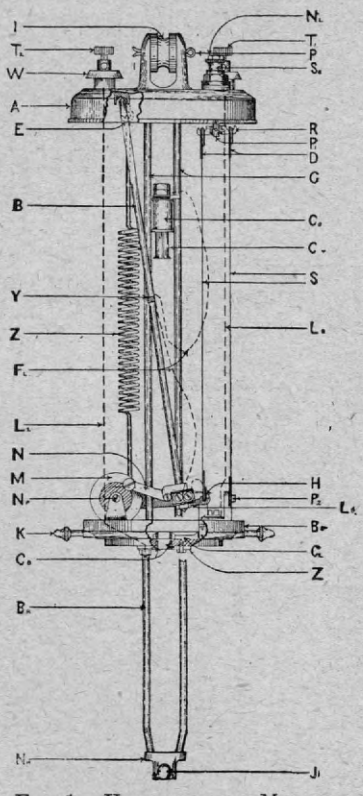

FIG. 1.—VIEW SHOWING MECHANISM.

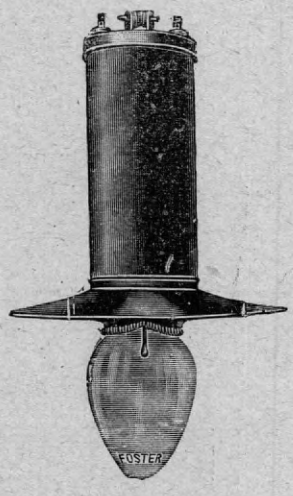

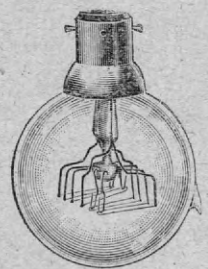

FIG. 2.—GENERAL VIEW OF LAMP.

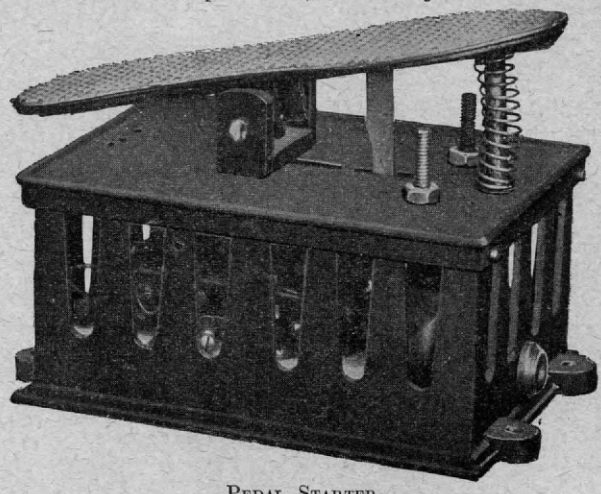
current in expanding the strip S, causes the disc M to rotate and lift a clutch C_L, thus striking the arc. The reverse of this takes place if the arc lengthens or breaks. In this lamp the unreliable dashpot is conspicuous by its absence, and there is also no self-induction, so that a high power factor is maintained. On 200/440 volts it is advisable to burn the lamps in series parallel with a transformer, so that each lamp is independent in the circuit, and also the substitutional resistance and cut-out can be dispensed with on high voltage circuits. Fig. 2 shows an outside view of the lamp.

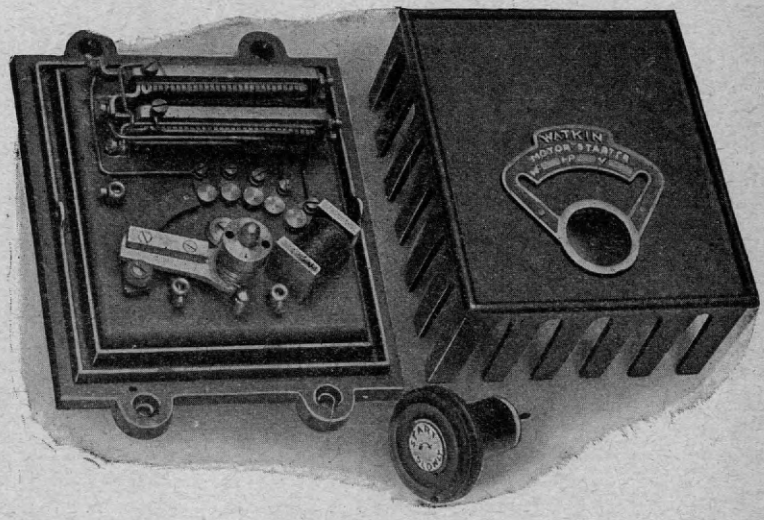
Incandescent Lamps.

Messrs. Ward & Goldstone (Springfield Lane, Salford, Manchester) have turned special attention to metal filament lamps for motor-car lighting, and supply these from 2 to 12 volts for various candle powers from 1 to 22. For headlights they have developed the special form of focus lamp illustrated here with several filaments arranged in the same plane in a special bulb with the pip at the side. The 4-volt lamps of this kind range up to 16 c.p. and a 32-c.p. 3-volt lamp taking 4 amperes is also made. The firm also list the "festoon" form of lamp for interior lights.



"AUTO-METAL" FOCUS LAMP. (Ward & Goldstone.)

The Linolite Co. (25 Victoria Street, S.W.) whose "tubolite" system of tubular lamps in special aluminium trough reflectors was originally introduced when the carbon lamp was all that available, have for nearly three years had on the market a tubolite metal filament lamp for 25 volts. They now inform us of further advances and of their readiness to supply metal filament "tubolite" lamps of 12 c.p. each for circuits from 100 to 125 volts with an efficiency of about 1·5 watts per c.p. The total cost of the complete fitting with these lamps is the same as for the old lamps, notwithstanding the fact that the price of the lamps themselves is slightly higher. New pamphlets and price-lists are now available.



Switches, Fittings and Accessories.

The Adams-Watkin Co. (36 Victoria Street) have issued a list which, in addition to their well-known resistance switches for incandescent lamp circuits, contains particulars of some

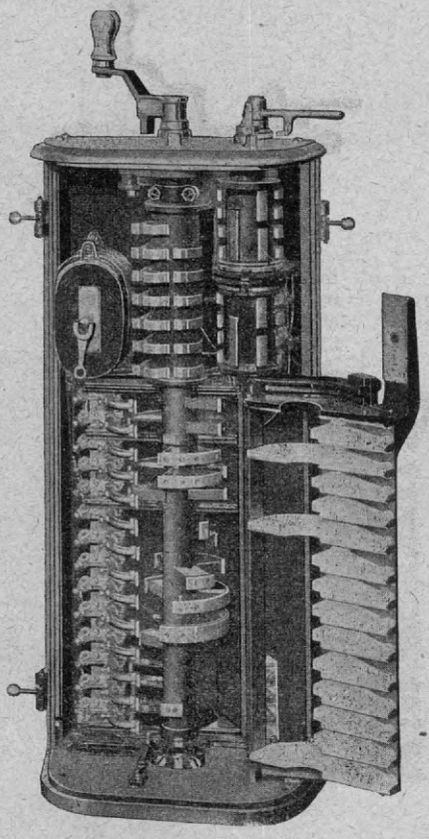
PEDAL STARTER. (The Adams-Watkin Co.)

new patterns of small motor starters and regulating switches which they have brought out. One of these starters with no-voltage release such as is made for motors from ½ to 7½ h.p.

STARTER FOR SMALL MOTORS. (The Adams-Watkin Co.)

is illustrated here, while another illustration shows a foot starter and regulator for motors up to ¼ h.p. for sewing-machines, dental and jewellers' appliances, etc. Complete small motor panels are also listed.

Miscellaneous.



A booklet from the British Westinghouse Electric and Manufacturing Co., Ltd. (Trafford Park, Manchester) entitled the "Cinematograph Theatre," deals very thoroughly with the electric equipment for these establishments and describes apparatus which the company have developed specially for this purpose giving useful information as to its use. The superior economy of motor generators over resistances is demonstrated and the special switch and central gear which has been standardised is explained. Illustrations of actual installations are given, and for cases where public supply is not available, gas and petrol driven generating sets are put forward. A few words on general interior and exterior lighting and on the much neglected subject of ventilation are also included. A reprint of the booklet now in the press contains in addition, all the regulations governing the use of electricity in cinematograph theatres.

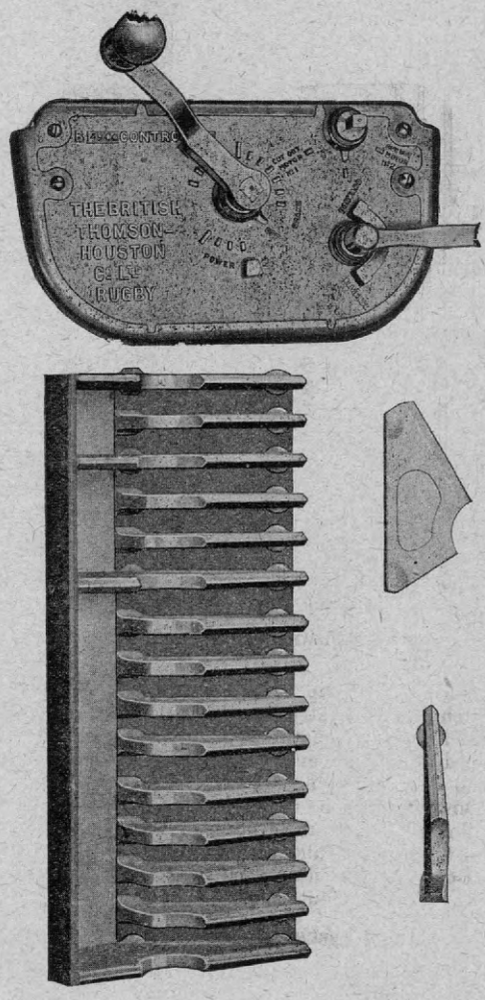
A NEW TRAMWAY CONTROLLER

FOR tramway service a simple form of control apparatus is essential, in order that a driver in case of emergency may instinctively do the correct thing to avoid accident. Very reliable and simple forms of controllers have been in use for many years, but with respect to rheostatic braking in the event of a car running away backwards, there has been room for improvements.

Controllers of the braking type now in use are arranged so that if the car is running in a forward direction, on moving the handle to the brake notches currents are generated in the motors, producing a retarding torque, the direction of the currents in the motors being such as to strengthen the magnetism of the fields. If, however, the car is running backwards, and the controller handle be moved to the brake notches, the direction of currents generated in the motors is such as to demagnetise the fields, so that no braking effect is produced.



NEW PATTERN OF B.T.-H. TRAMCAR CONTROLLER, GIVING RHEOSTATIC BRAKING WHILE CAR IS RUNNING BACKWARD.

To obtain a braking action when the car is running backwards, the British Thomson-Houston Co., Ltd., of Rugby, have designed and manufactured controllers in which, when the controller handle is moved to the "off" position, connections are made which cause one or more of the motors to act as generators, producing the desired effect. These connections are such that no braking action is obtained during forward running of the car if the handle is in the "off" position. An arrangement preferable to this, however, is one in which the motion of the control handle, which produces braking for forward running will also produce braking for backward running. The B.49 controller shown in the illustration will give this result. The reverse switch handle may be in either the forward or reverse position when, by moving the main control handle to the braking notches, a rheostatic braking effect will be obtained for either forward or backward motion of the car. This controller is suitable for use with two 40-h.p. 500–600-v. series motors, and has four series, four parallel, and seven brake-controlling points.

Another important new feature is the mechanism by which a defective motor may be cut out of service without removing the cover of the controller. To cut out a motor it is only necessary to remove the reverse-switch handle from its spindle, and apply it to the cut-out spindle which projects through the cap plate, shown in the illustration near the back edge of the cap plate. This cut-out spindle has three running positions: a central position for which both motors are in circuit, and a position on each side to cut out either motor. An interlocking mechanism prevents the reverse-switch being moved unless the cut-out switch spindle is in one of its three running positions. The usual interlocking mechanism is provided to prevent the reverse switch being moved unless the main cylinder is in the "off" position.

The arc deflector, consisting of fire-proof barriers, is of strong mechanical construction, the large deflector plates being being supported at both ends, and the small plates moulded with large bosses for the fixing screws, thus providing rigid fixing for the plates. A strong magnetic blow-out is provided for all fingers of the main cylinder on which arcing takes place, and an insulating trough surrounds the back half of the main cylinder protecting the frame from the influence of the arc or live parts. The trough is divided into sections by barriers; these, with the arc deflector which covers the front half of the main cylinder, form separate chambers for enclosing various sections of the cylinder which may be at different potentials.

The brake cylinder is mounted on the main cylinder spindle in accordance with long-established standard B.T.H. practice, thus preventing any possibility of change in the relative positions of brake cylinder and handle, which may occur due to wear on the gears or cams when the brake cylinder is mounted on a separate spindle. One feature of this controller not to be found on most tramway controllers, is the provision of ample space for the incoming cables, and the arrangement of the various parts to enable wiring to be easily and quickly effected.

THE HEATING OF CABLES WITH CURRENT

AT the request of the Wiring Rules Committee of the Institution of Electrical Engineers, an investigation has been made at the National Physical Laboratory to determine the temperature rise and the current density for a given rise of temperature in cables of various sizes with different coverings, and the results obtained were given in a Paper by S. W. Melsom and H. C. Booth, which was read at last Thursday's meeting of the Institution. The cables, some of which were paper-insulated lead-covered, and the others rubber-insulated, taped, braided, and compounded, were tested in air, and also, in respect to the rubber cables, in casing and in iron tubes, laid in air and in plaster 4 ins. deep by $6\frac{1}{2}$ ins. wide. The temperature rise was measured by the increase of conductor resistance. The initial temperature of the cables was assumed to be that of the air, and was taken at the same level and about 3 ft. from the cable, under conditions adapted for constancy of temperature. The temperature co-efficiency was obtained by cutting about a metre off several cables, and testing each

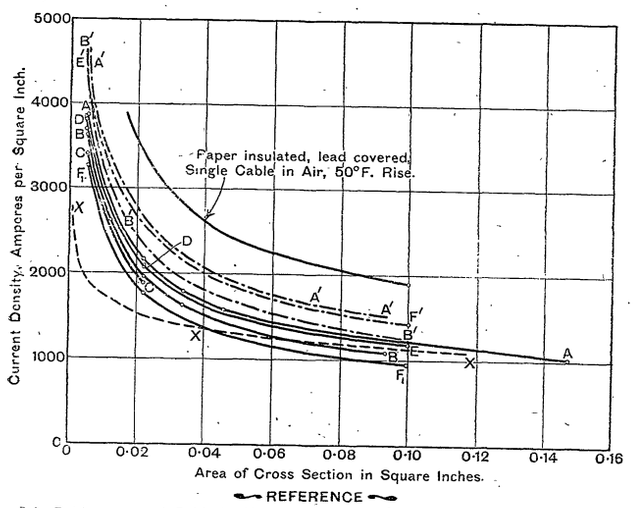

FIG. 1.—CURVES OF CURRENT DENSITY AND SECTIONAL AREA OF CONDUCTOR.

separately in an oil bath at various temperatures, and this was used in the following formula for the rise of temperature, $R_t = R_{15}\{1+0{\cdot}004(t-15)\}$, where R_{15} is the resistance of the conductor at 15° C., and R_t the resistance at t° C. Mr. Wordingham suggested that, in the case of the larger stranded cables, the resistance would not rise in proportion to the temperature, there being a possibility of the strands, when hot, coming into better contact than when cold; but from a test carried out on a 0·5 sq. in. paper-insulated, lead-covered cable, which was heated in a wooden box by means of woven resistances, to a temperature of 50° C., it was found that the presumed variation in resistance due to the tightening of the strands made no difference to the previous results. The resistance of conductors was taken on a Kelvin double bridge of the direct-reading type. The following precautions were taken to avoid undue heating or cooling at the ends: cable of the same size as that under test was used for connection to the standard resistance, the joints were wrapped in canvas, and the potential leads joining the cable and bridge were taken off at a point just inside the joints; water-cooled German-silver tubes, in which the rise of temperature is very small, formed the regulating resistances for the larger currents, and in the case of the smaller cables Eureka strip was used. A battery connected up to give six volts supplied the current, which was kept steady throughout the tests. An Elliott precision millivoltmeter, adjusted to give a full-scale reading for a drop of 0·15 volt, was used to measure the current. The standard resistances were made of manganin sheet or wire, the resistances of which closely resembled that of the cable under test. The heating effect of alternating current was tested by heating the cable with the current and then switching it on to a direct-current supply to measure the resistance, the result obtained coming to within 3 per cent. of the previous tests with direct current, being within the probable limit to which the alternating current was kept constant. A comparison was made between the solid wire and the different methods of stranding by making a correction in the result for the small differences in cross section between the conductors, and it was found in the case of a 14 S.W.G. and a 7/21 s. cable that the difference of a current required for a given temperature was

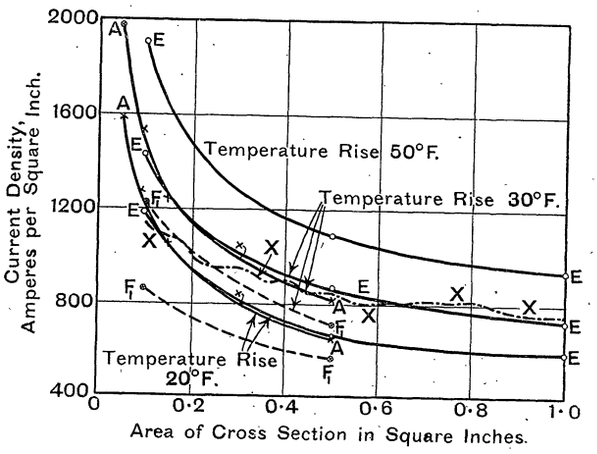

FIG. 2.—CURVES OF CURRENT DENSITY AND SECTIONAL AREA OF CONDUCTOR.

only 3 per cent., the actual temperature difference being 1° F. with 20 amperes. Curves of results were shown in which it was seen that the current-carrying capacity of the rubber cables for a temperature-rise of 20° F. was about 10 per cent. less when run in casing than in air, and that there was very little difference between the rubber- and paper-insulated cables when laid under similar conditions, also the difference between the rubber cable in casing and in tubing laid in air was very small compared with the tubing when embedded in plaster, which produced such a good cooling effect as to agree very closely with the result of the lead-covered single cable. The curves reproduced in Figs. 1 and 2 show the results of the whole series of cables tested in current-density per sq. in. of conductor for a given temperature rise, which show that with the single rubber-covered cables in air and wood casing, and the paper-insulated lead-covered cables, both single and concentric, the connection between cross section and current density could be fairly represented by the general formula of the type $i = K(\frac{D}{S})^n$, where n is a constant and is obtained from the slope of the curve, and K depends on the units adopted and the temperature rise. Log i and Log $\frac{D}{S}$ were plotted, showing that, for the same rise of temperature, 20° F. and 30° F., the values follow approximately a linear law. In the curves given here the current density allowed by the present wiring rules is shown by the curve x, which, on comparing with the other curves, is seen to give a temperature rise of 20° F. for cables from 0·05 sq. in. to 0·15 sq. in., rising to rather more than 30° F. for cables up to 1 sq. in., and for those smaller than 0·05 sq. in. the temperature rise is much less than 20° F., being only about 7° F. for a 3/18 s. cable in casing.

DISCUSSION.

Mr. C. P. SPARKS (Chairman of the Wiring Rules Committee) said that attention had been called to the fact that the new rules permitted a high current density in the smaller conductors, but it had not been pointed out at the same time that a lower current density was allowed in the larger cables. A study of this Paper would show that with even that large decrease they were still working on a very conservative basis. For instance, an increase of temperature rise of 20° with rubber cables and 30° for paper cables was very small indeed, since it was assumed that it was safe to work up to an air temperature of 100° F., so that 20° heating was still a very moderate figure even at the higher current densities. The real reason for the change

Hosted by Google

was the largely increased use of electricity for power and heating purposes, as in these cases the pressure drop was not of such importance as with lighting. It was the supply engineer who realised that it did not help the industry to have idle copper, and he was more responsible than the contractor. They could feel quite satisfied with regard to public safety, for besides going through the hands of the Committee and Council, the rules had been accepted by about forty-eight leading insurance offices. It was proposed to go further in the revision later, and to deal with the question of critical temperature. Safe temperatures had been given of 120° for rubber and 150° for paper, but the deterioration of these materials deserved careful investigation.

Mr. H. HUMAN (Guardian Fire Office) recalled his early attempts to frame wiring rules on the basis of a certain number of amperes per square inch. This, however, implied that the temperature rise for a given current was proportional to the sectional area of the wires, and this was not the case. In 1890 he recast his rules in consequence of Dr. Kennelly's researches on rubber-covered cables in casing, as compared with gutta-percha, which was previously used. In 1897 the Institution Rules contained a table of current densities based on rise of temperature, and he adopted these rules for the sake of uniformity. There were, however, no reliable data available, so that when the rules were further revised the National Physical Laboratory was asked to make an investigation.

Mr. J. F. C. SNELL said that although the larger sections of cable had been badly rated in the past, no evil results had shown themselves. He would like to see a thorough investigation of the heating of cables laid in the streets. It was suggested in the Paper that a temperature rise of 3° was sufficient for cables in wet earth, and this seemed to be rather a strong indication that armoured cables or lead-covered cables laid in the soil were capable of carrying higher currents than solid cables or cables laid within ducts. If the investigation could be extended in this way, it would materially assist them, especially with three-core cables laid solid and in concrete ducts. The authors did not deal with the effect of the current densities and temperature rise upon the dielectrics used. He believed it was true that with paper cables the insulation resistance actually dropped some 4 per cent. per degree F. rise of temperature.

Mr. W. R. RAWLINGS, who represented the Electrical Contractors' Association on the Wiring Rules Committee, said that the old rule of 1,000 amperes per sq. in. had permeated the industry to such an extent that it had blocked progress. To lay down a small heating installation under the old wiring rules it cost £100, as against £30 under the new rules. The new rules should greatly develop the heating day load.

Professor PORTER said the Paper gave experimental verification of theoretical assumptions made many years ago, and referred to experimental work of his own in the past.

Mr. A. W. WHALLEY asked if experiments had been made with lead-covered rubber cables, and, if so, were they identical with the lead-covered paper cables? He hoped the formula given in the Paper would be simplified, after the manner of that given by Kennelly.

Mr. C. C. PATERSON (National Physical Laboratory) pointed out they were not any worse off in the matter of voltage drop than under the old tables, on account of the universal use of metal filament lamps, with which the fall in candle-power per volt drop was only half what it was with carbon filament lamps.

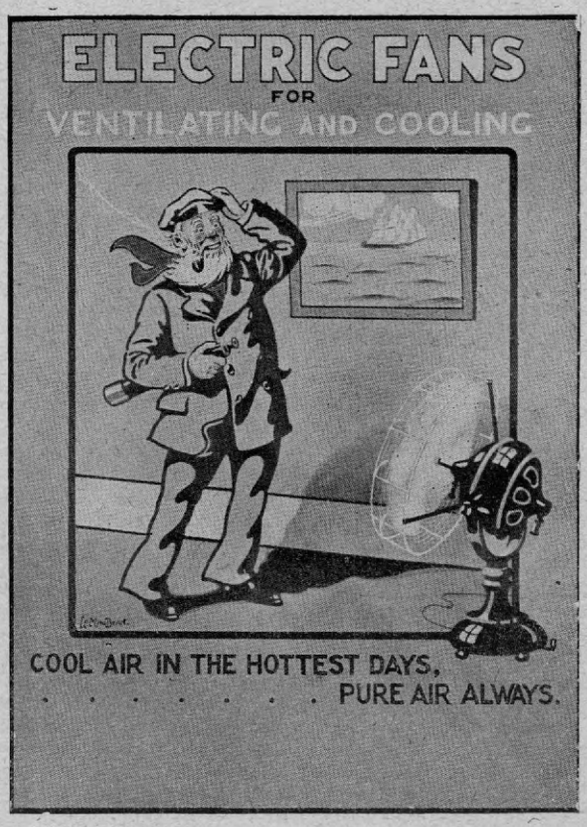
Mr. T. RITCHIE thought the alteration in current densities would affect arc lamp work very materially. He had just inspected a large arc lamp installation, and calculated that the work could be done under the new rules for about 17 per cent. less capital expenditure. He thought that information would be valuable in the case of pit shaft cables, where there was moisture and practically forced draught.

Mr. W. P. DIGBY said that in the case of lead-covered rubber cables there was an increase in dielectric strength with rise of temperature, which offset some of the effects due to fall of insulation resistance.

Mr. MELSOM, in reply, said that the insulation resistance of paper cables dropped about 50 per cent. for each degree F. rise of temperature, and not 4 per cent. No experiments had been made with lead-covered rubber cables, but the formulæ given in the Paper made it quite easy to calculate. With regard to a simpler formula, Kennelly's was simpler, but it was not strictly accurate for covered cables. The formula in the Paper gave the heating which determined the current density which would be obtained in the cable, and in order to determine the heating it was necessary to know the true diameter of the copper, which Kennelly did not take into account. One of the figures in the Paper gave the nearest approximation he could get to a colliery shaft. That cable was in a shaft, along which was drawn a current of air at normal temperature, which kept the cable cool. When actually laid in a colliery shaft, it would keep cooler than the current density curves shown.

Railway Electrification.—According to a Reuter telegram from Santiago de Chile, the Chilian Minister of Public Works proposes to submit a Bill for the conversion to electric traction of over 600 miles of railway.

CATALOGUES AND PAMPHLETS, &c., RECEIVED



SMALL TRANSFORMERS.—A new price list from Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston) deals with transformers for "Tantalum," "Onewatt," and other types of metal filament lamps. This list has been specially prepared owing to the popularity of transformers for use in conjunction with low-voltage metal filament lamps, and particular attention should be called to the double-wound type for Stannos installations on the concentric system, although the firm will be pleased to quote on inquiry for any type of transformer not included in the list. A wide selection of auto-transformers, balancing auto-transformers, double-wound transformers, and bell transformers is standardised at prices comparing very favourably with those of other manufacture. The windings of these transformers are protected by the cases, and it is therefore impossible to damage them accidentally. They are practically noiseless, and are tested before despatching at a voltage considerably in excess of that for which they are designed.

INSTRUMENTS.—A booklet from R. W. Paul (33 Leicester Square, W.C.) describes some recent improvements in electrical measuring and testing instruments, including resistances and bridges, moving-coil instruments, testing sets, condensers, potentiometers, alternating and high-frequency instruments, and apparatus for measuring inductance and capacity and for telephonic research.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

CABLES, &c.—A card from the St. Helens Cable & Rubber Co., Ltd. (Warrington), calls attention to their various manufactures, including cables and wires, tyres, matting, insulating gloves, tape, &c. The back of the card gives some condensed hints on golf.

ELECTRIC SUPPLY ADVERTISING.—The Electric Supply Publicity Committee are making a further issue of advertising matter, including a large poster designed by Mr. L. C. McBean,

ELECTRIC FAN POSTER.

depicting an old seafaring man enjoying the breezes from an electric fan. A special fan booklet and an ironing folder have also been produced. Another publication is an electric sign circular, and the Committee have also prepared a miniature edition of the fan poster for attaching to correspondence.

RECTIFIERS.—A folder (in German) from the Allgemeine Elektricitäts-Gesellschaft calls attention to special mercury vapour rectifiers for running cinematograph arcs. These are arranged to start automatically as soon as the arc is struck, and obviate the use of series resistances.

Hosted by Google

STRIP FITTINGS FOR ILLUMINATIONS.—A leaflet from the Electrical Co., Ltd. (122-124 Charing Cross Road), gives notice of a special offer of series striplite with porcelain holders for illuminations at 1s. per point complete.

CORONATION ILLUMINATIONS.—A card from Simplex Conduits, Ltd., gives particulars of special coloured lanterns for Coronation illuminations, of which an effective coloured illustration is given.

POLYPHASE INDUCTION MOTORS.—Messrs. Bruce Peebles & Co., Edinburgh, have issued a pamphlet dealing with induction motors. Part 1 relates to their open bedplate type, which are arranged with two or three bearings, and Part 2 deals with the endhood pedestal type of machine, the bearings being carried in the end hoods. This type is well adapted for direct coupling to pumps, fans, &c. Lists are given showing the range of voltage, 110-6,600, with approximate weights and dimensions of both types.

ELECTRIC KETTLES.—As we go to press we have received a pamphlet from the British Thomson-Houston Co., Ltd. (Rugby), describing their latest form of electric kettle, a special feature of which is the heating element, consisting of calorite wire wound on a mica former enclosed between cast-iron plates.

WIRELESS TELEGRAPHY

MR. G. Marconi, in a lecture on radio-telegraphy at the Royal Institution on Friday, June 2nd, said that while it was easy to transmit waves up to a distance of 2,500 miles, beyond this distance there were many curious facts requiring a satisfactory explanation. For example, short waves will traverse much greater distances by night than by day, while longer waves will traverse only about the same or less distances, also at night much greater distances are obtainable in a north-southerly direction than in an east-westerly direction, and mountains and land generally obstruct short waves in the sunlight, but not at all in the night. He referred to improvements made in his earlier system to secure selectivity, which comprised two tuned circuits in the transmitter and receiver known as the syntonic system. At the Transatlantic station at Clifden, in Ireland, he employed air condensers and rotating disc dischargers, producing a musical note in the receivers, which are tuned both to the same note and the wave frequency thus securing great selectivity. Towards the end of last year a number of long distance tests were carried out between the stations at Clifden and Glace Bay in Canada and a receiving station on the Italian ss. Principessa Mafalda in the course of a voyage to the Argentine. The aerial was supported by a kite, and signals and messages were obtained without difficulty by day as well as by night up to a distance of 4,000 miles from Clifden. Beyond this distance reception could only be carried out during the night. At Buenos Ayres, over 6,000 miles from Clifden, the night signals from both Clifden and Glace Bay were generally good. Improvements introduced at these two stations had greatly reduced the effect of interference and had strengthened the received signals so that they could be recorded. The recording was done photographically, a fixed record of the messages being received at a much greater speed than any operator by sound or sight could attain. He thought that he was not too bold when he said that wireless telegraphy is tending to revolutionise our means of communication. The fact that a system of Imperial Wireless Telegraphy was to be discussed by the Imperial Conference showed the supremely important position which radiotelegraphy over long distances had assumed in the short space of one decade. Its importance from a commercial, naval and military point of view had increased very greatly during the last few years owing to the innumerable stations which had been erected or were in the course of construction. Notwithstanding this multiplicity of stations and their almost constant operation, mutual interference between properly equipped and efficiently tuned instruments had so far been almost entirely absent. In regard to the high power Transatlantic stations the facility with which interference had been prevented had to some extent exceeded his expectations. During a recent demonstration arranged for the Admiralty, at a receiving station situated only eight miles from the powerful sender at Clifden, messages could be received from Glace Bay without any interference from Clifden when the latter station was transmitting at full power on a wave-length differing only 25 per cent. from the wave radiated from Glace Bay. Permanent arrangements are now being made to send and receive simultaneously at these stations, which will constitute in effect the duplexing of of radiotelegraphic communication between Ireland and Canada. It would, therefore, also be practicable to operate at one time on slightly different wave-lengths a great number of long distance stations situated in England and Ireland without danger of mutual interference.

MUNICIPAL WIRING

A REFERENCE to the possibility of "serious developments" in Marylebone is made in the leading article of the June number of the *Electrical Contractor*, the official organ of the Electrical Contractors' Association, and this has impelled us to make inquiries to ascertain what is precisely the position there with regard to the statutory powers of the Sales Department as to house wiring.

The Marylebone Borough Council, by their special Electric Lighting Act of 1904, may "provide sell let for hire and fix set up alter repair and remove (but shall not manufacture) lamps meters electric lines fittings motors apparatus and things for lighting and motor power and for all other purposes for which electrical energy can or may be used or otherwise necessary or proper for the supply distribution consumption or use of electrical energy and may provide all materials or do all works necessary or proper in that behalf." The power given in this Act is, however, subject to the proviso that the Council shall not themselves execute the wiring of private property except between the main of the Council and the consumer's meter.

On the other hand, the L.C.C. (General Powers) Act, which was passed two years later, viz., 1906, gave power to any Metropolitan Borough to carry out wiring work without the restriction contained in the Marylebone Act.

Although it might be thought that under this latter Act the Marylebone Borough Council would be quite safe in carrying out wiring work, yet it appears that the Council prefer to be on the safe side, and contend that they do not do any wiring work themselves. They certainly furnish all the material, such as cables, fittings, motors, cooking and heating appliances, lamps, etc., for the work which they undertake, but it is claimed that in all cases, without exception, the actual wiring is sub-let to contractors. Even if it were not so, however, we cannot but think that the Electrical Contractors' Association would find it very hard to make a good case against the Marylebone Borough Council, as it is not at all certain that under the latter Act the Council could not do the whole wiring themselves without exceeding their powers.

The action of the Electrical Contractors' Association against the Sheffield Corporation is making slow progress. The plaintiffs have experienced some difficulty in obtaining an Order authorising an investigation of the books of the Corporation, but it appears now that permission has been given them to see some of the books and documents required. In Sheffield it will be remembered the Corporation took over its electricity supply business from a company, a large proportion of whose work consisted of private wiring. The Corporation maintain that they are quite justified in continuing the wiring business as they are doing, but the contractors contend that the Corporation possess no real authority to carry on other business than supply.

The Newcastle-upon-Tyne Branch of the Electrical Contractors' Association is issuing a writ against the Sunderland Corporation, contending that this Corporation are doing electric light wiring in contravention to the statutory powers which they possess. According to the *Electrical Contractor*, there has been some little hitch in connection with the financing of this proposed action. The Newcastle Branch of the Association have contributed to the "fighting fund" which was collected by the Association in view of the Bill which the Incorporated Municipal Electrical Association were threatening to introduce to authorise all municipalities to carry out house wiring. The Newcastle Branch, therefore, claim that their Association should finance the action they are proposing to take against the Sunderland Corporation, but the Central Board has replied through the Secretary, Mr. L. G. Tate, to the effect that this "fighting fund" was organised to deal with matters vital to the Association as a whole, and that allotments cannot be made from it for local cases. The Newcastle Branch, however, are still insisting that the general fund should be applicable to such purposes. We must confess our sympathy with their point of view. In the first place, it is improbable that the question of general wiring powers for all municipalities will have to be fought in Parliament for some time to come; and secondly, any success that may be obtained in an action in any particular district would tend to strengthen the cause of the Electrical Contractors' Association. It is greatly to be regretted that a compromise was not arrived at between the two Associations at the Conference held in London a few months ago, for there continues to be a very large amount of electric wiring to be done and new business to be sought, all of which will be facilitated if the supply authorities and the contractors work in perfect amity.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 1, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

11,048/10. **Telephonic Apparatus.** A. J. BOULT (*International Telechronometer Company, New York*). This invention provides a metering apparatus, which is installed at a telephone subscriber's station (in conjunction with the telephone set) to register the number of calls and also the length of time the call takes. Each of the mechanisms comprises an operating electro-magnet. A normally open shunt circuit round the electro-magnet, which can be closed by contacts under control, is arranged to remove the impedance of the operation from the circuit. For recording a number of messages and also the length of time the line is in use, the operating electric magnet and the shunt controlling magnet are oppositely polarised, so that one responds to current flowing in one direction, and the other magnet responds only to current in the opposite direction. Two circuits are provided for impressing currents of opposite polarity on the subscriber's circuit with the necessary arrangement, whereby the message meter and the time recording device are not operated until the call has been answered by the removal of the receiver, when the circuit is complete. Two figures.

11,186/10. **Motor Starting Devices.** ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*). This patent covers an improvement on the electrically operated step-by-step mechanism, which now rotates a contact drum gradually to cut out resistance from the motor circuit. The electrically operated mechanism is controlled by a relay device, which, when energised, establishes a circuit, causing the step-by-step mechanism to operate, and when de-energised produces a circuit allowing the mechanism to operate as soon as the current is restored, when the contact drum is moved and the whole of the resistance is in the motor circuit ready for starting. An auxiliary contact segment is provided, and operated simultaneously with the contact drum, the segment controlling the circuit through a solenoid, which operates the main switch in the motor circuit. The segment also opens the circuit through a solenoid operating the step-by-step mechanism, when all the resistance is either out or in the motor circuit. One figure.

13,518/10. **Arc Light Electrodes.** BRITISH THOMSON-HOUSTON CO. (*General Electric Co., Schenectady, New York*). This invention aims at the increase in life of titanium carbide electrodes by the addition of a small percentage of chromium carbide. An iron tube, closed at the lower end by a plug, contains the mixture. It is found that an addition up to 5 per cent. of chromium carbide increases the life of the electrode, and also slightly increases the candle power of the arc, but beyond this, though the life of the electrode is increased, the candle power slightly decreases. The best results have been obtained with 95½ per cent. of titanium carbide mixture, and 4½ per cent. of chromium carbide.

11,747/10. **Lamp-holder Locking Device.** G. H. IDE. This device consists of a circular metal ring and a thumbscrew. The ring is made of toughened brass or steel, which may be pressed, cast, or formed from drawn tube, its shape and size being such that it can be fitted over the lower portion of a standard incandescent lamp-holder of the bayonet pattern. The lamp can only be removed by means of the thumbscrew.

14,505/10. **Electric Drills.** A. STEWART and THE WESTMINSTER TOOL & ELECTRIC COMPANY, LTD. This invention relates to electric drills of the kind provided with an adjustable friction clutch for transmitting the motion to the drill. Upon the motor armature spindle a collar is mounted, which rotates with the armature, and a number of springs, which may be flat, curved, or helical, project tangentially from the periphery of the collar. The outer ends of the springs are fitted with shoes, which are held by them in contact with the inner face of the driven clutch, and which actuates the drill gearing. In conjunction with each of the springs, means is provided for adjustment so as to regulate the pressure between the shoes and the clutch surface. This may consist of a set screw in conjunction with each spring, the set screws being mounted radially to modify the shoe pressure against the clutch. In order to keep the armature cool, the clutch may be formed with vanes. Three figures.

19,804/10. **Electric Furnace.** J. H. REID. This patent is a combination with an electric smelting furnace of a refining and tapping furnace. The former is of the type in which the metal to be treated is supported on electrodes, inclined from the sides of the furnace, and which allow the molten metal to fall through various chambers into the lower furnace, where it is further treated and tapped. One figure.

19,772/10. **Electrolytic Production of Antimony.** In this process of treating stibnite with ferric chloride and electrolysing the solution, which is a mixture of ferrous and antimonious chlorides, soluble instead of insoluble iron anodes are used. The electrolytic action is stopped before the electrolyte is completely exhausted of its antimony, and after the electrolysis the solution is converted, either by adding free chlorine, nitric acid, or simply by blowing hot air through the solution, or other means of oxidising, into ferric and antimonic chlorides, becoming an active solvent for taking up more antimony from a fresh supply of stibnite, the process thus being cyclic, efficient, and economical.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: KORTING and MATHIESEN AKT.-GES. [Alternating current] 6,336/11.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: BOWYER and ANCHOR CABLE CO. [Identification of conductors] 15,792/10.

Dynamos, Motors, and Transformers: ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Motor control] 12,026/10; ELECTRIC CONSTRUCTION CO. and PENSABENE [Induction motor control] 13,962/10; ALLGEMEINE ELECTRICITÄTS GES. [Commutator A.C. machines] 14,024/10; MACDONALD [Screw motors] 5,853/11.

Heating and Cooking: NEWITT and FLETCHER [Electric heating] 12,322/10; LEONARD [Rheostats and heaters] 19,019/10; LOFQUIST [Electric geyser] 19,100/10; BYNG and ARCHER [Electric heaters] 20,289/10; ROCHE [Electric water heaters] 29,733/10.

Incandescent Lamps: SHIRLEY [Fixing and removing of] 22,103/10; DARBY [Socket for] 22,304/10.

Switchgear, Fuses, and Fittings: LOCKE [Time-signalling apparatus] 12,071/10; BERRY [Switch apparatus] 12,427/10; IRVING [Railway switch point control] 16,157/10; TRAUS [Lamp switches] 2,520/11.

Traction: SEFTON-JONES (*Oesterreichische Daimler Motorenges Akt.-Ges.*) [Overhead collectors] 27,798/10.

Miscellaneous: PHILLIPS [Wave-control of aerial vessels] 6,316/10; AITKEN [Electric light control] 11,854/10; HERBERTS [Means for varying A.-C. voltage] 11,951/10; BRITISH THOMSON-HOUSTON CO. (*General Electric*) [Alloy resistances] 12,757/10; HENRI, HELBRONNER and VON RECKLINGTON [Sterilising liquids] 12,949/10; CLARK (*Telelectric Co.*) [Electrical music apparatus] 16,620/10; GOLDSTONE and LIGHTFOOT [Electric cord grips] 17,819/10; ALLGEMEINE ELEKTRICITÄTS GES. [Couplings for electrically-driven looms] 29,309/10; LANGE [Aerial conducting structures] 2,242/11; SIEMENS BROS. & CO. (*Siemens and Halske Akt.-Ges.*) [Electric block signalling] 6,627/11; ALLGEMEINE ELEKTRICITÄTS GES. [Voltage regulation of D.-C. machines] 8,150/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Telephony, &c.: GIRARDEAU [High-frequency alternator for radio-telegraphic and telephonic plants] 3,948/11; GOLDSCHMIDT [High-frequency transmitter] 11,162/11.

Miscellaneous: PÖRSCKE and ACHENBACH [Secondary cell electrodes] 9,945/11 and 9,946/11.

Opposition to Grant of Patents

17,349/08. **Wireless Telegraphy.** E. VON LEPEL. The appeal which was lodged against the Comptroller's decision, and which was mentioned in ELECTRICAL ENGINEERING, September 8th, 1910, p. 582, has been withdrawn. It covers the disc discharger of the Lepel system.

Amendment Allowed

26,289/09. **Electric Light System.** T. FERGUSON. Leave has been granted to correct three figures in the drawings describing this patent, which covers a switch having two windings for controlling the lighting circuit of trains, &c.

Expiring and Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Instruments, &c.: F. CONRAD [Alternating-current meter] 3,540/04.

Switchgear, &c.: A. J. BOULT (*Continental Hall Signal Co.*) [Railway points and signals electrically controlled] 3,325/99 and 3,597/99; A. J. FULLER [Circuit brakers] 3,088/05.

Telephony, &c.: W. W. MASSIE [Wireless telegraphy] 4,221/06.

Traction: W. GRIFFITHS and B. H. BEDELL [Electric railways] 3,886/03.

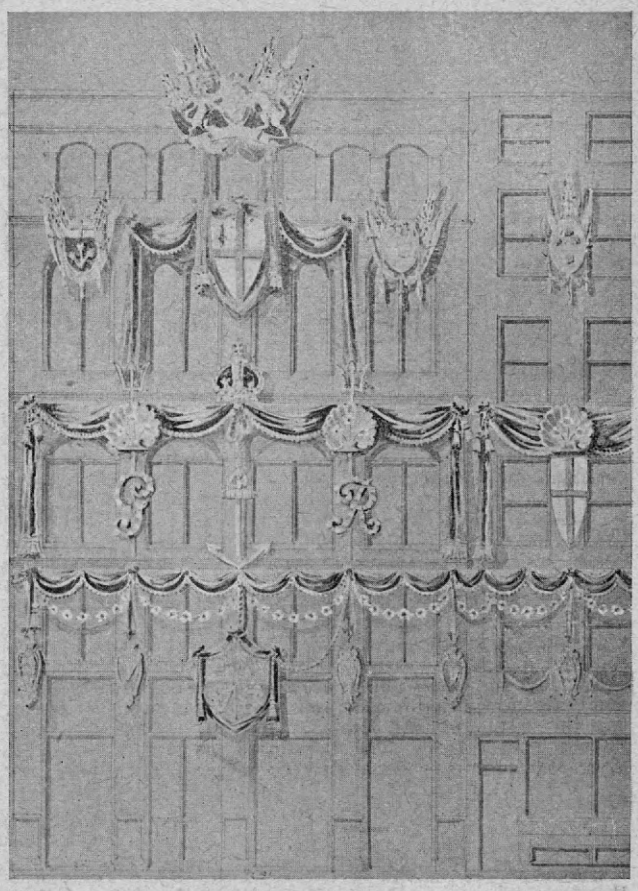
Miscellaneous: W. W. MASSIE [Electric condensers] 4,220/06.

Hosted by Google

HAMPSTEAD ELECTRICAL SHOWROOMS

THE Hampstead Borough Council opened their new showrooms of electrical appliances at 283 Finchley Road, N.W., on Thursday, June 1st, when we had the pleasure of inspecting them. The Council are endeavouring to bring within the means of all householders such apparatus as heaters of all kinds, toasters, kettles, flat-irons, bed-warmers, etc., by a very reasonable system of charging. The flat rate for lighting is 4d. per unit, for heating and cooking 1½d. per unit, and for power 1½d. per unit. All these, however, can be had under the "telephone" system for 1d. per unit with a fixed annual charge of £8 5s. for a demand of 1,000 watts. Apparatus can be hired or purchased on a hire-purchase scheme. The electric kitchen, a photograph of which is reproduced here, is fitted with every convenience for cooking, and demonstrations with the "Tricity" stove were given. The principles of this stove were outlined in ELECTRICAL ENGINEERING, Vol. VI., pages 93 and 519. The demonstration showed that the heat in the oven was remarkably uniform, and this is essential in order that the reduction in weight of the meat when cooked shall be a minimum. The "Vickers-

Eclipse" cooker is another worth mentioning: this is constructed of cast iron heavily lagged. The heating elements are placed on either side of the oven, and are protected by perforated cast-iron gates, which carry the runners for the oven grids and shelves, and are easily removable for cleaning purposes. At the top of the cooker two circular hot-plates are provided, and one combined hot-plate and grill, the former being controlled by a three-heat turn switch and the latter by an "on" and "off" switch. A ruby lamp is also provided as a reminder should the cook leave any switches on when the cooking is finished. Cookers can be hired on the following charges: 15s. the first day, 10s. the second day, and 5s. the third day, with longer periods on application. Demonstrations were also given with the electric iron and the imperial vacuum cleaner. A feature of the exhibits was the Halliwell portable hair-dryer, consisting of a motor-driven fan and an electric heater, which can be put in or out of circuit to give either a cooling or heating effect. We understand there is great demand for a cheap, economical and reliable electrical geyser. The showrooms are illuminated with Siemens tantalum and one watt lamps in conjunction with holophone glassware, the distribution of light being very uniform and effective. A very pleasant afternoon can be spent in these showrooms, where tea and toast is available free of charge for visitors willing to make it themselves.



Obituary.—Mr. J. W. Boucher, manager of the Edison & Swan United Electric Light Co.'s business in Dublin, shot himself in his office last week.

Telephone Transfer.—The Court of Appeal have fixed June 14th for hearing the appeal against the judgment of the Railway and Canal Commissioners on the points decided last week, and which were reported on page 307 of our last issue.

Tramcar Accident at Stalybridge.—A serious accident took place upon the tramway system of the Stalybridge, Mossley, Hyde, and Dukinfield Tramways and Electricity Board on Monday. Whilst descending a steep hill a car got beyond control and left the rails on a curve, dashed across the road and turned over. The Board of Trade have imposed three compulsory stops on the hill in question, as two previous accidents have occurred there. The car was double decked, and contained some 50 passengers at the time of the accident, of whom 33 sustained injuries.

CORONATION ILLUMINATIONS AT PIMM'S

THE illustration below shows the frontage of Pimm's, in Poultry (London, E.C.), which is being decorated and illuminated for the Coronation by Messrs. Siemens Bros., Dynamo Works, Ltd., Tyssen Street, Dalston. Approximately 150 8-c.p. carbon lamps are used and the load is approximately 4½-kw. The festoons consist of lamp-holders fixed on a Bro-ite strip, and each holder will be surrounded by a sort of rosette-shaped reflector, made of metal and fixed by means of the shade carrier ring, which gives the appearance of a flower when the lamp is lighted. The two large letters,

G.R., seen in the illustration are each illuminated with 17 lamps, and the anchor between these (not illuminated) is of wood finished in gilt. Above these are seen three devices in the shape of a large shell, in the centre of each of which is a spray of three lights, with reflectors arranged in a somewhat similar manner to those on the festoons. The Royal Arms surrounded by flags and the City Arms and other devices beneath, together with the window canopies, all add to the effect, which, it is seen, is a very pleasing one. The frontage is 46 feet long. Messrs. Siemens Bros., Dynamo Works, Ltd., are supplying the whole material and the work is being carried out by contractors.

Meters on Tramcars.—With reference to the Local Note in our last issue to the effect that Mr. J. H. Cowell, the Blackburn Corporation Tramway Manager, is not satisfied that there is a reliable tramcar meter yet on the market, we would point out the fact that a large number of corporations and tramcar companies have been using them for some time with very satisfactory results. Figures relating to a large tramway company near London have reached us, from which it appears that by fitting 50 cars with such meters, the power bill was cut down from £10,000 to £8,250 with very little trouble. Those responsible for this installation tell us that it is only a question of having accurate instruments, so that they can point out to the motormen that it is cheaper to "coast" than to wear out the brake blocks, and prevent the shed staff from having the brake blocks too tight on the wheels. Ferranti meters have been used in this case, and the average of 35 meters showed a maximum error of about 3 per cent. above or below the average. A second batch of 15 meters showed results equally close, and as the meters have had hard traction wear, the results must be regarded as speaking extremely well for the accuracy of the ampere-hour meter.

CONSTANTINOPLE TELEPHONE SYSTEM

MESSRS. F. GILL and W. W. Cook, Engineer-in-Chief and Assistant Engineer-in-Chief of the National Telephone Company, have been appointed consulting engineers to the Constantinople telephone scheme, the formal agreement for which was executed between Djavid Bey, then Minister of Finance, and Mr. Herbert Laws Webb, at Constantinople on May 6th last. A staff of engineers left London this week to make a telephonic survey of Constantinople and to prepare plans and specifications for the system, which is to have an original capacity of 10,000 lines and to be ready to start service in July, 1913. Mr. John Scott is in charge of the engineering force, and left London last week for Constantinople. The work Mr. Scott has in hand is one of many difficulties, as Constantinople is the most peculiarly situated of all European capitals. The city is divided by the Bosphorus, which is deep and has swift and variable currents; moreover, it is extensively used as an anchorage. The European section is again divided by the Golden Horn, an arm of the sea over which there is no permanent bridge. In all parts of the city the streets are extremely primitive, narrow, winding and ill-paved, and many of them are precipitous hills.

As no telephone service yet exists in Turkey, all modern facilities having been debarred by the ex-Sultan, there are no available data whereby to gauge the probable use of the service or the probable traffic which the system will be called upon to carry. The peculiar composition of the population of Constantinople, about one-half of which consists of non-Moslem races, Greek, Armenian, Jewish, and so on, makes the business part of the engineering study one of much complexity. Three languages are current—Turkish, Greek, and French—while many more are spoken, and the variety of local customs and practices is probably greater than in any other large city in the world. No exact statistics exist, but the population of the area is estimated at between 1,000,000 and 1,250,000 inhabitants. Means of communication are at present so primitive and expensive that a large demand for the telephone service may be anticipated.

The Telephone Development Company, Limited, has been formed for the purpose of carrying on the necessary work pending the organisation of the Ottoman Telephone Company, which will construct the plant and operate the service.

THE ELECTRIC SUPPLY PUBLICITY COMMITTEE

THE first annual conference of this Committee was held at the Institution of Electrical Engineers on Tuesday, May 30th. Mr. H. B. Renwick, Chairman of the Committee, presided, and over thirty members representing London and provincial undertakings were present. The Chairman outlined the aims and future programme of the Committee. He remarked that the meeting was thoroughly representative, and referred to issues of publicity literature which had been made at frequent intervals throughout the year, including posters, show-cards, booklets, pamphlets, circulars, folders, leaflets, mail-cards, postcards, and adhesive labels, covering practically the whole of the field of electric supply. The issues had been arranged so as to be appropriate to the various seasons of the year, and the shape and size of the publications had been carefully chosen, so as to fall in with the general office arrangements of supply undertakings. The total sales during the year numbered nearly one million and a half, and extended throughout the whole of the United Kingdom, in addition to the Colonies and abroad. The Committee, he said, had also done signal service in connection with the newspapers, and the various erroneous reports which had been given currency to in the Press in regard to the causes of fires. Corrections had been arranged in the Press wherever necessary, and the interests of electric supply generally upheld. A certain amount of newspaper advertising had also been done, and there was hope that in the forthcoming year this would be carried on on a much larger and more comprehensive scale. He concluded with some remarks on the necessity for concerted action in this class of advertising.

Mr. W. A. Vignoles (Grimsby), who strongly upheld the Committee's work, spoke particularly as to the energetic pushing of electric cooking, and Mr. H. R. Burnett (Barrow-in-Furness) suggested the inclusion of an information bureau in the Committee's sphere of action. Mr. A. H. Shaw, of Ilford, was in favour of large-sized posters. Another suggestion was that of Mr. Cramp (Croydon), who thought that the Committee might undertake the registration of canvassers. A vote of thanks to the Chairman and officers was proposed by Col. Hopkins (Marylebone), and seconded by Dr. Mansfield Robinson, and replied to by the Chairman and by Mr. Walker, the Honorary Secretary.

LOCAL NOTES

Belfast: *Cavehill and Whitewell Tramways.*—The Corporation have taken over the workings of the Cavehill and Whitewell Tramways, pending a settlement of the legal point arising out of the Arbitrator's award. It will be remembered that the Arbitrator's award was £66,000, but the Corporation contend that he had no jurisdiction to base the award upon the principles which he adopted.

Blackburn: *Electricity Accounts.*—The net profit from the electrical undertaking last year was £697 less than in the previous year. Mr. P. P. Wheelwright, the Borough Electrical Engineer, attributes this to the continued bad trade in the town, which was very marked during the first three quarters of the years, but which showed improvement in the last quarter.

Blackpool: *Coronation Illuminations.*—The Corporation have decided to supply electricity free to private consumers for illuminations during the Coronation.

Brighton: *Electricity Accounts.*—The accounts of the electricity, which were abstracted in our last issue, were passed at the Council Meeting on Thursday, great satisfaction being expressed with them. The Chairman of the Committee, in moving the adoption of the report and accounts, said they would, in the near future, be able to consider a substantial concession to consumers, and if they could offer a reduction of ½d. per unit they would render electricity so superior and economical that there would soon come a time when gas would be prohibited as an illuminant in private houses.

Croydon: *Electricity Accounts.*—The accounts of the Electricity Department for the year to March 31st show that there was a decrease of £3,494 in the total receipts compared with the previous year. Special attention is drawn to the fact that the tramways have taken 20·6 per cent. less energy than in the previous year, the cash value of this being £5,372, and that in addition the reductions for power supply and public lighting account for a further reduction of £418. Taking these facts into consideration, Mr. A. C. Cramb, Borough Electrical Engineer, regards the position as a satisfactory one. The profit available for distribution is £6,978, and a balance of £372 is carried forward after transferring sums to the reserve fund and to relief of rates.

Dundee: *Electricity Accounts.*—The accounts of the Electricity Department for the past year show a total revenue of £46,047 compared with £39,908 in the previous year. The sum of £22,957 was carried to net revenue account, and after meeting interest and sinking fund the balance has been transferred to reserve fund and depreciation. The number of units sold during the year was 7,720,018 against 6,144,927.

Edinburgh: *Reduction in Lighting Charge.*—The Electric Light Committee recommend the Town Council to reduce the price of electricity for lighting purposes to 2¾d. per unit. The question of reducing the rate for power purposes is to receive further consideration.

Glasgow: *Tramways Assessment.*—The appeal by the Tramways Committee against the assessment of their undertaking has been dismissed by the Sheriff's Court. The Committee contend that the tramways should be assessed as a railway, viz., upon the basis of one-fourth of the rateable value.

Kingston-on-Thames: *Electricity Accounts.*—The accounts of the Electricity Department for the year to March 31st show a loss of £1,193. Mr. J. Edgcome, in his report, points out that during the past eight years there has always been a substantial profit from the working of the undertaking, after paying interest on borrowed capital, the smallest being £1,925 and the largest £3,732, and that it is entirely due to the heavy repayments of capital that there has been a succession of deficits during the last five years. The loss shown by the accounts this year is £450 less than that of last year. During the year 140 public incandescent lamps have been erected, and there has been a satisfactory increase in the number of consumers for light and also in the number of electric motors, fans, and heating and cooking apparatus which has been installed.

Llanelly: *Electric Traction.*—The electric tramcar service

Hosted by Google

was commenced last week. There are about a dozen cars, the length of track being about 12 miles.

London: *Islington.—Coronation Illumination.*—Special arrangements are being made for supply for this purpose at a fixed rate equivalent to 1d. per unit with a fee of 5s. for connecting and inspection.

Macclesfield: *Electric Lighting.*—The New Electricity Company of Macclesfield applied for an electric lighting Provisional Order for this district, and the Macclesfield and District Railless Electric Traction and Electricity Supply Co. now have a Bill before Parliament in which electric lighting powers are also sought. The Macclesfield Corporation refuse to give their consent to the first-named, and the Board of Trade have decided to dispense with this consent, but have made the Order out in such a form that it is left to Parliament to decide which of the two companies shall be given the powers in question.

Maidstone: *Municipal Wiring Powers.*—The Electricity Committee report that they have approached the Incorporated Municipal Electrical Association with a view to getting that body to promote a Bill in Parliament granting powers to all local authorities to wire and fit consumers' premises for electric supply.

Manchester: *Proposed Tube Railways.*—It is stated in the Manchester papers that efforts are being made to promote a Bill in Parliament for the construction of a system of tube railways in Manchester, Salford and district.

South Shields.—After meeting interest and sinking fund charges there is a net profit of £3,344 upon the tramways for the past year. It is recommended that £1,844 be transferred to reserve fund and £500 to an accident and compensation fund.

Electricity Accounts.—The accounts of the electricity undertaking for the past year show a net profit of £1,400 against £209 for the previous year.

West Bromwich: *Electricity Accounts.*—The net profit from the Electricity Works for the past year was £1,782, an increase of £56 over the previous year. There was a considerable decrease in the energy used for tramway purposes, but the revenue from private consumers increased by £1,568.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Atherton.—The Council have received the sanction of the Local Government Board to borrow £2,867 for the electrical extensions.

Barking.—A loan of £11,400 is to be applied for in connection with the scheme of extensions at the Electricity Works, the tender for the buildings for which has been let.

Bradford.—A Local Government Board inquiry was held last week concerning a loan of £60,000 for extensions by the electricity department. There was no opposition, and the Inspector undertook to bring before the Local Government Board the Electricity Committee's request for as long a period for repayment as possible.

Farnworth.—The Council have decided to apply to the Local Government Board for permission to borrow £3,000 for electrical extensions.

Hull.—An inquiry was held last week concerning a loan of £99,322 for extensions to the electric supply undertaking. The Inspector amended and raised the amount of the loan to £101,087 in consequence of certain items only being estimates and in his opinion rather low. There was some opposition.

Ilford.—A Local Government Board inquiry was held last week concerning a loan of £8,070 for electric lighting extensions. The new loan is required for the provision of a feeder from the electricity works to the Broadway, conduits, distributing switch board, and also other mains and services.

Kettering.—Tenders are invited by June 19th for an oil eliminating plant and extensions to pipe work. Particulars from Messrs. Kennedy & Jenkin, 17 Victoria Street, Westminster.

London: *Bermondsey.*—Estimates for new generating plant, amounting to £18,563, have been placed before the Council. After consideration, the Electricity Committee are unable to recommend the Council to take a supply in bulk from either of the companies now supplying electricity in the district.

Poplar.—Tenders are invited for a 3,000-kw. turbo-alternator with surface condensing plant, two water tube boilers with super-heaters, air heaters, fans and chimneys, a 30-ton electric overhead travelling crane and water-softening plant. Particulars from the Borough Electrical Engineer.

Loughborough.—An inquiry was held last week concerning a loan of £2,310 for extensions to the electricity works.

Manchester.—The Electricity Committee invite tenders for two water tube boilers with superheaters, etc. (See advertisement on another page.)

Mexboro'.—The Electricity Committee require a balancer-booster set. Particulars from Electrical Engineer and tenders by June 10th.

Pontardawe.—Mr. J. Morgan has been requested to prepare a report upon lighting the district by electricity.

South Africa.—According to the *African World*, Mr. W. A. Harper, of Messrs. Harper Bros. & Co., consulting engineers, of London and Johannesburg, has just returned from a visit to South Africa in connection with a number of large power schemes. An important one is the installation of a power station at the Tweefontein Colliery, another relates to supply to the Kimberley and neighbouring diamond mines, whilst a further scheme is in contemplation for the neighbourhood of Vryheid.

Swindon.—Tenders are invited by June 20th for a battery of 220 cells, automatic reversible traction booster, three wire hand regulated booster and switchgear. Particulars from the Borough Electrical Engineer.

Turkey.—The Turkish Ministry of War invites tenders by June 26th for electric accumulators. Applications to Commission des Achats, Administration Generale des Fournitures, Ministere de la Guerre, Constantinople.

WIRING

Brighton.—The plans for the new pier winter gardens have passed the requirements of the Board of Trade, and the constructional work is to be commenced at once.

Coventry.—Tenders are invited by June 14th for electrical work at the Coventry and Warwickshire Hospital. J. A. Rudd, Secretary.

Devonport.—New wing at Beaconsfield High School for Girls.

Edinburgh.—New science laboratories at Heriot's School. Architect, John Anderson, Heriot Trust Office.—New building for Edinburgh Provincial Committee for training teachers.

Horsforth.—Parish hall and school. Architects, Empsall & Clarkson, 7 The Exchange, Bradford.

Ipswich.—Sanatorium. Architect, Mr. H. M. Gautley, 32 Museum Street.

Macclesfield.—Infirmary. A. E. Hanrahan, Secretary.

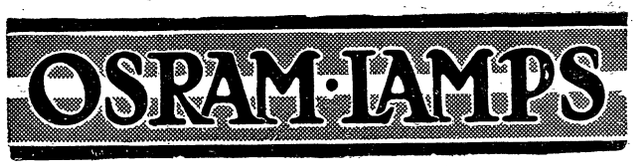
Margate.—Electric lighting of Pavilion and Winter Gardens.

Rotherham.—Erection of Kimberworth Upper Standard School. Director of Education, Imperial Buildings.

Sheffield.—Hospital at Hallwood.

St. Albans.—Additions to School of Art, Technical Buildings. County Surveyor, Hatfield.

Wrexham.—Alterations to market hall, &c. Town Clerk.



MISCELLANEOUS

Brumby and Frodingham.—A Local Government Board inquiry has been held concerning a loan of £1,100 for the purpose of street lighting. It is proposed to take energy from the Frodingham Iron and Steel Co. The streets are at present lighted by oil.

Eccles.—The Town Council have decided to light with electricity several streets in the borough, and are borrowing the sum of £666 for the provision and laying of a high tension electric feeder for this purpose.

Egypt.—Tenders are invited by the Ministry of Public Works for the supply and erection of a complete electric pumping installation. Forms from Mr. A. L. Webb, C.M.G., Queen Anne's Chambers, Westminster.

London: *L.C.C.*—The County Council invite tenders by July 4th for four electric traversers for their car-sheds. Particulars from the Clerk to the Council.

Hosted by Google

Nelson.—A Local Government Board inquiry was held last week concerning a loan of £14,525 for tramway purposes.

Swansea.—Tenders are invited for a one and two years' supply of continuous current motors and starting switches. Particulars from the Electricity Department and tenders by June 13th.

TENDERS RECEIVED AND ACCEPTED

Dublin.—The contract for the electric lighting installation at St. Mark's Church, Great Brunswick Street, has been secured by Messrs. Dockrell, Sons & Co., Ltd.

Blackburn.—The tender of the British Westinghouse Company has been accepted for a 2,000-kw. turbo-generator and two rotary converters.

Caversham.—A contract has been entered into with the Reading Electric Supply Co. for public lighting. There are to be installed 247 lanterns each equipped with two 55-watt lamps, and 11 lanterns each equipped with two 80-watt lamps. The prices vary from £1 17s. 3d. per post per annum to £3 2s. 6d. per post per annum, according to the number of hours the lamps are burning.

G.P.O.—Messrs. Siemens Bros. Dynamo Works, Ltd., have been awarded a contract for tantalum and onewatt lamps of various voltages and candle powers for the General Post Office, to extend for a period of six months.

Grimsby.—The tender of the Stirling Boiler Co. has been accepted at £318 for a new steel casing and fire-brick lining for one of the boilers at the power station.

Queensland Government Railways.—Messrs. Willans and Robinson, Limited, of Rugby, have received an order from the Railway Commission for a 750-kw. Willans impulse-disc and drum turbine, with a General Electric Co.'s two-phase alternator, and surface condensing plant. This turbine will be capable of giving its normal full load with high-pressure steam or with any mixture of high-pressure and exhaust steam, and is intended for installation in the Ipswich Locomotive Works of the Queensland Government Railways.

Messrs. Siemens Bros. Dynamo Works, Ltd., send us a further list of orders received for Coronation illumination work in London, in addition to the list published on page 309 of our last issue.

APPOINTMENTS AND PERSONAL NOTES

The Sunderland Electricity Department require a superintendent to take charge of main and sub-stations. Salary £182 per annum. (See an advertisement on another page.)

Electrical fitters experienced in shipwork are required. (See an advertisement on another page.)

Mr. Egerton J. Ward has resigned his position as senior engineer-in-charge at the Eccles Corporation Electricity Works in order to take up the post of assistant engineer with the Para Electric Railways and Lighting Company, at a commencing salary of £600 per annum.

The Leek Corporation have increased the salary of Mr. W. B. Child, Assistant Electrical Engineer, from £100 to £110 per annum.

The Mysore Government have appointed Mr. T. G. Hanscombe to succeed Mr. Gibbs as Chief Electrical Engineer to the State. The latter retires in July to take up the appointment of General Manager to the Tata Hydro Electric Supply Co., Bombay.

Electrical Equipment of the s.s. "Titanic."—The new 45,000-ton White Star liner *Titanic*, which was launched last week at Belfast, will have a very complete electrical installation. Four 400-kw. sets, supplied by Messrs. W. H. Allen, Son & Co., are provided in a separate watertight compartment aft of the turbine room. The engines indicate each about 580 horse-power, and are of the Allen vertical three-crank compound, running at 325 r.p.m. They take steam at 185 lb. per square inch, and exhaust either into a surface heater, which is the usual seagoing condition, or to the condenser. Each engine is direct-coupled to a compound-wound continuous-current 10-pole dynamo, fitted with interpoles, with an output of 4,000 amperes at 100 volts. In addition to the four main sets, there are two 30-kw. engines and dynamos in a recess off the turbine-room at saloon-deck level. Three can be supplied with steam from either of several boiler rooms, and will be available for emergency purposes. The distribution is on the single-wire system. The main switchboard is on a gallery in the electric engine-room. The main feeders pass up through port and starboard cable trunks to the various decks, radiating thence to switch and fuse boxes grouped at convenient points in the machinery spaces and accommodation, from whence run branches to the distribution fuse boxes scattered throughout the vessels. In addition to lighting, electricity is largely employed for heating, as well as for motive power. There are 75 motor-driven "Sirocco" fans from 55 in. to 20 in., all of which are provided with automatic and hand-speed regulation.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars net c.i.f. port of arrival, quoted on Tuesday night, was £56 15s. to £57 5s. per ton (last week the same).

Patents for Sale.—Patents relating to improvements in secondary battery plates and improvements in galvanic battery plates are for sale. (See an advertisement on another page).

The Globe Electric Co.—This company inform us that they are taking in hand the manufacture of signs, and for this and general extension of their business, they are taking two more floors in the building they occupy.

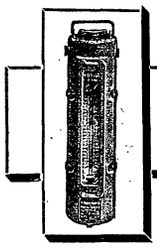
Dissolution of Partnership.—G. Bradwell and Matt Jennison, electrical engineers, 4 St. Anne's Square, Manchester, and 77 Victoria Street, South Grimsby, have dissolved partnership. Debts by Matt Jennison.

Bankruptcies.—At the first meeting of the creditors of J. D. Carlmark, electrical engineer, 402 High Street, West Bromwich, it was stated that the liabilities amounted to £442 and the assets to £52. The debtor attributes his failure to keen competition and bad trade, and to his having made himself liable for £200 as a guarantor. The debtor began business in 1899 in partnership with another, without capital, and the Official Receiver remarked upon the fact that no balance sheets or profit and loss accounts were ever prepared. The matter was left in the hands of the Official Receiver.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Urban Electric Supply Co.—The accounts for 1910 show a profit of [30,982, which falls short of £1,528 of the amount required to meet 5 per cent. guaranteed dividends on the company's capital. This debit balance has been provided by Edmundson's Electricity Corporation, Ltd., under their contract with the company.

Traction & Power Securities.—The accounts for 1910 show a gross profit of £32,105. The directors have applied £1,920 to writing down certain securities, and have transferred £25,000 to investment account, carrying forward £5,185. The company has loaned £140,500 to the Clyde Valley Electric Power Co., and has undertaken to increase this to £194,500, the Power Company granting, as security, a first charge on their undertaking.



Calcutta Electric Supply Corporation.—The profits for 1910 amounted to £85,598, and the directors recommend a final dividend on the ordinary shares, making 8½ per cent. for the year, carrying forward £5,622. This distribution is after providing £20,000 for depreciation and renewals, and £7,500 for reserve. A site has been purchased for the erection of a new generating plant in the Cossipore district, in connection with which a new issue of capital will have to be made.

Aron Electricity Meter.—The transfer books and register of members will be closed from June 12th to June 24th inclusive.

Adelaide Electric Supply Co.—Applications have been invited for £100,000 5 per cent. debenture stock at par.

Peel-Conner Telephone Works.—The accounts just published show a net profit from the commencement of the company, after writing off the preliminary expenses and placing £2,151 to reserve, of £7,276. After meeting the full dividend on the 5 per cent. preference shares, the sum of £320 is carried forward. The Board express their satisfaction with the result of the first year's trading. The difficulties of training efficient labour are gradually being overcome, and the work executed has met with the full approval of purchasers. The number of contracts recently obtained will ensure the full employment of the factories for some considerable time.

THE "NEW BASTIAN" METER

IS THE MOST RELIABLE IN THE WORLD.

CORONATION HOLIDAYS.

In consequence of the Coronation Holidays, our next issue (dated June 22nd) will be published two days in advance (Tuesday, June 20th).

Our offices will be closed from Thursday, June 22nd, to Saturday, June 24th, inclusive.

Advertisement copy for our issues of June 22nd and June 29th should be sent us AT ONCE.

SUMMARY

A highly interesting report has been published on the electricity supply of Zürich from the water-power of the river Albula. A tunnel 4½ miles long conveys the water to a power station containing eight 3,000 h.p. turbine sets, and the energy is transmitted at 47,000 volts, three-phase, over two pole lines, 85 miles long, to Zürich. The lighting of the town is by single-phase current supplied from motor-generator sets to which are coupled D.C. machines for running off a battery when the three-phase supply fails. (Page 327.)

A letter from the English house of a well-known Continental firm points out the exaggeration in some statements regarding foreign tariffs made recently. (Page 328.)

Mr. C. Vernier's Paper on cable laying and jointing has been further discussed at Glasgow. (Page 328.)

The power-house of the Commissioners for the Port of Calcutta contains continuous-current plant aggregating 700 kw. Power is supplied for various purposes about the docks. (Page 329.)

A simple form of automatic liquid starter is described. (Page 330.)

A recent Paper by Prof. J. T. Morris, read before the Physical Society, compares different methods of magnetic testing. (Page 330.)

A Paper by Mr. G. Archer, read recently before the Dublin Section of the Institution of Electrical Engineers, described a system of records of connections, &c., in sub-stations, distributing points, &c., of a network. (Page 331.)

An illustrated description of a new starter for single-phase induction motors is given. (Page 331.)

Mr. A. Scott-Hansen read a Paper recently before the Faraday Society on the water-power resources of Norway. (Page 332.)

The Osram Lamp Works, Ltd., in addition to proceeding against the "Z" Electric Lamp Supply Co., their agents, Messrs. Baxter & Caunter, and the Café Royal, who are users of "Z" lamps, for alleged infringement of the Just-Hanaman and "weighting" patents under which Osram lamps are manufactured, have also threatened proceedings against the Corona Lamp Works Co., who reply denying infringement. (Page 333.)

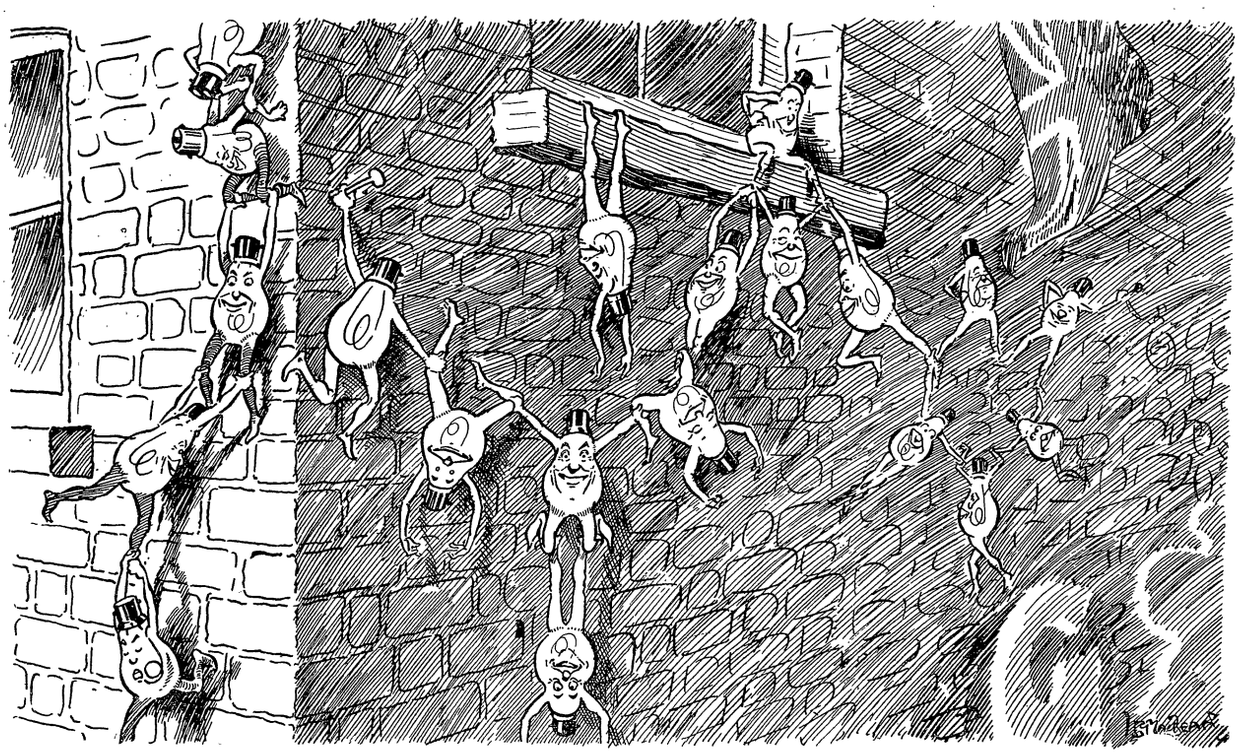
A work on the cable communications of the Empire, and a treatise of graphic statics are reviewed on page 334.

Among the specifications published by the Patent

Hosted by Google

Office on Thursday last was one by J. Darby relating to lamp sockets. The Allgemeine Elektricitäts-Ges. describe a coupling for electrically-driven looms. H. Lang deals with aerial conducting structures, and another by Körting and Mathieson Akt.-Ges. covers arc-lamps. An application has been made by Hans Theodore Hansen to amend his specification for a block signalling system. Opposition has been entered to the grant of a patent to J. L. Paillet and E. Roger on the discharge of electricity from materials. (Page 334.)

THE Holborn Borough Council have found themselves compelled to accept the combined tender of the gas and electricity companies for the lighting of the borough. Half of the borough will be lighted by electricity and half by gas. The Council have also accepted the request of the companies that an addition of 10 per cent. is to be made to the price in the tender on account of the clause dealing with maintenance of candle-power. A clause compelling the companies to adopt all new lighting devices free of charge has been withdrawn. (Page 335.)



THE Belfast City Electrical Engineer recommends the erection of a new power house with an extra high-tension system and sub-stations.—The Bournemouth Tramway Manager reports a considerable saving in current consumption since the substitution of the overhead system for the conduit.—The proposal to spend £18,563 upon additional plant at Bermondsey is meeting with considerable obstruction.—The proposal of the Marylebone Electricity Committee to purchase an electrically driven van has been referred back on the ground of high maintenance costs.—The substitution of trolley omnibuses for tramways in Scarborough is under consideration.—£15,000 have been transferred to relief of rates from the Nottingham Electricity Committee, and £15,000 from the tramways. (Page 336.)

AN expenditure of £6,500 is contemplated at Dudley; £7,000 at Limerick.—The £60,000 scheme at Stoke-on-Trent is being inquired into.—An Electric Lighting Co. is being formed for Wharfedale.—Tramcar bodies and equipments are required at Aberdeen.—Telephone apparatus in Australia, and electrical accessories in Birmingham. (Page 336.)

A SCHEME for the re-arrangement of the British Electric Traction Co. is shortly to be formulated.—At the annual meeting of Callender's Cable & Construction Co. it was stated that the shareholders may in the near future be asked to assist in the formation of a banking institution.—The capital of the Brush Electric Engineering Co. is to be re-organised. At present the company is doing much better business.—At the first annual meeting of the Peel-Conner Telephone Works, Mr. Hugo Hirst suggested cheap rates for the installation of telephones in all private houses, the connection being made by local contractors.—A 6 per cent. dividend is recommended by the Aron Electricity Meter Co. (Page 338.)

Parliamentary Intelligence.—The L.C.C. (Tramways and Improvements) Bill, has been read a third time in the House of Commons. The following received Royal Assent last week:—London Electric Railway Act; Metropolitan District Railway Act; and London United Tramways Act.

Telegraph Traffic and Movements of Cable Ships.—Land-line communication is restored with all offices in Mozambique.—Some trouble has been experienced with the lines about Bassorah for several days.—Recently the c.s. *Minia*, of the Anglo-American Telegraph Co., repaired the company's 1874 cable, and then put through the Newfoundland cable of the Direct United States Cable Co., interrupted some 250 miles from Halifax. Afterwards she completed work in connection with the Western Union Telegraph Co.'s cable between Bay Roberts and Coney Island, which was broken some 150 miles from the former place. Cables awaiting repair are those between Assab and Perim, and Malta and Tripoli; the former has been interrupted since July 8th, 1909, and the latter since April 20th, 1910.

(Large quantities of Carbon Filament Lamps are being used for Coronation Illuminations.)

Carbon Filament Lamps (*in Chorus*): **God save King George V—There is some use for us yet.**

THE ALBULA-ZURICH 47,000-VOLT TRANSMISSION SYSTEM.
A 20,000-h.p. Water-Power Station

BRITISH engineers who are interested in the development of water-power for the supply of electrical energy, can well be advised to purchase a copy of a report which has just been published on the constructional work involved in the harnessing of the water-power of the River Albula for the supply of electric power to the town of Zürich, 85 miles distant.. The report is entitled "Bericht über die Erstellung des Albulawerkes" (Buch-und Kunstdruckerei Jean Frey, Zürich. 8 francs, excluding postage), and has been prepared by Messrs. H. Peter and H. Wagner, the Managers and Engineers of the Water and Electricity Supply Departments of the city of Zürich. It comprises 70 pages of text and a large number of excellently reproduced drawings, diagrams, and coloured plans, besides some 50 reproductions from remarkable photographs of the hydraulic works in various stages of construction, of the machinery and switchgear in the power house, and of the transmission line and sub-stations.

The lighting, power, and traction supply of Zürich has been dealt with for many years by a combined steam and water-power station near by, but the growing demand for power led the authorities to consider the acquisition of one of the available water powers, and that of the Albula was chosen as the most suitable. The river has been dammed at a point somewhat over four and a half miles above the position of the power house, so that a total head of about 500 feet is obtained. From the intakes the water is conveyed through a concrete tunnel four and a half miles long to the two pipe lines. These are nearly six feet in diameter and have a length of 1,500 feet. Very complete information is given in the report of the hydraulic works, including the constructional details of the tunnel and pipe lines, and the costs of the work. Even the calculations for the anchorage of the pipe line are dealt with in detail. The method of constructing the tunnel is also fully described with the aid of numerous drawings.

The size of the present tunnel (78 sq. ft. section) permits of the delivery, at the permissible velocity of 7·5 ft. per second, of some 510 cubic feet of water per second which, with the available net head of 466 feet and a turbine efficiency of 75 per cent., corresponds to a turbine capacity of 20,600 h.p. Eight Francis turbines, by Escher, Wyss & Cie, each of 3,000 h.p. capacity, have been installed, and coupled to each is a 2,500 k.v.a. 600 r.p.m. alternator, by the Maschinenfabrik Oerlikon, generating at 6,900 volts, three-phase, 50 cycles. The guaranteed efficiencies, &c., and the prices submitted by the firms who tendered, as well as the actual figures obtained on test and very complete particulars of the machines are given in the report. The mechanical construction of the 10-pole alternator rotors, which are over five feet in diameter, is of especial interest in that they are built to withstand the exceptional forces which would obtain on the turbine speed rising to double the normal, *i.e.* 1,200 r.p.m. Each pole is made up of five packets of laminations interspaced by long steel plates, the ends of which are bolted up between the five steel rings of which the yoke is composed. Another interesting feature of the generators is the stator winding. The coils are of copper, 7·5 mm. by 7·5mm., and are insulated with micanite after they are wound on the formers. The latter is not, therefore, subjected to the strains of bending. Finally, the coils are thoroughly impregnated. Two 200-kw. exciters are installed. These are interpole machines driven by separate water turbines and generating at 125 volts.

It is interesting to note that a high-tension direct-current series system with a line pressure of 80,000 volts, was submitted as an alternative, but that it was rejected mainly on account of the unfavourable effect of the heavy constant line loss, and the impossibility of "linking up" with existing and future three-phase systems.

The generators are connected direct through isolating switches to three-phase transformers. Each generator has its own transformer and forms a unit, paralleling being carried out on the high-tension side of the transformers. The primary windings of the transformers are connected in delta and the secondary (47,000-volt) windings in star, the neutral point being connected to earth through a running-water resistance. This is arranged so that in the event of one phase being earthed, the current is limited to about 100 amperes. The transformers are of the water-cooled, oil insulated pattern, constructed by Brown, Boveri et Cie. They are rated at 2,000 kw. each and have an efficiency of 97·87 per cent. at 80 per cent. power factor.

The general arrangement of the switchgear and a complete diagram of the connections are given in the report, but the apparatus itself is not described in any detail. A considerable amount of information can be derived, however, from a careful study of the diagram and the excellent series of photographs already mentioned. The oil-switches between the transformers and the H.-T. 'bus-bars are of the Oerlikon pattern in which each contact is enclosed in a separate oil pot. They are actuated by small D.C. motors controlled from an operating desk on a gallery overlooking the engine-room, and supplied with current from the station battery.

It should be mentioned that only six generators are used at present for the Zürich supply. The other two supply a local electrochemical works and the neighbouring districts at the generated pressure of 6,900 volts. A special turbine set supplies the station lighting and the power required for the battery.

The transmission line which, as mentioned above, is 85 miles long consists of four three-phase circuits divided between two pole lines. Each wire is hard-drawn copper 50 sq. mm. in section. The total energy loss along the line at full load and 80 per cent. power factor is 13·8 per cent., so that the pressure at the Zürich end is about 40,000 volts. Four different kinds of poles are employed, namely, reinforced concrete poles of H-section, Siegwart reinforced concrete poles of circular section, Mannesmann tubular steel poles, and ordinary steel lattice poles. The span from pole to pole is nowhere greater than 50 feet. Results of the tests carried out on these poles and on the insulators are given in great detail in the report. The cross-arms are in all cases of impregnated wood attached to the poles by fittings of galvanised iron. Samples of the petticoat insulators were tested up to 100,000 volts under artificial rain. The line is carried for the most part through valleys, and a way had to be cut through much forest land, involving considerable expense. Switching stations are provided at intervals of about twelve miles, and one or more circuits of any of the intermediate sections can be made dead for repairs. A diagram of the connections for a typical switching station shows how this is accomplished, and what precautions are taken against lightning and pressure surges. It is interesting to note that the transmission line cost over twice as much as the complete power station.

An elaborate system of telephones and telegraphic signalling apparatus is provided, the latter being used for important messages which cannot, therefore, be misunderstood and are recorded. The signalling circuit is in duplicate, and is insulated throughout to withstand a pressure of 15,000 volts in view of the fact that the wires are strung along the pole line the induced voltage from which may rise to this amount. The insulators used will withstand a pressure of 30,000 volts. At the switching stations each of the signalling circuits is brought into a separate chamber containing the protective apparatus. From here cables lead to a signalling room, all the apparatus in which is carefully protected against high-pressure.

There are four main sub-stations in Zürich, where the current is transformed down to 6,000 volts for distribution by underground cables. The largest of these contains four 2,000-kw. water-cooled, oil transformers, while the others have two or three 1,000-kw. transformers. All these stations are connected by a 40,000-volt ring main and also by the 6,000-volt distribution network. Special feeders are laid to the steam plant now used as a reserve, the lighting sub-station, and the tramways sub-station.

The lighting system in the town is single-phase alternating current with small transformer sub-stations, and was originally supplied with current at 2,000 volts from the steam station. The new lighting sub-station contains three motor-generator sets each consisting of a 2,200-h.p. 6,000-volt synchronous motor coupled to a 1,500-kw., 2,000-volt single-phase generator, and also to a 1,800-kw., 600-volt D.C. machine which can run either as a motor or a generator. The sets run at 500 r.p.m. A battery of 6,000 ampere-hours capacity is connected in parallel with the D.C. machines. Normally, the single-phase generators supply the lighting load and the D.C. machines run in parallel with the battery without any appreciable interchange of current. Immediately the three-phase supply is interrupted, the D.C. machines take current from the battery and pick up the load automatically, the change-over being hardly noticeable. The diagram of the connections of this plant given in the report is well worthy of careful notice.

The report concludes with some particulars of the organisation of the system, and a large map of the city showing the lay-out of the distribution network. The complete system was first set in operation in September, 1909, and has since then been giving every satisfaction.

CORRESPONDENCE

To the Editor, Electrical Engineering.

IMPENETRABLE TARIFFS.

Sir,—I have before me the copy of a speech made a few days ago by the chairman of a large electrical engineering company on the occasion of their annual meeting of shareholders. Amongst other things it contains the following statement: "It must also be remembered that in this market of free imports we have to meet the competition of most powerful Continental manufacturers, who with their home markets secured to them by *impenetrable tariffs*, are able to work at a good profit," &c. By "powerful Continental manufacturers" I suppose the speaker means principally German manufacturers. If so, I cannot understand how such a statement passed unnoticed and without protest from those present at the meeting, some of whom must surely know that the German tariff is anything but impenetrable, at least as far as it applies to electrical material. The import duties levied in Germany on electrical goods of English origin work out at about 2 per cent. to 4½ per cent. of the value for motors, ¾ per cent. to 1½ per cent. of the value for glow lamps, 3 per cent. to 4 per cent. of the value for turbo-generators, whilst lead-covered cable and a few other classes of goods pay no import duty at all.

I should feel obliged if you could find room for this letter in your next issue.

Yours truly,
A.E.G. ELECTRIC CO., LTD.
L. Pfeffer,
General Manager.

133–135 Oxford Street, W.

CABLE LAYING AND JOINTING

Mr. C. VERNIER'S Paper on "The Laying and Maintenance of Transmission Cables," which was discussed before the Institution of Electrical Engineers on March 9th, and also at Newcastle (see Electrical Engineering, March 16th, page 135, March 23rd, page 151, and April 20th, page 208), was further discussed by the Scottish Local Section of the Institution of Electrical Engineers at Glasgow on Tuesday, May 16th.

Mr. McLeod (Clyde Valley Electric Power Co.) understood that Mr. Vernier assumed that conductors would expand 4 ft. 6 in. per mile. He therefore emphasised the importance for free movement of all cable joints, but did not think the particular joint mentioned in the Paper adequate to take up movement due to contraction and expansion. For this purpose he preferred the method adopted by the Clyde Valley Co., whereby large expansion bends were provided similar to expansion pipes in a steam-pipe range.

Mr. W. W. Lackie (City Electrical Engineer, Glasgow) was practically in agreement with all the statements made in the Paper. He preferred creosoted or haskinised wood troughing as being superior to wood treated with Stockholm tar, which he had found of little protection. As a filling-in compound he preferred plastic pitch, the only objection to this material being lack of mechanical strength, which he expected to remedy by adopting a mixture of pitch and whin-stone dust. He referred to the importance of filling up the space between the different cores of a cable with some plastic material so as to exclude all air from the inside of the cable, as he found that when the cable was laid solid in hot pitch or bitumen compound, considerable expansion of such air took place inside the conductor.

Mr. Tidd (Morris Warden & Co.) showed a collection of samples of bitumen fibre conduits as originally used in America and now to a considerable extent in this country. Mr. Tidd explained that the "socket joint duct" and the "sleeve joint duct" were usually laid in concrete and direct in the ground respectively, and no difficulty was experienced in making them water-tight. Samples of the Key fibre troughing were also shown and its use explained.

Professor Baily (Heriot Watt College, Edinburgh) suggested the use of slag wool as a filling for underground troughing in combination with pitch. He asked the author if he knew whether there was any likelihood of the lead covering not returning to its original position after expansion, because he knew of combinations of lead and iron being subjected to heating and cooling when the lead thickened up at some parts and became thin at others.

Mr. S. Mavor referred to the mains engineer's chief difficulties being associated with the proper lying of cables, and especially with the proper jointing of them, as little trouble was experienced with the cables themselves as at present manufactured. He gave an interesting description of a visit to the Carlton Colliery, following the underground disaster which recently occurred there. After the explosion at that colliery the cables in the mine were buried under thousands of tons of rock which had fallen from the roof, and the whole system when tested was found to be practically perfect, as the lowest insulation was 50,000 ohms with all the boxes connected.

Mr. Vernier, in reply, while agreeing with Mr. McLeod as to the expansion of cables being 4 ft. 6 in. per mile, mentioned that this included lateral displacement, the total expansion being considerably less, and being easily taken up in the joints described in the Paper. He did not consider expansion bends any use to prevent troubles due to subsidence unless these were provided close to positions where subsidence was expected. If iron bridges were used for cable supports, he recommended the earthing of the lead sheathing, but he did not consider them as satisfactory as other methods.

In connection with filling up strands, he considered this of more importance in low-tension work, as all high-tension cables have their strands filled up by impregnation under a vacuum. He was favourably disposed towards the systems of fibre ducts shown by Mr. Tidd, but he thought difficulty might be experienced in getting the top half quite filled in with the circular form of conduit. He had never had any trouble due to the lead covering not regaining its original form after expansion, although he knew similar trouble had occurred in other directions, although not in connection with cables. Mr. Vernier told of some recent tests on a 20,000-volt cable, which was subjected to three times the working pressure for a quarter of an hour, then to a pressure of 50,000 volts for five minutes on a length previously saturated overnight in heated water at 160° F. Another short length was subjected to 100,000 volts for a quarter of an hour without damage.

Annual Tables of Scientific Data.—At the International Congress of Applied Chemistry held in London in 1909 an International Commission was appointed for the purpose of compiling and publishing annual tables of constants and numerical data, and this Commission was subsequently accorded the patronage of the Association of Academies at the meeting of that body held in Rome in 1910. The tables published in any year are intended to contain all the numerical data likely to be of interest in connection with chemistry, physics, and allied sciences, pure and applied, to be found in the literature published during the previous year, and are to be accompanied by full bibliographic references. Portions of the volume for 1910 are already in the press. It is hoped that ultimately the enterprise may become self-supporting, but obviously this cannot be the case for some time to come. The Commission has been greatly assisted by grants from various societies, and donations from private persons, but further help is still needed. The organisation of the Commission is sufficiently complete to deal effectively with the periodical literature, but data published only in non-periodical publications may easily be overlooked. Accordingly, the authors of such books, monographs, &c., are requested to communicate with one or other of the members of the Commission. The members of the International Commission for the United Kingdom are: Dr. A. Findlay, the University, Birmingham; Dr. R. T. Glazebrook, National Physical Laboratory; and Dr. N. T. M. Wilsmore, University College, London; and the General Secretary is Dr. Charles Marie, 98 Rue du Cherche-Midi, Paris VI.

The Thomas Transmission.—The Royal Automobile Club has now issued its certificate regarding the performance of the Thomas transmission in its 2,000 miles trial referred to in Electrical Engineering, May 4th, page 236. It is recorded that no work was done on the transmission during the 2,008·25 miles except lubrication, 5½ ounces of oil being used for the purpose. The route explained in the article referred to was exceptionally hilly. The fuel consumption worked out at 7·555 miles per gallon, or 58·046 ton miles per gallon for gross weight, or 24·03 for useful load carried. River Hill was climbed at an average speed of 7·206 miles per hour, and the total weight, including load and passengers, was 7·683 tons, of which 4·502 tons is accounted for by the vehicle itself. The average rise of temperature of the electrical machines was 22·8° C. Satisfactory working of the electric lighting equipment is also recorded.

In considering these results, the large amount of extra weight carried in the shape of tanks, seats, lighting and starting battery, tools, and spares must be borne in mind. The hilly nature of the route, and the fact that no speeds above 12 m.p.h. were allowed, so that short hills could not be rushed, were also serious handicaps as regards petrol consumption, and it must also be remembered that the energy for charging the battery is included. The efficiency of the transmission from engine to road wheels has been calculated from the time up River Hill assuming a road resistance of 70 lbs. per ton as 83 per cent., including the losses in the back axle gearing as well as in the planetary gear and the electrical machines.

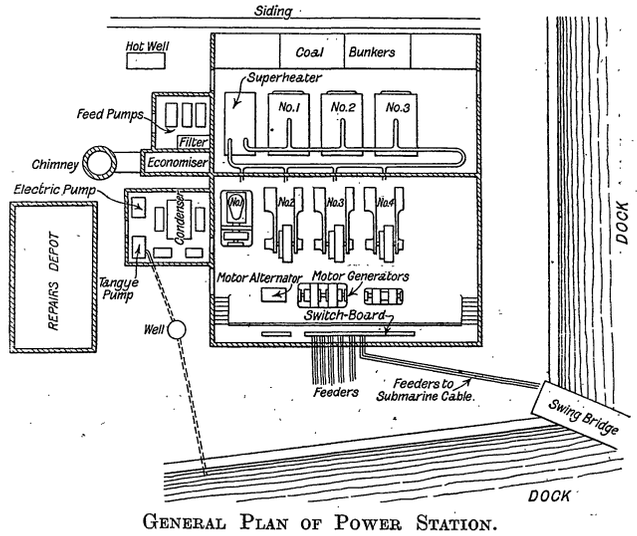
THE NEW GENERATING PLANT FOR THE PORT OF CALCUTTA

By Cyril E. Robertson (Messrs. Crompton & Co., Ltd., Chelmsford).

THE new generating plant of the Port Commissioners (which cost £13,000 for station, machinery, and electrical gear, exclusive of cables) is situated at Garden Reach, near the Kidderpore Docks. The power station, which was begun in 1906 and completed at the latter end of the following year, has a direct-current capacity of approximately 700 kw. The building, which is of hard brick and stone, and the concrete engine foundations, were contracted for by a local firm of civil engineers and architects, whilst the engines, machinery, generators, and electrical gear were supplied by Messrs. Galloways, Ltd., and the British Westinghouse Electric and Manufacturing Co., of Manchester, respectively.

In the boiler-house there are three Lancashire marine-type boilers, working under a pressure of 180 lbs. per square inch, and arrangements are being made for putting down a fourth boiler owing to the demand for another generator being installed, which will probably take place very soon as two 60-h.p. Crompton motors will shortly be coupled to the mains. There is also a separately fired superheater working up to 500° F., and a Green economiser. The boilers are hand-fired by native firemen, one fireman on each boiler for each watch, along with two coal trimmers, who help to clean the boiler flues and remove ashes and clinkers. Coal is supplied direct from the collieries in trucks to sidings, and is emptied out direct into the coal-bunkers by native labourers, broken up by the coal-trimmers, and fed to the boilers.

In the boiler feed pump-house are a Worthington steam pump and two Allen three-throw pumps geared to Westinghouse motors. The former is used chiefly as a standby.



Feed water is obtained from the docks, which contain fresh water, with the help of an artesian well, the level of which is controlled by the tidal basin water level. The water from the artesian well is pumped by means of a Tangye electrically-driven pump into a steel tank with a capacity of 40,000 gallons on the roof of the condensing plant.

In the engine-room are four compound-wound British Westinghouse generators direct-coupled to Galloways' compound condensing engines. No. 1 engine set is of the enclosed self-lubricating vertical type with piston-valves, and runs at a speed of 500 r.p.m. It is controlled by a shaft throttle governor. The generator has six poles and has a maximum output of 153 amperes at 450-500 volts. The other three generators are large machines with ten poles each, and are direct-coupled to horizontal compound condensing slow-speed Corliss-type engines, running at a speed of 90 r.p.m. The maximum output of each of these big sets is 434 amperes at 450–500 volts.

The condensing plant is of the jet type, with electrically-driven air and circulating pumps. There are two sets of these pumps; the air pumps are of the three-throw Edwards type, geared to Westinghouse motors; the circulating pumps are centrifugal, and are direct-coupled to British Westinghouse motors running at 500 r.p.m. While one set of condensing pumps is in use the other set acts as a standby. The vacuum maintained in the condenser is 28·5″. Circulating water is obtained from the artesian well mentioned, to which it is returned.

The switchboard is of black polished slate, and is erected on an elevated gallery. There are four generator circuit-breaker panels, two balancer control panels, and fifteen feeder panels. Each panel has its own set of circuit-breakers, knife-switches, safety cartridge fuses, voltmeter, ammeter, and wattmeter, and, in addition to these the four generator panels have each a paralleling knife-switch. All the instruments on the switchboard are supplied by the British Westinghouse Co., with the exception of the master voltmeter for 0—600 volts, which has been supplied by Messrs. Crompton & Co., Ltd., of Chelmsford, and is of the sector type with an external resistance, and the voltmeter and earth recorders supplied by Messrs. Kelvin & White and Elliot Bros. respectively. The station voltage may be conveniently controlled by the attendants, there being shunt regulators placed immediately opposite each generator circuit-breaker panel. The balancer loads and voltage are controlled from the balancer panels by rheostat-type regulators. There are two sets of balancers, a small and a big set. The smaller set runs during the day shift, when there is a light load on the generators of 400 amperes, and the big set is put under way to cope with the night load, which is fairly big, when three big generator sets are run in parallel. All the circuit-breakers are of the spring arm type; they can be set for full and overloads, and have release current coils fitted at the back of the switchboard. The feeder bus-bars are a continuation of the generator bus-bars connected by spiral expansion coils, and the neutral bus-bar, which supplies 230–250 volts to the line, is connected to the balancers and runs the full length of the feeder panels. This half-volt circuit is used for incandescent lighting and low-power work. A few yards from the main switchboard there is a small switchboard with two panels which works a motor-generating set. The generator is an alternating three-phase, fifty-cycle machine, direct-coupled to a high-speed direct-current motor. This set is used for testing the insulations of machines and cables in the station, and has two oil-cooled transformers for transforming the alternator volts to the required pressure.

In the power-station yard, divided by a party wall from the engine-room, there is a lightning-arrestor tank containing salt water. This is connected to the switchboard, and is put in or cut out as required by means of contact plugs on the balancer panels. The framework of all the generators and motors in

GENERAL PLAN OF POWER STATION.

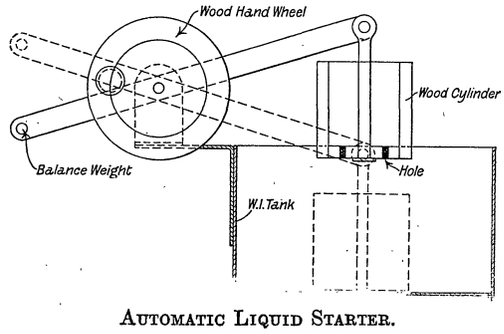
the station are connected to an earthed conductor, which is in turn connected to the balancer bus-bars and lightning-arrester.

The total capacity of the station, as previously mentioned, is 700 kw., and the maximum load very often nears this figure during a night run. There are five main sections to be fed, each with an independent sub-station, which in turn feed numerous smaller sections. The current is conveyed to the five sub-stations by armoured cables and overhead bare copper conductors, and the approximate carrying capacity of these is 2,000 amperes. The cables are laid in trenches 3 ft. by 4 ft., and are placed on petticoat insulators in melted coal-tar pitch in earthenware troughs, the tops of which are sealed over with slabs and Portland cement. The trenches are then filled in to the surface with earth and beaten down firm owing to the heavy railway traffic which passes over them. The cables are insulated with paper rubber composition and gutta-percha, and are lead covered. There are always three sets of cables laid in each trough for full- and half-voltages, positive, neutral, and negative. The overhead conductors have also three lines each, and in the event of the underground cables burning out through any reason, the supply can be transmitted by the overhead network alone, and vice *versa*. To maintain a supply on the opposite banks of the docks, there are two sets of submarine cables laid in the bed of the basin. These meet at the sub-station on the opposite bank, which distributes the supply for this area.

There are altogether five sub-stations, each of which is fitted with a receiving and feeding panel, distributing switches, deflecting instruments, and regulators for raising or lowering the voltage on the line as required. The current generated in the station is consumed chiefly in the Commissioners' dockyard, where there are some 400 Excello arc lamps in the shipping wharves, sheds, and along the railway tracks, &c. Then in the tidal basin there are four caissons, worked by electric power, for damming the various dock

Hosted by Google

gates to maintain the right tidal level in the docks, and also for damming the water from the dry graving docks. There are also two 50-ton electric cranes and a lighting circuit for some 2,000 incandescent lamps in the various offices of the Commissioners, in the dockyard, and in the quarters of the Commissioners' officials and employees.



These different circuits are all controlled by four of the sub-stations. The remaining sub-station supplies light and power to the Commissioners' jute wharves, tea warehouse, and workshops. In the jute wharves there are several arc and incandescent lamps installed. In the tea warehouse there are 21 electric lifts, and the four storeys are lit with incandescent clusters and arc lamps. In the third floor there is an electric bulker in which the different qualities of teas are blended. In the ground floor there are four electric packers, which receive the blended teas from the bulker and pack them automatically in wooden chests for export to all parts of the globe.

The workshops are electrically driven by 80 Westinghouse motors here, driving the various shafts and direct-coupled in some cases to the machinery. These shops are also fitted with incandescent and arc lamps. During the day the workshop load alone registers 400 amperes. All repairs to station machinery and outdoor lines are executed by the workshops and mains departments respectively.

Before concluding, it may be interesting to say a few words on the cost of generation. As previously stated, the coal is obtained direct from the collieries, and the fact of the Commissioners purchasing large quantities of this for the consumption of their numerous vessels and hydraulic and pumping stations, &c., enables them to obtain it at approximately ten shillings to twelve shillings per ton. Then again, native labour in India is comparatively cheaper than what the labour in England is, and the cost of generation, after paying expenses, works out roughly to three farthings per unit, it is retailed to the Commissioners' employees, etc., at 4d. per unit.

A NEW LIQUID CONTROLLER

THE accompanying illustration shows a form of automatic liquid controller which has been designed by Mr. F. C. Morris, of Bolton, to meet the demand for a starter which is simple in construction and "fool proof." By turning the handle to the right, a lever, with a bucket or cup attached

AUTOMATIC LIQUID STARTER.

to one end, is released. The bucket has one or two small holes at the bottom, and gradually fills with water so that it sinks and slowly cuts out the resistance. A controller on this principle can easily be made to be electrically controlled to work in conjunction with pump, motor, &c. The device is provisionally patented.

Wireless Telegraphy.—Mr. T. Thorne Baker lectured on the practical progress of wireless telegraphy at the Royal Institution on Thursday, June 18th, and dealt principally with portable equipments, describing that of Marconi for use in the field. With this apparatus, which is packed on four horses, each carrying 120 lbs., communication can be maintained up to about 50 miles. The aerial is raised by means of a portable mast, which can be raised to a height of 80 feet. Telegraphy on aeroplanes was also discussed, a model aeroplane being exhibited, showing the aerial attached, which was altogether 110 feet long. The difficulty of receiving messages owing to the noise of the engine has been overcome by means of a coherer in conjunction with a relay and lamp, which glows and reproduces the Morse signals. He described how the instrument could be tuned to receive musical sounds. Some interesting experiments had been made with Sharman's telephonic apparatus, communication being carried on through one mile of ground, pegs being stuck in the ground at the receiving and transmitting ends. In conclusion, the author mentioned the Habibia system, in which the conductivity of the water of a river is utilised.

MAGNETIC TESTING

A PAPER was read before the Physical Society on May 12th entitled "The Method of Constant Rate of Change of Flux as a Standard for determining Magnetisation Curves of Iron," by J. T. Morris and T. H. Langford.

The research described was instituted with the object of finding what differences there were between the magnetisation curves for a given sample of iron when determined (1) by the older methods in which the flux is changed suddenly, (2) by a method in which it is changed exceedingly slowly and at a uniform rate.

The methods experimentally examined were :—Method of constant rate of change of flux; "slow cyclic" hysteresis loops by method 1; "step by step" magnetisation curve; "step by step" hysteresis loops; method of reversals; alternating-current magnetisation curve. Details are given of the theory and practical working of the first method, in which the magnetising current is continuously increased through a primary winding by a specially designed resistance at such a varying rate as to maintain a constant voltage generated in a secondary winding. A certain amount of skill is required, and the complete change of the current occupied times varying from one up to some five minutes.

Tables are given of the magnetisation curve determined by the six different methods at a number of values from **H** 0·3 up to 70·0, and of the permeability from **B** 500 up to 17,000. At low values of the magnetising force the uniformly varying flux method gives results of some 200 lines per square centimetre in excess of the older methods. As regards the time required for determinations by the various methods experimentally examined, ballistic methods are undoubtedly the most tedious. The alternating-current method has considerable advantages in this respect, a full set of readings of magnetising current and induced voltage occupying a very short time. When, however, it is necessary to take oscillograms at various points in order to plot curves of form factors, the time required is enormously increased. The method of uniformly varying flux is peculiarly adapted for use where time is a consideration, and at the same time a high degree of accuracy is desired. A complete magnetisation curve may be taken in a very few minutes, and the mean of many such curves obtained in, say, one hour, the iron being demagnetised between each test.

The method of "uniformly varying flux" appears to possess advantages, both scientific and practical, over the older methods in use for the testing of ring samples of magnetic materials. It avoids difficulties due to eddy currents and magnetic viscosity, which effects are themselves due primarily to rapid or irregular changes of flux. Besides rapidity of experiment it also has the advantage of accuracy of repetition under standard or predetermined conditions of magnetic change. The method is, therefore, commended for the carrying out of magnetic tests, especially where great accuracy under definitely known conditions of experiment are essential.

University College.—In connection with the organisation of the new Department of Heating and Ventilating Engineering at University College, towards which the London County Council have made a grant in aid, Mr. Arthur Henry Barker, Vice-President of the Institution of Heating and Ventilating Engineers, has been appointed lecturer for the session 1911–12.

Diesel Engines for Large Stores.—An instance of the reliability of the Diesel engine is furnished by the fact that one of the large Continental stores, that of Hermann Tietz, is dependent entirely for power and lighting in its branches at Munich, Berlin, and Hamburg on Diesel engines. These engines have all been ordered from the Maschinenfabrik Augsburg-Nürnberg A.-G. (London office: M.A.N. Co., Caxton House, Westminster, S.W.), and the sizes of the various power stations are 2,200 b.h.p., 540 b.h.p., 3,500 b.h.p., 800 b.h.p., and 1,250 b.h.p.—altogether 8,300 b.h.p. M.A.N. Diesel engines for similar purposes have been installed at the large stores of Rudolph Hertzog, Berlin, at the Bon Marché and Galeries Lafayette, Paris, and at a great number of smaller stores.

Electrical Propulsion of Ships.—The experimental vessel built by Messrs. Mavor & Coulson, of Glasgow, to demonstrate their system of electrical ship propulsion has been undergoing trials on the Gareloch. The boat, which is named the "Electric Arc," is 50 ft. in length, 12 ft. beam, 7 ft. 4 in. moulded depth, and of 17 tons displacement. She is now driven by a 45-h.p. Wolseley petrol engine, but it is intended ultimately to replace this by a gas engine and producer of similar power. The engine drives a three-phase alternator and exciter, and a multiple wound variable speed induction motor of special construction drives the propeller. The control is entirely from the bridge by means of simply arranged interlocked switches controlling the excitation and the motor and generator connections to give various frequencies and effective numbers of poles. The vessel attained a mean speed of 8¼ miles per hour, and is reported to have given great satisfaction as regards ease of control and manœuvring.

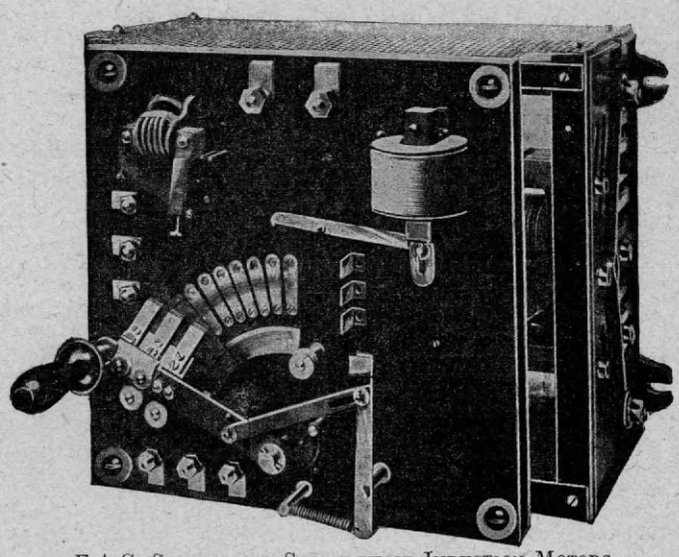
A NETWORK FILING SYSTEM

THE system of records of connections of sub-stations, feeding points, distributors, &c., in use on the Dublin system was described in a Paper read before the Dublin Section of the Institution of Electrical Engineers, on May 11th last, by Mr. G. Archer (Chief Assistant Engineer, Dublin Corporation Electricity Works). In this system, which has far less limitations than special maps or the filing of written reports of alterations, the chief feature is the placing of small plugs of bone or metal in holes in special diagrams to indicate the position of links, switches, and fuses. First of all, the various sub-stations were taken into consideration, and what was the natural or normal network to be fed by each sub-station was decided upon; and this being done, a diagrammatic plan was prepared for each sub-station network, showing all network boxes and section pillars, &c., each carefully numbered; the points where linking up with another sub-station was possible being indicated. These were called reference plans. The next question was to represent the connections in the sub-station itself, and to do this a diagrammatic sketch was made of the high-tension and low-tension switchboards, plug-holes being provided where links, switches, or fuses were used. The position of the plugs on this diagram will indicate at once which circuits are being fed from the sub-station. Provision is made on the sub-station card for miscellaneous information, such as size of transformers in use, inspections made, &c. The sub-station switchboards and the cables radiating therefrom having been dealt with, each section pillar, network box, and transformer kiosk was treated in like manner. The diagrams are glued on to boards and contained in the drawers of a neat and compact filing cabinet.

Mr. G. F. PILDITCH (Chief Electrical Engineer, Rathmines), who opened the discussion, said that with the author's system there seemed to be a risk of the plugs being put in the wrong holes in the card dummies, which if not discovered at the time might lead to chaos. He thought it better in such an emergency to go straight to the boxes and see how the connections actually were. On his own system at Rathmines the boxes were all symmetrically arranged, but where there was any obscurity he had diagrams of the connections painted on boards, which were kept in the disconnecting boxes.

Mr. W. J. U. SOWTER (Chief Electrical Engineer, Bray) thought that all disconnecting boxes should be symmetrically arranged so that they formed their own diagram. On high-tension systems there was grave risk to human life if the engineer could not make disconnections with absolute certainty that he was right. He remembered a case where it was supposed that a faulty high-tension cable was entirely disconnected. when the jointer received a severe shock because wrong links had been taken out. The author's system apparently provided no means of identifying the cables one from another in the streets.

Mr. S. L. R. PRICE (Chief Electrical Engineer, Pembroke) said that it was hopeless to rely upon written reports or personal memory. He believed that in Newcastle one man was entirely responsible for all alterations and disconnections, and that nothing could be done without his sanction. If there were two or three men in a position to give orders, mistakes were very likely to occur.



Mr. P. T. BLISSETT (Messrs. Guiness & Co.) asked what precautions were actually taken in the Dublin sub-stations to ensure beyond doubt that the 'bus-bars were actually dead before work was commenced upon them.

Mr. T. TOMLINSON agreed that it was very necessary to make accurate plans showing the position of every main under the road surface. Many years ago he had represented a company seeking a concession for lighting a portion of Paris, and the City Engineer there required a very complete set of maps showing the position and depth of every main laid, including even consumers' services. The City Engineer there was able in a few moments to ascertain to an inch the position of any gas, water, or sewage pipe in any quarter of the city. He strongly approved of the author's system.

Mr. ARCHER (in reply) mentioned that the system was, of course, kept absolutely up to date, as otherwise it would be worse than useless. The various assistants reported to the mains engineer any alterations which were made in the connections, and the alterations were made in the filing system accordingly by the draughtsman. As regards seeing the connections from the boxes themselves, Mr. Archer reminded his critics that on large systems the box-covers were naturally heavy, and many of them took a considerable time to open, and it might occur that during the time of a breakdown many of these boxes would be opened unnecessarily, whereas by referring to the filing system all the information required could be obtained in a few moments. Regarding the question of the identification of the cables in the streets, a very elaborate system of maps was kept, and they never experienced any difficulty in that respect. Regarding the question of dual control, the mains engineer was entirely responsible, and all orders were issued through him; the draughtsman worked under him and kept the filing system to his instructions. Replying to Mr. Blisset's question, the 'bus-bars were always earthed before any work was undertaken in connection with the high-tension side of the sub-stations.

STARTERS FOR SINGLE-PHASE MOTORS

THE starter illustrated here has been designed by the Electrical Apparatus, Co., Ltd. (Vauxhall Works, South Lambeth Road) with the object of securing simplicity in operation, while providing apparatus which could be relied on to start single-phase motors without troublesome individual adjustments. The starter is operated by a single handle, moved in one direction only, which cannot be left in the starting position, and all parts are under one cover. If the motor does not start on the first step, the movement of the handle to the right will progressively increase the torque up to the maximum that the motor is capable of developing. This important feature is obtained by utilising both resistance and a choking coil in the stator circuits, and resistance in the rotor in the case of slip-ring motors. The use of the stator

E.A.C. STARTER FOR SINGLE-PHASE INDUCTION MOTORS.

resistance allows the rotor resistances to have comparatively low values, so that they and the choking coil can be mutually designed to the very best advantage. This is a great gain over the common method of providing a fixed stator resistance, if any, and gradually cutting out the rotor resistance, since in that case the effect of the auxiliary phase becomes less and less, completely neutralising the increase of effect of the main phase. The lever carries two brushes: one supplies current to the running phase, gradually cutting out resistance. while the other energises the starting phase through a choking coil: this phase is automatically opened, when the handle nears the full running position, by means of a quick break knife switch linked to the main handle. In the case of squirrel-cage motors, this comprises the whole of the operations to be performed. For the slip-ring type, three brushes are provided which short circuit the rotor resistances in one step in the final position of the handle. Carbon breaks are provided for all motors over 5 h.p. No-voltage and overload releases or press-button spring releases can be provided.

The starters are made in various sizes up to 50 h.p. in the open, semi-enclosed, or totally enclosed patterns.

Hampstead Electrical Showrooms.—We regret that in our description of the new Hampstead Electrical Showrooms on page 321 of ELECTRICAL ENGINEERING of June 8th, we gave the prices of 15s. for the first day, 10s. for the second day, and 5s. for the third day as applying to the hire of cookers. These prices should apply to vacuum cleaners.

Brimsdown Lamp Works.—The works had their third annual outing on Saturday, June 3rd. A special train from Waltham Cross, calling at various intermediate stations, arrived at Liverpool Street at 6.26 a.m., where the staff of the sales department and a number of guests met the train. The party of over 500 arrived at Hastings in excellent time, and dinner was partaken of at 12.30 in the Royal Concert Hall. Mr. E. Sharrer was in the chair, and was supported by Mr. J. Chiswell. The Red Hungarian Band was specially engaged for the occasion. The whole function was a great success, and the return journey was not commenced before 8 o'clock p.m. The fine June weather conduced to a perfect day's enjoyment.

WATER POWER IN NORWAY

AT a meeting of the Faraday Society on May 2nd, a Paper was read by A. Scott-Hansen, of Christiania, dealing with the various power schemes of Norway, where, as is well-known, facilities for water power are very plentiful.

Norway, which possesses in some districts a very large rainfall, is fortunate in having splendid catchment areas, which make it easily available as a source of energy. In the district of Bergen the annual rainfall is sometimes over 158 inches, which means a fall of 16,000 tons per acre annually. A few miles behind the chain of coast mountains the rainfall is very considerably diminished on the eastern side, and it is not much over 15·8 inches. If the rainfall were evenly distributed throughout the year the Norwegian rivers would be amongst the best supplied in the world. This, however, is not the case. From October to April or May the rainfall in the mountainous districts takes the form of snow. Consequently the rainfall cannot at once be utilised. Owing to the melting of the snow floods occur in May, and are usually heaviest during June and July. Thus in order to make use of the power, considerable storage capacity is necessary. Fortunately the country is furnished with lakes of various size, which have frequently very contracted outlets, and can be easily converted into valuable reservoirs at a comparatively small outlay. In this way the watershed of Skien from Mösvand to Hiterdalsvand, the original horse-power was equal to about 50,000 h.p., but can easily be raised to 375,000 h.p.

One of the reservoirs formed by damming the mountain lake Mösvand has a surface of about 60 sq. kilometres, and has been converted into a reservoir containing about 840 million tons of water. This reservoir has increased the minimum flow into the river from 5 tons per second to 47 tons per second. Owing to this the water-power of the Rjukan factories has been increased from about 30,000 h.p. to 250,000 h.p., and this has been achieved at a cost of about £85,000. The total water-power which might be made available in Norway has been estimated at from 5 to 7,000,000 h.p., but even this is probably a low estimate. Hitherto electric power has principally been applied to light and for power purposes, and in towns and populous districts, to which it is transmitted from the waterfalls inland, or in sparsely populated districts. The cost depends on various circumstances; but it may be taken that the power stations can supply power at from 22s. to 40s. per horse-power year at the power station.

The industries able to make use of large powers, for instance, 50,000 to 100,000 h.p., are not those which only require power to actuate machinery, but industries of an electro-chemical or electrometallurgical nature. In 1906 Prof. Birkeland first communicated to the Faraday Society the results of his and Mr. Eyde 's discoveries on the fixation of atmospheric nitrogen. From this discovery an industry has arisen that will in the course of the present year make use of 170,000 to 180,000 h.p., and it is hoped will in the course of a few years employ about another 300,000 h.p. In the manufacture of calcium carbide about 60,000 h.p. are employed, and in other electro-chemical and electrometallurgical industries about 20,000 h.p., the results of developments during the last ten or fifteen years. The following are the official statistics for 1909 :—

	Tons.	Value in Kroner.
Calcium carbide	48,352	5,802,200
Calcium cyanamide	752	120,300
Nitrate of lime	9,422	1,300,300
Nitrite of soda	2,577	1,015,400
Aluminium	486	1,093,300
Ferro-silicon	2,645	449,600
Soda	179	357,400
	64,413	Kr. 10,138,500

In English money this represents about £557,480. The 1910 figures are not yet available, but the exports of nitrate of lime and nitrite of soda have increased very considerably, and another article has been added to the above list, namely, nitrate of ammonia.

Another industry which promises to be of the greatest importance is the electric smelting of iron and steel. The question of obtaining a suitable furnace for smelting iron ore appears to have been solved in the Grönwall furnace, which has been worked for some time on a commercial scale, with excellent results, first at Domnarfvet and Trollhättan in Sweden. The patent rights in Norway have been acquired by the Norsk Elektrometal, who have granted licences to the Hardanger Elektriske Jern og Staalverk, who will obtain electrical energy from the power company, A/S Tyssefaldene and to the Arendals Fosse-Compagni, who own the waterfall Böilefos, near the seaport town of Arendal. A company has also been formed to use a different type of furnace at the Tinfoss in Telemarken. At the Hardanger Iron and Steel Works they will commence with 5,000 e.h.p., which may be increased to 15,000; at Arendal, 6,000, which can be increased to 30,000, and at Tinfoss, 5,000 e.h.p., which may be increased to 10,000 or 15,000. Great hopes are entertained that other ores—copper, nickel, zinc, and so forth, will be capable of being electrically smelted, and perhaps further worked up.

Large quantities of timber are floated down the rivers in the summer from the forests, and this timber at times causes great trouble to the power stations and bridges. One of the most important power stations, now under construction, is Vamma, on the lower part of the Glommen River. The dam at Vamma is to have a height of about 90 ft., and will be one of the largest in Europe. The power station will be in the middle of the river-bed, immediately below the dam. There will be ten or twelve generating units, each for about 7,000 h.p. The power will be partly used for lighting power and partly for a factory of nitrogenous products. The difficulties encountered in building some of the pipe lines in Norway were described, and Mr. Hausen gave particulars of a great many power schemes, yet even after great engineering difficulties had been surmounted, power was now obtained at a remarkably cheap rate.

THE OLYMPIA ELECTRICAL EXHIBITION

THE Exhibition Committee have had a most effective poster prepared of which we give a reproduction here. A large number of these are being printed, and copies will be forwarded to the supply authorities, contractors, and all engaged in the electrical industry, who will be kind enough to display them prominently in their premises, or in their windows. The design of the poster is already familiar to many of our readers from the adhesive labels in use in large quantities by exhibitors, and is even more effective in the larger size.

Electric Power in Flour Mills.—Before the National Association of British and Irish Millers, recently, Mr. W. Cramp discussed systems of driving flour mills. He assumed certain combined rates of interest and depreciation, and estimated that the price of power would vary from 2d. to 6d. per sack of flour produced, and this, under certain conditions, the chief of which was that of locality. With regard to steam plant, the slow-speed horizontal engine, on account of being costly, heavy, and requiring large floor space, was dismissed in favour of the high-speed vertical type with a direct or electrical drive, because it was more economical in capital cost, floor space, and foundations. The question whether the miller should generate his own electricity or take it from the mains depended, of course, on the price per unit of supply. Though the main load of a mill was regular day and night, and the auxiliary load could be put on at times other than those of the station peak load, it would be more economical to generate it by means of a steam, gas, or oil plant, since a very large supply would not cost less than 0·3d. per unit, and for smaller quantities 0·5d. per unit. For country mills suction gas and oil engines were about equal, and when the latter was used, the Diesel engine was, in his opinion, the only one that could be considered. The exhaust steam turbine as an addition to existing plant would increase the power and economy, and of the electrical systems, the three-phase alternating-current was preferable in all cases. In very large mills, with gas engines, a producer plant should be used.

Petrol-Electric Omnibuses in London.—A number of petrol-electric omnibuses of the same type as that described in ELECTRICAL ENGINEERING, October 27th, 1910, page 678, but differing slightly in constructive detail, are being put into service by Messrs. T. Tilling, Ltd. One of the innovations is the use of a spring drive between the engine and the generator; a new design of live worm-geared back axle is used, and the engine and radiator arrangements are different. The main feature of purely electric transmission with a single generator and a single motor with control on the generator field are, however, retained. The electrical equipment was supplied by Messrs. W. A. Stevens, Ltd., Maidstone. The generator is rated at 25 kw., and runs at speeds from 350 to 1,600 r.p.m., giving voltage varying up to 350. It is designed with a falling characteristic. The weight of the whole 34-seated vehicle is 3 tons 9½ cwt., of which the electrical equipment is responsible for 1,120 lbs. The overall efficiency is given as 79 per cent.

METAL FILAMENT LAMP PATENT LITIGATION

IN the series of actions which the Osram Lamp Works, Ltd., are commencing against some other lamp makers, they are alleging infringement, not only of the Just-Hanaman patent, but also of the "weighting" patent, which covers the method employed in the manufacture of Osram lamps for rendering the filament straight and uniform after squirting.

This patent (No. 8,563 of 1907), which was taken out by the Deutsche Gasglühlicht Aktiengesellschaft (Auergesellschaft) of Berlin, describes a method of ensuring that the contraction which takes place when a filament squirted from a paste is sintered, shall be uniform along the filament. If there is a lack of uniformity, there is a danger of the spots at which the resistance is higher attaining a higher temperature, and so shortening the life of the filament. To prevent these bright spots being formed, the filament is subjected to a slight tension during the process of sintering by hanging a small weight such as a tungsten hook from the filament at the bend of the loop. This not only ensures uniform contraction, but gives the sintered filament the required pointed shape.

The Just-Hanaman patent is No. 23899 of 1908.

It was granted to Dr. A. Just and F. Hanaman, of Vienna, and describes a process of manufacturing filaments of pure tungsten by mixing finely divided tungsten or tungsten compounds such as tungstite, tungstic acid, or tungstic sulphide with an organic binding medium such as collodion, or a solution of cellulose in chloride of zinc or cupreous ammonia oxide. The filaments squirted from the resulting paste are then carbonised (in some cases after denitration), and the carbon is then removed by passing current through the filament and raising it to a high temperature in an atmosphere of steam and hydrogen. The carbon is oxidised to form carbonic oxide, and a filament of pure tungsten is left. The filaments are then rendered uniform by submitting them to the action of current in an atmosphere of volatile tungsten compounds in the presence of a large quantity of hydrogen, whereby the tungsten deposited equalises the filaments.

This patent was published in full in ELECTRICAL ENGINEERING of September 9th, 1909, after the grant of an amendment by the Comptroller.

It is under these two patents that the Osram Co. is bringing its action against the "Z" Electric Lamp Manufacturing Co., Ltd., and their agents, Messrs. Baxter & Caunter, and an action, we understand, is also to be brought against the Café Royal, who are users of "Z" lamps. Another firm which is being attacked is the Corona Lamp Works Co., successors to Mr. S. Horvath.

The Corona Lamp Works Co. have sent us a copy of correspondence which has passed between the solicitors of the Osram Lamp Works, Ltd. (Messrs. Bristowe, Cooke & Carpmael), and their solicitors (H. C. Morris & Co.). The Osram Lamp Works claim that the above patents have been infringed by the manufacture by the Corona Lamp Works Co. of "Mascot" lamps, and their sale to Messrs. Galsworthy, Ltd., who, we understand, act as sole selling agents for these. The letter asks in the usual form for an undertaking that the alleged infringements shall cease forthwith; that the lamps in stock shall be delivered up; and that full information should be given as to the number and power of the lamps already sold, so that an estimate of the amount of damage might be formed.

In reply to this, the solicitors of the Corona Lamp Works Co. have contended that their clients' lamps are manufactured by an "altogether different method, marking a great advance in the manufacture of metal filament lamps, and differing altogether from the patents above mentioned"; that their clients are prepared to indemnify their customers in respect of any proceedings which the Osram Co. may bring against them in consequence of their selling "Corona" or "Mascot" lamps; and that they will hold the Osram Co. liable for any loss or damage that they may sustain owing to the Osram Co.'s "interference with their agents or customers."

In this connection, in order to have the complete history of the matter up to date, our readers may also refer to ELECTRICAL ENGINEERING of January 26th, 1911, in which the case against Messrs. G. M. Boddy & Co. was dealt with.

Trolley Omnibuses.—We understand that the British Electrical Federation has for some months past been making inquiries into the possibilities of the trolley omnibus for rural and other districts where the expense of laying down tramways would not be justified.

REVIEWS OF BOOKS

Imperial Telegraphic Communication. By Charles Bright. 212 pp. 7¾ by 5 in. (London: P. S. King & Son.) 3s. 6d. net; abroad 3s. 9d.

AT a time when imperial matters are much to the fore in connection with the Conference, the publication in book form of a collection of Mr. Charles Bright's recent writings upon the cable communications of the world is very opportune. The matter included is mainly that contained in articles from the *Quarterly*, *Fortnightly*, *Monthly* and *Westminster Reviews*, together with the substance of a paper read lately before the Royal Colonial Institute. A readable introduction summarises the present position, and a map is included on which are marked the new state owned routes which Mr. Bright proposes in addition to the existing cables, in order to make the communications of the empire self-contained from the strategic point of view. The first few sections of the book deal with the Pacific cable question, and further articles reprinted are headed respectively Imperial Telegraphs, Imperial Consolidation by Telegraphy, Imperial Telegraphy as a popular Tariff and Communication by Cable, titles which in themselves indicate the nature of the contents, and finally the paper referred to above on Imperial Telegraphy. An appendix gives tables of cable rates.

The Elements of Graphic Statics. By W. L. Cathcart and J. I. Chaffer. 312 pp. 9¼ by 6¼ in. 159 figures. (London: Constable & Co.) 12s. net; abroad, 12s. 10d.

GRAPHICAL methods are becoming more and more popular in all branches of engineering work as their clearness, speed, and convenience are becoming realised. This book, which is founded on lectures to students of marine and mechanical engineering in America, is largely addressed to mechanical engineers. The stresses in stationary structures are, however, dealt with at considerable length, as well as the pressures and stresses in moving shafting, gearing, &c. The treatment both of the general principles and methods of meeting special problems is clear and straightforward, and the utility of the book is enhanced by the examples at the end of each chapter.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

CARBON BRUSHES.—A new and very complete list of graphitic carbon dynamo and motor brushes, made by Fabius Henrion (Nancy), is to hand from W. Geipel & Co. (72A St. Thomas' Street, S.E.).

FITTINGS.—In issuing their latest list of the well-known Benjamin wireless clusters and other fittings not requiring internal wirings, the Benjamin Electric, Ltd., call special attention to the suitability of these for temporary lighting of stands at the forthcoming Electrical Exhibition at Olympia. The list contains particulars of a considerable variety of clusters, adaptor, angle holders, complete fittings, reflectors, shades, and accessories, including weather-proof fittings for exterior lighting.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

WIRES AND CABLES.—A new list from the Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.), deals with wires and cables in considerable variety, including V.I.R. electric light wires, cables, and flexibles; flexibles for special purposes, such as armoured flexibles and those with a third steel conductor; bell and telephone wires; and special multiple cables for intercommunication systems.

CONDUIT FITTINGS.—The same company are also issuing a leaflet advising reduced prices of "Kalkos," and other boxes for screwed tube.

FANS.—Another leaflet from the Sun Electrical Co. gives notice of a cheap clearing line of table and desk fans available from stock.

MOTOR STARTERS.—A new and very comprehensive list of starters, speed regulators, &c., for continuous-current motors up to about 50 h.p. is being issued by the Union Electric Co., Ltd. (Park Street, Southwark, S.E.). These are of the lever pattern, with no-volt and overload releases, and can be either open, semi-enclosed, or watertight.

COOKING APPLIANCES.—A card from Simplex Conduits, Ltd., calls attention to the latest forms of electric ovens and combination cookers and grills which are on the market at favourable prices, and are guaranteed for a year.

Telephone Purchase.—According to the *Birmingham Daily Post*, it is likely that the Telephone Transfer Bill, which is to be introduced into the House of Commons very shortly, will contain clauses providing for the purchase of the two remaining municipal telephone systems at Hull and Portsmouth.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 8, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

11,854/10. **Electric Light Control.** R. J. AIKEN. An arrangement for the control of a number of lights or groups of lights supplied on the maximum demand system is covered by this patent, in which each light is operated by means of ordinary tumbler switches adapted to work with a detachable key, which cannot be removed while it is in the "on" position. Nine figures.

17,819/10. **Electric Cord Grips.** M. H. GOLDSTONE and J. LIGHTFOOT. In the ordinary type of cord grip, in which a tapered insulating piece of wood or other material is split down the centre, and down which grooves run to take the conductors, it is possible for the conductor to get squeezed and short-circuited. This invention is a safety device to isolate the conductors entering the electrical appliance, which consists of a grip divided into two or more pieces, the centre piece acting as an insulator between the two conductors, and they are then clamped in the usual way. Another method, getting the same result, is to have a grip of two sections so shaped that the wires cannot come together, one section fitting into the other like a knife-shaped wedge. Five figures.

20,289/10. **Electric Heaters.** E. G. BYNG and C. H. ARCHER. This invention relates to improvements in electrical heating apparatus, in which the heater is separate from the appliance, and provides a thick case of some heat insulating material, such as fireclay or earthenware. It is shaped to fit the appliance to be heated, and supports both the heating coils and the appliance itself. By this method no heat is lost by radiation. Two figures.

22,304/10. **Lamp Socket.** J. DARBY. Details in the manufacture of lamp sockets of the type in which a double break is made in each side of the circuit, are described in this patent. The controller is placed between two heads of insulating material, and rotates on an axis coincident with that of the socket. The circuit is closed by a pair of springs attached to the controller, engaging with two pairs of contacts fixed to the two heads of insulating material, the controller being operated by a pawl moving in a straight line, which is actuated by a pull chain. Ten figures.

29,309/10. **Couplings for Electrically-driven Looms.** ALLGEMEINE ELEKTRICITÄTS-GES. In electrically-driven looms, it is important to bring the motor to the desired speed before connecting it to the loom, so that with the high starting speed the shuttle is sent the entire length of the warp. This is provided for by a device in which the motor switch and the gear rod of the loom are connected to a member, which, when moved in one direction, brings the motor up to full speed, whilst in the reverse direction the loom is put out of gear before the motor is disconnected from the mains. A locking device is also provided to prevent the motor and loom from being switched on together. Four figures.

2,242/11. **Aerial Conducting Structures.** H. LANGE. An improvement in the manufacture of aerial conducting structures, in which metal ribbons are used instead of metal wires, is covered by this patent. Formerly marginal radiation was prevented at the expense of increasing the solidity of the structure, by shaping it with beaded edges and inserting wires or cords, which need not be very thick to be sufficiently solid, and yet the thicker the wire the better the radiation. In this invention, the inserted material is made of hemp or cotton, which is a favourable form to prevent radiation, and at the same time gives sufficient solidity. The metal ribbon may be bent round one or more ropes made of the above material, and the thickness can be chosen, such that the ribbons bent round them in no place show small radii of curvature, without increasing the weight as in the case of the inserted metal. This method gives a greater flexibility to the structure. Five figures.

6,350/11. **Alternating Current Arc Lamps.** KÖRTING and MATHIESEN AKT.-GES. It is known that an alternating current arc sometimes acts as a converter to direct current, which affects the magnetic system in the case of lamps fed mechanically by an armature and a solenoid, and renders the control of the lamp difficult. This is remedied by connecting the solenoid to the secondary of a small transformer, the primary being connected across the lamp. The advantage of using the transformer is that the secondary pressure can be selected as required, and the solenoid winding need not be calculated in regard to the lamp pressure, but can be identical for various types of alternating current arc lamps. Two figures.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Motors, Dynamos, &c.: FRIED. KRUPP AKT.-GES. [Separately excited direct current generators] 7,045/11; IMRAY [Static frequency converter] 11,526/11.

Miscellaneous: REGAL [Electric Jacquard apparatus] 10,363/11; SCHNIEWINDT (*firm of*) [Resistances] 11,326/11.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: GIRDLESTONE and THORKELIN, 5,806/11; KÖRTING and MATHIESEN AKT.-GES. [Alternating current] 6,783/11.

Dynamos, Motors, and Transformers: HEATHER [Induction motor control] 9,957/10; SHELTON [Electric steam generators] 22,293/10.

Electric Ignition: BATT, 21,236/10.

Electrometallurgy and Electrochemistry: JOHNSON (*Deutsche Gold & Silber Scheide Anstalt vorm*) [Electrolytic manufacture of glycollic acid] 26,546/10.

Heating and Cooking: SCHATZL [Electric furnaces] 3,533/11.

Incandescent Lamps: A.E.G. UNION ELEK.-GES. [Manufacture of tungsten filaments] 19,095/10; RUTTER [Portable battery lamps] 25,991/10.

Instruments and Meters: BESANCON [Electric hour-meter] 28,884/10.

Switchgear, Fuses, and Fittings: TAYLOR [Switches] 7,141/10; FIELD and FERRANTI [Motor starters] 12,300/10; RAILING and GARRARD [Electric cut-outs] 15,988/10; INGLEDON and INGLEDON [Connections for conduit fittings] 17,426/10; KRIZIK [Electromagnetic alternating current apparatus for adjustable purposes] 19,557/10; POOLE [Control of pressure and current regulators] 23,314/10; ALLGEMEINE ELEKTRICITÄTS-GES. [Voltage regulators] 7,668/11.

Telephony and Telegraphy: BROWN [Telegraphy] 12,664/10; CONNER [Telephone receivers] 19,517/10; BELLINI and TOSI [Antennæ for wireless work] 2,632/11.

Traction: LUDW. HEISSE (*firm of*) 12,843/10.

Miscellaneous: HENRI, HELBRONNER and VON RECKLINGTON [Sterilising apparatus] 12,948/10; PARSONS & BALL [Electromagnets and armatures] 13,525/10; MCKENZIE & HOLLAND, LTD., and PEARCE [Signal apparatus] 15,831/10; ENGEL [Lighting plants] 17,277/10; ANCHOR CABLE CO. and WOOD [Apparatus for winding bobbins] 18,034/10; BEACH [Anodes for electrolytic purposes] 20,180/10; VOIGTLAENDER [Electric fire alarm] 21,069/10; MASLIN and DE CHAVANNES [Automatic signal devices] 25,516/10; HARTMANN and BRAUN AKT.-GES. [Mounting electrodes of metal vapour apparatus] 26,747/10; MOWBRAY [Thermal electric fire alarms] 1,848/11; SIEMENS & HALSKE AKT.-GES. [Train recorder] 6,823/11.

Opposition to Grant of Patent

28,552/10. **Discharge of Electricity from Materials.** J. L. PAILLET and E. ROGER. Opposition has been entered to the grant of this patent. The specification describes the employment of tuning devices, which neutralise the high frequency currents, in combination with "Oudin's Resonator" connected with well-insulated radiating conductors to eliminate the electricity which is developed in textile and other materials during their manufacture.

Application for Amendment

25,129/09. **Block Signalling Systems.** HANS THEODORE HANSEN desires to amend this specification in order to make the claims more explicit. It deals with a method of utilising Hertzian waves, which control an apparatus on the train to put the signal at danger, and means for locking the signal in this position should a train enter the block immediately in the rear of the occupied block. The proposed amendments are detailed in the Official Journal of the Patent Office of June 8th, 1911.

Expiring and Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: F. M. LEWIS 4,557/03.

Distribution Systems, &c.: L. FIEDLER [Electric distribution] 4,704/06.

Dynamos, &c.: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., New York*) [Motors] 4,771/04; J. BURKE [Motors] 4,040/05.

Instruments, &c.: EVERSHED & VIGNOLES and S. EVERSHED [Motor meters] 3,534/00.

Switchgear, &c.: H. W. W. DIX and J. SANDFORD [Switches and cut-outs] 4,275/03; H. HOLMES & Co. and G. J. RALPH [Switches] 4,773/06.

Traction: J. P. O'DONNELL and E. C. IRVING [Electrical control of signals] 5,032/02.

Miscellaneous: W. O. DUNTLEY [Electric drills] 4,041/05; S. O. COWPER COLES [Printing surfaces] 4,684/06.

STREET LIGHTING IN THE BOROUGH OF HOLBORN

THE Holborn Borough Council, sitting as a special committee, have reported with regard to the proposals for street lighting concerning which there has already been considerable controversy (see ELECTRICAL ENGINEERING, February 16th, p. 81; March 2nd, p. 110; March 16th, p. 141, and April 27th, p. 227). At the meeting of the Council as a committee, thirty members were present, including the Mayor, and the report was down for consideration at the meeting of the Council last night—which will take place after we have gone to press.

It will be remembered that in January, 1911, both the Gas Light & Coke Co. and the electric lighting companies submitted tenders for a re-organisation of the street lighting in Holborn. The total approximate candle-power in both cases was to be 405,000. The electric lighting companies tendered at the same time at £6,602 per annum, and the gas company at £7,527.

In spite of the higher price, the tender of the Gas Light & Coke Co. was recommended for acceptance by the Works Committee, but the Council refused to adopt this recommendation, and referred the matter back. A new specification was thereupon prepared by the Borough Surveyor, but, when its terms were considered by the gas and electric light companies, the two parties conferred, and came to the conclusion that the position was such that they could no longer continue the competition. They consequently sent in a joint tender for the lighting of the borough approximately half by electricity and half by gas, at a total price of £6,950, subject to certain objections to two clauses in the specification. The candle-power under this tender was to be 424,140, and there would be 20 1,800 c.p. lamps, 13 600 c.p. lamps, 212 400 c.p. lamps, 1 300 c.p. lamp, 4 180 c.p. lamps, and 71 690 c.p. lamps. The contract price also included the installation and maintenance of lamps and fittings, and the supply of electricity and gas. The tender is for 10 years, subject to the Council paying the sum of £4,400 if the contract is terminated at the end of five years, and smaller sums at longer periods up to 10 years.

The clauses objected to are Nos. 28 and 35. Clause 28 reads as follows:—

> The candle-power set against each lamp in the Schedule shall be the minimum power as directly measured by the Council's photometrical apparatus placed at ground-level, and in the event of same falling more than 10 per cent. below such minimum, the contractors shall be liable to a penalty not exceeding £5 for every occasion on which it is shown that the lamps are below the minimum candle-power, an average of 30 lamps taken on three successive nights to be taken as the basis of calculating the candle-power for this purpose.

The companies suggested, instead of this, a clause by which the normal reduction in candle-power should not be less than 20 per cent., two tests being taken at angles of 20 degrees and 50 degrees, and at three feet above the ground-level, the candle-power to be the average of two readings taken in any position. The apparatus to be used for testing was to be agreed between the parties, and if the candle-power was not brought up to the standard within 48 hours of the companies being notified, the Council should have the right to rectify the defect, and to charge the cost to the companies.

The Committee, in their report, regard this clause as quite unacceptable. However, as the companies offer to accept the Council's Clause 28, subject to an increase in the price of the contract by 10 per cent., the Committee recommend that the clause be retained and the additional 10 per cent. paid.

The other clause objected to, No. 35, provided that the contractors should adopt, without additional cost to the Council, any subsequent improvements in burners, lamps, or appliances that may be made. This clause the companies refuse absolutely, and the Committee now consider that it is too onerous, and that it can be well deleted without prejudice to the Council's interests.

They have therefore come to the conclusion that there is no alternative but to accept the offer of the companies for the combined scheme of electricity and gas lighting at £6,950, plus an additional 10 per cent. in respect of Clause 28, bringing the total price to £7,645.

Automatic Telephones.—Mr. A. W. Martin and Mr. T. F. Purves, of the engineering staff of the General Post Office, and Mr. J. S. Jones and Mr. J. Lee, also of the telephone and telegraph department of the Post Office, have issued a report upon their visit to the United States, which was undertaken for the purpose of investigating automatic telephones. On the whole, the report is in favour of automatic telephones, but no public exchange will be erected until experience has been obtained with an experimental exchange of this character in the G.P.O. It is also possible that, later on, experimental automatic exchanges will be erected in the provinces.

Electrical Lighting at the Fort Pavilion, Margate.—Messrs. Siemens Brothers Dynamo Works, Ltd., send us some particulars of the electrical installation at the Fort Pavilion, Margate, for which they have obtained the contract. The main concert hall will be lighted by four cut-glass electroliers, with six 9 in. projecting arms, and provided with ten 50-c.p. lamps each, and four similar electroliers with eight 50-c.p. tantalum lamps. Under the balconies there will be 14 holophane bowl fittings, each having three projecting arms; in the central bowl there will be a 200-c.p. Onewatt lamp, and 50-c.p. tantalum lamps in holophane reflectors will be placed on each of the projecting arms. Under and over the gallery there will also be four holophane bowl fittings similar to the above, but without projecting arms, containing 200-c.p. Onewatt lamps. On the stage ceiling there will also be ten holophane bowl 200-c.p. fittings. Holophane fittings are also being supplied for the Colonnade and entrance halls; ornamental brackets with etched shades will be used for the front of the gallery. In the outside entrance hall, torch fittings and flambeaux will be used, whilst for subways and outside steps cast-iron watertight fittings will be used. For external lighting there will also be 40 cast-iron standards, approximately 8 ft. high, for 100-c.p. Onewatt lamps. The footlights will be 30 ft. long, being constructed with sheet-iron reflectors, enamelled white inside and black outside. There will also be a quantity of holophane shades and accessories for use in pendants, &c. We understand that the value of the fittings will be £400, and the total cost will be £729 15s. The contracting work is placed in the hands of Messrs. Kingston & Co., of Northdown Road, Margate.

Electrical Contractors' Dinner.—The annual dinner of the Electrical Contractors' Association will be held at Frascati's Restaurant on July 3rd, under the chairmanship of Mr. G. Harland Bowden, President of the Association.

Electric v. Gas Cooking.—The Berry Construction Co. have called our attention to a letter which they have received from one of their clients after six weeks' use of "Tricity" cooking appliances. Not only is the increased convenience and cleanliness of electric cooking over gas emphasised, but it is stated that electrically-cooked joints are more tender and much less shrivelled up than when cooked by gas or coal. Some figures show the reduction of the loss of weight of the joints during cooking when cooked electrically very clearly. Thus the average loss of weight for four joints cooked, one by gas and three by coal, worked out at 29·1 per cent.; only 14·5 per cent. was loss on an average of five joints cooked electrically. The saving from the point of view of the butcher's bill is obvious.

The Stalybridge Tramcar Accident.—Colonel von Donop held a Board of Trade inquiry last week into the serious accident upon the Stalybridge tramway system on Whit Monday, when 30 passengers were injured through a car getting beyond control on a hill and finally overturning. The driver of the car, John Napper, who came from the Potteries tramway system with a good record, said he brought the car to a stop at the top of the hill where the accident occurred by means of the hand brake, and put on power to start the car again, at the same time releasing the hand brake. He says he did not apply the hand brake again, but that when he applied the Westinghouse magnetic brake it failed to act. Consequently, he could not pull up at the second stopping place on the hill, and concluding that the magnetic brake was out of order he shut it off and applied the hand brake. The cause of the car leaving the rails at the curve was, he said, due to the fact that all the passengers had crowded on to one side of the top deck. In another part of his evidence, however, the driver said that the wheels were skidding, which seems to indicate that the hand brake was used. The subsequent examination of the car showed that the magnetic brake was in good order. The inquiry was concluded, the Inspector intimating, however, that it might have to be reopened.

LOCAL NOTES

Belfast: *Proposed New Power House.*—The City Electrical Engineer has presented a report in which he recommends the erection of a new power station with a view to providing for future requirements and the possible considerable extension of power supply in the city in the near future. He points out the disadvantages experienced in the present power house, and recommends the purchase of a site where there will be facilities for sea-going vessels to come alongside the works, and ability to secure an abundant supply of circulating water at all states of the tide. An extra high-tension system with sub-stations is suggested, and the cost of the first instalment of 4,000 h.p. is put at £89,208, exclusive of land and buildings.

Bournemouth: *Overhead Tramways.*—Mr. C. W. Hill, tramway manager, reports a considerable saving in current consumption on the tramways recently changed over from conduit to overhead working. This amounts to no less than 500 units per day, and confirms Mr. Hill's view of the enormous waste of energy which the conduit system occasioned.

Bury: *Electricity Accounts.*—The accounts of the electricity department for last year show a net profit of £1,656 after meeting all capital charges. Mr. S. J. Watson, the Borough Electrical Engineer, in his report points out that had the undertaking belonged to a private company having half its capital issued as stock and half as ordinary shares, the gross profits would have enabled a dividend of 4½ per cent. to be paid on the stock and 7 per cent. on the ordinary shares, leaving £2,606 to be carried to reserve fund. The Electricity Committee congratulate the Tramways Committee upon the large saving which has been made in the consumption by the use of tramcar meters, although, of course, this result is bad for the electricity department. The reduction in the amount of energy taken by the tramways amounted to £1,406.

Crewe: *Electric Lighting Accounts.*—The accounts of the Council's electric lighting department for last year show a net profit of £1,268 after meeting capital charges.

Eastbourne: *Electricity Accounts.*—The net profit upon the electricity undertaking last year was £2,329, of which £1,500 have been added to reserve, £632 to renewals fund, and £197 to capital account.

India: *Simla Water Power Scheme.*—According to the *Pioneer Mail*, the tenders which have been received from firms in India for the machinery required for the Simla hydro-electric scheme are now to be sent to the India Office, under orders from the Secretary of State, though such an arrangement was not contemplated in the first instance. Tenders from firms in England will then be invited, and all will be considered before the final orders are issued. This will probably cause a delay of four or five months in the completion of the scheme next year. It was originally intended that any contract entered into should be fulfilled by April 1st, 1912.

Keighley: *Tramway Accounts.*—The net surplus from the tramway undertaking for the past year was £1,205, an increase of £458 over the previous year. The Tramway Manager reports that the undertaking seems now to have got over all its early difficulties, and he expresses the opinion that continued development and improvement may now be looked for.

Electricity Accounts.—The accounts of the electricity undertaking for the past year show a loss of £527.

Lincoln: *Electricity and Tramways Accounts.*—There was a net profit of £3,323 upon the electricity undertaking last year, which is an increase of £820, and a loss of £153 upon the working of the surface contact tramways. This deficiency has been provided for out of the profit of the electricity undertaking.

London: *Bermondsey.*—The proposal of the Electricity Committee to spend £18,563 upon additional plant at the electricity works is meeting with considerable obstruction in the Council. At the last Council, the report of the Electricity Committee was referred back to the Finance Committee for the latter to submit an estimate of the Council's requirements. Several Councillors hold the view that a supply should be taken from one of the two supply companies in the district.

Marylebone: An Electrical Vehicle.—At the last meeting of the Council, a recommendation by the Electricity Committee that an electrically driven van be purchased from the Electrical Power Storage Co., Ltd., at £260, was opposed by Mr. Duncan Watson, who objected on the ground of heavy maintenance. He put the depreciation at 20 per cent. viz., £52 per annum; tyres £55; insurance, including third party risk, £15 15s.; electric current £5; battery renewals £25; driver £78; assistant £52; making a grand total of over £292. After some discussion Mr. Watson's amendment to refer the matter back to the Committee was carried.

Manchester: *New Tramway Scheme.*—Mr. J. Newton and Mr. L. Moorsom, consulting engineers, of Manchester, are said to be preparing a scheme for the construction of a tramway from Ashton-under-Lyne to Bury under the title of the Manchester Northern Tramroad. The main line will be eleven miles in length, with a four mile branch to Heywood, and a local branch to Bury. The capital proposed is £300,000.

Electricity Accounts.—The annual report and the accounts of the Corporation electricity department were presented at the meeting of the City Council yesterday. The net surplus for the year was £27,573, of which £15,000 have been transferred to relief of rates. The large Tudor storage battery (ELECTRICAL ENGINEERING, April 21st, 1910, Vol. VI., p. 261) has resulted in a very substantial reduction of the station costs at Dickinson Street and Bloom Street. A contract has been entered into with Messrs. James Howden & Co., Ltd., for a further turbo-alternator. The efficiency of the distribution system is given at 79·85 per cent., the quantity of energy lost being an increase of 2·05 per cent. on the previous year.

Middlesbrough: *Electricity Accounts.*—The net profit of the electricity undertaking last year was £2,079, against £1,296 in the previous year.

Newcastle: *Tramway Accounts.*—There was a profit of £23,703 on the tramways for 1910-11, the whole of which is proposed to be carried to reserve, bringing this fund to £98,959.

Nottingham: *Electricity Accounts.*—The electricity accounts for last year, after meeting capital charges, enabled the sum of £15,350 to be transferred to relief of rates.

Tramway Accounts.—The sum of £15,000 has been transferred to relief of rates from the tramway accounts after meeting capital charges, and placing £3,817 to reserve and renewals. The number of passengers carried increased by 611,829.

Scarborough: *Trolley Omnibuses.*—It is stated that a company is negotiating with the Scarborough Tramways Co., for the purchase of the tramways and their substitution by a system of trolley omnibuses.

Stevenage: *Provisional Order Revoked.*—The Board of Trade have revoked the Stevenage Electric Lighting Order which was granted in 1902.

Swansea: *Electricity Accounts.*—The accounts of the electricity undertaking for 1910-11 show a net profit of £2,802, which is an increase of £80 over the previous year. Owing to the increased assessment of the undertaking, rates absorbed £1,638, against £799 in the previous year.

Tramways.—A special Committee of the Corporation recommend that negotiations be entered into with the tramways company, in order to fix 30 years as the period at the end of which the Corporation may acquire the whole of the Company's undertaking.

Wood Green: *Electricity Supply.*—The result of the post card poll of the inhabitants with regard to the supply of electricity has been very unsatisfactory, as of the cards sent out, 867 were not returned, 337 were against the scheme and only 110 were in favour. The question of handing over the Provisional Order to the North Metropolitan Electric Power Supply Co., or taking a supply from the Hornsey Council, is now under consideration.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—The Ararat Borough Council propose to engage a consulting engineer to report upon the question of electricity supply.

Canada.—The *Board of Trade Journal* mentions that a Quebec Power Company will shortly be inviting tenders for 10,000 h.p. dynamo and turbine. The address may be obtained from 73 Basinghall Street, E.C.

Crewe.—A loan is to be taken up for mains extensions.

Dudley.—An expenditure of £6,500 is proposed upon electrical extensions.

Limerick.—The Electricity Committee recommend a loan of £7,000 for extensions at the electricity works.

Stoke-on-Trent.—A Local Government Board inquiry was held yesterday into the scheme for unifying the electric supply of the several towns comprised in the new county borough of Stoke. The estimated cost of the scheme is £60,000.

Hosted by Google

Wharfedale.—A company is in course of formation for the supply of electricity in Wharfedale and the surrounding districts of Otley, Ilkley, Guisely, Yeadon, &c. Messrs. Newstead & Wade, solicitors, of Otley, are acting in the matter.

WIRING

Beckenham.—The Electricity Committee invite tenders for the electric wiring of houses in their district. Particulars from the Borough Electrical Engineer.

Belfast.—New art gallery in Botanic Gardens.

Buxton.—New Cottage Hospital.

Cheltenham.—A scheme for the erection of new municipal offices is under discussion.

Chichester.—The Council chamber is to be wired for electric lighting.

Colchester.—New wing to Infirmary. Architects, Messrs. Goodey & Cressall, St. Peter's Chambers, High Street.

Dover.—Additional Barracks. Director of Barracks Construction, 80 Pall Mall, S.W.

Eastbourne.—Proposed sanatorium for consumptives.

Edinburgh.—New school at Bellevue Park.

Gateshead.—New Lunatic Asylum. Architects, Messrs. G. T. Hine and H. Carter Pegg, 35 Parliament Street, Westminster.

Mansfield.—New wing at hospital.

Pudsey.—New Masonic Hall, Church Lane. Architects, Messrs. J. Kendal & Sons.

Rochdale.—Nurses' home at the Workhouse. Architect, Mr. H. H. Clough, Butts Avenue, Rochdale.

Rotherham.—Smallpox Hospital. Borough Engineer.

Stockport.—Extensions to hospital in Dialstone Lane. Architect, Mr. J. Jepson, 35 Great Underbank.

Tettenhall.—The Tettenhall church is to be wired for electric lighting.

Walthamstow.—Proposed new Town Hall.

MISCELLANEOUS

Aberdeen.—Four new tramcar bodies and electrical equipments are required.

Australia.—The Deputy Postmaster-General, Brisbane, invites tenders by July 19th for 2,150 telephones. Specifications, etc., can be obtained at 72 Victoria Street, S.W. or 73 Basinghall Street, E.C.

Birmingham.—The electricity department requires a supply of electrical accessories for the year ending July 31st, 1912. Tenders to the City Electrical Engineer by June 26th.

London: *Battersea.*—The further conversion of street gas lamps to electric lighting is recommended at an estimated cost of £1,368. The number of posts to be dealt with is 432.

TENDERS RECEIVED AND ACCEPTED

Aberdeen.—The tender of the Tudor Accumulator Co., Ltd., has been accepted for the electrical welding of tram rail joints at £2 14s. per joint.

Bath.—The tender of the Diesel Engine Co., Ltd., for a Diesel oil engine coupled to a Dick, Kerr 450 kw. generator, at £5,451, is recommended for acceptance. The tender of Messrs. Dick, Kerr & Co. for a 300 k.v.a. motor-alternator at £1,140 is recommended for acceptance.

South Shields.—The Electricity Committee recommend the acceptance of the tender of the British Westinghouse Co. for new generating plant at £7,792.

Wrexham.—A Local Government Board inquiry was held last week into an application for a loan of £4,145 for extensions to the electricity works. The local gas and water companies opposed the loan.

York.—The tender of the Tudor Accumulator Co., Ltd., at £1,625, has been accepted for replating the battery at the electricity works, and the supply of an automatic reversible booster, switchboard, cables, &c.

Among important orders received by the British Westinghouse Co., we note the following: Underground Electric Railway, one 1,200-kw. rotary, transformers, and switchgear; Metropolitan Railway, one 1,000-kw. rotary converter; Borough of Poplar, three 250-kw. rotary converters and switchgear; Cardiff Corporation, one 700-kw. rotary converter and transformers; Stoke-on-Trent, three 600-kw. and two 300-kw. rotary converters; Glasgow I. & S. Co., one 40-kw. rotary converter, one 47 k.v.a. transformer and control gear; C. W. Fairweather, two 250 h.p. A.C. motors, one 37 h.p., one 35 h.p. sq. cage motors, two starters, and two 625 k.v.a. transformers; Cleveland and Durham, two 600 k.v.a. transformers; Prestwich County Asylum, one booster set and one balancer set; Reunert & Lens, one 400-kw. alternator; Kuishin Tanko Kisen K. Haisha (Takata & Co.), two 500-kw. three-phase, 50 per cent. 3,500 v. 3,600 r.p.m. turbo-alternator set, two surface condenser air pumps, motors, transformers, etc.; Greenock Corporation Trams, sub-station switchgear; Earl's Court Exhibition, 4,500 illumination holders; Oldham Corporation, twelve sets magnetic brakes with skid-proof attachments; Aberdeen Corporation, sub-station switchgear.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars net c.i.f. port of arrival, quoted on Tuesday night, was £57 10s. to £58 per ton (last week £56 15s. to £57 5s.).

Customs Changes.—A decision recently given, allows a rebate of 3 per cent. ad val. off the 15 per cent. ad val, duty upon British car fittings for tramways and railways imported into British South Africa. Insulating paper, letheroid and cloth for electrical purposes is now allowed in free.

The Electrical Apparatus Co.—Mr. T. G. Travis, formerly of the British Westinghouse Co., has been appointed as Lancashire and Yorkshire representative of the Electrical Apparatus Co., and will shortly open an office in Manchester.

Coronation Arrangements.—Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.) inform us that they have made arrangements to hold their offices and stores at Dalston open during Thursday and Friday, 22nd and 23rd inst., from 9.30 a.m. until the official time of extinction of Coronation illuminations, 12.30 a.m., and are holding stocks of lamps and accessories used in connection with Coronation illuminations, holding themselves ready as far as possible to deliver goods or render assistance if necessary in answer to telegraphic or telephonic requests. A section of the Dalston staff will be in attendance at 39 Upper Thames Street, and, in addition, a staff of engineers will make periodical visits over the illuminations for which Messrs. Siemens are responsible.

Dissolutions of Partnerships.—T. P. Shillcock and J. H. Payne, electrical engineers, 10 Gothic Arcade, Snow Hill, Birmingham, have dissolved partnership. J. H. Payne continues.

Bankruptcies.—The trustee in the bankruptcy of A. E. Felgate and W. Storey, trading as Felgate & Storey, Electrical Engineers, 10 Queen Victoria Street, Reading, has been released.

The trustee in the bankruptcy of C. Rix, trading as Budgwater & Wright, Electrical Engineers, 78 York Road, London, W., has been released.

Liquidations.—Improved Electric Traction, Ltd., is to be wound up voluntarily. Mr. H. M. Gowar, Birkbeck Bank Chambers, High Holborn, is liquidator. A meeting of creditors will be held to-day at the above address.

Creditors of Arc Lamps, Ltd. are requested to send in their claims to H. B. Clark and G. E. Corfield, the liquidators, Crown Buildings, Crown Court, E.C. by July 7th.

The Engineers' Standardised Publications Association, Ltd., is to be wound up voluntarily. Mr. J. D. B. Innes, of Craven House, Kingsway, and J. C. Butler, 23 Powis Square, W., are liquidators.

The last day for receiving proofs of claims in the reconstruction of the Uxbridge & District Electric Supply Co. is June 20th. The liquidator is the Senior Official Receiver, 33 Carey Street, W.C.

Change of Address.—Messrs. Vickers, Ltd., announce that their address and registered offices are now Vickers House, Broadway, Westminster, London, S.W., and their telephone number 10110 Gerrard (8 lines). Their telegraphic address will continue to be "Vickers, London."

Canadian Agencies.—A Lancashire firm manufacturing electric light fittings, radiators, and electrical accessories wishes to extend its business in Canada.

A Lancashire firm manufacturing lifts and hoists desires to appoint first-class agents in Canada.

Further information can be obtained from 73 Basinghall Street, E.C., in the first case, and 17 Victoria Street, London, S.W., with regard to the second inquiry.

Hosted by Google

APPOINTMENTS AND PERSONAL NOTES

Mr. E. Kilburn Scott has been appointed Lecturer in Electrical Design at University College for the session 1911–12, in succession to Mr. H. M. Hobart, resigned.

An East Coast of Scotland Electric Supply Company has a vacancy for a switchboard attendant. (See an advertisement on another page.)

The salary of Mr. G. Tough, Engineer and Manager of the Coventry Electricity Department, has been increased from £450 to £550 per annum. In making the recommendation, the Chairman of the Electricity Committee pointed out that the gross profits upon the Coventry undertaking were the largest of any municipal electricity undertaking, and the prices to consumers were the lowest. At the same time the salary they paid their engineer was also one of the lowest, and the increase had been recommended by the Committee without any application from Mr. Tough.

Mr. Patrick, Charge Engineer at the York Electricity Works, has resigned, and a successor is required at a salary of £91, rising to £110 per annum.

Mr. E. J. Jarvis, of Torquay, has been appointed Junior Assistant Electrical Engineer at Devonport.

The Motherwell Lighting Committee have appointed Mr. J. A. Wishart, at present Mains Engineer, to be Electrical Engineer in succession to Mr. Williams, resigned. The commencing salary is £250 per annum.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Peel-Conner Telephone Works.—The first annual meeting was held on Monday, when the report and accounts given in our last issue were adopted. Mr. Hugo Hirst, chairman, who presided, gave a short history of the company, pointing out that its formation was impossible under the old system, by which the National Telephone Company purchased their plant principally abroad. On the Post Office taking over the management, however, every encouragement was given to those connected with the production of common battery telephone exchanges in this country. The company's plant had found great favour with purchasers in consequence of the great success of the Glasgow exchange, and as a result they had a considerable number of repeat orders from the Post Office and also many orders from abroad. In view of the fact that the company had to thank the broad-minded and patriotic policy of the Post Office for calling the company into existence, Mr. Hirst thought it his duty to express himself upon the attacks that have lately been made regarding the future management of the telephone system by the Post Office, and gave reasons for holding the opinion that the telephone system should be in the hands of the Post Office. As regards the allegations that the Government could not work the system so efficiently as a company, he pointed to the fact that the whole of the National Telephone Company's staff would be taken over by the Government; therefore, there was no reason, even if the Post Office engineers were incapable, which it was obviously absurd to suggest, that the system could not be managed just as efficiently in the future as in the past. Finally, Mr. Hirst threw out the suggestion that the Post Office should bring telephone mains in close proximity to all houses in the same manner that electricity mains are brought to premises, leaving it to local contractors to make the necessary connections. This, he thought, would lead to a great development. There was no discussion on the accounts, and the proceedings terminated with the usual vote of thanks.

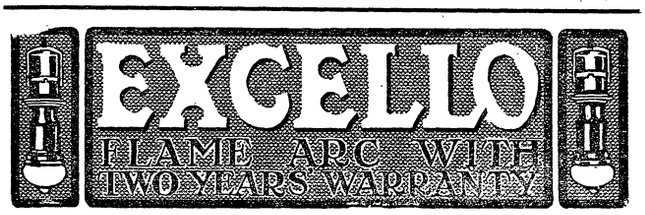
Potteries Electric Traction Co.—The accounts for 1911 show a net profit of £27,384, against £27,290 for the previous year. A 2 per cent. dividend is recommended on the ordinary shares, placing £2,302 to depreciation and £7,525 to renewals, carrying forward £406.

Lisbon Electric Tramways Co.—The accounts for 1910 show considerable increases in passengers carried and receipts, notwithstanding the revolution in Lisbon in October, when the company's operations were entirely suspended for three days. The company is still at issue with the municipality with regard to certain contracts, and in consequence of the unreasonable demands which the company think the Corporation are making, the matter is to go to the Law Courts.

Companies Struck off Register.—The name of the South Western Electrical Co., Ltd., will be struck off the register of joint stock companies within three months unless cause is shown to the contrary.

Karlgoorlie Electric Power & Light Co.—The accounts for 1910 state that although the plant was only lightly loaded for the first eight months of the year, owing to the fire at the Boulder Mines, the profits show an increase over those of the previous year, and a further sum of £4,000 has been added to reserve for depreciation and renewals. The tramways company have exercised their option of continuing to take current at the existing price for a further period of five years.

Callender's Cable Construction Co.—The annual meeting was held on Thursday, and Mr. T. O. Callender, the managing director, said that the anticipations that they formed some years ago were at last being fulfilled. Never had the electrical supply industry been in a healthier position than at present. With regard to foreign trade, he mentioned an instance in which a very large order for cables had been expected, but that, owing to pressure brought by the German Ambassador upon the supply company in question, the order had been placed in Germany. This position was becoming a very serious one, and he and other friends engaged in the supply of electrical machinery of various sorts had discussed the necessity of forming some kind of bank or financial association to help them to fight these very heavy influences. One of these days—it might be this year or next—they would come to the shareholders and ask them to assist the directors to form such an institution.



Brush Electric Engineering Co.—At the annual meeting on Wednesday last week, Mr. E. Garcke referred to the unfortunate position of the company, and incidentally pointed out that under the new Insurance Bill of the Government their expenses would be increased by over £2,000 per annum, which was a very heavy item for a business which was not clearing its charges. The only consolation they seemed to have was that the cumulative effect of these successive burdens must be to hasten the coming change in the attitude of public opinion in respect to our home industries. During the last few months there had been a decided revival of business in the electrical engineering industry, and the company had entered the current year with a much larger volume of orders than in the previous year. This circumstance, coupled with the fact that the new orders secured this year were a much larger volume of orders than in the previous year. This circumstance, coupled with the fact that the new orders secured this year were at prices above the average, justified the hope that they would turn the corner this year. With regard to the position of the company, he suggested that the best thing to do was to reduce the capital at once rather than to let the debits stand in the hope of gradually wiping them off out of profits on future orders, but, in reply to a suggestion by a shareholder, he said he did not think there was any necessity to form a committee of shareholders, although the directors would welcome the advice or assistance of individual shareholders.

Aron Electricity Meter.—The accounts for the year to March 31st, 1911, show a net profit of £27,521, and a 6 per cent. dividend is recommended on the ordinary shares, transferring £5,000 to reserve, £7,000 to expenses of debenture issued, and carrying £5881 forward. This is the first ordinary dividend since 1900.

Northern Electricity Supply Co.—There was a loss of £2,777 for 1910, which makes a total debit balance of £5,756.

Underground Electric Railways Co. of London.—A circular has been issued to the shareholders, summarising the principal points of the Act of Parliament under which the Lots Road power-house is to be leased to the London Electric Railways Co. and the Metropolitan and District Railways Co. for 999 years. It is proposed that the lease shall take effect on July 1st, and that the price is to be £2,200,000 of power-house rent charge stock at par. A Joint Committee is to be formed, with an equal number of representatives of the two railway companies to take over the management of the power-house.

British Electric Traction Co.—The report for the year to March 31st shows that the traffic receipts from the associated companies have improved to a marked extent. For the most part, however, these increased profits have been added to the reserve and renewal funds, or have been otherwise applied in strengthening the position of the companies. Consequently, the profit of the British Electric Traction Co. has not increased by so large an amount as would otherwise have been the case. After meeting the debenture interest for the year, there is a balance of £60,047, and a dividend of 3s. per share is recommended on the preference shares, transferring £25,000 to reserve and carrying forward £10,832. Last year the amount carried to reserve was only £15,000. The report points out that opportunities for promoting new electrical undertakings in this country with a prospect of reasonable profit under present conditions continue to be restricted, but the directors hope that some foreign enterprises which have engaged their attention will mature during the current year. Sir Charles Rivers Wilson proposes to resign the chairmanship, and Mr. E. Garcke has been appointed to succeed him. The report also makes mention of the fact that the directors will place proposals before the shareholders at an early date for a reorganisation of capital.

I.M.E.A. CONVENTION AT BRIGHTON.

(*June 27th—30th.*)

Copies of "Electrical Engineering" may be obtained at Messrs. W. H. Smith & Son's Railway bookstalls at Victoria, London Bridge, East Croydon, and Brighton; at the Grand, Metropole, York, and Albion Hotels, Brighton; and also at Messrs. John Beal & Sons, 55 East Street, Brighton.

SUMMARY

The 16th Annual Convention of the Incorporated Municipal Electrical Association will be held at Brighton and Portsmouth next week under the presidency of Mr. John Christie, Borough Electrical Engineer, Brighton. In accordance with our usual custom, we are publishing portraits and short biographies of the President and those members who are down to read papers and to open discussions. We are also publishing a brief description of the Brighton Electricity Works which will be visited on the Tuesday, and a detailed article on the new 3,000-kw. alternator there, the steam consumption tests of which show a consumption of only 13lbs. per kw.-hour. A description follows of the locomotive shops of the London, Brighton & South Coast Railway, which will be visited on the Thursday. These are electrically driven, and take about 1½ million units a year from the Corporation. A list of members and visitors who, up to the time of our going to press, have intimated their intention of being present at the Convention, is also published. (Pages 341 to 347, and 350.)

The Holborn Council, after having themselves, as a Special Committee, recommended the acceptance of the combined tender of lighting the borough partly by electricity and partly by gas, has now been referred the question once more to the Works Committee for a further report. (Page 348.)

Mr. Justice Swinfen Eady gave judgment on Saturday upholding the validity of the Bremer flame arc lamp patent, and deciding that the Electrical Co., Ltd., infringed the Bremer lamp in their "Sunshine" flame arc lamp. (Page 348.)

The annual report of the Electrical Inspector of Factories and Workshops (Mr. G. Scott Ram) has been issued with the report of the Chief Inspector of Factories and Workshops. (Page 348.)

An Appeal Court consisting of the Master of the Rolls and Lords Justices Farwell and Kennedy is hearing the appeal of the Postmaster-General against the judgment of the Railway and Canal Commission upon the preliminary points in relation to the transfer of the National Telephone Co.'s undertaking to the State. (Page 349.)

A letter from Mr. H. L. Webb answers some remarks on the telephone transfer made recently by Mr. Hirst. (Page 349.)

Among the specifications published by the Patent Office on Thursday last was one by S. G. Brown on telegraphy. T. H. Parsons and A. E. J. Ball dealt

Hosted by Google

with electromagnets and armatures, and a method of preparing tungsten filaments was described by the A. E. G. Union Elektricitäts Ges. The grant to J. Lysaght, Ltd., and B. Beddoe of a patent relating to zinc condensers, has been allowed, on appeal to the Law Officer of the Crown. An invention by R. Bosch for an electric igniter for gas engines has expired after the full term of fourteen years. (Page 351.)

A PROPOSAL to sell the Worcester electricity undertaking has been rejected.—Considerable opposition was offered last week to the Stoke-on-Trent scheme of extensions.—The Irish High Court has set aside Mr. Lynden Macassey's award with regard to the purchase of the Cavehill and Whitewell tramways.—Mr. Stanley Clegg reports that the yearly cost of repairs of the G.B. surface contact system is £18 per annum above the Company's guarantee.—A number of arc lamps are being changed over to 500 c.p. incandescent lamps at Tunbridge Wells.—There was a loss of £5,938 upon the Stalybridge tramways last year. (Page 352.)

THE Wednesbury Council proposes to spend £2,550 upon new mains and services; the Manchester Corporation £12,186 upon generating plant, and £50,000 on mains; Taunton £2,500; Walsall £17,840; Aldershot £2,500; Redditch £5,850; Newcastle-under-Lyme £5,400; and Stoke-on-Trent £6,750 upon new generating plant; electrical measuring and telephone instruments, dynamo and booster, &c., are required in Australia, and overhead tramway equipment in New Zealand. (Page 352.)

NEGOTIATIONS are said to be proceeding between Marconi's Wireless Telegraph Co., and the British and Colonial Governments for large extensions to wireless telegraphy. At the meeting of the British Electric Traction Co., last week, the appointment of a committee of shareholders was agreed to on a show of hands, but was rejected on a poll. (Page 354.)

THE Electrical Congress at Turin will be held from September 10th to 17th. A complete list of the Papers and subjects for discussion is given. (Page 354.)

ARRANGEMENTS FOR THE WEEK

TUESDAY, JUNE 27TH.

I.M.E.A.

10 a.m. Annual Convention at Royal Pavilion, Brighton; (1) Presidential address, by J. Christie; (2) "Electricity Supply Viewed from the Municipal Committee's Standpoint," by Councillor H. Leese; (3) "Modern Wiring Practice," by J. W. Beauchamp.

2.45 p.m. Visit to Southwick power station and other works.

8 p.m. Reception and conversazione by Mayor and Mayoress, at the Royal Pavilion.

WEDNESDAY, JUNE 28TH.

I.M.E.A.

10.15 a.m. At Municipal College, Portsmouth: (1) "Internal Combustion Engines Working on the Diesel Principle," by H. L. Howard; (2) "Internal Combustion Engines for Power Stations (Gas Engines and Producer Plants)," by R. M. Carr.

2 p.m. Visit to H.M. Dockyard power house, and a ship of the "Dreadnought" class.

"*Dynamicables.*"

7.30 p.m. Dinner at Trocadero.

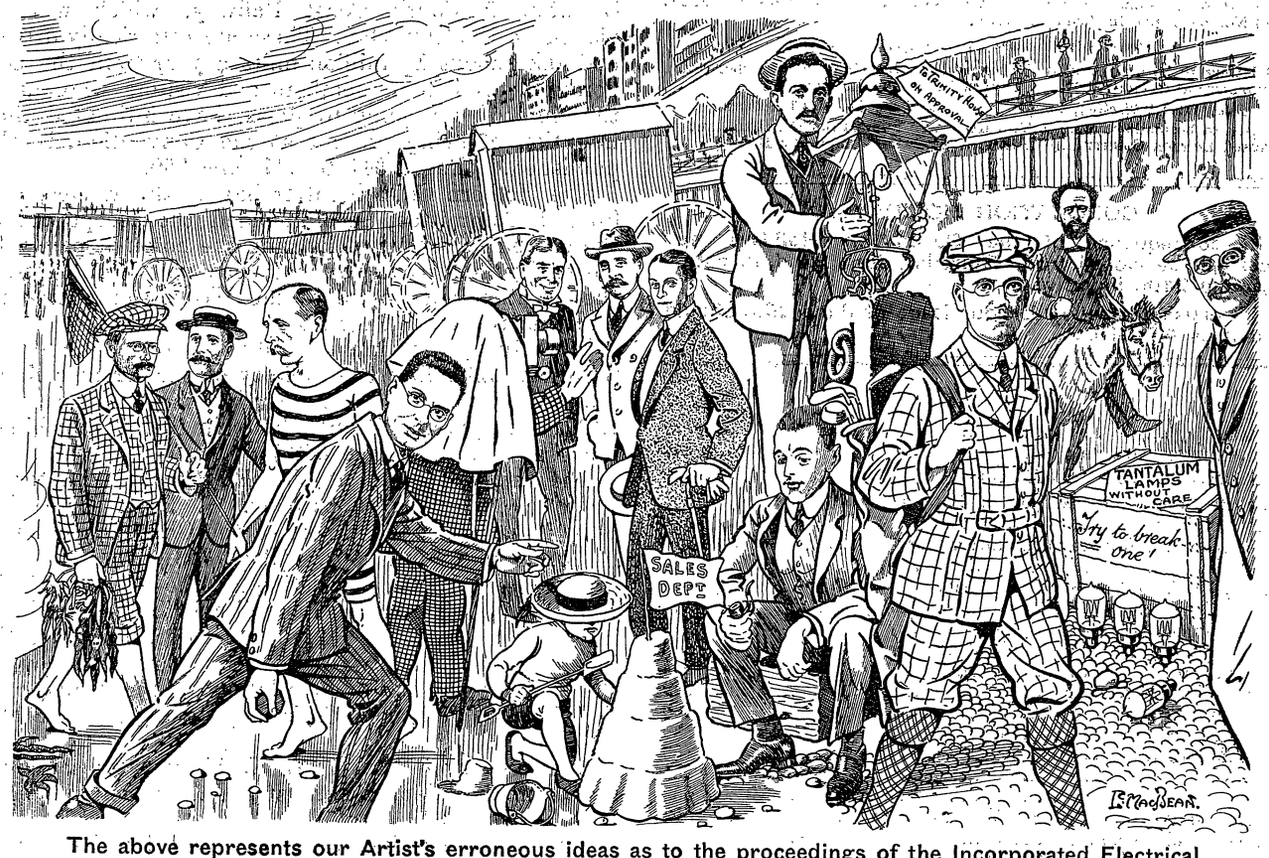
THURSDAY, JUNE 29TH.

I.M.E.A.

10 a.m. At Royal Pavilion, Brighton:—Discussions: (1) "Purchase of Fuel," to be opened by Mr. C. E. C. Shawfield; (2) "Street and Shop-front Lighting," to be opened by Mr. A. H. Seabrook.

2.45 p.m. Visit to Corporation electricity sub-stations and L.B. and S.C. Rly. locomotive workshops.

7 p.m. Annual Dinner at the Dome.



FRIDAY, JUNE 30TH.

I.M.E.A.

10 a.m. Annual General Meeting, at the Royal Pavilion, Brighton.

Physical Society.

5 p.m. At Imperial College of Science, London: (1) "On the Effect of a Narrow Saw-cut on the Edge of a Conducting Strip on the Stream Lines in the Strip, and on the Resistance of the Strip," by Prof. C. H. Lees, F.R.S.; (2) "The Capacity of Co-efficients of Spherical Electrodes," by Dr. A. Russell; (3) "Exhibition of the Benkö Primary Battery," by W. R. Cooper.

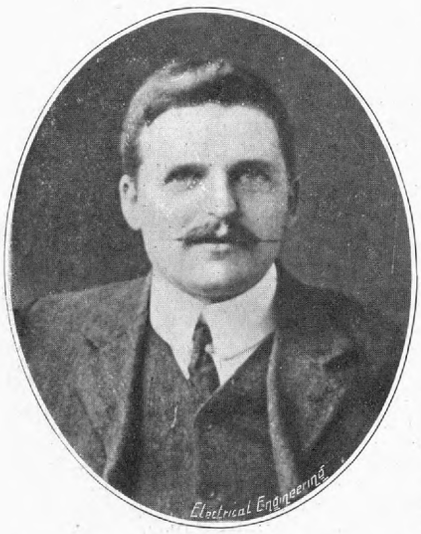
The above represents our Artist's erroneous ideas as to the proceedings of the Incorporated Electrical Association meeting at Brighton next week.

Hosted by Google

THE I.M.E.A. CONVENTION

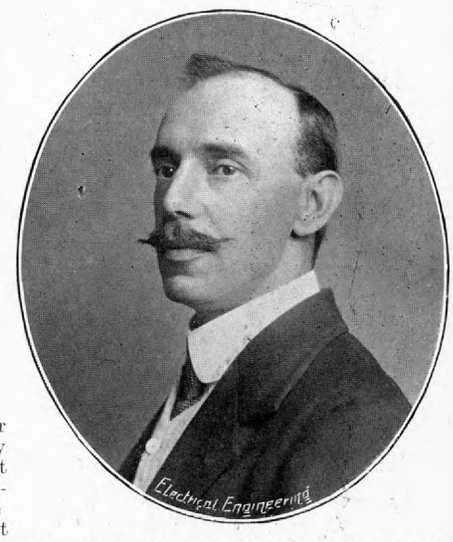
THE Incorporated Municipal Electrical Association will hold its Sixteenth Annual Convention in Brighton and Portsmouth from Monday to Friday next week, under the Presidency of Mr. John Christie, Chief Electrical Engineer to the Brighton Corporation.

COUNCILLOR H. LEESE, Chairman Stoke-upon-Trent Electricity Committee, who will read a Paper on "Electricity Supply Viewed from the Municipal Committee's Standpoint."

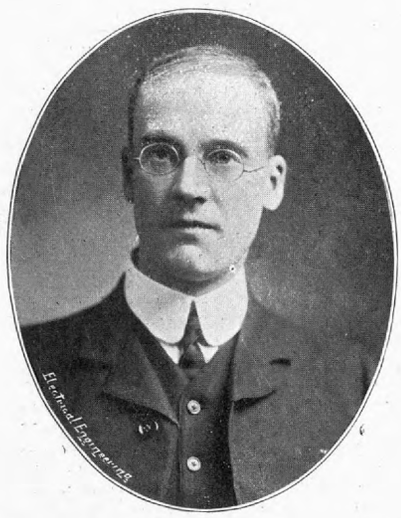


THE PRESIDENT.

MR. JOHN CHRISTIE,
Chief Electrical Engineer, Brighton.



MR. JOHN CHRISTIE, the President, is engineer and manager of the Brighton Corporation Electricity Works. He will be forty-three years of age next month, and is a native of Glasgow. His apprenticeship and early experience was as a marine engineer, and he started his electrical work at Messrs. Crompton's works at Chelmsford. His first municipal job was as second engineer to the St. Pancras Electricity Works, in which situation he was for about a year, and, after a few months in the testing department of Messrs. Siemens Bros. and Co., at Woolwich, he proceeded to Glasgow as second engineer at the Corporation Electricity Works. Early in 1894 he was appointed chief electrical engineer at the Londonderry Corporation Electricity Works, which at that time only supplied public lighting. He remained there for four years, and in 1898 he returned to Glasgow as power-house superintendent, under Mr. W. A. Chamen, who was then city electrical engineer. He remained there 2½ years; but his work was not confined to the charge of the generating station, as he also assisted Mr. Chamen in superintending the installation of the plant at the Port Dundas Power Station, which was under erection during that period. In the summer of 1900 he was appointed engineer and manager to the Brighton Corporation Electricity Works, when Mr. Arthur Wright retired from the position of chief engineer and started his practice as consulting engineer, retaining his association with the Corporation in that capacity. The Brighton electricity undertaking was then a far smaller one than it is now, but in June, 1906, the present new turbine power station at Southwick was opened by Mr. John Burns, and Mr. Christie has been responsible for its running and management. For many years Mr. Christie has taken the keenest interest in the affairs of the Incorporated Municipal Electrical Association, and although, owing to his retiring disposition, he has never been prevailed upon to read a paper and has seldom spoken in discussions, yet his work upon the Council and the committees has been in-



MR. W. J. BEAUCHAMP, Chief Electrical Engineer, Tunbridge Wells, who will read a Paper on "Modern Wiring Practice."

MR. H. L. HOWARD, Chief Electrical Engineer, Barking, who will read a Paper on "Internal Combustion Engines working on the Diesel Principle."

MR. R. M. CARR, Chief Electrical Engineer, Leek, who will read a Paper on "Internal Combustion Engines for Power Stations: Gas Engines and Producer Plants."

MR. C. E. C. SHAWFIELD, Chief Electrical Engineer, Wolverhampton, who will open a discussion on "Purchase of Fuel."

MR. A. H. SEABROOK, Chief Electrical Engineer, Marylebone, who will open a discussion on "Street and Shop Front Lighting."

Hosted by Google

valuable, and he is one of the most popular members of the Association.

AUTHORS OF THE PAPERS.

Councillor H. LEESE, Chairman of the Stoke-on-Trent Electricity Committee, who will read his Paper on "Electricity Supply from the Municipal Committee's Standpoint" after the Presidential Address has been delivered on June 27th, was first elected a member of the old Stoke-on-Trent Council in 1903, and served on that body until March, 1910. He was then elected to the newly formed Federated Council. He was a member of the Stoke Electricity Committee for seven years, and in September last year was elected Chairman of the Electricity Committee of the new County Borough. A £60,000 scheme, which will remodel the electric supply of the various towns comprised in the new County Borough of Stoke-on-Trent, is in hand, and the L.G.B. inquiry in connection with the loan was held last week.

Mr. J. W. BEAUCHAMP, Chief Electrical Engineer to the Tunbridge Wells Corporation, will read a Paper on "Modern Wiring Practice." Mr. Beauchamp served his pupilage with a London firm of engineers, and afterwards spent about five years with London contractors. Following this, for two years he managed a manufacturing business in Birmingham, a post which he relinquished to join the staff of the Sheffield Electricity Department. Seven years ago he was appointed chief assistant electrical engineer under Mr. S. E. Fedden, remaining in that position until he was successful in being appointed chief electrical engineer to the Tunbridge Wells Corporation in succession to Mr. Horace Boot, who is now consulting engineer to that body.

Mr. H. L. HOWARD, chief electrical engineer to the Barking Council, will read a paper at Portsmouth, on "Internal Combustion Engines Working on the Diesel Principle." Mr. Howard, who is now thirty-eight years of age, was educated at the City of London School, and received his technical education at King's College. He served his time with Messrs. S. Z. de Ferranti and Co., after which he took a post with the City of London Electric Lighting Co., as assistant in the testing department. Three years later he joined the British Insulated Wire Co., and was three years with them as contract superintendent. He was next station superintendent with the Leicester Corporation for 2½ years, and then chief assistant mains engineer at Manchester for 3½ years, after which he obtained his present appointment as engineer and manager of the Barking Council's electricity works, which he has held for the last five years.

Mr. R. M. CARR, chief electrical engineer, Leek, will follow Mr. Howard, with a paper on "Internal Combustion Engines for Power Stations (Gas Engines and Producer Plants)." He commenced his engineering career with the North-Eastern Marine Engineering Co., at Sunderland and Walsend, afterwards gaining experience in turbine work with Messrs. C. A. Parsons, Newcastle-on-Tyne. He joined the staff of the Post Office Engineering Department in 1896, and remained in the service three years. In 1899 he was appointed chief assistant at Bexhill, and succeeded to a similar appointment at Maidstone two years later. He was appointed by the Leek Urban District Council to act as clerk of works during the erection of the gas engines and electrical plant at Leek, and on the commencement of the supply, in 1904, was retained as chief engineer and manager. Mr. Carr acts as consulting engineer to the council, and on his advice a bituminous producer gas plant was installed in 1908, which has proved a great success.

Mr. C. E. C. SHAWFIELD, Chief Electrical Engineer and Manager to the Wolverhampton Corporation, will open a discussion on June 29th on the "Purchase of Fuel," a subject upon which he has spoken with authority at previous meetings. After a course at the Durham College of Science, Newcastle-on-Tyne, Mr. Shawfield was articled for three years with the Newcastle-on-Tyne Electric Supply Co., and subsequently passed through the works of Messrs. Robey & Co., of Lincoln. In 1896 he was appointed chief assistant electrical engineer to the Wolverhampton Corporation, and in June, 1898, succeeded Mr. Harman-Lewis (who resigned through ill-health) as chief engineer. The addition of the tramway load and a considerable increase in the power demand since Mr. Shawfield became chief engineer, has necessitated very large additions to the plant, all of which he has designed and carried out.

Mr. A. H. SEABROOK, Engineer and General Manager of the Marylebone Electric Supply Department, will open a discussion on Street and Shop Front Lighting. Mr. Seabrook served his apprenticeship with Messrs. Crompton & Co., Chelmsford. He was subsequently assistant engineer at Yarmouth and Hampstead, and later engineer and manager of the Barking Council's electricity undertaking. This latter position he resigned in 1905 on his appointment as engineer and manager of the West Ham electricity undertaking. Mr. Seabrook completely reorganised the technical side of the West Ham undertaking, especially in regard to the supply in the Silvertown district, but it was his vigorous policy in developing the commercial side of the business which brought him into prominence whilst at West Ham. Mr. Seabrook's two particular weaknesses, viz., sales departments and tariffs, have brought him considerable criticism at Marylebone, the management of which undertaking he took over in 1909.

WORKS TO BE VISITED

THE BRIGHTON ELECTRICITY WORKS

THE Corporation Electricity Works at Southwick, which supplies electric light and power to Brighton, is of comparatively recent date, although the electricity undertaking itself is one of the oldest municipal electric light undertakings in the United Kingdom, dating back to 1891. The original generating station in North Road was, however, converted to a sub-station when the new works at Southwick, 3½ miles from the centre of the town, were opened in 1906. The latter station, designed by Mr. Arthur Wright, is situated on the east arm of Shoreham Harbour, so that heavy colliers can be moored alongside the boiler-house, and sea-water is used for condensing purposes. Its present capacity is 10,200 kw., and it supplies three-phase current at 8,000 volts to the sub-station, where conversion takes place by means of transformers and rotary converters and motor generators to 115, 230, and 460 volts for lighting and power, and 550 volts for the tramways.

The works are arranged with a boiler-house on each side of the engine-room, but only one boiler-house is in use at present. The entire condensing plant is placed immediately below each turbine, and the switchboard gallery at one end of the engine-room. At present there are 9 B. & W. boilers, each capable of evaporating 18,000 lbs. per hour. The superheaters are separately fired. Steel chimneys are used, with induced draught. The arrangements for coal handling and weighing are well thought out and merit inspection.

In the engine-room are four 1,600-kw. Westinghouse double-flow turbo-alternators, and a 3,000-kw. Richardson-Westgarth-Siemens turbo-alternator, which has been erected this year. Fig. 1 is a general view of the engine-room, from a photograph which Mr. John Christie, the Corporation Electrical Engineer, has kindly given us. We are indebted to Mr. Christie for showing us over the works, and the other works which are to be open for inspection at the Convention, and for supplying us with much of the data in these articles. The long steam pipes seen connected to alternate sets in Fig. 1 are due to the fact that these sets are arranged to be fed alternately from the second boiler-house, and these long pipes may therefore be regarded merely as temporary expedients. Photographs and drawings and a detailed description of the new Richardson-Westgarth set, together with a curve showing the extremely low steam consumption obtained at the reception tests, are published below in a separate article.

The sea-water for condensing is drawn from the harbour by separate centrifugal pumps for each set. Trouble was experienced last year through the pipes having become clogged by mussel-spawn. Steps have been taken to prevent a recurrence of this, and the circulating water pipes are now accessible for inspection, cleaning, and repair.

A feature of the engine-room is the Graham loud-speaking telephone, enabling the switchboard attendant to communicate with the sub-station. A Lea recorder enables a record of the steam consumption to be kept.

The switchboard is of the Westinghouse remote-control pattern, and this has recently been moved by the works staff to give more room in the engine-room.

Five armoured lead-covered 3-core cables connect the works to the North Road sub-station, the distance being 4·7 miles by the route which has had to be followed.

At the North Road sub-station there are two 1,500-kw. rotaries with air-blast transformers and induction regulators, five 500-kw. and two 880-kw. induction motor-generators, and a 300-kw. motor-generator balancing set. These are all of the Westinghouse make with the exception of two sets, which consist of the old original dynamos used at North Road, to which induction motors have been coupled in place of the old Willans engines. It is also interesting to note that there are small workshops in North Road, where, in addition to the repairing work, the lead service boxes used in the network are made, and the copper connections for these are cast.

During the year ended March 31st last, 10,285,680 units were sold, the maximum load on the feeders was 5,140 kw., and the load factor 22·8 per cent., a very large figure for a residential

Hosted by Google

district, in which only about one-fifth of the units supplied are for the tramways. The good load factor is largely accounted for by the supply to the locomotive shops of the London, Brighton, and South Coast Railway, described on another page, which consumed 1½ million units. From the accounts for the year 1910–11, recently published, it appears that something under ¾d. per unit was charged for this supply. For lighting the charges are from 6d. to 1d. per unit on a sliding scale, for general power supply from 2d. to 1d., for a small bulk supply to the Hove Corporation and the Adrington district 5d. and 1d. per unit, for supply to the Brighton tramways 1·2d., and for public lighting 1¾d., exclusive of maintenance and renewals. The average price obtained per unit was 2·08d. The number of prepayment meters on the mains continues to increase, and there are now no less than 405, which represents a fair proportion of the total number of 5,239 consumers. The fuel costs were 0·38d. per unit, the total "works" costs 0·73d. per unit, the total costs (exclusive of capital charges) 1·01d., and, inclusive of capital charges, 2·05d. per unit. The gross profit on the undertaking for the year was £49,266, representing 6·07 per cent. of the total capital, and the net profit, after deducting interest and sinking fund, £4,752.

Visitors to Brighton for the Convention will also have an opportunity of seeing the public illuminations. About 3½ miles of the sea front are being lighted with 10,000 lights hung about 2 ft. apart in festoons.

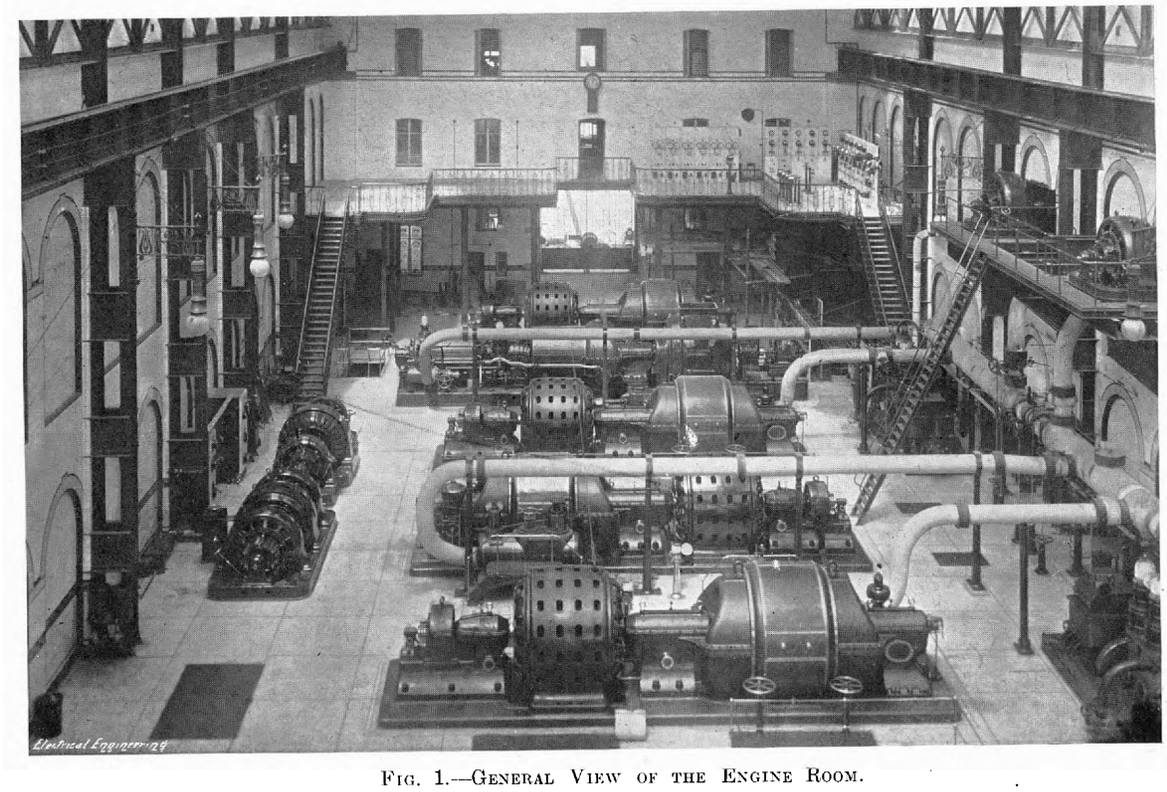


FIG. 1.—GENERAL VIEW OF THE ENGINE ROOM.

THE NEW 3,000-KW. TURBO-ALTERNATOR AT THE ELECTRICITY WORKS

As has been mentioned above, the latest extension to the generating plant at the Southwick power-house consists of a 3,000-kw. Richardsons, Westgarth steam turbine coupled to a Siemens alternator. The turbine is of the two-cylinder Parsons type to the designs of Messrs. Brown, Boveri & Co., Ltd., and is of the same type as the 6,250-kw. set at the Dunstan power-house of the Newcastle-upon-Tyne Electric Supply Co. The same pattern, as manufactured by Messrs. Brown, Boveri & Co., has been adopted extensively on the Continent, and Messrs.

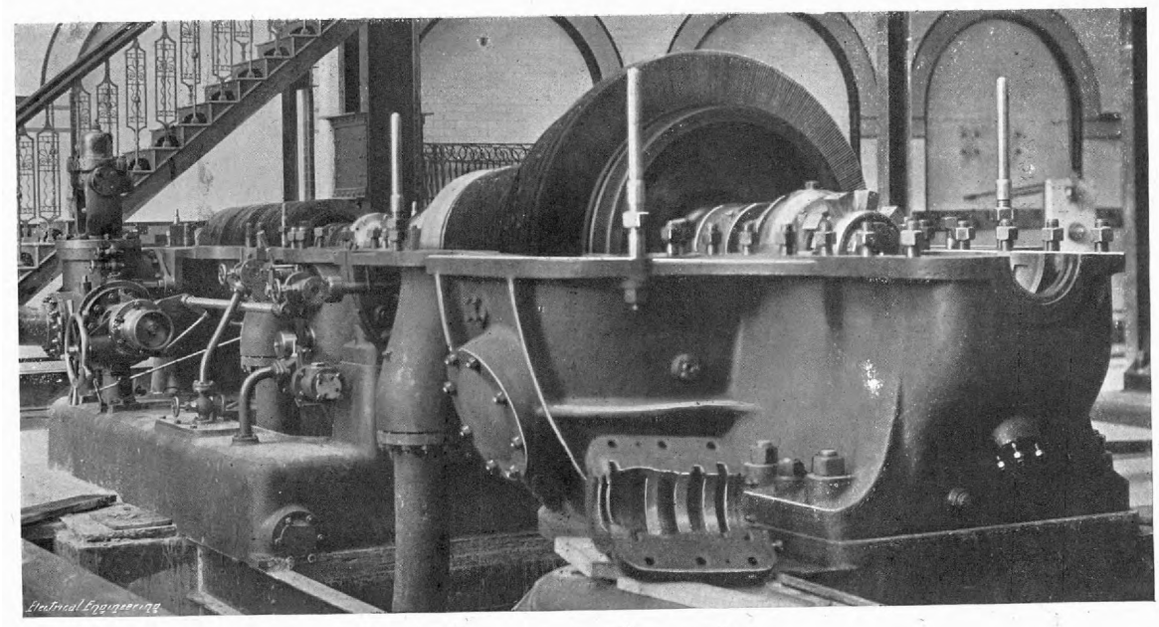

FIG. 1.—TURBINE DURING INSTALLATION.

Hosted by Google

C. A. Parsons & Co. have supplied sets of this type for the Lots Road power-house of the Underground Railways Co. of London.

The two-cylinder Parsons type is an improvement upon the single-cylinder type, as it allows greater economy to be obtained by increasing the number of rows of blades without increasing the distance between bearings. Owing to the smaller pressure drop per row of blades, the velocity of the blades, and therefore the diameter of drum, may both be reduced, and in consequence the two-cylinder turbine has a greater blade height with a reduced clearance ratio, which results in a considerably improved consumption. This construction allows a comparatively small high-pressure drum to be used, practically of uniform diameter and therefore free from distortion troubles. The steam pressure at the inlet to the low-pressure cylinder does not exceed approximately 50 lbs. per sq. in., so that the low-pressure cylinder is not subjected to any high temperatures. In the low-pressure portion the numbers of rows of blades have been increased very considerably as compared with the single-cylinder type, thus still further improving the efficiency of this portion. Fig. 1 shows the turbine during installation. The high-pressure rotor can be seen on the extreme left, and it will be noticed that this is comparatively short and of uniform diameter. Steam is admitted to the turbine through a double-beat valve controlled by the governor through an oil relay, details of which are seen in Figs. 3 and 4.

The valve gear consists of a double-beat valve Q (Fig. 4), actuated by the spring-loaded piston O, which is under control of the oil under pressure entering at S from the main lubricating system. The controlling pressure of the oil is determined by the vertical position of the sleeve K (Fig. 3) and the spring-controlled governor J. If the speed increases, the governor J lowers the position of the sleeve K, thus increasing the outlet area of the oil pipe T', which diminishes the pressure of the oil under the piston O (Fig. 4), resulting in a corresponding closing of the double-beat inlet valve Q. When the speed of the turbine decreases, the position of the sleeve K is raised, whereby the exit area of the oil pipe T' is decreased with the opposite result. The oscillating movement of the valve, which practice has shown to be an advantage for very close governing, since all moving parts of the gear are kept in constant motion, is obtained by the very simple device of making the upper governing edge of the rotating sleeve K at an angle with the axis. The exit area of the oil pipe T' is thus varied slightly once in a revolution of the shaft, with the result that a tremor is produced in the valve Q and its piston and rod, which is in synchronism with the revolutions of the shaft D. Thus the undesirable wavelike fluctuations in the steam pressure produced by the ordinary oscillating motion are avoided.

The alternator is of Messrs. Siemens Bros. Dynamo Works, Ltd., standard type, and is designed to give 3,000 kw. at 0·85 power factor, three-phase, 50 cycles, 8,000 volts, 1,500 r.p.m. After a three hours' continuous run on full load, plus one hour on 25 per cent. overload, the temperature rise is guaranteed not to exceed 75° F. on any part, the same heating limit applying after a continuous run of three hours on full load, plus fifteen minutes on 50 per cent. overload. The machine will also carry a continuous output of 3,500 kw. with the same temperature limit.

The stator frame is fully enclosed, and is ventilated by means of a fan attached to one end of the rotor. A special air intake and air outtake is provided. The cooling air passes through an air-filter connected to the inlet situated in the basement beneath the machine, and the heated air passes out through the aperture at the top of the stator frame. The filter is of the vertical screen type, and manufactured by the Buffalo Forge Co., Ltd.

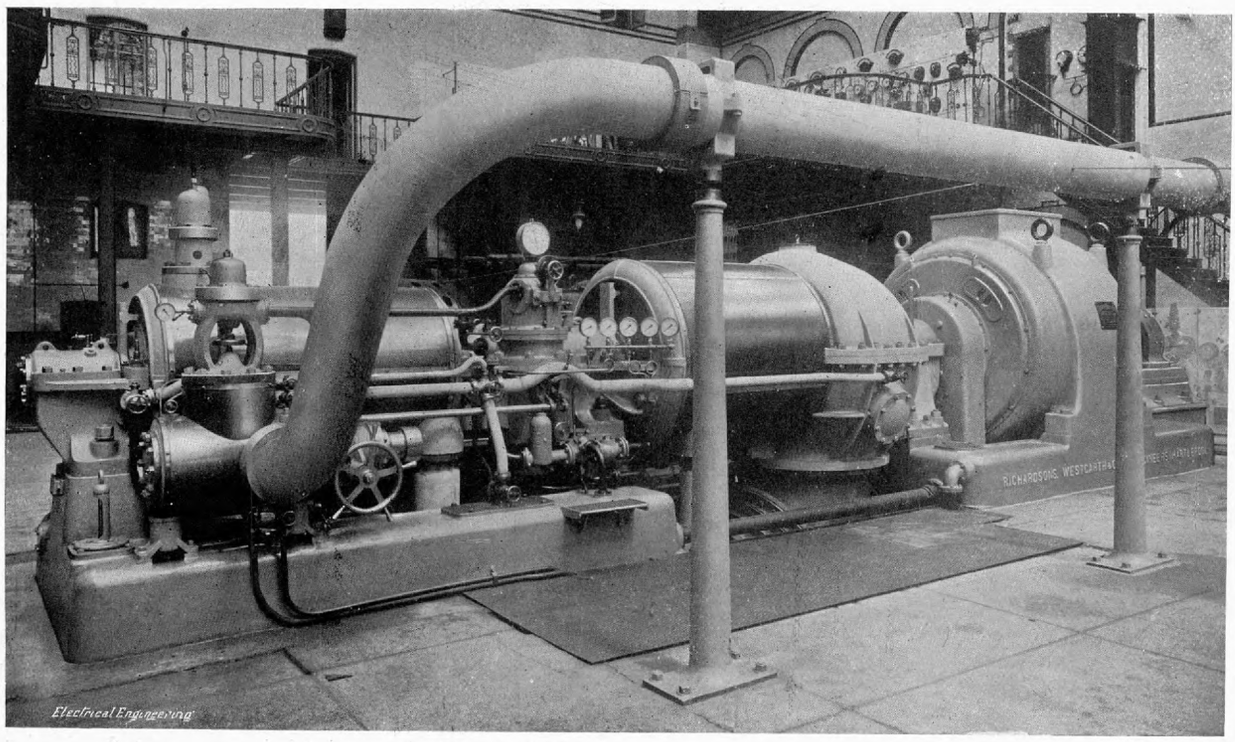

FIG. 2.—TURBO-ALTERNATOR COMPLETED.

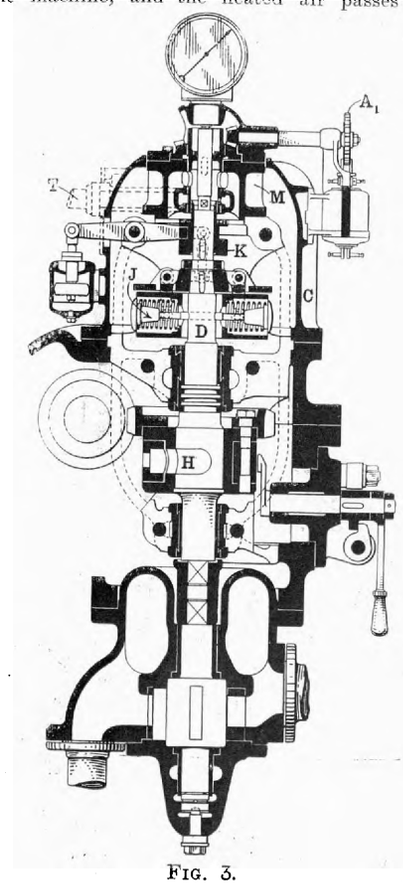

FIG. 3.

Hosted by Google

The stator coils are of the pull-through type, and are wound in semi-open slots, and the end connections of the coils are supported in the most substantial manner.

The rotor is of the cylindrical type, with a distributed winding. The windings are carried in equi-distant open slots closed by metal wedges, and the end-connections are held down by forged steel winding covers, which are machined inside and out, and registered at either end on machined surfaces. The shaft is particularly ample in section.

Cool air is drawn through the rotor by means of a second fan, also attached to the rotor. The core end-supports and

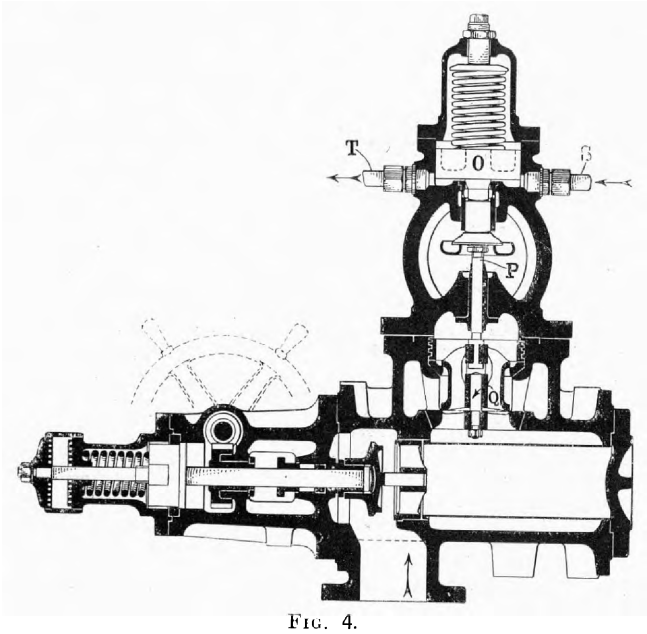

FIG. 4.

winding covers are provided with grooves carrying adjustable balance weights.

Both the stator and rotor are ventilated on Siemens' patent axial system, which consists in the provision of ducts passing through the active iron in a direction parallel to the shaft of the machine. These ducts are so situated that the cooling air comes into the most intimate possible contact with the active copper and iron which requires to be cooled. It should be noted that with the axial system of ventilation the hottest parts of the machine will be those remote from the air intake, viz., the ends of the stator and rotor respectively, and these are immediately accessible to a thermometer.

The slip rings are of steel, and the brushes of copper carbon.

The exciter is driven from the main shaft by means of a flexible coupling, and has its own bedplate and bearings, which are mounted on an extension of the turbine bed. The bearings are arranged for forced lubrication.

The alternator pressure is adjusted by means of a series regulator in the alternator field, and a shunt regulator in the exciter field. Both are operated by hand-wheels carried on a single pillar, the drive being by means of concentric spindles.

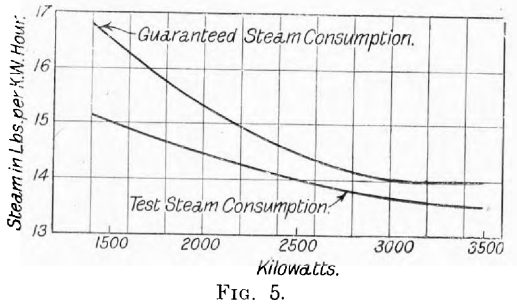

FIG. 5.

The temperature rises obtained on test were well within guarantee, and the machine runs without vibration, and is almost noiseless.

In Fig. 2 the complete turbo-alternator is shown, this view giving a good impression of the valve gear.

The guaranteed steam consumptions of this set are given in one of the curves of Fig. 5, the conditions being 180 lbs. steam pressure, superheated to 530° F., and a vacuum of 28·25 ins. In this figure are also plotted the results of the preliminary trials reduced to guarantee conditions (for permission to reproduce which we are indebted to Mr. Christie). In one of the tests, with a load of 3,550 kw., steam pressure 200 lbs. per sq. in., steam temperature 523° F., and vacuum 28·46 ins., the consumption was only 13·0 lbs. per kw.-hour (exclusive of auxiliaries, the consumption of which is only in the order of 1 per cent. of the total).

The condensing plant was made by the turbine builders, and is of their standard "Contraflo" type, fitted with a vacuum augmentor and Edwards air-pumps. The condenser has a cooling surface of 5,000 sq. ft., and is guaranteed to maintain a vacuum of 28·25 ins. when dealing with 53,500 lbs. of steam per hour, and supplied with 6,000 gallons of water per minute at 70° F. During the turbine tests, the water temperature was 63° F., and a vacuum of 28·25 ins. was maintained without using the augmentor.

THE L.B. & S.C. RAILWAY LOCOMOTIVE WORKS

THE locomotive works of the London Brighton and South Coast Railway at Brighton have just been entirely rebuilt, and are now driven electrically. Current is supplied by the Brighton Corporation, as has been mentioned in the article on an earlier page, and during the last year some 1½ million units were consumed. The maximum current taken is about 2,500 amperes at 230 volts. The aggregate h.p. of the motors is over 2,000. Independent drive is employed for all the larger machines, but the smaller machines, including the rolls for thin plate work, are all run off line shafting.

Four feeders of one square inch section run from the North Road sub-station to the works switchboard, and are connected through duplicate B.T.H. meters. The switchboard is of standard Westinghouse design, and seven-power circuits are taken

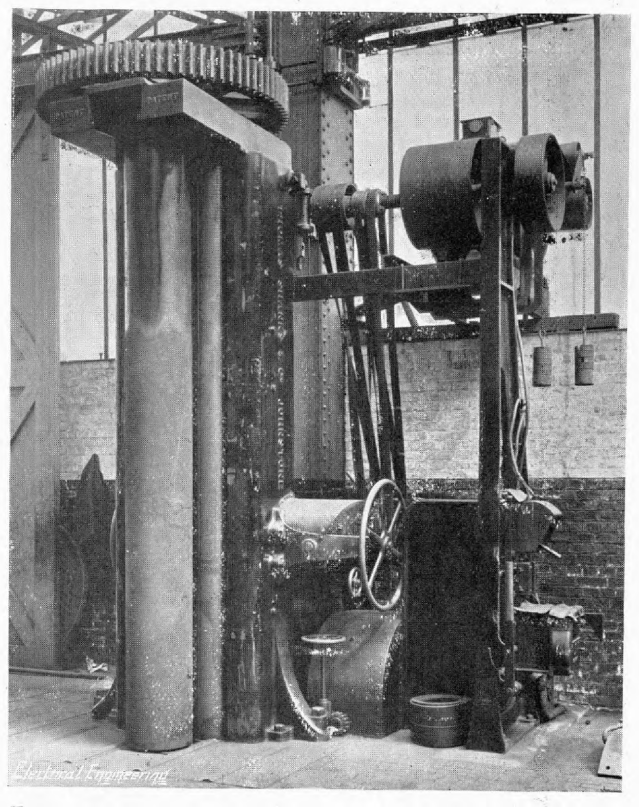

FIG. 1.—VERTICAL PLATE BENDING ROLLS IN BOILER SHOP.

from it through double-pole switches, and on one pole a circuit-breaker, and on the other a fuse.

The boiler shop is divided into three bays, and has on the west side a small bay which is used as a store for plates, tubes, &c., and is served by a 5-ton three-motor travelling crane, converted from rope to electric driving. In the west bay is a 12-ton crane, similarly converted, in the centre bay a new 20-ton crane, and in the east bay a converted 12-ton, and a new 20-ton crane. All these are three-motor cranes, the motors by the Lancashire Dynamo Company, and the crane-work by Craven Bros., Ltd.

In the transverse bay, at the South end of the boiler shop, is placed the riveting plant, consisting of two hydraulic riveters, an hydraulic jib crane, and a 15-ton three-motor electric crane, by Vaughan and Son, Ltd. The latter travels on rails 41ft. from the floor, and is operated entirely by a tramway-type

Hosted by Google

controller, placed so that the operator can work the 17ft. gap riveting machine with his right hand, while adjusting the work held up by the crane to a nicety, by working the controller with his left. The line shafts are driven through helical

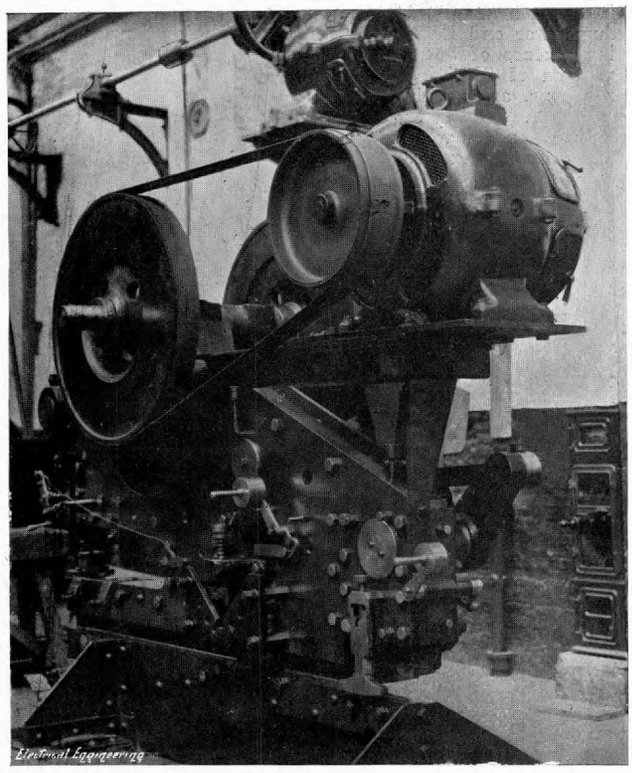

FIG. 2.—SPLITTING SHEARS AND PUNCH IN BOILER SHOP.

gears by 15 and 30 h.p. G.E.C. motors, this practice being carried out in the other departments also.

Air is largely used for hoisting, drilling, caulking, &c., and is supplied at 100 lbs. pressure throughout the works by two "Sentinel" air compressors, by Alley and MacLellan, each driven at 225 r.p.m. by 70 h.p. Hall motors, the air being accumulated in large reservoirs placed at convenient points in the various departments.

The large punch and shear deals with plate up to 1 inch thick, and was formerly driven by a steam engine attached to the main casting. It is now worked by a 30 h.p. G.E.C. motor.

The vertical rolls in the boiler shop (Fig. 1) are by Thomas Shanks, and are adapted for rolling plates up to 12 feet wide by 1 inch thick. They are driven by a 30 h.p. G.E.C. motor, through a short belt, tension being maintained by a weighted jockey pulley mounted on a pivoted arm. Through a worm and bevel drive the same motor also supplies power for a 2-ton jib crane, fixed above the rolls for handling the plates and taking out the rolls when necessary.

Near by is a set of horizontal rolls by Craig and Donald, of their patent 5-roll type, also capable of dealing with plates 12 feet wide by 1 inch thick. These are driven through spur gearing by a 30 h.p. G.E.C. motor. The starters for both these rolls are Adams' "Igranic," fitted with no-voltage and overhead release, as are all the starters throughout the works.

Two splitting shears, with attachment for punching and bar cropping, are driven by 15 and 10 h.p. G.E.C. motors respectively. These shears, which are by Pels, can shear plates of any width or length, owing to the plate construction of the frame. They are seen in Fig. 2, which also shows one of the motors for the main shaft drive.

The erecting shop has two bays, 570 feet long, and 55 and 45 feet wide respectively, in each of which are two 35-ton three motor cranes, those in the west bay being 40 feet span, and made by Vaughan and Co., with motors by J. P. Hall and Co., and the two in the east bay 53 feet 6 inches span, by Craven Bros., with motors by Lancashire Dynamo Company. The two shops can accommodate, for repairing purposes, about 56 engines of the various types, and the usual output of repaired engines is from six to seven each week.

The machine shops are driven by motors working line shafts, the machines being grouped according to requirements. At the south end (Fig. 3) is a large 23-feet planing machine, to which has been fitted a "Mitchell" drive, a pair of belts being alternately tightened and loosened for the power and return strokes by a striker, communicating power to the rack wheel and pinion from a 30 h.p. motor, by the Lancashire Dynamo Company.

In the smiths' shop all the smiths' fires are provided with down-draught hoods, the flame and smoke being exhausted by large exhausters placed at either end, and driven in one case by a 70 h.p. Hall motor, and in the other by a 30 h.p. G.E.C. motor. The gain in headroom and the good lighting due to this arrangement is very apparent. The furnaces for the drop stamping battery are also worked on the same principle, a 15 h.p. G.E.C. motor driving a Sturtevant exhausting fan for the purpose. It is interesting to watch the drop stamping, in which, by the use of dies, heavy parts are quickly finished which would otherwise have entailed the expenditure of hours of highly-skilled labour. We may also mention that oil fuel is employed for all the bolt fires.

A 5-ton three-motor Craven crane traverses the smiths' shop and yard, the down-draught system having been adopted to render this most convenient arrangement possible.

At the north end of the smithy is the grinding shop, the stones in which are driven by two 30 h.p. G.E.C. motors, and under the floor of this shop is the pump room, containing the driving gear of two treble barrel deep well pumps by

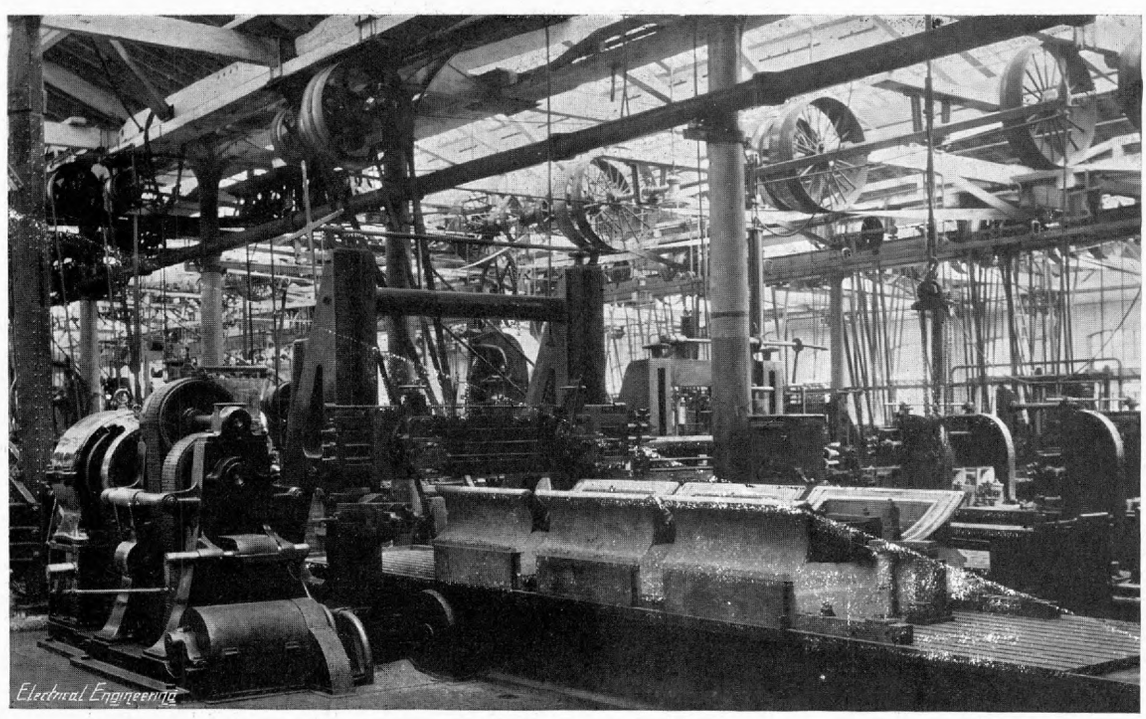

FIG. 3.—MACHINE SHOP WITH LARGE PLANING MACHINE, WITH MITCHELL DRIVE IN FOREGROUND.

Hosted by Google

Tangye, arranged to be driven independently or together, by a 70 h.p. Hall motor. Formerly they were worked by a beam engine. These draw water from a well 160 feet deep, and provide the chief water supply of the works, station, and locomotive running sheds. The frame building shop is served by

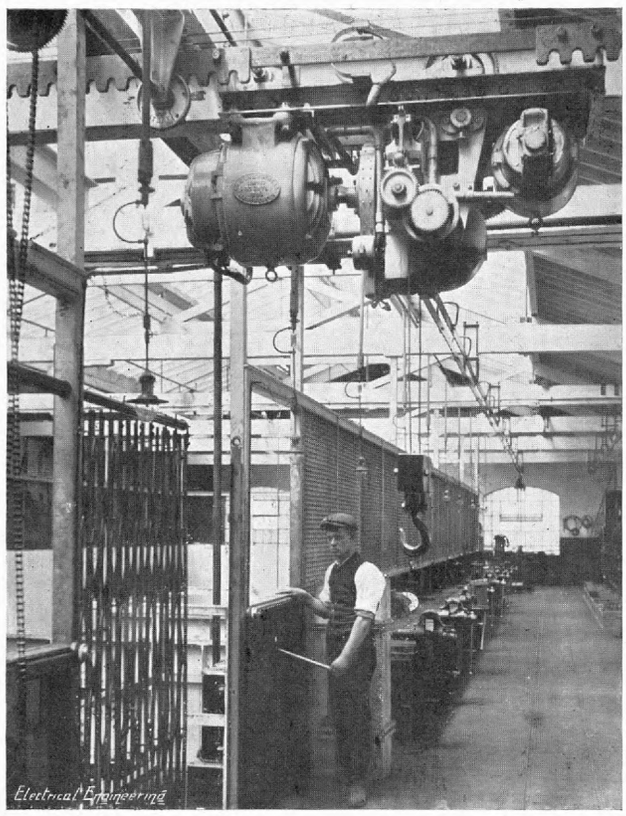

FIG. 4.—JIGGER CRANE, FRAME SHOP GALLERY.

a 10-ton three-motor Vaughan crane, operated from the floor, and a gallery above accommodates the millwrights and Westinghouse brake fitters. Heavy parts and packages of small details are conveyed from the shop below up to the gallery, or vice-versa, by a 2-ton jigger crane (Fig. 4), which travels on a rail slung to the roof principals. By means of toothed arms

FIG. 5.—BASCULE CRANE.

engaging in pin wheels, the crane, in conveying material to the galleries, opens and shuts scissor doors in the gallery fencing, to protect the men working near from falling through to the floor below, as might be the case were the gates to remain open at the option of the crane attendant.

The cylinder and frame machining shops adjoin the frame shop, and noticeable in the frame machining shop is the large frame slotting-machine, with a bed 45 feet long by 7 feet wide, which has three drilling and slotting heads. This machine is driven by an independent 25 h.p. motor. In the cylinder shop the machines are grouped and driven by 15 and 30 h.p. G.E.C. motors. A group of axle lathes is driven from a line shaft, which is driven by a 30 h.p. G.E.C. motor by means of a Westinghouse chain drive.

The wheel shop is well equipped with a number of wheel lathes, all driven by independent motors, most of which are 15 h.p. Lancashire Dynamo Co.'s, some of the lathes being new and others converted to electric driving by Craven Bros. A 7-ton three-motor crane, by Vaughan, is provided for dealing with the wheels, and is operated from the floor, automatic knock-offs being fixed at each end of the shop in case of the attendant stumbling or losing charge of the crane.

Material is carried from shop to shop, wheels transferred from road to road, trucks loaded and unloaded and shunted by a novel type of travelling electric crane (Fig. 5). This has a bascule jib, which can perform a complete circle of 17 ft. 6 in. radius, and has a range in any vertical plane of 14 ft. 6 in. The motors are totally enclosed, and are of $5\frac{1}{4}$ b.h.p. at 380 r.p.m. for the hoisting, 4 b.h.p. at 450 r.p.m. for slewing, and $8\frac{1}{2}$ b.h.p. at 420 r.p.m. for travelling The motors are driven by accumulators having an output of 15 b.h.p. for one hour, at 220 volts, these accumulators acting also as a counterweight to the load on the bascule jib. Charging plugs are provided in various convenient parts of the works, where the batteries may be recharged during meal hours, &c.

We must express our indebtedness to Mr. D. Earle Marsh (the locomotive superintendent of the L.B. and S.C. Railway) for permitting us to inspect the works, and for supplying us with photographs and the particulars which are embodied in this article.

SOME OF THE OTHER WORKS OPEN FOR INSPECTION

The "Electrobus" Charging Station.—The Brighton, Hove, & Preston Omnibus Co., Ltd., have sixteen electric omnibuses in use. These are each equipped with 46 Tudor cells of 500 ampere-hour capacity (at the 5-hour rate), which are charged at a charging station, described in detail in ELECTRICAL ENGINEERING of June 24th, 1909 (Vol. V., p. 576). The average time occupied for charging is about five hours. The Stevens regenerative system of charging is employed; boosters are connected in the battery circuit, but they run as motors during the earlier stages of the charge, thus interposing a back E.M.F. between the line pressure and the battery terminals; at the latter period of charge, when a higher pressure is required, they run as actual boosters. This is effected by a potentiometer rheostat in the fields of the boosters.

Volk's Electric Railway.—It is interesting to note that this railway is nearly 28 years old. Current is supplied by an old $2\frac{1}{2}$-kw. Kapp machine, originally driven by a gas-engine, and now by a motor, and a Parker motor-generator of the same capacity. Current is taken from the Corporation mains, and a small buffer battery is connected on the low-tension side. The line is narrow-gauge on the third-rail system. It is fitted with an interesting device, designed by Mr. Volk, for cutting off the current from the third rail at level crossings and on public ways when the train is not on the section.

The Reason Manufacturing Co.'s Works.—Members wishing to visit these works are requested to communicate with the Reason Manufacturing Co., Ltd., of Lewes Road, Brighton. They will be shown the Reason electrolytic meter in process of manufacture and on test, the company's arc lamps, outside electric lighting fittings, and adapted fittings, fuse and service boxes, &c., and the manufacture of taximeters is also being carried on.

Allen West & Co.—The works of this firm adjoin those of the Reason Manufacturing Co. One of the specialities of this firm is a range of controllers particularly adapted for workshop motors, a feature of which is the use of hinged fingers with helical springs instead of the usual plain phosphor-bronze springs, and all-mica insulation. Another is a special form of stamped resistance grids.

The Brighton Corporation Car Sheds and Workshops.—These are also in Lewes Road, and are open to inspection by members and visitors.

At Portsmouth on Wednesday, June 28th, members will, by permission of the Lords Commissioners of the Admiralty, have an opportunity of inspecting H.M. Dockyard power-house and a ship of the *Dreadnought* class. The Portsmouth Corporation Lighting and Tramway power-houses will also be on view.

A LIST OF MEMBERS AND VISITORS ATTENDING THE CONVENTION WILL BE FOUND ON P. 350.

Hosted by Google

STREET LIGHTING IN THE BOROUGH OF HOLBORN

THE Holborn Borough Council seems determined not to arrive at a decision with regard to its street lighting. After having resolved itself into a Special Committee to consider the subject, and having recommended the acceptance of the joint tender of the Electric Lighting & Gas Companies as set out on page 335 of our last issue, the Council on Wednesday solemnly referred its own recommendation to the Works Committee, for further consideration.

At the meeting on Wednesday, Alderman Green expressed the hope that the Council would not adopt the recommendation to accept the combined tender, using mainly for his argument the point that the candle-power of 425,000 was excessive for the needs of the Borough, being 50 per cent. greater than that which was recommended as necessary by the Works Committee last year. Curiously enough, although seven speakers took part in the discussion, the majority of whom were not in favour of the Committee's recommendation, none drew attention to the fact that the Electric Lighting Companies had offered to carry out the lighting at a cheaper price than the joint tender, although a vague reference was made to the Town Clerk's opinion that the Electric Lighting Companies' offer did not constitute a tender. The Councillor who made this remark, however, mentioned that he had not received any explanation of why this was so. With the exception of Alderman Green, nobody gave any cogent reason why the report should be sent to the Works Committee for consideration, but the amendment to do so was carried by 25 to 7.

One fact which seemed to weigh with many of the Councillors was that it would be necessary for the Council to repay the Companies by annual instalments the sum of £9,000, expended upon the columns, lamps, lanterns, &c., which at the end of the 10 years' contract would belong to the Council. This item, it appears, has never been before the Works Committee, and they seemed to be quite unaware of the need for this expenditure. The Finance Committee, in a special report, called attention to the fact that it would be necessary to get the sanction of the L.C.C. to this annual payment, as it includes the payment of interest, and in the absence of such sanction would leave the members of the Council with the risk of being surcharged by the amount representing the interest. Consequently, the Finance Committee recommend that the words, "Subject to the sanction of the L.C.C. being first obtained to the form and principle of the contract," should be added to the recommendation to accept the tender, or in the alternative that the Works Committee negotiate with the Companies in order to purchase at once the columns, lamps, lanterns, &c. This point will now be considered by the Works Committee.

Incidentally we may mention that there was hanging upon the walls of the Council Chamber a plan of the proposed street lighting under the combined tender, from which we noted that practically all the main thoroughfares in Holborn and the central portion of the Borough were given to electric lighting, whilst the side streets were for the most part allocated to gas.

THE BREMER FLAME ARC LAMP PATENT

Again Upheld by the Courts

MR. JUSTICE SWINFEN EADY gave judgment on Saturday in the action taken by the British Westinghouse Co., Ltd., against the Electrical Co., Ltd., for infringement of the Bremer flame arc lamp patent, No. 18,786 of 1902. The action, which was reported in our issues for May 4th, p. 233, and May 11th, p. 248, relates to the Electrical Co.'s "Sunshine" flame arc lamp, which it was alleged contains every essential element of the Bremer specification, one of the carbons being swung by a device acting at its lower end, and there also being a horizontal feed mechanism, thus giving the floating feed of the Bremer lamp. The Westinghouse Co., it will be remembered, brought a similar action against Mr. G. Braulik in 1909, and were successful in the Appeal Court last year in getting judgment in their favour, and the Bremer patent upheld (ELECTRICAL ENGINEERING, Vol. VI., p. 122). The Electrical Co. denied infringement, and also alleged anticipation, the specifications chiefly relied upon in this connection being the United States specifications of Graham, No. 268,218 of 1882, and Crosby No. 553,335 of 1896. Another American specification by Wright was also mentioned as of importance. The evidence for the defence, however, was somewhat different to that in the Braulik case, as further working models made in accordance with the Graham specification were exhibited. Judgment was again given in favour of the Westinghouse Co., the Judge holding that the patent was not rendered invalid through anticipation, and that the Electrical Co.'s lamp was an infringement.

In giving judgment, Mr. Justice Swinfen Eady first said that he was bound by the construction put upon the Bremer specification by the Appeal Court in the action against Mr. Braulik. With regard to anticipation, he was satisfied that Graham did not contemplate or describe in his specification anything intended to obtain a floating feed. There was no mention of floating or of any horizontal movement of the carbons in the arm striking the arc. The essence of Graham's specification was his device for regulating the feed of the carbons. Crosby, in his opinion, was further off floating than Graham, and must be dismissed for the reasons set forth by Lords Justices Fletcher-Moulton and Buckley in the previous action. Wright, from the point of view of floating, was quite a hopeless lamp. The contention of the defendants in this action was that the substance of Bremer's patent was to be found in Graham, Crosby, and Wright, and adding common knowledge. In his opinion that contention could not be supported. The Bremer patent was for a lamp of a certain definite type, and was a distinct advance upon anything that had gone before. It had enabled the flame arc lamp to come into commercial use, and it had given to a definite type of lamp a floating horizontal feed in a definite manner, quite superior to anything that had gone before. In his opinion, the invention was new and useful, and subject matter for a valid patent.

The infringement in this case seemed clear. The defendants had taken plaintiff's lamp, although with variations. They pivoted the guides, with the result that there was a larger mass to be moved, but it made no difference in principle whether they merely moved the electrode and its holder or whether they regarded the whole frame as being the electrode holder, pivoted that, and then operated it as near the bottom as possible. Horizontal floating was obtained in the same manner in each case. He therefore gave judgment for the British Westinghouse Co., and granted an inquiry as to damages, delivery up, and a certificate of particulars of purchase.

It was agreed that the delivery up should be stayed on condition that notice of appeal was given within fourteen days.

ELECTRICITY IN FACTORIES AND WORKSHOPS

THE annual report of the Chief Inspector of Factories and Workshops for 1910 refers in the opening summary to the continued advance in the use of electric power in factories. The reports of the inspectors of the different districts contain various references to electrical matters. In the South-Eastern Division a few cases of lead poisoning in accumulator factories are mentioned, but, on the whole, the regulations are reported to be fairly well observed, and considerable improvement in this respect is reported by the superintending inspector of the Midland District, who also writes:—"Electricity seems to be playing a valuable part in industrial life. Workshops, so called, are being changed into factories through the facility with which the electric motor can be installed." Advance in the use of electric furnaces for steel manufacture is mentioned in the report for the North-Eastern Division, and in the Northern Division attention is called to the introduction of mercury vapour lamps for lighting composing rooms at Dundee, where the workers report that they no longer suffer from headache, and that the eye-strain is less than when gas or ordinary electric lighting was used.

The report of the Electrical Inspector (Mr. G. S. Ram) is now incorporated in the main report, and covers the first year when the new regulations have been in force. It is remarked that while many occupiers have taken trouble to ascertain whether their installations are in conformity with the requirements, a large number have done nothing pending instructions from the inspectors. Reports from some of the inspectors show, however, that a good deal has been done in getting some of the more obvious defects remedied, such as bare conductors, fuses, switches, &c., protected, and defective switches repaired. Dealing generally with the accidents, it is pointed out that while more accidents causing burns occur with continuous-current apparatus, the fatalities with one exception were all on alternating-current systems. The inspector for South London men-

Hosted by Google

tions several cases where the supply authorities' fuses were not properly sealed, and Mr. Ram deals with this question generally, pointing out that this is often done on purpose in factories in order to enable the consumer to renew fuses himself, and to avoid loss of time in case of a breakdown. Ordinarily, service fuses are sealed up by the supply authorities and are exempt from the regulations; if, however, the occupier has access thereto, necessitating the exposure of live metal, the regulations must be complied with.

Non-compliance with the regulations is not limited to old installations, and two cases of installations put in by well-known contractors are mentioned, where only half the prescribed passage-way had been provided behind the switchboard. In one of these an accident had resulted. Speaking generally as to the effect of the regulations, Mr. Ram writes:—"Before the establishment of the regulations, the questions arising were discussed in reference to the points of safety or danger. Now that the regulations are in force and the numerous points are crystallised under the different regulations, the matters are considered in reference to the question of compliance or non-compliance." It is again pointed out that unsuitable and dangerous apparatus is often supplied by electrical manufacturing firms, and Mr. Ram recapitulates some of the recommendations regarding connector plugs, &c., made in previous reports. As is well known, these have been largely taken advantage of by manufacturers, and one firm even endeavoured to annex the idea themselves by applying for a patent, the granting of which was successfully opposed by the Home Office. Attention is drawn to a tendency to the use of fuses or switch fuses for very large currents under conditions where circuit-breakers would be safer and more suitable. General improvement is recorded in the design of circuit-breakers and oil-switches, particularly as regards prevention of the possibility of explosion of the latter due to the hydrocarbon gases produced by arcing under the oil. The practice of acceptance of the lowest tender seems to be responsible for a good deal of the unsatisfactory and dangerous work.

A classified table of accidents gives a total of 282 non-electric accidents during the year (including 5 fatalities) at public supply stations, and 35 at other stations. The electrical accidents are classified as follows:—At switchboards when engaged in ordinary routine work, mostly due to faulty design of apparatus or to mistakes on the part of the switchman, 15 in public stations and 2 in other stations; cleaning, repairing, &c., at live switchboards or other live conductors, 16 (including 2 fatalities) at public stations and 7 in other stations; cleaning, repairing, or other handling of switchboards or apparatus supposed to have been made dead, 5 (including 1 fatality), all to skilled persons at public stations; adjusting brushes and cleaning commutators, 2 in public stations and 1 in other stations; of the remaining miscellaneous electrical accidents, 7 (including 1 fatality) were in public stations and 3 in other stations. The mechanical accidents are somewhat fewer than in the previous year. The electrical accidents are also fewer, the number of fatalities, 4, being, however, the same. The actual figure, 45, for the public supply stations, is remarkably small, and compares with 58 and 76 for the two previous years. The 276 electrical accidents, including 5 fatalities, in factories other than electrical stations in 1910 are classified as follows:—Arcing of switches, 48; arcing of fuses, 13; shock or burns from fuses when replacing fuse-wires, 28 (including 1 fatality); portable apparatus, connectors and flexible wires, unprotected conductors, switches, terminal fuses, &c., 21 (including 1 fatality); working on or near live conductors, skilled persons 34, unskilled persons 17; miscellaneous accidents in electrical manufacturing works, mostly in testing operations, 30 (including 1 fatality); adjusting brushes and cleaning commutators, 7; miscellaneous, 24 (including 1 fatality). The total is greater than last year by about 7 per cent., which is probably below the increase in the use of electricity; the number of fatalities is 5, as compared with 8 for the previous year.

THE TELEPHONE TRANSFER
Hearing of Appeal

THE Appeal of the Postmaster-General against the judgment of the Railway and Canal Commissioners, upon the preliminary legal points raised in connection with the transfer of the National Telephone Co.'s undertaking to the Post Office, commenced before the Master of the Rolls and Lords Justices Farwell and Kennedy on Wednesday last week. By a majority the Railway and Canal Commissioners held that the portion of the Postmaster-General's notices of objection relating to taking over lines not on the metallic circuit system, and lines along, upon, or across any railway worked, or about to be worked, by electric power, were not specific enough, and were, consequently, invalid. On the other hand the Court held that the notices relating to certain specific lands, buildings, and plant were good notices, but, as the Company's contention is that, if any part of the notice is bad, the whole of the notice is bad, the Company have cross-appealed on this point. The Postmaster-General is also appealing against the decision of the Railway and Canal Commissioners, who, by a majority, held that the words "suitable for the requirements of the Postmaster-General," which were made use of in the purchase agreement, related to the quality of the plant, and not to the quantity; in other words, the Postmaster-General cannot refuse to take over plant merely because it duplicates plant in an area where the Postmaster-General has erected a competing exchange.

The arguments, which are the same as those which were made before the Railway and Canal Commissioners (*Electrical Engineering*, May 18th, p. 267, and June 1st, p. 307), are still proceeding. The Attorney-General and the Solicitor-General have concluded the case for the Post Office, but Sir Alfred Cripps, K.C., has not yet finished his argument for the company. Mr. Danckwerts, K.C., will follow Sir Alfred Cripps.

CORRESPONDENCE

THE TELEPHONE TRANSFER.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The views of Mr. Hirst on this subject, so fully expounded at the meeting of a manufacturing company, and so widely circulated in the Press, deserve some comment. It may be, perhaps, considered cynical to suggest that those views are somewhat coloured by a lively sense of orders to come; but I am impelled to that suggestion, both because Mr. Hirst's published opinions are in direct opposition to those of almost every member of the electrical industry having knowledge of the subject and of most of the technical, financial, and lay Press, and because the Post Office looks like being the only future customer in this country for the company for which Mr. Hirst was speaking.

As a business man Mr. Hirst should find some difficulty in advocating so ardently the transfer of a business which under commercial management is operated at 58 per cent. of the gross receipts, to a department which operates the same business at over 74 per cent. of the gross receipts. The difference represents over 3 per cent. on the capital employed, which much more than offsets the lower rate of interest at which Government can raise capital as compared with a company or a Telephone Authority.

The telephone service is at present very little developed in this country, a state of affairs which *is*—Mr. Hirst to the contrary notwithstanding—very largely the fault of the Post Office, as the Post Office telephone policy has been obstructive from the very beginning.

To accelerate the development of the telephone, which has been artificially restricted for years past, requires large expenditure of capital. Mr. Faithful Begg, in a recent Paper before the London Chamber of Commerce, put the capital required for the next ten years to develop the telephone adequately in the United Kingdom at £116,000,000. Is it likely that the Post Office, which earns a bare 3 per cent. on its telephone business, will be able to induce the Treasury or Parliament to invest any such sum in a Government telephone monopoly? It may be argued that when the National Company's business is taken over the telephone profits of the Post Office will be greatly increased. So they will—for a year or two. But in time the same causes, relentless as the tides, which have turned the telegraphs into a losing business, will wipe out the telephone profits; it is only a matter of time, if the telephone becomes a Government monopoly, when the Postmaster-General of the day will tell a thin and bored House that the telephones, like the telegraphs, are "past praying for."

As to pushing the telephone business, if that is not done by a trained business department, much confusion would result. One powerful argument for a Telephone Authority is that under such management the very important question of business relations with the public would be adequately dealt with.

I am, &c.,

HERBERT LAWS WEBB.

35 Old Queen Street, S.W.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

METERS.—A leaflet from Messrs. Gillespie and Beales (Amberley House, Norfolk Street, Strand, W.C.) gives particulars of the "Alva" continuous current Watt-hour meter for two and three wire circuits. This is a motor meter of the commutator type.

GLOVER'S ALMANAC.—In accordance with their usual custom, Messrs. W. T. Glover and Co. are issuing, at this season of the year, their well-known and deservedly-popular almanac, with humorous, technical, and artistic embellishments to the sheet for each day. Judging by the copy we have been favoured with, this issue fully maintains the high reputation of its predecessors.

HOLOPHANE FITTINGS.—A card from Simplex Conduits, Ltd., illustrates a few of the many designs of special fittings for Holophane glassware, in which this firm specialise.

CHAINS.—A new catalogue from Hans Renold, Ltd., deals very fully with bush roller chains and sprockets.

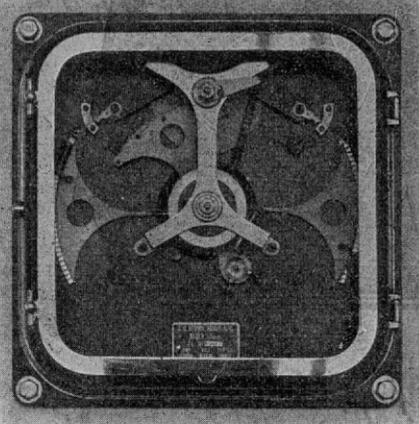
MEMBERS AND VISITORS ATTENDING THE I.M.E.A. CONVENTION

THE following is a list of the Members and invited guests who had intimated their intention of attending the Convention up to the time of our going to press.



The abbreviation *Ch'n* stands for Chairman of the Electricity Committee, *C'r* for member of the Electricity Committee, *E.E.* for Chief Electrical Engineer.

Acland, R. L. (*E.E.*, Chesterfield).
Allan, P. F. (*Siemens Brs. Dynamo W'ks*).
Allen, S. T. (*E.E.*, Carlisle).
Anderson, A. B. (*Ferranti, Ltd.*).
Angus, H. W. (*E.E.*, Eccles).
Arden, G. D. (Southampton).
Aron, Prof. (*Aron Elec. Meter, Ltd.*).
Ashworth, Jas. (*Ch'n*, Heywood).
Atchison, C. C. (*E.E.*, Rochdale).
Atkinson, H. S. (*Ch'n*, Cleckheaton).
Ayton, F. (*E.E.*, Ipswich).
Bache, W. J. (*E.E.*, Cheltenham).
Bailey, W. (*Ch'n*, Greenock).
Balmforth, C'r (*C'r*, Doncaster).
Barbour, R. H. (*Electl. Apparatus Co.*).
Barker, E. A. (*E.E.*, Barnsley).
Bastian, J. (*Bastian Meter Co.*).
Beauchamp, J. (*E.E.*, Tunbridge Wells).
Bell, A. R. (*E.E., Uxbridge Co.*),
Bell, J. (*E.E.*, Aberdeen).
Billington, G. (*Ch'n*, Salford).
Binns, W. (*E.E. Trams.*, Reading).
Bishop, H. C. (*E.E.*, Newport).
Black, A. S. (*E.E.*, Southport).
Blackler, E. T. (*Ch'n*, Torquay).
Blackman, A. S. (*E.E.*, Sunderland).
Bland, A. V. (*C'r* Morecambe).
Blascheck, C. A. (*E.E.*, Canterbury).
Bloxam, T. W. (*E.E.*, Belfast).
Bolam, J. H. (*E.E.*, Weymouth).
Boot, Horace (London).
Boyd, W. J. (*Ch'n*, Londonderry).
Bremner, Ashton (*Acting E.E.*, Walsall).
Britton, S. E. (*E.E.*, Chester).
Brodie, Ald. (*Ch'n*, Blackpool).
Brooking, J. H. C. (*St. Helen's Cable Co.*).
Brydges, J. K. (*E.E., Eastbourne*).
Bruce, J. G. (*E.E.*, Willesden).
Bumpus, Ald. A. A. (*Ch'n*, Loughboro').
Burbidge, A. H. (*E.E.*, Kilmarnock).
Burman, J. B. (*C'r*, Birmingham).
Burnett, H. R. (*E.E.*, Barrow-in-Furness).
Campion, R. H. (*E.E.*, Dewsbury).
Carr, R. M. (*E.E.*, Leek).
Chattock, R. A. (*E.E.*, Birmingham).
Chisholm, G. S. (*Siemens Bros. & Co.*).
Clarke, R. (*Ch'n*, Worcester).
Clegg, S. (*E.E.*, Lincoln).
Cramb, A. C. (*E.E.*, Croydon).
Cridge, A. J. (*Electrical Co.*).
Christie, J. (*E.E.*, Brighton).
Cleary, Jas. (Brighton).
Clothier, J. H. (*E.E.*, St Annes-on-Sea).
Clough, A. (*E.E.*, Liverpool).
Cloughton, G. (Portslade).
Colville, G. H. (*Vice-Ch'n.*, Swansea).
Cooke, W. F. (*C'r*, Nelson).
Cooke, W. H. (*E.E.*, Luton).
Cooper, A. G. (*E.E.*, Colne).
Cooper, W. (*Vice-Ch'n*, Bolton).
Coupe, H. (*Ch'n*, Rawtenstall).
Couzens, H. H. (*E.E.*, West Ham).
Couzens, H. W. (London).
Coveney, A. (*E.E.*, Erith).
Craig, G. (*Ch'n*, Leith).
Crawford, W. (London).
Crawter, F. W. (*Chloride Co.*).
Croager, A. (London).
Croot, G. (*Ch'n*, West Ham).
Cross, Ed. (*E.E.*, Rotherham).
Crowther, J. A. (*E.E., Wallasey*).
Crowther, J. W. (*C'r.*, Sheffield).
Davies, Ald. R. C. (*Ch'n*, Chester).
Day, A. A. (*E.E.*, Bolton).
Day, C. (*Mirrlees, Bickerton & Day*).
Denton, H. H. (*E.E.*, Crewe).
Deverill, A. G. (*Brush Elec. Eng. Co.*).
Dexter, W. A. (*Mirrlees Watson Co.*).
Dick, J. R. (*Lucy & Co.*).
Dickinson, E. (*Ch'n*, Wigan).
Dixon, H. L. (*E.E., Leatherhead Co.*).
Dormann, E. (*E.E., Aron Elec. Meter*).
Duxbury, Ald. R. D. (*Ch'n*, Bury).
Eckersall, H. (*W. T. Glover & Co.*).
Ellaway, A. G. (*Ch'n*, Birmingham).
England, H. (*Ch'n*, Wakefield).
Eunson, D. M. (*E.E.*, Cambuslang).
Fawcett, Abraham (*C'r*, Halifax).
Fedden, S. E. (*E.E.*, Sheffield).
Fellingham, E. (*C'r*, Brighton).
Ferguson, R. F. (*E.E.*, Hastings).
Field, M. B. (*Ferranti, Ltd.*).
Foulds, H. (*Birmingham Elec. Dept.*).
Fox, E. J. (*Stewarts & Lloyds*).
Francis, O. F. (*E.E.*, Kirkcaldy).
Freir, W. E. (*Light Rly. & Try. Journal*).
Friederichs, H. F. (*E.E.*, W. Hartlepool).
Frisby, W. (*E.E.*, Colchester).
Furness, C. (*E.E.*, Blackpool).
Gatehouse, T. E. (*Electrical Review*).
Gibb, Thos. (*Ch'n*, Aberdeen).
Gibson, S. C. (*E.E.*, Nuneaton).
Gill, J. C. (*E.E.*, Peterborough).
Good, W. F. (*Ch'n*, Maidenhead).
Goslin, E. T. (*E.E., Glasgow Trams*).
Gregory, J. P. (*B. T-H. Co.*).
Hall, T. (*E.E.*, Burton-on-Trent).
Halmshaw, C'r (*Vice Ch'n*, Doncaster).
Hamilton, C. K. (Southsea).
Hammond, R. (London).
Hargreaves, T. W. (*Vice-Ch'n*, Burnley).
Harrison, Haydn (London).
Hawkins, H. J. (*E.E.*, Salford).
Hawtayne, W. C. C. (London).
Heald, J. (*Ch'n*, Lancaster).
Helme, D. (*E.E.*, Nelson).
Hewlett, E. H. (*E.E.*, Mansfield).
Higham, C. (*Vice-Ch'n*, Blackburn).
Hoadley, E. E. (*E.E.*, Maidstone).
Hodgkinson, S. (*Ch'n*, St. Annes-on-Sea).
Hogarth, L. B. (*E.E.*, Morecambe).
Hollingsworth, E. M. (*E.E.*, St. Helens).
Hopkinson, A. H. (*J. Hopkinson & Co.*).
Howard, H. L. (*E.E.*, Barking).
Huddleston, J. S. (*Siemens Bros. & Co.*).
Hurlbatt, E. J. (*Dick, Kerr & Co.*).
Jackson, J. (*Ch'n*, Partick).
Jackson, Ald. Wm. (*Ch'n*, Todmorden).
Jackson, W. A. (*E.E.*, West Bromwich).
Johnstone, Ald. M. (*Ch'n*, Carlisle).
Juttke, Dr. J. (*Aron Elec. Meter*).
Kilburn, J. E. (*Ch'n*, Dewsbury).
Kilpin, Ald. S. L. (*Ch'n*, Bedford).
King, J. H. (*C'r*, Burton-on-Trent).
Lackie, W. W. (*E.E.*, Glasgow).
Langdon, W. (*C'r*, Torquay).
Lea, J. E. (*Lea Recorder Co.*).
Lee, C'r (*Vice Ch'n*, Coventry).
Leward, C. F. (Lancaster).
Lewis, A. (*Ch'n*, Kettering).
Lloyd, Ald. S. (*Vice-Ch'n*, Bristol).

AUTOMATIC PRESSURE REGULATORS

(British Patent No. 19992 of 1908.)

FOR A.C. AND D.C. GENERATORS BOOSTERS, ETC.

We are supplying these Regulators in large numbers, particularly for COLLIERY, STEEL WORKS and other POWER STATIONS where the FLUCTUATIONS in LOAD are RAPID and SEVERE, and where such apparatus is required to work for months on end without attention. Being PRACTICALLY FRICTIONLESS, these Regulators are ACCURATE, RAPID and CERTAIN in their action and are REASONABLE in Price.

BROWN BOVERI & Co., LIMITED,

Caxton House, Westminster, LONDON, S.W.

Prospectus post free.

Practical Electricity

BY THE LATE PROF. AYRTON and THOMAS MATHER, F.R.S., M.I.E.E.

". . . . *It ranks with the best in the now somewhat large circle that is available to students of electrical engineering.*"—MECHANICAL ENGINEER.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 8, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

12,664/10. **Telegraphy.** S. G. BROWN. The chief object of this patent is to render the transmission and reception of signals, especially in cable telegraphy, more distinct, and to protect the instruments from the action of Hertzian waves, and other outside influences, both electrical and mechanical. The relay described in the author's patent No. 11,135 of 1908, and which is used in this invention, being very sensitive to these outside sources, is encased in metal or other suitable material, together with its coils and conductors, and is provided with anti-vibration supports. The apparatus also includes a zero regulator, comprising a supplementary local winding and a current controlling device, and the relay contacts are arranged between the divided winding of the local regulating magnet of the relay. Twelve figures.

13,525/10. **Electromagnets and Armatures.** J. H. PARSONS and A. E. J. BALL. With electromagnets which have an armature reciprocating across the poles, jamming is likely to take place owing to the pivots wearing or through the structure becoming strained. This is obviated by constructing the armature in the form of a roller with a pivot at each end, and mounting it in a frame with pivots and slots, so that it is free to roll to and fro over the pole face and keep contact with it, and its motion can be transmitted to suitable apparatus. To increase the range and efficiency of the magnetic pull the pole can be shaped to an angle of about 15°, and a greater effective range of motion obtained. Instead of forming slots in the frame, the armature may be connected to the frame by pivoted links. In order to protect the pole and roller from rust and small particles of iron, they are electroplated. Four figures.

15,988/10. **Electric Cut-Outs.** MAX J. RAILING and C. C. GARRARD. This invention relates to cut-outs or fuse-holders, in which the fuse is supported inside a tubular structure of porcelain or other material, the idea being to prevent injury to the person placing them in circuit. It consists of an improved means for securing a shield and a handle to the fuse bobbin fitted with end contacts. The handle, which can be of wood or other insulating material, is attached to the fuse-holder, and between these two the shield, preferably of vulcanised fibre, is placed, being attached to the handle of the fuse-holder by means of a suitable projection on each of the contact pieces of the bobbin, and tapped to receive fixing screws, which pass through the ends of the handle, through suitable distance pieces, to the shield and fuse-holder, thus clamping the whole firmly together in a readily detachable manner. Two figures.

17,426/10. **Connecting Electrical Conduits to Fittings.** W. B. and A. K. INCLEDON. A means of ensuring proper metallic contact between T-shaped fittings and tubular conduits is covered by this invention, which consists of keeping the interior of the circular socket parallel for a short distance within, so as to fit the conduit, and then from the parallel part, of tapping further in and slightly tapering inwardly, with a V-shaped quick pitch screw thread, the threads being arranged so that when the plain end of the conduit is pushed into the socket and given a small turn, they will scrape the coating of enamel or other substance from the end and thus make proper contact. Two figures.

19,095/10. **Tungsten Filaments.** A.E.G. UNION ELEKTRICITÄTS GES. In the method of preparing tungsten filaments, where a binding material is used with the metal, a porous structure is left, in which the particles of metal are loosely combined, and the fusing together in the subsequent sintering operation is incomplete. This is particularly noticeable when the sintering is done by heating the filaments in a hydrogen atmosphere in an electrical furnace. The high temperature which is required, however, quickly destroys the material of the furnace, and this invention subjects the filaments to a preliminary treatment before sintering, which brings the particles into close combination. They are heated to a temperature of about 700—900° C. in ammonia or other gases containing nitrogen, so as to convert them into a nitrogen compound, which is again decomposed in the sintering operation.

Opposition to Grant of Patent

4,667/09. **Zinc Condensers.** J. LYSAGHT, LTD., and B. BEDDOE. The grant of this patent has been allowed after appeal to the Law Officer of the Crown. It relates to improvements in zinc condensers. A tube partially closed with a plug composed of a mixture of lime and carbon is attached to the outlet of the condenser. When the plug gets hot, the carbon prevents the entrance of oxygen, and also the ignition of the zinc vapour, while the lime reacts on any chlorides of ammonia or zinc that may be present.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.
Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: BERRY [Distributing system] 12,926/10; RASMUSSEN [Insulating composition] 28,834/10.

Dynamos, Motors, and Transformers: BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Transformers] 13,694/10; [A.-C. motors] 19,359/10.

Electrometallurgy and Electrochemistry: HERING [Electric furnaces] 15,139/10.

Heating and Cooking: GEISSINGER [Automatic electric heat control] 29,463/10.

Incandescent Lamps: UPTON [Means for fitting bulbs in sockets] 17,873/10; LUDECKE and IMPERIAL LAMP WORKS (*Brimsdown*), LTD. [Manufacture of metal filaments] 132/11; SCHALLER, 9,815/11; EARLE [Automatic lighting and extinguishing] 13,052/10.

Storage Batteries: DUNNE [Secondary batteries] 21,922/10.

Switchgear, Fuses, and Fittings: ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Switches] 13,195/10; [Starters] 13,224/10; [Controllers] 13,325/10; [Electro-mechanical controlling devices] 17,110/10; LITTLER [Circuit-breaker] 16,485/10; DICKSON [Switches and signs] 18,359/10; THOMPSON (*Wirth, Beck, and Knauss, Firm of*) [Electrically-operated mechanisms] 24,808/10.

Telephony and Telegraphy: SIEMENS & HALSKE AKT.-GES. [Telephone exchange circuits] 22,013/10; [Exchanges with automatic call distributors] 27,860/10; GARDNER and FERGUSON [Apparatus for causing electrical impulses] 27,223/10; DR. ERICH F. HUTH GES. and HIRSCH [Wireless telegraphy apparatus] 5,248/11.

Traction: SPEIGHT and WALMSLEY [Ears for overhead conductors] 21,522/10; SOC. VEDOVELLI, PRIESTLEY ET CIE. [Suspension chain for H.-T. transmission wires] 27,174/10.

Miscellaneous: DU BELLE [Electrical mechanism for typewriters] 13,910/10; SIEMENS BROS. DYNAMO WORKS, LTD., KIEFFER, KLOSS, and CROWLEY [Centrifugal fans] 18,349/10; BAUER [Appliances for producing X-ray pictures] 25,205/10; LEEDS FORGE CO. and FERGUSON [Electric lighting from variable-speed dynamos] 28,695/10; CROMPTON & CO. and BURGE [Means for converting electric currents] 29,726/10; TAYLOR [Railway signalling apparatus] 917/11; SAUL [Motor tractors for agriculture purposes] 13,932/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Switchgear, &c.: SCHRODER [Time switches] 7,416/11; ELEKTROMOTOREN-WERKE HERMANN GRADENWITZ [Remote control systems] 10,550/11; MONARD [Signal and point control] 10,740/11; ALLGEMEINE ELEKTRICITÄTS GES. [Motor control] 12,921/11.

Instruments: SCHOTT & GEN. [Electrolytical measurement of electricity] 10,792/11; SOC. ANON. DES ETABLISSEMENTS LACOUR BERTHIOT [Telemeters] 12,319/11.

Miscellaneous: SOC. ANON. "LE DETECTIVE" [Electro-thermic contacts for fire bells] 12,450/11; RENNERT [Automatic fire alarms] 12,485/11; WHALTON [Electric hammers] 12,742/11.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

15,411 of June 28th, 1897. **Electric Igniter for Gas Engines.** R. BOSCH. This invention relates to an electric ignition apparatus with stationary armature placed between the poles of one or more powerful magnets, around which a suitably actuated envelope is suspended and moves to and fro.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: CROMPTON & CO. and A. J. HODGSON, 5,164/04.

Distribution Systems, &c.: BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Electric insulating compositions] 4,925/06.

Dynamos, &c.: OTIS ELEVATOR CO. (*Otis Elevator Co.*) [Dynamo-electric machines] 5,003/06; F. W. HOWORTH (*Maschinenfabrik-Oerlikon*) [Dynamo-electric machines] 5,037/06.

Instruments, &c.: J. E. LEA [Meters] 4,961/06.

Telephony, &c.: H. H. LAKE (*Direct Line General Telephone Co.*) [Telephone systems] 4,362/05; W. D. SHAW-BROWNE and S. A. WILLIAMS [Telephones] 5,093/06; L. DE FOREST [Wireless Telegraphy] 5,258/06.

Traction: E. M. PRESTON and A. F. ROCK [Railway Signals] 5,306/04.

Miscellaneous: K. R. ODMAN [Electric lifts] 21,146/06.

Hosted by Google

LOCAL NOTES

Barking: *Electricity Extensions.*—The Barking Traders' Association have decided to engage counsel to oppose an application by the Council to the Local Government Board for sanction to a loan of £11,400 for extensions to the electricity works.

Barrow-in-Furness: *Electricity Accounts.*—There was a deficit of £759 upon the working of the electricity undertaking last year. The sum of £900 was spent out of revenue upon new street lamps.

Belfast: *Cavehill and Whitewell Tramways.*—Judgment was delivered in the King's Bench Division, Dublin, last week, with regard to the objection of the Belfast Corporation to the validity of Mr. Lynden Macassey's award as to the purchase price which the Corporation should pay for the Cavehill and Whitewell tramways. The Corporation objected to the award on the ground that it was excessive by reason of the basis which was adopted by the arbitrator for valuing the undertaking. The arbitrator refused to value the undertaking except as a going concern, but the Court now held that this was a wrong basis, and that, consequently, they had jurisdiction to set it aside. The price given by the arbitrator was £56,155, and the Court have set the award aside, and remitted the matter to the arbitrator for him to make a new award not later than November 1st. The reason for the decision of the Court is that Mr. Macassey, in the arbitration, had placed a wrong construction upon the agreement between the parties by which the Corporation were to purchase the tramways.

Burnley: *Tramway Accounts.*—The tramway accounts for the past year enabled the placing of £5,000 to reserve, and £4,049 to relief of rates. The reserve fund now stands at £46,096. The Committee have decided to cover the remaining 21 cars with top covers.

Dover: *Electricity Accounts.*—There was a net profit of £922 upon the electricity undertaking last year. This is the first time a profit has been made since the Council took over the undertaking from the company, and the profit has been utilised in the reduction of the outstanding deficit, reducing this to £4,424.

Glasgow: *Tramway Accounts.*—The accounts for the year to May 31st, after meeting sinking fund and interest, show a net profit of £68,678, against £52,028. The total number of passengers carried was 237,967,307, against 222,730,571.

Electricity in Theatres.—The City Magistrates have been requested to consider the appointment of a special inspector for dealing with electrical fire risks in theatres and music halls. It was decided not to recommend such an appointment, as this work is at present efficiently carried out by the chief officer of the fire brigade and the electrical engineer.

Kettering: *Action by Borough Electrical Engineer.*—Mr. W. A. Walker, Engineer and Manager of the Corporation Electricity Works, recovered £10 damages against the proprietors of the *Northampton Mercury*, last week, for libel. It appears that in the report of a case regarding an assault which took place in the Kettering Electricity Works, and in which Mr. Walker's name was mentioned, the process of sub-editing allowed Mr. Walker's name to appear immediately after a line which said that somebody else was the worse for drink. Mr. Walker complained that this inferred that he was the worse for drink, and, although the proprietors of the paper in question inserted in two successive weeks an explanation and apology, Mr. Walker desired greater publicity in open court.

King's Lynn: *Electricity Accounts.*—There was a net profit of £1,033 upon the working of the electricity undertaking last year. Of this, £300 are to be transferred to relief of rates. The charge for private lighting is to be reduced to 4d. per unit.

Lincoln: *G.B. Tramway.*—In his report upon the working of the G.B. Surface Contact Tramways, at Lincoln, last year, Mr. Stanley Clegg states that the system has now been running for 5½ years; the life of the stud-heads had only been estimated at 5 years, and it was necessary to renew them, as most of them had worn below the road level. The carbon in various parts of the track was also renewed, and the total cost of repairs during the year amounted to £263. The total amount spent in repairs on the G.B. system since 1906 is £539, an average of £108, or £18 per annum in excess of the amount guaranteed by the G.B. Company, but Mr. Clegg thinks there is no need to anticipate that by the end of the ten years' guarantee given by the Company this excess amount will still appear. The re-carboning should be finished this year, and for the next two or three years the cost of maintenance should be very considerably reduced.

Russia: *New Electrical Work.*—A Reuter telegram from St. Petersburg states that an inter-departmental Commission has passed a very favourable report on the project submitted to the Government by Mr. C. H. Stewart, an English engineer, for the construction of water power electricity works in the Caucasus. It is proposed to establish two generating plants, one on the banks of the river Terek, and the other on the mountain of Gokycha.

Stafford: *Electricity Accounts.*—There was a net profit of £607 on the electricity accounts for last year, and from the accumulated balance of £752, the Electricity Committee recommend the transfer of £600 to depreciation account.

Stalybridge: *Tramway Board's Account.*—The accounts of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board show a deficiency for the past year of £5,938 on the tramways. The loss will be borne equally by the four corporations concerned.

Stoke-on-Trent: *The New Electricity Scheme.*—Mr. H. R. Hooper, Local Government Board Inspector, held an enquiry last week into an application by the Corporation for sanction to borrow £60,000 for the purpose of erecting a new generating station for the unification of electric supply in the new federated town. The proposal is to erect a new power station in Hanley, using the existing stations in Hanley, Burslem, Stoke, and Longton as sub-stations. The details of the scheme are as follows: buildings, £9,415; generating plant, £29,056; sub-station plant, £8,435; extra high tension mains, £13,494. Mr. C. H. Yeaman Borough Electrical Engineer, and Mr. J. F. C. Snell, who is advising the Corporation, gave evidence regarding the scheme, among the opponents to which are the Northern Electricity, Power, and Gas Co., North Staffordshire Railway Co., and a number of individual ratepayers, including Mr. H. Coates, who was at one time chairman of the Hanley Electricity Committee. The evidence of the engineers was to the effect that it is impossible to face next winter without further generating plant, and that it was much more economical to concentrate in one large power station than to extend the existing smaller stations.

Sunderland: *Electricity Accounts.*—There was a net profit of £1,189 upon the electricity undertaking last year. The total units sold were 10,800,000 as compared with 7,000,800 units in the previous year.

Taunton: *Electricity Accounts.*—The accounts of the electricity department for last year show a net profit of £105.

Tunbridge Wells: *Street Lighting.*—A number of arc lamps have been changed to 500 c.p. incandescent lamps.

Warrington: *Electricity and Tramway Accounts.*—The accounts of the electricity and tramways undertakings for the past year show profits of £2,667 and £2,344 respectively, the bulk of which has been transferred to relief of rates.

Worcester: *Position of Electricity Undertaking.*—At the last meeting of the Corporation, a discussion took place as to the position of the electricity undertaking, and the loss which it is alleged to be making. The Chairman of the Committee contended, however, that the Committee paid last year £202 as income tax, and obviously they would not have done so had there been no profit. As a matter of fact, they were making a profit of £3,000 a year, but it was absorbed in repayment of loans. Alderman Millington contended that the undertaking should be sold, and suggested that he knew persons were were willing to buy it now. An amendment to the adoption of the Electricity Committee's report to the effect that negotiations should be entered into for the sale of the undertaking, was lost by a large majority.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Aldershot.—An application has been made to borrow £2,500 for extensions at the electricity works.

Australia.—Tenders are invited, says the *Board of Trade Journal*, for the supply of a dynamo and booster, storage battery, and accessories, switchboard, cables, and wires, by the Mortlake Butter and Cheese Factory Co., Ltd., Victoria, by August 14th. Specifications, &c., from Messrs. F. A. M'Carty and Co., 31, Queen Street, Melbourne. Fee, 10s. 6d., returnable. A specification may be seen at 73, Basinghall Street, London, E.C.

Hosted by Google

The Brisbane Metropolitan Water and Sewage Board invite tenders, by January 30th, 1912, for the installation and erection of electric generating plant and pumping plant. Particulars from the Secretary, Albert Street, Brisbane.

Manchester.—A Local Government Board enquiry was held last week concerning a loan of £12,186 for additional generating plant, and £50,000 for new mains and services.

Newcastle-under-Lyme.—A loan of £5,400 is to be applied for by the Electricity Committee.

Redditch.—A loan of £5,850 is to be applied for by the Electric Lighting Committee.

Rotherham.—The Electricity Department invite tenders, by July 8th, for a year's supply of single vulcanised bitumen-covered cables of various sizes. Particulars from Borough Electrical Engineer.

Rugeley.—The Council have an electric lighting scheme under consideration. A proposal has been placed before it by a firm of electrical engineers.

Stockton-on-Tees.—A Local Government Board inquiry was held, last week, into a loan of £6,750 for extensions to the electricity plant.

Taunton.—A loan of £2,500 is to be applied for in connection with extensions to the electricity department.

Walsall.—The sum of £17,840 is to be expended on electrical extensions.

Wednesbury.—A loan of £2,550 is to be applied for in connection with new mains and services.

WIRING

Bexhill.—Infants' school. Architect, H. B. Burke-Downing, 12 Little College Street, Westminster Abbey, S.W.

Bristol.—Mission hall in St. Mark's Road.

Dumbarton.—Proposed new baths.

Exmouth.—Police station and petty sessions room. Devonshire County Architect, Exeter.

Londonderry.—Tenders are invited, by July 7th, for the electric lighting and fitting of the new Guildhall. Particulars from City Electrical Engineer.

Pontypool.—New church.

Pontypridd.—Infants' school at Wood Road. Borough Surveyor.

Southampton.—New out-patients' building at the Royal Southampton Hospital.

Stoke-on-Trent.—Enlargement of Goldenhill school buildings. Architects, A. R. Wood and Son, Town Hall, Tunstall.

Taunton.—New Council school.

MISCELLANEOUS

Australia.—The Deputy Postmaster General, Melbourne, invites tender, by August 8th, for the supply of electrical measuring instruments and telephone instruments and parts. Copies of specification at 72 Victoria Street, S.W.

New Zealand.—The *Board of Trade Journal* states that tenders for the supply of overhead tramway material, feeders, &c., for the Wanganui tramways, are invited by August 4th. Tenders to the Secretary, Gonville and Castlecliff Tramway Board, Ridgeway Street, Wanganui. Copies of specification, &c., may be seen at 73 Basinghall Street, London, E.C.

Rotherham.—Tenders are invited, by July 8th, for a year's supply of ampere-hour meters. Borough Electrical Engineer.

TENDERS RECEIVED AND ACCEPTED

Bristol.—The following tenders have been accepted: W. Geipel and Co., open type arc lamp carbons, £345 15s.; Sloan Electrical Co., Ltd., flame arc lamp carbons, £371; Sykes and Sugden, Ltd., conduit, £199; British Westinghouse Co., A.C watt-hour type meters, £385 15s.

Nelson.—The Council have accepted a tender of the Tudor Accumulator Co. for the replating of the storage battery and its general maintenance for a period of ten years, and also for the supply of a booster balancer machine and switchgear.

Salford.—The tender of the Hadfield Steel Foundry Co., Ltd., Sheffield, for special tramway work, at £2,304, has been accepted.

Royal Society of Arts.—The Albert medal of the society for the current year has been awarded to the Hon. C. A. Parsons, F.R.S., for his work on steam turbines.

Damages for Electric Shock.—At the Westminster County Court last week a carpenter named William Potts was awarded £50 damages against the Metropolitan District Railway Co., for an electric shock. It was stated that he was standing on Putney Bridge Station platform in a pool of water after a heavy rain shower, and that he received an electric shock, which threw him on to the rails and severely injured him.

MISCELLANEOUS BUSINESS NOTES

The North British Rubber Co.—This company have taken a large stand at the forthcoming indiarubber exhibition, where their comprehensive exhibit will embrace practically everything of indiarubber and vulcanite.

Bankruptcies.—The public examination of Mr. E. M. Oppermann took place last week. The liabilities are returned at £2,425, and the assets at £12. In 1905 the debtor formed the "X" Electric Accumulator Co., Ltd., of which he was manager, at a salary of £500 per annum. This company failed in 1906, and the "X" Syndicate was formed to take over the business. He was managing-director of this company until it went into compulsory liquidation in 1908.

Change of Address.—Mr. J. G. Lorrain, Consulting Engineer and Chartered Patent Agent, informs us that from 24th inst. his address will be:—Staple Inn Buildings, Holborn, W.C.

Trolley Omnibuses.—The trolley omnibus services in Leeds and Bradford were opened on Tuesday.

Forthcoming Publication.—Messrs. J. J. A. Churchill (7, Great Marlborough Street, W.) inform us that they have in preparation a volume entitled "Who's Who in Science," forming a book of reference, containing the names, appointments, and achievements of the world's foremost men of science, and edited by Mr. H. H. Stephenson.

Immingham Docks.—We have received from Messrs. W. H. Jackson & Co., of Grimsby, a copy of a publication entitled "The Port of Grimsby and Immingham," which gives interesting general information about the new docks at Immingham in three languages, and points out their great facilities in connection with many branches of commerce.

Hartlepool Tramways Arbitration.—On Wednesday, Mr. Justice Bray, in the King's Bench Division of the High Courts, reserved judgment in an action which raises an interesting legal point in connection with the purchase of the Hartlepool Electric Tramways Co.'s undertaking by the Hartlepool Corporation. Arbitration proceedings were concluded a short time ago, by which it was agreed between the parties that the sum of £12,963 should be taken as the agreed sum to be paid by the Corporation for the tramways within the Borough. At the same time, the arbitration proceeded under protest by the Corporation in the following circumstances. The original provisional order for the Hartlepool Tramways was obtained in 1895 by Messrs. Sellon & Ashby, who transferred it to the Hartlepool Tramways Co. for the sum of £990. This transfer, however, did not receive the sanction of the Board of Trade, and the Corporation raised the point as to whether either Messrs. Sellon & Ashby or the Hartlepool Tramways Co. had a good title to the tramways. Mr. Atherley Jones, K.C., who appeared for the Tramways Co., argued that inasmuch as Messrs. Sellon & Ashby had not received statutory sanction to the transfer of the Order, they were still "Promoters" for the purposes of the Tramways Act, and that the money should be paid to them. It was immaterial, he said, to whom the Corporation paid the money, so long as they had a good title to the undertaking, and Messrs. Sellon & Ashby, in conjunction with the Tramways Co., would take all the necessary steps to see that the Corporation, when they had paid the money, would have a good title to the tramways. Mr. Balfour Browne, K.C., who appeared for the Corporation, argued that Messrs. Sellon & Ashby had transferred their powers to the Tramway Co., and therefore were no longer concerned in the matter. At the same time, the transfer had not been sanctioned, as provided for by Parliament, and consequently in a legal sense the Tramway Co. were trespassers on the streets of Hartlepool, and the Corporation, in his opinion, had no legal power to pay either party. He believed that they would be surcharged by the Local Government Board if they paid the money over in the present circumstances. It seemed to him that the tramways at present belonged to nobody, and the only way to put the matter right was to apply to Parliament for a new Provisional Order or an Act of Parliament which would clothe the Company with the necessary powers. The Corporation would not oppose an application to Parliament of this sort. Mr. Justice Bray said it seemed to him that he could only refuse to order the Corporation to pay the money over to Messrs. Sellon & Ashby if he could see that there was not a good title to the undertaking. It appeared to him that Messrs. Sellon and Ashby had never sold their right to work the tramways, because they had entered into an invalid sale, and consequently they still had a good title. Judgment will be given later.

OSRAM·LAMPS

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Marconi's Wireless Telegraph Co.—It is anticipated that the annual report, which will shortly be published, will show a sufficient balance to pay off the arrears on preference dividends and also to pay a dividend on ordinary shares. According to the *Yorkshire Daily Observer*, important negotiations are proceeding between the company and the British and Colonial Governments, with regard to a proposal to link up all the colonies.

Westinghouse Electric and Manufacturing Co. (U.S.A.).—The gross earnings for the year to March 31st were $3,819,312 more than in the previous year. The directors recommend the payment of the accumulated preferred stock dividends.

Victoria Falls & Transvaal Power Co.—The profit on the last year's working was £157,749, compared with £50,534 in 1909, and after meeting the preference dividends the sum of £37,400 was carried forward. An additional power station is being erected at Vereeniging, from which transmission lines will be carried to the Rand.

British Electric Traction Co.—At the annual meeting last week the report and accounts given in our last issue were adopted. Sir Charles Rivers Wilson, the retiring chairman, presided. In giving a short retrospect of the Company's history, he said that their earlier anticipations had not been realised owing to a large extent to the introduction of a large and disturbing element of local politics. If it were possible to increase the average fare per passenger by only a small fraction of a penny, they would be able to earn sufficient profits, notwithstanding the higher wages and other advantages to the workpeople which municipal tramway undertakings offered, and which large tramway companies had been forced to follow. The main reason why the British Electric Traction Co. was not now paying larger dividends was that the considerable investments which they had in their associated companies were not adequately remunerative for the reasons he had stated. So far as the present position was concerned, an improvement had taken place last year, and it was being fully maintained during the present year. The scheme for dealing with the arrears of dividends upon the preference shares was a rearrangement, and not a reduction, of capital. The directors did not despair of being able to formulate a scheme which would be acceptable to both classes of shareholders. A long discussion took place at the end of the Chairman's speech, and a resolution calling for the appointment of a shareholders' committee was carried on a show of hands. The directors, however, demanded a poll, with the result that the appointment was rejected by 6,047 to 2,982 votes.

NEW COMPANIES

VENNER TIME SWITCHES, 6 Old Queen Street, Westminster. Capital, £7,000. To adopt an agreement with R. F. S. Venner, R. C. Griesbach, and E. E. Sharp.

ELECTRIC FITTINGS COMPANY (1911), 38 Conduit Street, London. Capital, £5,000. To acquire the existing company at the above address.

J. J. GUEST & CO., Coventry.—Capital, £20,000. Electrical and mechanical engineers.

PATENT SERIES LIGHTING CO., Halifax.—Capital, £5,000.

SAMUEL HARTFORD & CO., *Liverpool.*—Capital £1,000. Manufacturers of and dealers in wires, cables, &c.

CAVENDISH ELECTRICAL CO., 130, Great Portland Street.—Capital, £5,000. Manufacturers of, and dealers in, medical electrical apparatus.

Wireless Telegraph Notes.—The official report of Thursday afternoon's proceedings at the Conference of Colonial Premiers states that Sir Joseph Ward moved a resolution with regard to extending the use of wireless telegraphy throughout the Empire, with the ultimate object of establishing a chain of British State-owned wireless stations which in emergency would enable the Empire to be to a great extent independent of submarine cables. Mr. Herbert Samuel, Postmaster-General, agreed with the proposition, but the Government did not think it advisable at the outset to establish the system in every direction simultaneously. The Government proposed that a beginning should be made with a chain of six stations, one each in England, Cyprus, Aden, Bombay, Straits Settlements, and Western Australia, and from there would be linked up to New Zealand. Later on South Africa would be connected. It was suggested that the United Kingdom should bear the cost of the first three stations, that India should bear the cost of Bombay station, and that New Zealand and Australia should bear the cost of the stations in their respective territories.

THE ELECTRICAL CONGRESS AT TURIN

THE International Congress of the Applications of Electricity, at Turin, is fixed for Sept. 10th-17th. The following subjects are down for discussion. The names of those presenting reports on these subjects are given in brackets. Electrical and mechanical characteristics of modern electric generators, with special reference to very high speed machines (P. Behn-Eschenberg); present state of technical progress in the manufacture of staticnary and traction batteries (Dr. Beckmann); on the simultaneous running of several generating plants, all feeding the same system of network; the selection of the transmission and distributing pressure and the design of switchboards and sub-stations in large electrical installations, taking into account both economy in first cost and continuity of service (P. Torchio); underground high tension networks in metallic connection with overhead lines (1. Grosselin); present state of research in reference to abnormal rises in pressure and means of their prevention and protection of the system (J. Faccioli); construction and use of automatic circuit breakers (E. Ragonot); methods of cooling transformers of moderate power; converters, rectifiers and motor generators (S. P. Thompson); the problem of frequency transformation (P. Bunet); three-phase variable speed motors, with special reference to rolling mills and paper mills (G. Sarli); technical and economical influence on the lighting industry of the new metallic filament-lamp and the metallised carbon arc lamp (D. Wedding); monophase traction versus three-phase traction on main lines; high tension continuous current traction versus monophase traction on suburban lines (F. J. Sprague); overhead line construction for electric railways (G. L'Hoest); direct production of steel from ores by means of the electric furnace (R. Catani); sterilisation of water by processes employing electricity (Dr. Erlwein); electricity meters, with special reference to different kind of loads (H. C. Sharp and A. Durand); Government control of meters (A. Denzler); rational methods of commercial measurement of electric power (G. G. Ponti); the problem of increasing the load factor in central stations (G. Sartori); application of electricity to submarine boats (A. Bezzi); long distance wire telephony (F. B. Jewett); wireless telephony (V. Poulsen); automatic telephone exchanges as a means of economy and improvement in telephonic communication in large cities (H. Milon); research on secrecy in wireless telegraphy (P. O. Pedersen); present and future development of electric heating (C. A. Rossender); comparative study of the direct and indirect methods of taxing electricity in different countries (M. Bonghi and Dr. Frey); Government regulations in reference to the electric transmission of power (E. C. Ericson and H. Schreiber); distribution of electric power for agricultural purposes (Mr. Leclerc); the various systems of multiple telegraphy (Major W. A. J. O'Meara). The following papers are also announced: Mr. P. Boucherot (Paris), "Les phénomènes électromagnétiques qui résultent de la mise en court-circuit brusque d'un alternateur"; Dr. Hallo (Karlsruhe), "Cascadenumformer"; Mr. H. Stockar (Zurich), "Aluminium für elektr. Leitungen"; Ing. E. Soleri (Turin), "Gli estremi limiti di applicabilità dei cavi ad alta tensione"; Mr. J. Routin (Lyons), "Régulateurs automatiques"; Mr. J. Neher (Geneva), "Misuratori elettrici a tariffa multipla"; Ing. A. Dina (Palermo, Italy), "Su alcuni metodi di prevenzione delle sovratensioni interne"; Mr. S. Q. Hayes (Pittsburg), "Commercial apparatus for 100,000 volts service"; Prof. R. Arnò (Milan), "Watt-voltamperometri elettrodinamici e a induzione"; Prof. R. Arnò (Milan), "Di una soluzione del problema della compra-vendita razionale dell'energia elettrica"; Ing. P. Lanino (Rome), "La trazione elettrica in riguardo alle esigenze del servizio ferroviario"; Dr. W. Kummer (Zurich), "Ueber die Ausbildung der Triebfahrzeuge für elektrischen Vollbahnbetrieb mit Einphasenwechselstrom"; Ing. Guillaume Gyaros (Budapest), "Traction électrique appliquée aux lignes vicinales spécialement par rapport au système du courant continu à haute tension"; Dr. Osuke Asano (Tokio), "Progress in electrical installation in Japan"; Mr. J. A. Montepellier (Paris), "La technique de l'accumulateur électrique notamment en ce qui concerne l'accumulateur alcalin fer-nickel"; Mr. Etienne de Fodor (Budapest), "Etat actuel de la question de la destruction des ordures en combinaison avec les usines électriques"; Mr. Leon Gaster (London), "The international outlook in scientific illumination"; Dr. Charles P. Steinmetz (Schenectady); Mr. le Prof. Quirino Majorana Calatabiano (Rome), "Ricerche di telefonia senza fili"; Dr. A. E. Kennelly (Cambridge, U.S.A.), "The rotating electric current field"; Mr. T. C. Martin (New York), "The electrotechnical industries of America"; Mr C. O. Mailloux (New York), "Electrification of railroads."

READERS OF "ELECTRICAL ENGINEERING" who do not have their copies posted to them direct from the Publishers are particularly requested to communicate with us, if they do not obtain the paper regularly and punctually. We are desirous that ALL readers should have their "Electrical Engineering" at the earliest moment that it is possible to get a copy to their locality, and upon receiving any complaints, we will take steps to ensure a prompt supply.

Companies' Dividends, Reports, Meetings, &c.	375

SUMMARY

In his Presidential Address to the Incorporated Municipal Electrical Association at Brighton, on Tuesday, Mr. Christie spoke in favour of the flat rate system of charging, but advocated the development of restricted hour charges for power, &c., mentioning bakers' ovens as a good field for extension in this direction. While in favour of municipal powers for selling and hiring, he was opposed to any general extension of municipal wiring or the selling of electric light fittings. Councillor Leese followed with a Paper made up of a number of interesting notes and comments from a Committeeman's point of view. This included also two curves showing the variation in the cost per kw. of turbo-alternators with size, and the comparing the steam consumptions of units of different outputs. Speakers in the discussion endorsed Mr. Leese's contention that profits should not be allocated to relief of rates, and Councillor Smith of Glasgow stated authoritatively that the President of the Local Government Board held this view. The other Paper on Tuesday was on Modern Wiring Practice, by Mr. J. W. Beauchamp. He recommended that the supply authority, since they could not enforce regulations as to details of wiring, should issue "official" model specifications. He next reviewed existing practice at considerable length, bringing out several interesting points, and expressing his opinion freely on various technical details. Mr. Beauchamp and several speakers regretted that the new edition of the Institution Rules condemned ordinary slip-joint conduit systems, but one of the other speakers said that they would not have them installed on any pretence whatever. Some interesting comparative prices for wiring were quoted, and wires simply threaded through the joists without casing were warmly advocated by three speakers. Stannos wiring was also discussed. On Wednesday, at Portsmouth, two Papers were discussed. One by Mr. H. L. Howard dealt with Diesel engine plant, and gave figures in support of the author's contention that, even in the case of a very large electricity works, Diesel engine plant would involve lower capital cost and lower works costs than steam or gas plant. The Diesel engine was described and illustrated, and its advantages enumerated. In the other Paper, Mr. R. M. Carr advocated gas engines and producer plants for small stations. (Pages 357 to 362 and 365 to 369.)

Railless trolley services have been inaugurated in Leeds and Bradford, and are the first of their kind in this country. Each car is equipped with a pair of under-running trolley poles, and is driven by two 20 h.p. motors, one driving each rear wheel through worm gearing and side chains. (Page 363.)

A new form of steam trap of the float type, in which only a small relay valve is marked by the float, so that a very large main valve can be employed, is described in a short article. (Page 364.)

We illustrate an illuminated car which has taken part in the Coronation festivities at Bradford. (Page 364.)

A simple form of current gauge is described in a short article. (Page 369.)

Electricity has played a prominent part in the Coronation illuminations. We describe the principal features of some notable installations in London. (Page 370.)

Among the specifications published by the Patent Office on Thursday last was one by G. Berry on series transformer switchgear, and another on transformers by the British Thomson-Houston Co. Crompton and Co. and H. Burge dealt with converters, and the Adams Manufacturing Co. described motor starters. A patent for copper refining, which had expired, has been restored to L. Juman. Opposition has been

Hosted by Google

entered to the grant of a patent to P. Marino on separators for primary batteries, and a printing telegraph system by H. A. Rowland has expired after the full term of fourteen years. (Page 372.)

THE Postmaster-General will shortly introduce a Bill authorising the transfer of the National Telephone Co. to the State. This Bill will authorise an expenditure of £4,000,000 upon the development of the telephone system, in addition to the £2,000,000 already authorised.— A system of travelling scholarships is to be established in the Post Office in order to enable Post Office engineers to study the telephone abroad.— The whole of the Company's staff will be taken over at the end of the year.—In the Court of Appeal yesterday the Master of the Rolls and the Lords Justices Farwell and Kennedy gave judgment in the case between the National Telephone Co. and the General Post Office, a decision being given in favour of the Post Office. (Page 372.)

THE accounts of several of the electricity undertakings have been published during the week. Profits are reported from Barrow-in-Furness, Finchley, Luton, South Shields, Oldham and Sunderland, but at Clacton-on-Sea and Dudley the result has been a deficit.—The L.C.C. tramway service over Battersea Bridge commenced traffic last week. (Page 373.)

TENDERS are invited for gas engine plant, battery and street lighting equipment for Swinford; Local Government Board enquiries have been held at Bispham, Carlisle and Worcester, and an application for a loan of £5,000 is to be made at Torquay; and a Diesel engine and dynamo is required for Aldershot. (Page 374.)

THE American Marconi Co. is stated in the report to be more than self-supporting. Steps are to be taken for the protection of the Marconi patents in America. The Marconi International Marine Communication Co. reports a profit of £10,765, and a dividend of 5 per cent. is recommended. The accounts of Messrs. J. G. White and Co. show a net profit of £91,466. The Rosherville Station of the Victoria Falls and Transvaal Power Co. is stated in the report to be nearly completed. (Page 375.)

ARRANGEMENTS FOR THE WEEK

THURSDAY, JUNE 29TH (TO-DAY).

Institution of Civil Engineers.

10 a.m. Continuation of Conference on the Training of Engineers.

9 p.m. Conversazione at the Albert Hall.

I.M.E.A.

10 a.m. At Royal Pavilion, Brighton:—Discussions: (1) "Purchase of Fuel," to be opened by Mr. C. E. C. Shawfield; (2) "Street and Shop-front Lighting," to be opened by Mr. A. H. Seabrook.

2.45 p.m. Visit to Corporation electricity sub-stations and L.B. and S.C. Rly. locomotive workshops.

7 p.m. Annual Dinner at the Dome.

FRIDAY, JUNE 30TH.

I.M.E.A.

10 a.m. Annual General Meeting, at the Royal Pavilion, Brighton.

Physical Society.

5 p.m. At Imperial College of Science, London: (1) "On the Effect of a Narrow Saw-cut on the Edge of a Conducting Strip on the Stream Lines in the Strip, and on the Resistance of the Strip," by Prof. C. H. Lees, F.R.S.; (2) "The Capacity of Co-efficients of Spherical Electrodes," by Dr. A. Russell; (3) "Exhibition of the Benkö Primary Battery," by W. R. Cooper.

MONDAY, JULY 3RD.

Electrical Contractors' Association.

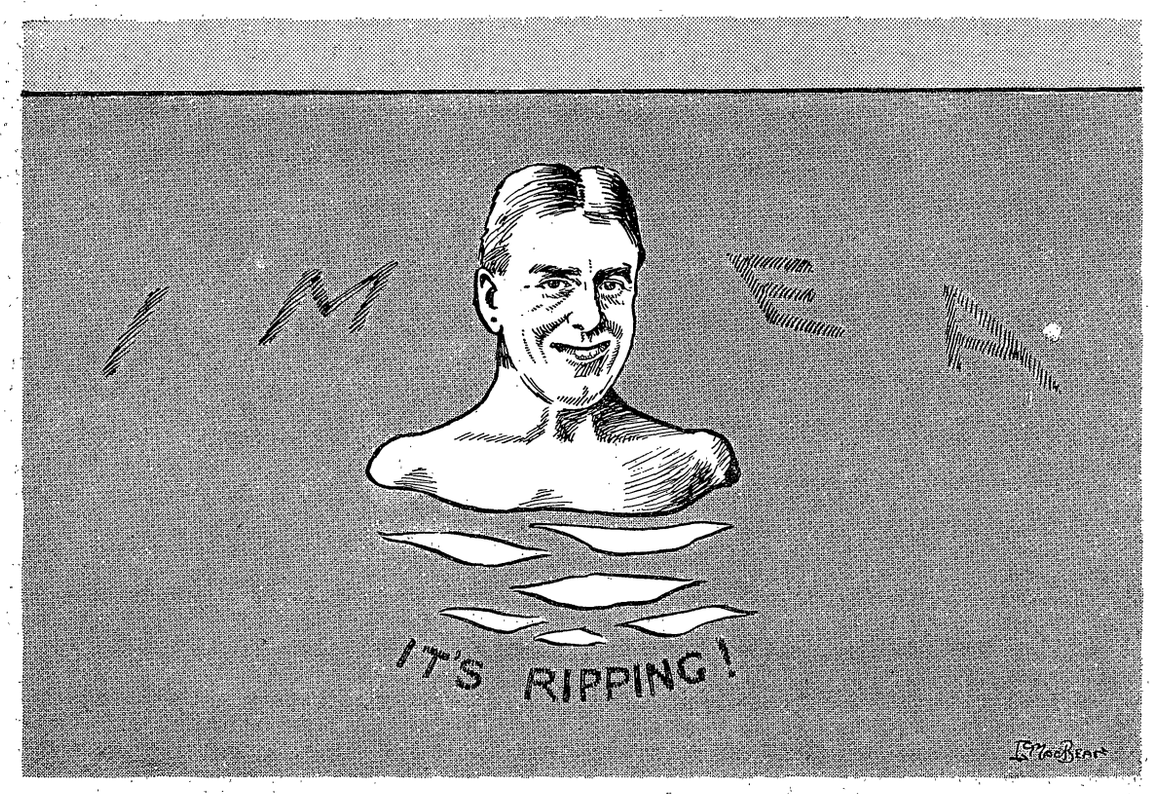
6.30 p.m. Annual dinner at Frascati's Restaurant.

WEDNESDAY, JULY 5TH.

National Electrical Manufacturers' Association.

12 noon. Council meeting at the Institution of Electrical Engineers.

3 p.m. Special general meeting at the Institution of Electrical Engineers.



THURSDAY, JULY 6TH.

National Electrical Manufacturers' Association.

2.30 p.m. Council meeting at Offices of Association.

Institution of Electrical Engineers.

9 p.m. Conversazione at Natural History Museum, South Kensington.

MR. JOHN CHRISTIE (President of the Incorporated Municipal Electrical Association, which is meeting at Brighton this week): It's Ripping!

(With apologies to the S.E. & C. Railway's Herne Bay poster.)

Hosted by Google

SIXTEENTH ANNUAL CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION

THE sixteenth annual Convention of the Incorporated Municipal Convention Association was opened at Brighton on Tuesday. Councillor C. Thomas Stanford, M.A., J.P., the Mayor of Brighton, offered the Association an official welcome, and referred to the pride which the Council and town generally have in their electrical undertaking, and also their pleasure at the selection of Mr. John Christie, their electrical engineer, as President. The attendance at the Convention is a record one, more members being present than on any previous occasion, and the number of ladies who have accompanied them is also a record one. After a vote of thanks to the Mayor for his welcome, Mr. Christie delivered his Presidential Address, which we give in a slightly abbreviated form below.

PRESIDENTIAL ADDRESS.

BY J. CHRISTIE.

(Engineer and Manager, Corporation Electricity Department, Brighton.)

Mr. Christie commenced his Address by thanking the members for having paid the town of Brighton the compliment of selecting her engineer as their President for a second time. The previous occasion was fifteen years ago, under the presidency of Mr. Arthur Wright. The Association then numbered only 114, and the capital represented was about £3,000,000; now there are 407 members, representing practically the whole of the municipal electrical undertakings throughout the kingdom, and a capital of £41,000,000.

So far as he could ascertain, Mr. Christie continued, Brighton could claim to have been first in the field with regard to both electric lighting and traction. The first electric railway in this country had been started there in August, 1883, through the enterprise of one of their respected townsmen, Mr. Magnus Volk, and the dynamo now driving it had been in regular daily use for upwards of a quarter of a century. In 1891 one of the earliest experiments in electric lighting in this country had been carried out under the auspices of the Brighton Corporation; the installation consisted of six arcs, each lamp being run off its own separate machine. The following year Messrs. Hammond & Co. laid down a small plant which supplied a series of arc lamps installed in the business premises of several of the leading tradesmen, and this was, Mr. Christie believed, the first instance of a central station for the public supply of electricity to be established in this country; and during these twenty-nine years the inhabitants of Brighton had always enjoyed the use of electricity as an illuminant. In those days it had been rather a luxury, costing in the neighbourhood of 2s. per unit, and in spite of this good price the enterprising promoters had obtained little but experience as a reward. Series arc, and later multiple-series incandescent lighting, gave place to the 2,000-volt A.C. house to house transformer system. In 1891 the Corporation obtained a Provisional Order, and shortly thereafter commenced a two-wire D.C. supply with underground mains, competing with the company. In 1893 the company was bought out for £5,000, and the old plant disposed of. After that the two-wire system was changed to a three-wire system, H.T. single-phase alternating current was again introduced to meet the demand in the outlying area at times of peak load, later the voltage of the supply in these districts was doubled, and continuous current once more displaced the alternating. In 1905 the North Road Works as a steam generating station was superseded by the new three-phase turbine waterside station at Southwick [see description in last week's ELECTRICAL ENGINEERING]. To meet the continually increasing demands in the outskirts of the town, sub-stations, either equipped with 3-phase A.C. plant or internal combustion engines, will shortly be put in. The consumption per head of population last year amounted to 78 units, which constitutes a record for a non-industrial town of 132,000 inhabitants.

Brighton was the home of the maximum demand system of charging. Although, said Mr. Christie, this system is undoubtedly the most equitable from both the consumers' and suppliers' point of view, even at Brighton, where it was first evolved, it became unpopular with the majority of consumers, and by insisting on retaining it the Council were steadily losing good business. Three years ago, therefore, it was abolished for all new business. To those consumers who elected to retain it the price was raised from 7d. and 1d. to 6d. and 2d. per unit, the alternative offered being a flat rate of 4d. per unit for domestic and shop lighting, and 3d. per unit for hotels, churches, &c., with special rates to very large consumers. This change of policy fortunately came into force just as the metallic filament lamp came into general use, and to-day everyone is satisfied with the result, including some 20 per cent. of the remaining consumers on the maximum demand system who obtain their supply at less than the flat rates.

Before leaving the subject of the maximum demand system, the President mentioned that when discussing the matter with Mr. Wright some months ago, Mr. Wright had put forward as his belief that we might ultimately come to a fixed charge per square foot of floor area, have no meters, and allow consumers to use the supply for any purpose without other restriction.

Mr. Christie then referred to the development of a day-load power supply on the restricted hour basis, which was also first introduced in Brighton. This class of business comprises engineering shops, printing works, laundries, breweries, mineral water factories, refrigerators, saw mills, ventilating and domestic machinery, and a lucrative business has also been obtained in charging the accumulators of electro-buses and motor-cars. From these sources a day load of some 3,000 h.p. connected has been attained, consuming last year almost 3,000,000 units, and this has so improved the load factor that there have been marked economies in works costs. Practically all the small isolated steam plants in the area have now been displaced by electric motors, and the consequent diminution of the smoke nuisance is a matter of no small importance in a health resort like Brighton. Electrically-operated bakers' ovens, Mr. Christie continued, are a commercial success. These make demands from 25 to 100 kw. each, and are usually only wanted between 11 p.m. and 6 a.m., when our plant and mains are otherwise comparatively idle. It would be feasible to cut the price per unit for this class of business to something like ½d. per unit, which figure, he is informed, can effectively compete with the existing methods of heating these appliances, whilst the advantages in the way of cleanliness and ease of regulation are all in favour of electricity.

The remainder of the Address dealt chiefly with the vexed question of selling, hiring, and wiring powers. Mr. Christie considered that it was most essential for the supply authority to possess powers to sell and hire out motors, &c., as in most provincial towns the average contractor was not in a position financially to establish a hiring system, and the prospective user for similar reasons was unable to purchase these accessories through the contractor. Brighton has enjoyed powers to sell and hire, but not to wire, since 1901, but never exercises them if there is any possibility of a consumer doing a deal through his contractor, and no insurmountable difficulty has yet been experienced in arranging for the consumer's contractor to carry out the necessary wiring. It is also found that consumers who could afford to buy their motors outright prefer to continue to hire from the Corporation, and to have the assurance of knowing that all their stock of spares and the resources of the department are at their disposal in case of trouble. The rental charged for motors is some 20 per cent. of prime cost, which includes insurance, cleaning, oiling, adjustment, and regular inspection. This just pays its way with a bare margin of profit, writing off the cost in ten years, but the department undoubtedly gains by the increased sale of energy. This policy, said Mr. Christie, must be extended to the hiring of heating and cooking appliances, which are daily coming into more general use. He pointed out that the money necessary to put these powers into force can only be raised after a Local Government Board inquiry, which should be sufficient guarantee that they will not be abused. No fewer than twenty-eight undertakings, involving a capital outlay of upwards of £11,000,000 sterling, already possess them, and this is a very strong argument in favour of our legislation being revised so as to allow of all authorities being treated alike.

On the wider question of wiring, supplying, and selling electric light fittings, Mr. Christie candidly confessed that he is not in sympathy with municipal authorities carrying out this work themselves except under very exceptional circumstances. Supply authorities, he said, can no more afford to ignore the

Hosted by Google

existence of *bonâ fide* contractors than these firms can afford to take up an attitude hostile to the interests of the supply undertaking, and by friendly co-operation much unnecessary expense in the way of elaborate showrooms, canvassing and publicity organisation can often be saved without detriment to the undertaking in any way. He is convinced that in certain instances this so-called business getting has been overdone. A suitable showroom to interest consumers and to demonstrate the use of the latest novelties in systems of lighting, power, heating and cooking apparatus, is most desirable, and if judiciously operated in conjunction with the collector's office, it forms one of the most valuable advertisements an undertaking can possess, but he does not consider that it is by any means always necessary actually to sell the goods to ensure success.

Embarking in retail trading, carrying out wiring installations, &c., may only boost up an artificial and temporary demand, necessitating the raising of additional capital to meet it, and seldom yielding an adequate return on the outlay incurred.

Incidentally, Mr. Christie expressed the opinion that all undertakings where possible should have the collection of their accounts in their own hands, thus enabling the department to get into personal touch with the consumer, and to deal promptly first hand with any complaints that may arise. Some three years ago the Brighton Electricity Department took over the collection of their own accounts, and the results have been most satisfactory in every way, whilst the bad debts have been reduced by no less than 60 per cent. A capable engineer as Publicity Officer to assist and advise consumers free of cost as to the lay-out of their installations to the best advantage is also a necessity. Mr. Christie says that at the present time there is a dearth of suitable men, and urges young engineers who possess the necessary personal qualifications to specialise in this department.

Alderman G. PEARSON (Chairman of the Bristol Electricity Committee) proposed a vote of thanks to the President for his address. This was seconded by Mr. C. E. C. SHAWFIELD (Chief Electrical Engineer, Wolverhampton), and was carried with acclamation.

REPRESENTATION ON THE COUNCIL.

Before the Papers were read, the President mentioned that the Council had received a number of letters from some of the smaller Councils, urging that they should be represented upon the Council of the Association. This, he said, was a matter for the annual general meeting, and could only be dealt with then. He mentioned this at the commencement of the Convention in order that the members could talk the matter over before the annual general meeting.

ELECTRICITY SUPPLY VIEWED FROM THE MUNICIPAL COMMITTEE'S STANDPOINT.

BY COUNCILLOR LEESE, J.P.

(*Chairman of the Stoke-on-Trent Electricity Committee.*)

The chairman of a committee, said Councillor Leese, has to occupy a somewhat thankless position. He acts as spokesman of his committee and interpreter of his engineer's reports; at the same time, he is the buffer between the oft conflicting forces of other municipal departments and his own, and the recipient of workmen's and consumers' grievances. To illustrate his duties as interpreter, Mr. Leese gave some examples of the peculiar questions a chairman is sometimes called upon to answer, and incidentally suggested that it would be simpler if engineers always spoke of lbs. of steam per Board of Trade unit instead of per kw.-hour.

It fell to Mr. Leese's lot, as the Chairman of the Electricity Committee of the district formed by the Federation of the six Pottery towns last year, extending roughly 10 miles from north to south, by about 2 miles in breadth, to deal with the scheme for amalgamation and extension. Four of the six towns had their own electricity works :—

Town.	Date of Opening.	System.	No. of sets.	Capacity of plant (Kw.).
Burslem...	1905	3-wire D.C. 220 and 440 v. ...	4	1,250
Hanley ...	1894	Single-phase A.C. 2,200 v. ...	5	2,000
Longton...	1901	3-wire D.C. 230 and 460 v. ...	3	500
Stoke ...	1904	3-wire D.C. 240 and 480 v. ...	4	800

The Burslem Works are 3 miles north of the Hanley Works, the Stoke Works are about 2½ miles from the Longton Works, the Hanley Works being about 1¾ miles north of Stoke and 3 miles north-west of Longton. The Burslem Works supply a district (Wolstanton) outside the federated area and Tunstall in addition, while Stoke obtained powers to supply Fenton (which is between Stoke and Longton), but had not done more than run one main to that portion of the borough.

The aggregate winter peak load in 1910 considerably exceeded the plant capacity available, after allowing for reasonable spares, and was only carried with difficulty in the case of two of the stations.

After visits to several other stations and several special meetings, it was decided not to make additions to the small plant in the existing stations, but to build and equip a new power station, as nearly as possible in the centre of the area of supply. This will be connected with the four existing stations by trunk mains, and will contain two 1,500 kw. turbo-alternators with the necessary equipment of boilers, switchboards, &c. The D.C. plant at Burslem and Stoke and the A.C. single phase at the Hanley Works will be retained for peak loads so long as it is economical to do so. The problem is complicated by two of the works having destructors combined with them and by the difficulty of coupling two alternating systems and still maintaining flexibility.

In selecting the turbo-alternators, a frequency of 50 cycles per sec. and a speed of 3,000 r.p.m. were chosen. The curve, Fig. 1, was prepared to illustrate the relation of cost per kw.

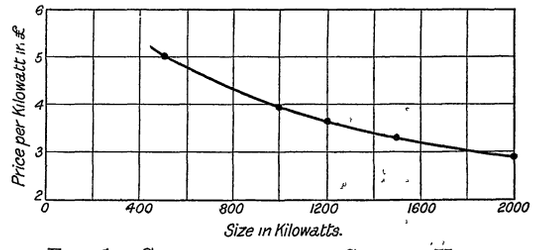


FIG. 1.—COST PER KW. AND SIZE OF UNIT.

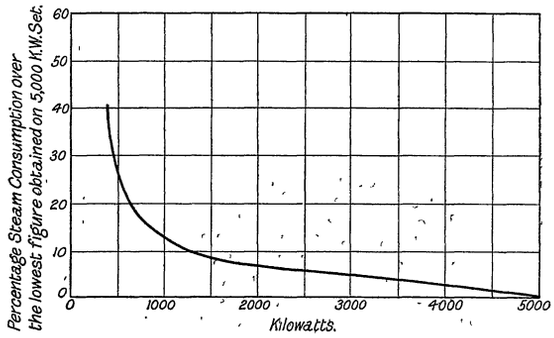
to size of plant, and Fig. 2 to show the relation between steam consumption and size of unit, the ordinates showing the percentage increase in steam consumption compared with that of a 5,000 kw. set. The rapid rise for sizes below 1,500 kw. is noticeable.

Two interesting curves were also shown which explained how an increase in the morning, afternoon, and evening peaks in Hanley last year actually increased the costs, in spite of improvement in load factor, owing to its having been necessary to run an additional set of old make and small size to take these peaks.

The next question dealt with in the Paper was the allocation of profit from electricity undertakings. The author's opinion was that after allowing for depreciation, and building up a reserve fund to meet unforeseen contingencies, arrangement should be made to give the consumer the benefit either by extra discount or some other method. One of his reasons for objecting to profits being handed over for relief of rates was that a large manufacturer who was already supplied with electricity for power purposes at the lowest charge it



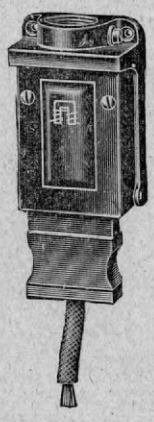


FIG. 2.—STEAM CONSUMPTION AND SIZE OF UNIT.

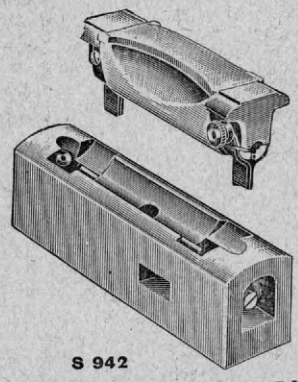
was possible to make would have a greater benefit in reduction of rates than the small consumer. Moreover, if a price must be charged in order to produce a profit for the reduction of rates, then it would seriously handicap committees in popularising the use of electricity by the poorer classes. When the six Potteries towns were federated, a clause was inserted in the Federation Act which compels the gas and electricity committees, in the event of a profit being made in any one year, to adjust the price of electricity and gas so as to absorb that profit.



The author then mentioned the difficulty of convincing a council that the *average* price is not the cost price of electricity. Owing to this the non-manufacturer too often jumps to the conclusion that manufacturers are supplied below cost, when the power rates are low because of the long hours of use. In this connection the author regretted that none of the published tables give particulars showing the price for lighting and power separately. It is the absence of such information, he says, which renders it necessary at

times to instruct one's engineer to send out a "catechism" to which sarcastic reference is occasionally made without much ground. In portions of Stoke-on-Trent area, large power users get supply at ½d. per unit. This figure is sufficient to cover the cost of generation, but it does not allow for sinking fund and interest on mains. In the author's opinion, the charge should be compounded of cost of generation added to the cost of distribution, just as a manufacturer quotes goods F.O.R. his works at one price and "delivered" at another and higher rate. Restricted hour supply for all purposes and at 1d. has been given in one of the writer's districts since March, 1906, and has met with encouraging success. Ordinary manufacturing works cannot cut off at 4 p.m. in winter, but there are sufficient users to justify the special rate, which is only given when a clock-controlled switch is provided by the consumer.

The author then invited opinions as to the utility of showrooms. His own committee are, generally speaking, antagonistic to them, but his opinion is that, given a fairly large district to work in, a good showroom is a necessity to the success of the electricity undertaking. But it must, he pointed out, be kept up to date, and be in charge of a competent attendant. For smaller areas he thinks the best method of increasing the output at the works is to employ a canvaser of the very best type, who can watch new property being built, wait upon the builder and explain the good qualities of electricity for lighting purposes in ordinary dwellings. In Hanley, six years ago, the local contractors were encouraged to canvass by being given supply at 1d. per unit, all Corporation wiring is done by them, and they are lent any apparatus required for demonstration, while in special cases they are paid a commission.

Stoke-on-Trent has done a little in the direction of cooking appliances, and for some time has given this class of supply at 1d. per unit, but the trouble has been to obtain reliable and substantial stoves at a reasonable price. The £5 ovens, said Mr. Leese, are flimsy articles, while if £10 or more is paid, the hiring rate is much in excess of a gas stove. The ordinary domestic user will not pay more than 2s. or 2s. 6d. per quarter. The cost of operation is low; in small houses, a Sunday's dinner for three or four persons can be cooked for 2d. But there is one objection; in very few areas are the existing mains large enough to stand a row of houses taking on electrical ovens.

Lastly, Mr. Leese made some remarks as to the wide variations in the prices tendered to carefully drafted and clear specifications, and remarked the fact that there is nearly always a covering letter to the tender, which, while accepting the conditions laid down in the tender form, suggests modification of this, that, and the other, "which, if agreed to, sometimes would almost alter the whole construction of the article in question."

Discussion.

Councillor CROWTHER (Vice-Chairman, Sheffield Electricity Committee) agreed with the author as to the undesirability of handing over profits in relief of rates. The present tendency was to place restrictions upon municipal electrical undertakings which, if applied to a company, would spell ruin. There were many objections to handing over profits in relief of rates. In the first place, it made the engineer and the committee feel they must make a profit at all costs, and consequently they became very reluctant to scrap out-of-date plant. In his opinion the success of an engineer did not depend upon the profits he made, but upon getting the maximum number of consumers at a minimum cost. It would have been impossible for Mr. Fedden to have reduced the costs at Sheffield from 4d. per unit to 0·48d. per unit if he had felt that his first duty was to make a profit. Coming to the question of contractors, he asked why they should be so tender for the feelings of the contractors, and caused considerable laughter by saying that the average contractor was really only a draper who had taken up electricity as a side line to his business. He was, however, quite willing to admit the contractor to a fair share of the business if he could get it. On the question of showrooms, municipal electricity departments were too modest in this matter, frequently putting them behind their power stations, or in a small room in an attic or down in a cellar. Another matter was to see that the consumer had the amount of light he required, but not double what he required. It was only by giving their electrical departments a free hand that they could make electric light adaptable to the needs of all members of the community, including those earning 30s. and 35s. per week.

Mr. C. O. MILTON (Chief Electrical Engineer, Maidenhead) asked how cooking business would be dealt with by small undertakings, if a number of stoves were put in at the end of a long main of, say, 0·1 sq. in. section. For cooking, electricity would have to be sold at 1d. per unit, but with small undertakings he failed to see how this could be done, as the time of the load coincided largely with the lighting peak.

Mr. F. AYTON (Chief Electrical Engineer, Ipswich) said that Councillor Leese should not encourage workpeople and consumers to bring their complaints to him. With regard to sending round long lists of questions to other engineers for information, he suggested that all requiring such information should employ a consulting engineer, and pay a reasonable fee for it, if they could not get the advice they wanted from their own engineer.

Bailie WILLOCK (Chairman, Glasgow Electricity Committee) supported Mr. Ayton in his remarks upon trusting the engineer, and leaving him to deal with all complaints in the first instance. This had been his policy during the 17 years he had been Convener of the Glasgow Electricity Committee. He understood that Mr. Leese had said that supply at 1d. a unit for heating and cooking was given through the same meter as for lighting, and he would like to know how this was done, as it represented a great advance.

Mr. S. E. FEDDEN (Chief Electrical Engineer, Sheffield) strongly supported the views already expressed as to the undesirability of paying over profits in relief of rates, and in this connection drew attention to the shorter periods for the repayment of loans now being insisted upon by the Local Government Board. This resulted in their having to make huge gross profits if they were to make both ends meet at all. At Sheffield, for instance, he had made out a balance sheet as for a company, to show Mr. Ross Hooper, the Local Government Board inspector. He assumed that one quarter of the capital was in 4½ per cent. debentures, one quarter 5 per cent. preference shares, and the remainder ordinary shares, and after allowing for debenture interest and preference dividend, would have had enough profit to pay 9·4 per cent. on the ordinary shares, if he could have allocated in that manner the capital charges which the electricity department had to pay. He thought to charge 0·5d. per unit for large power supplies, as was the case at Stoke-on-Trent, was too high. With 45 per cent. or 50 per cent. load factor, the costs would be about 0·2d. per unit, and this would be sufficient to pay interest and sinking-fund charges. On the point of covering letters with tenders, he regarded these frequently as almost amounting to sharp practice, as they covered things up so much, and it would be a good thing if contractors would take the tip from him and Councillor Leese, and send in straight tenders without covering letters, which involved all sorts of other things.

Alderman G. PEARSON (Chairman, Bristol Electricity Committee) was also a supporter of not assisting the rates out of profits. At the same time, he did not think they need discuss the matter at very great length, because with the shorter periods allowed by the L.G.B. they were not likely to make extensive profits. Nevertheless, he objected to the restriction such as had been put upon the new Stoke county borough, that they could not, even if they desired, allocate any profits to rates. He desired these matters treated with common sense and freedom, as it might be necessary in emergency to assist the rates to some extent. They need not worry themselves much about covering letters with tenders, as they could easily ignore them. The chief difficulty was to get the work carried out to time. At Bristol they adopted the plan of not complaining if the work were completed within 12 months after the contract period had expired. He also advocated leaving all complaints to the engineer and his staff, a plan which almost always made it unnecessary to appeal to the committee. To interfere with the discipline of the works was the parent of nearly every mischievous thing that could arise between the workmen and a committee.

Alderman W. F. GOOD (Chairman, Maidenhead Electricity Committee), as a supporter of the principle of retaining the profits with the undertaking, suggested that, after meeting capital charges and depreciation, the surplus should be divided as to one third to reserve and renewals fund, one third towards reducing the price to the consumer, and one third to reducing the cost of public lighting.

Councillor W. B. SMITH (Glasgow) said that, as a member of a recent deputation of the Smoke Abatement League of Great Britain to Mr. John Burns, President of the Local Government Board, he had then urged Mr. Burns to prevent profits being devoted to the relief of rates. Mr. John Burns was strongly in sympathy with the suggestion, and quite appreciated that profits should be devoted to reducing the price of gas and electricity, both of which commodities would do more than anything else to reduce the smoke evil in Great Britain, and thought his colleagues were very much with him on that point.

Mr. MILES WALKER (British Westinghouse Co.) congratulated Mr. Leese on the interest he had taken in his undertaking.

Alderman SMITH (Vice-Chairman, Liverpool Electricity Committee) expressed the opinion that as the rates had to bear any losses upon the undertakings, they should also share any profits; and he caused considerable commotion by saying that street lighting was more cheaply carried out by gas.

Councillor LEESE replied briefly, reminding Mr. Ayton and others that they had quite misunderstood the Paper, if they thought he wished to usurp the functions of the engineer. The system adopted at Stoke for charging for supply for cooking apparatus was to take the average consumption of the premises in the previous year or two years, and to charge all above that at 1d. per unit.

Hosted by Google

MODERN WIRING PRACTICE.

By MR. J. W. BEAUCHAMP.

(Chief Electrical Engineer, Tunbridge Wells.)

In the introductory part of his Paper, the author expressed his conviction that small consumers were remunerative; such business, he said, is of a special character, but on account of its possible magnitude and the comparatively high load factor of lighting supply to private houses, it deserves special treatment, more particularly as the growing demand for electric street lighting makes it necessary to lay cables in roads where only the smaller consumer can be obtained. Returns have shown him that the proportion of premises taking electricity supply varies from 5 to 25 per cent., whilst the percentage of houses rented at less than £50 per annum ranges from 40 to 70 per cent. of the total.

He next deplored the lack of uniformity in the quality of electrical installation work within any particular supply area. Small house and shop wiring usually falls to the lowest tender, and in many cases there is not the most elementary form of specification to ensure that the several offers are based on the same requirements. He recommended the drafting of simple and definite rules, to be made as light as possible, but to be stringently enforced.

Many of the existing rules, directed towards securing for the consumer a well-designed installation, with regard to capacity of conductors, sectionising, etc., cannot be enforced by the supply authority, and he therefore recommended that simple model "official" specifications should be issued, describing the requirements of good practice suitable for several different classes of wiring work.

He suggested that as the usual insulation resistance test depends chiefly upon dryness of the building and care used in connecting up fittings, a much lower insulation resistance than is usually called for would suffice, but should be supplemented by inspection of samples of hidden work in every case. He quoted figures to show the divergence in the limits of capacity of branch lighting circuits specified by various authorities, and said that the true limit should lie in the ability to make proper current carrying connections in the various "loop in" fittings used on branch lighting circuits; 10 amperes, he thought, should be a workable maximum. The limit of motor capacity which might be connected to one side of a 3-wire system was from 1½ to 9 kw. in one set of regulations, and, as he pointed out, these limits should depend upon the capacity of the system, yet in some cases most stringent regulations were issued by very large undertakings.

The regulation for maximum motor-starting currents would, he thought, be better stated in "limiting amperes" for any motor on a system or district according to capacity of cables or transformers—because having admitted, for example, a 10-h.p. motor at 1¼ times full load current (say 70 amperes), it is hardly reasonable to deny the users of smaller motors in the same district the privilege of taking up to the same value of starting current.

Provided that wiring is not dangerously overloaded, the question of pressure drop, he pointed out, concerns the consumer chiefly, and the increasing efficiency of lamps does not warrant the use of heavy wiring.

Amongst several "out of date" provisions he mentioned the following:—Motors to be insulated. No installation to have less than two branch circuits. No copper fuses to be used. S.P. switches to be used on each main. Meter shunt wire to be taken to lamp side of consumer's main switch. Slip conduit prohibited. Metal conduit to be avoided if possible. Others "conspicuously in advance of the period when they were written" were:—Bathroom lights to be out of reach of persons in water. No elbows to be used in conduit. Internal lighting fittings to be insulated. Meter main coil and all S.P. switches to be on live side of supply. Attention to the bath room rule is drawn in the Government Regulations of the South African Union, the recommendation being that all conduit and fittings should be out of reach of persons standing in or on the bath, or on a wet floor—and that porcelain switches should be used and key socket holders avoided. The position of the meter, main coil, should be tested for and insisted on in all cases. He also recommended that the following regulations in the more modern codes could be made general with advantage:—Electric irons to have some indicator showing when current is on. Capacity of cables for motors to be calculated on basis of short period over load ratings, and on basis of starting currents. In addition, he suggested that although most modern patterns of switches and fuses fulfil every requirement with regard to breaking circuit, they are greatly overrated so far as concerns their power of carrying full load current continuously, the makers apparently not making enough allowance for inaccurate machining and fitting of parts.

To replace the various earthing regulations, he pointed out that the essential requirement is merely that every part of a metallic sheathing or conduit system be permanently connected to earth by a conducting path of sufficiently low resistance to carry, without heating, the maximum current which the main fuses of the installation will pass. The minimum size of earth wire he proposed was No. 18 S.W.G., as he considered No. 14 unduly heavy and expensive for small installations. Tests made with lamp or bell for the continuity of a tube system give little indication of the current-carrying capacity of the many joints and connections.

Where the system of wiring makes it impossible to render all metal-work of motors, lamps, and other apparatus metallically continuous, the author recommended the running of a substantial and visible earthing wire or tape throughout the installation.

A number of other points were raised by Mr. Beauchamp, and we quote some of the opinions he expressed: The increasing stringency of Home Office Regulations has led to the production of various fittings which fall into two classes: one in which provision is made for earthing all metal-work, and the other in which insulating material shrouds all parts from which a shock might be obtained as a result of failure of internal insulation. When substantially made the latter class probably has the advantage.

It would seem worth while to consider earthing only portions of tube within usual reach in wet places, and keeping the remainder in isolated single lengths by the use of fittings and sockets which actually insulate instead of partially connecting as at present; this could be effected by lined sockets or by serving the outside of the tube with compounded tape or braiding. The use of "close" joint tube in any form of cement or plaster is undesirable but difficult to prevent on jobs where brazed or seamless material is not insisted on throughout. There appears to be a useful field for a conduit lapped with coarse tape or jute and compounded outside for such positions.

Various devices have been put upon the market to enable slip tubing to be made continuous without appreciable increase in cost. They are, however, always apt to be omitted where tube is fitted in awkward positions, whilst their weakest feature is that they do not render it necessary to remove the enamel from the tube and sockets. In some instances slip tubing has been put together with wet salammoniac in order to secure a rust joint—an injurious practice. There seems to be no reason, however, why a useful amalgam like jointing mixture should not be made, similar in composition to aluminium paint or the paste solders.

Where possible, the cartridge form or the modern development of the old Edison screw plug fuse, such as the "Zed" and "Diel" fuses, should be used, but the cheapness and convenience of the ordinary porcelain bridge fuse will prevent it from being easily superseded. The supply authority could fix printed cards by the service cut-out and the distribution boards, stating the usual fuse sizes rendered in terms of lamps and wire gauges.

The metallic filament lamp has led to a very general use of pressure-reducing transformers on A.C. distributions over 100 volts. This has not apparently made much difference to wiring practice, nor has it become general to use material of lower insulating quality on new work where pressures of 50 to 100 volts are intended. If makers should produce a high voltage lamp of small power and low price the transformers would presumably be abandoned in time, provided that the wiring were found suitable for the higher pressure. Where auto-transformers are used it is usual to insist on their being connected in such manner that the pressure to earth on the consumer's wiring is not greater than his working pressure. In any case, where low insulation work or earthed concentric wiring is put in, it should be made clear to the purchaser that he is possibly committed to the continual use of such transformers, or disappointment may arise in the future. Small transformers are responsible for a considerable number of faults on consumers' premises, particularly where their cores and frames are connected to earth. It is somewhat unfortunate that suppliers have not endeavoured to keep control over house transformers by a rental system. The pressure regulation of small transformers varies from 2½ to 4 per cent., and as they are seldom fully loaded, it follows that the average working pressure is raised somewhat at all times, and the lamps are considerably overrun.

The familiar bayonet pattern lamp holder is often contrasted with the foreign screw socket to the detriment of the former, but in this criticism the author does not concur.

Where it is possible to work on the surface of a building and to use concentric conductors with the outer or return sheath earthed, a saving in cost of 10 to 15 per cent. over slip joint conduit wiring can be secured by means of "Stannos" in the hands of men accustomed to its use. Its chief disadvantages appear to be:—The multiplication of mechanical joints or points where loose connections may occur. The difficulty of securing to plaster and composition walls and ceilings. Comparatively feeble resistance to accidental damage. Risk of loss of continuity and consequent sparking or pressure rise on the outer conductor in the event of loose contacts or breakage of sheathing. These difficulties are rather matters of detail, and many of them can possibly be overcome. Where it is required to use double "Stannos" wiring, the outer sheaths acting merely as a mechanical protection, no trouble arises from inductive drop with ordinary sizes and currents; experiment has shown that up to 25 amperes the drop at ordinary periodicities is quite inappreciable in a 55-yard run. The great value of this material lies in the fact that faults quickly develop into short circuits and put the bad section out of use whilst repairs are easily carried out; in

Hosted by Google

addition, all the simplicity and advantages of a single pole system are secured.

Flexible wiring has been much discussed from time to time, but no effort made to define its utility or to establish any regulations which might make it safe for certain classes of work without rendering it too expensive; in consequence, a considerable amount of such wiring is actually in use in this country in a most improper manner, and only saved from failure by its high quality. Some attempts have been made to produce a strong and safe flexible wire, the result being usually rather clumsy and as costly as the cheaper forms of permanent wiring. There would appear, however, to be a field for such material in connection with heating circuits. A disadvantage peculiar to all fixed surface wiring systems lies in the difficulty which is met with when redecorating walls and ceilings, particularly when papering.

The author then gave the following estimates of the cost per light of wiring in small private houses, complete with metallic lamps and simple pendants.

Screwed seamless conduit (steel) and 600 meg class non-association cable: Conduit 5s. 9d., Cable 5s. 9d., Fittings 5s. 9d., Labour 5s. 3d., Total £1 2s. 6d.

Brazed slip conduit with clamp continuity fittings: Conduit 5s. 6d., Cable 5s. 9d., Fittings 5s. 9d., Labour 4s. 3d., Total £1 1s. 3d.

Brazed slip conduit and 600 meg class non-association cable: Conduit 4s., Cable 5s. 9d., Fittings 5s. 9d., Labour 4s., Total 19s. 6d.

Brass-cased paper tube: Tube 3s. 6d., Cable 5s. 9d., Fittings 5s. 9d., Labour 4s., Total 19s.

Close joint slip conduit (steel) and 600 meg class non-association cable: Conduit 2s. 9d., Cable 5s. 9d., Fittings 5s. 9d., Labour 4s., Total 18s. 3d.

Wood casing and 600 meg class non-association cable: Casing 1s. 3d., Cable 5s. 9d., Fittings 5s. 9d., Labour 4s. 9d., Total 17s. 6d.

"Stannos" wiring (concentric): Cable 6s. 3d., Fittings 5s. 9d., Labour 1s. 3d., Total 13s. 3d.

Twin rubber and lead-covered cable: Cable 6s. 3d., Fittings 5s. 9d., Labour 1s. 3d., Total 13s. 3d.

Rubber and cotton flexible and button insulators: Cable 5s. 9d., Fittings 5s. 9d., Labour 1s. 3d., Total 12s. 9d.

600 meg class non-association cable and cleat insulators: Cable and insulators 3s. 6d., Fittings 5s. 9d., Labour 1s. 3d., Total 10s. 6d.

The Paper concludes with a detailed review of the new edition of the Institution of Electrical Engineers Wiring Rules (see ELECTRICAL ENGINEERING, May 11th, page 247). The author particularly criticises Rule No. 49*a*, providing for conduit to be earthed and metallically continuous throughout, and stating that slip socket conduit does not comply, some form of screw or grip fitting being necessary, and such fitting to be put on in a manner to secure the conductivity of the joint being equal to that of the tubing. In his comment Mr. Beauchamp says: "This regulation is far reaching and apparently puts the great majority of conduit installations beyond the pale of the Institution Rules—a somewhat serious matter; in the writer's opinion it is both undesirable and impossible to bar good quality slip pocket conduit and fittings for general house and shop work; admittedly, unless they are metallically continuous, the earthing regulation constitutes more danger than safeguard, although experience demonstrates that the danger is extremely small.

DISCUSSION.

Mr. S. E. FEDDEN (Chief Electrical Engineer, Sheffield) said that even with gas as cheap as it was at Sheffield there was no difficulty in having electric light adopted in houses of a rental of £30 per annum, provided they had not already been piped for gas, and if they could only get the builders to wire when erecting the houses. He had hopes they would get the £20 houses also. Although not an advocate of jerry work, he thought that some of the ideals of the regulations would have to be dropped in the future if the small houses were to be got at. The wiring of small houses could be reduced to from 8s. to 12s. to 4s. or 5s. per point by using slip tubing up inside the plaster of the walls, and wiring under the floors by boring the joists. The work in the joists was absolutely safe if the wires were placed far enough apart, and they need not worry about amperes per square inch. For many years he had indulged in the extravagance of 70/40 vulcanised flexible, as when he first went to Sheffield there was much trouble with flexible wires. But having got back the confidence of the consumers, he was now rather inclined to drop this expensive flexible and to go back to the cheaper one permitted by the Institution Rules. He did not think the question of earthing needed considering except in wet places, when he preferred screwed conduit connected to a good earth. He had known cases, however, where the use of voltage reducing transformers had increased the consumption instead of reducing it, owing to the enormous magnetising current losses. He thought the price of "Stannos" wire too high; he was sure that the manufacturers could afford to reduce it by about one half. He gave the following particulars of an estimate for a definite job as showing how "Stannos" wire came out: Wood casing with 600 megohm cable, £35. "I.M.E.A." flexible was £35. "Simplex" steel-armoured flexible, £41s. 10s. "Stannos" concentric with double wound transformers and earthed outer, £42 10s.

Mr. F. M. LONG (Chief Electrical Engineer, Norwich) said that fourteen years ago they started the free wiring of small houses in Norwich, and it had been entirely satisfactory. The larger portion of their 5,000 consumers were now wired in this way. Many houses of £16 and £10 yearly rental were dealt with. Nearly all the troubles with wiring were electrolytic, and were not caused by the overloading, consequently they had to differentiate between work intended for damp places and that to be used in dry places. In ordinary private houses much cheaper material could be used, and the wires were attached to the joists between the floors. With new houses that were being built, they tried to fix tubes on the walls for the switch wires before the plastering was done, but he had not found the close joint tube satisfactory for this work, as trouble arose from the moisture in the plaster. It was more satisfactory to use solid tube. With work of this sort, earthing was not at all necessary. He had found pure rubber insulation, double jacketed, the most suitable for flexible; it was less trouble and cheaper than vulcanised.

Mr. W. A. VIGNOLES (Chief Electrical Engineer, Grimsby) pointed out that the question of wiring on easy terms was an important matter, and might be discussed in connection with cheaper wiring. It seemed to him very necessary for every town in the kingdom to have wiring powers, and notwithstanding the failure of the conference with the contractors, he hoped the Council were bearing the matter in mind, and that steps would be taken to promote a Bill in the future. He did not think there was such a thing as a good slip joint conduit system. Every one was utterly bad, and ought not to be used under any pretence whatever. As Mr. Long, he had also largely used wires threaded through the joists. Single lead-covered wires were run some distance apart, and holes drilled in the centre of the joists, and the wires threaded through, tubes being put in to protect the wires where they came down to the switches. This had proved quite satisfactory. He used paper-insulated lead-covered wire, and simply taped the ends. He earthed the lead or conduit to the lead-covering of the service cable. He thought it was necessary to earth even in private installations, because frequently the gas pipes were left in, and the whole of the gas supply was not cut off, and it was very difficult to ensure that the workmen had not allowed the conduits or the lead-covered wires to touch the gas pipes. It seemed to him that the cost of wiring could be considerably reduced by the use of a double-wound transformer, and 25-volt lamps, in which case there was absolutely no necessity to use fuses of any kind.

Mr. F. AYTON (Chief Electrical Engineer, Ipswich) said he still pinned his faith generally to wood casing. In dry places a cheaper quality rubber wire could be used, and in damp places casing could be made reasonably safe by using porcelain roller insulators and coating the casing with a waterproof paint. The weak point in wiring work was the flexible. A very important point was the rating of switches, and it was one which ought to be taken up either by the Association or the Engineering Standard Committee. They should be rated on the wattage basis and not in amperes. They also wanted some standardisation in switches and ceiling roses in regard to the position of the entry holes for the wiring through the block. Standardisation could also be carried to wall-plugs: difficulty in getting interchangeability, especially with china plugs, which were easily broken. When sending round irons on approval, in every case he sent a Pragnell adapter, which enabled the consumer to use the light whilst he was trying the iron.

Mr. A. J. CRIDGE (Electrical Co., Ltd.) urged the necessity of not reducing quality too much in the effort to cheapen wiring. He also said that the assistant entrusted with the testing of installations should have common sense, and should not have so great an idea of his own importance as to enforce regulations in cast-iron fashion.

Mr. W. A. WALKER (Chief Electrical Engineer, Kettering) said that he had drawn up a schedule of prices for wiring houses, upon which any contractor could canvass, and for screwed conduit the price per point was 22s., against 22s. 6d. in the paper. This included pendants and lamps. He paid per point for wood casing 19s., against 17s. 6d. in the paper, but he thought the latter figure was too low. Was the wood treated with shellac, or was it plain?

Owing to the shortness of time, Mr. Beauchamp will reply in the Proceedings.

RAILLESS TRACTION IN BRADFORD AND LEEDS

THE trolley omnibus systems at Bradford and Leeds, which form the first trial of railless traction in this country, were both opened on Tuesday of last week, and although they have only been in service for little more than one week, are giving great promise, and showing every sign that the system has come to stay. The vehicles combine features of both the motor-bus and the tramcar. Current is supplied from overhead wires, but rubber-tyred wheels are used. The wires, which, where the going and return routes are the same, are four in number, consist in both towns of No. 0000 S. W. G. hard-drawn copper, and are carried in general on 18-ft. bracket arms, the two inside being positive and the two outers negative, so that between the former there is double insulation, and between a positive and negative treble insulation, and, of course, single insulation between the negative and bracket arm. These wires are correctly spaced and insulated by one ball and two links in the Leeds system, but in the Bradford system a twin straight line hanger of phosphor bronze has been adopted. The advantage of these is that they have a greater scrap value than if malleable castings were used. The Leeds track is about 4¼ miles in length, and the positive wires are divided into half-mile sections, as in standard tramway practice, but the negative wires run from end to end of the route, and are bonded to the existing tramrails. The Bradford authorities are experimenting with just over a mile of track, and have a Chamberlain & Hookham 200-ampere meter at the terminus for keeping a careful record of the current taken. The

FIG. 1.—CAR PASSING LORRY, SHOWING LONG REACH OF TROLLEY AT BRADFORD.

trolley poles are geared at their bases so that they run in absolute unison. Their length is 17 ft., and a deviation of 15 ft. on either side of the centre of the road is obtained. When in this extreme position, shown in Figs. 1 and 2, there is a tendency for the poles to be pulled off the wires, and this is lessened by the action of two springs, so arranged to cause the force pulling the trolley straight to be less the wider the deflection. The vehicle is driven by two motors rated at 20 b.h.p. at 500 volts, one for each wheel, of the Siemens interpolar traction type with shunted fields. The controller, made by the same firm, provides means for cutting out either motor, and is of the series parallel magnetic blow-out type, giving five running positions on the main barrel, two with the motors in series and field, full, and 50 per cent. shunted, and three with the motors in parallel and field, full and shunted 25 and 50 per cent. respectively. The reversing barrel contains the points for cutting either of the two motors in or out, or both in. The steering is arranged so that the vehicle will turn round in a radius of 12 ft. measured on the inner rear wheel. Two mechanical brakes are provided, operated by a pedal and hand lever, one acting directly on drum brakes upon the rear wheels,

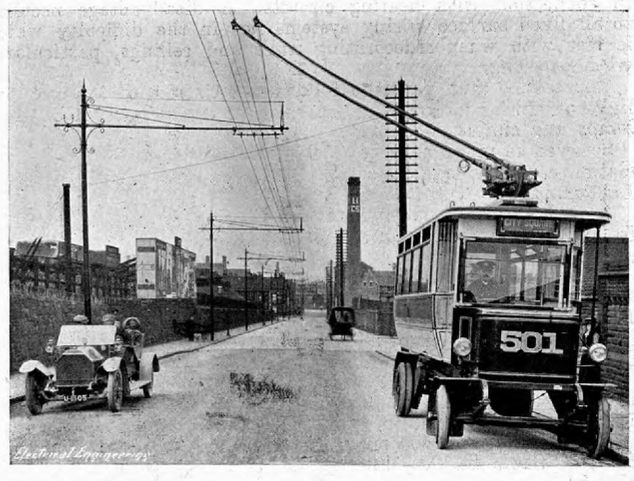

FIG. 2.—LEEDS RAILLESS CAR IN EXTREME POSITION.

and kept in the "on" position by a ratchet device on the hand lever, and the other acts on a countershaft. Each motor drives a countershaft through a double-reduction worm wheel, from which the drive is taken to one wheel by means of a sprocket and chain. Thus no differential gear is required. For running the cars in and out of the sheds at Leeds, a skate or contact arm, fixed under the car and arranged to fit the existing tramrails, takes the place of the overhead negative wire. At Bradford the overhead negative wire is run right into the sheds. All the handrails, &c., on the vehicles are insulated. The wheels are of the motor-omnibus pattern, with solid rubber tyres, the rear wheels being twin and the steering wheels single tyred. A trip along the whole route at Bradford showed how smoothly and quietly the cars ran. The roads are very good and undulate in places. They are partly sett

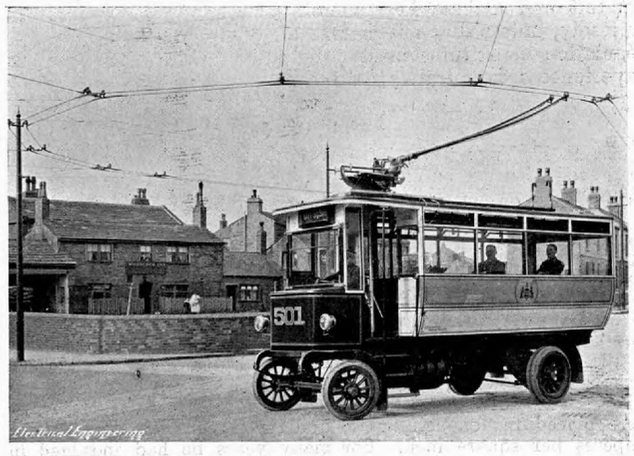

FIG. 3.—CAR ON TERMINAL LOOP AT LEEDS.

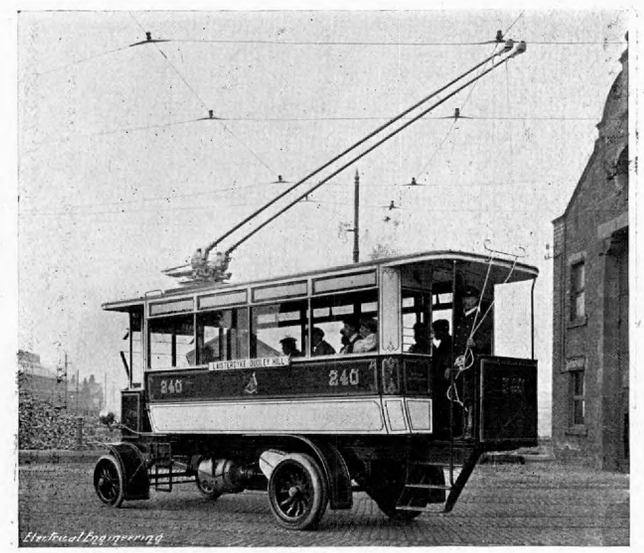
stones and partly macadam, so that the wear of the tyres should be satisfactory. The cars, which carry twenty-eight passengers, are very comfortable, being fitted with rattan spring seats arranged transversely, the interior fittings being of polished wainscot oak. The driver is well sheltered, the front platform being provided with adjustable side windows and hinged wind screen. In Leeds the termini are pro-

Hosted by Google

vided with loops, so that the trolley poles need not be taken off the wires, and the cross-over points have had to be very carefully designed, to prevent a short-circuit taking place. At the City Square loop a negative wire is simply erected by the side of the existing tramway wires, but in Bradford the poles are pulled off. The speed of the vehicle is about ten miles per hour. At present only one car is at work in each case. Both of these were supplied by the Railless Electric Traction Co., Ltd. (56 Moorgate Street, E.C.). We understand



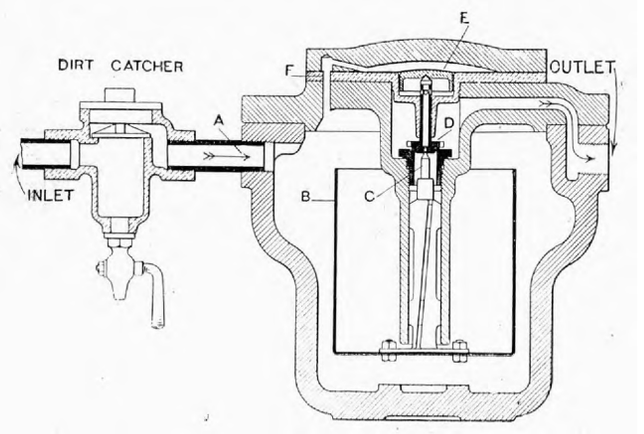


FIG. 4.—GENERAL VIEW OF BRADFORD CAR.

that the total number of cars on order is four. In conclusion, we must express our indebtedness to Mr. C. J. Spencer, General Manager of the Bradford City tramways, and Mr. J. B. Hamilton, General Manager of the Leeds City tramways, for putting at our disposal the photographs from which the accompanying illustrations are reproduced, and for the facilities afforded to our representative when visiting the installations.

THE RECORD STEAM TRAP

A NEW steam trap of the float pattern is being put on the market by Messrs. Gillespie & Beales (Amberley House, Norfolk Street, Strand). Its principal feature is that the bucket only contains a small relay valve, so that the main valve can be made of considerably larger size than in

SECTION SHOWING DETAILS OF RECORD STEAM TRAP.

most traps of this size as is actually opened and closed by the steam pressure. A section of the trap is given in the illustration.

The water enters at A and causes the float B to rise and close relay valve C. Above the main valve D is a diaphragm E the underside of which is open to the outlet by slight leakage past the valve spindle. The top side of the diaphragm is subjected to the same pressure as the steam pipe and trap, as a small hole at F admits steam from the inside of trap to top of diaphragm. It will be seen that the steam pressure acting on the top of diaphragm always tends to close the main valve D, which is held hard on its seat immediately steam or water under pressure is admitted to the trap. As more water accumulates the float B fills and sinks, causing relay valve C to open. Water which is under pressure is therefore admitted—through the hole in the spindle of the main valve—to the underside of diaphragm E putting it in equilibrium and free to deflect up or down. Immediately the diaphragm is in equilibrium, the pressure of water on the underside of the main valve D opens it and the water in the float is discharged. The float then rises and closes the relay valve C and, owing to the small leakage past the main valve spindle, the underside of the diaphragm is relieved of pressure, consequently the pressure on the top side immediately closes the main valve. It will thus be seen that the trap automatically adjusts itself to the pressure of the steam and in consequence, will work equally well at any pressure. An efficient dirt catcher is provided to prevent any possibility of grit getting between the valve and the seat.

ILLUMINATED TRAMCARS AT BRADFORD

WE illustrate here one of two illuminated cars which have taken part in the Coronation festivities at Bradford. The arrangement represents a crown upon a pedestal, the crown proper being in gold bronze suitably lined. The crown band is perforated and behind are fixed coloured celluloids and lamps representing jewels; on one side of the car is a ribbon with a ground work of royal blue and the words "Long Live The King" 1911, in bright gold, picked out with gold coloured lamps, also a shield in gold bearing the monogram "G.R.I." in white, red and blue lamps respectively. A ribbon on the opposite side of the car carries the words "God Save The Queen" 1911, and a gold shield with the monogram "M." in white. The whole of the devices on the car are picked out with suitably coloured lamps, there being in all 1,050 lamps used in the illumination of each car. The total height to the

ILLUMINATED TRAMCAR, BRADFORD CITY TRAMWAYS.

top of the Maltese Cross is 16 feet, the effect when the car is lighted being extremely brilliant. This device is one of the finest of its kind that has been attempted anywhere. The whole of the work of designing and preparing the cars was executed by the City Tramways Department.

Hartlepool Tramways Arbitration.—In the King's Bench Division on Wednesday last week, Mr. Justice Bray gave judgment on the legal point raised as to whether Messrs. Sellon & Ashby or the Hartlepool Tramway Co. were entitled to receive the purchase money for the Company's undertaking, which is being taken over by the Corporation. The facts were set out on p. 353 of our last issue. His Lordship held that the provisional order of the tramways, in view of the invalid transfer to the Hartlepool Co., still belonged to Messrs. Sellon & Ashby, and that the Corporation must pay the purchase money to them. All arrangements for giving the Corporation a good title must be made between the two gentlemen in question and the tramway company. Leave to appeal was given.

I.M.E.A.—Continued

INTERNAL COMBUSTION ENGINES WORKING ON THE DIESEL PRINCIPLE.

BY HENLEY L. HOWARD.
(*Chief Electrical Engineer, Barking.*)

On Wednesday the meeting was at Portsmouth. After the official welcome by the Mayor (Alderman Scott Foster), two Papers on Internal Combustion Engines were discussed.

The first of these, by Mr. H. L. Howard (Barking), dealt with the Diesel engine, of which the author is an enthusiastic advocate, and we print it below in slightly condensed form :—

The problem the station engineer is always up against is how to deliver a unit of electricity to the station bus-bars at a minimum cost, and although very fine figures are being put forward for both steam and gas plants, yet in the author's opinion these can be greatly improved upon by the adoption of Diesel plant.

It should be remembered that the fuel cost accounts for a very large percentage of the works' costs, and also that it is the only item that is capable of being materially reduced.

The standard Diesel engine of to-day is a single-acting four-cycle engine—that is, every fourth stroke is a working stroke, the cycle of operations being as follows :—

1st down stroke is the air-suction stroke, which fills the cylinder with fresh air.

1st return stroke compresses the above air to about 500 lbs. per square inch, thereby raising its temperature to about 900° Fahr.

2nd down stroke is the working stroke, fuel oil being injected into the cylinder and mixing with the compressed air already therein. The compression heat having ignited the oil, it burns and expansion of the gases follows.

2nd return stroke is the exhaust stroke, the products of combustion being cleared out, ready for the air-suction stroke.

It will be clearly seen from the above that, unlike the gas engine, the Diesel engine is not an *explosion* engine, for at every working stroke the fuel burns steadily as long as it is injected into the cylinder—every globule of the oil being surrounded by the air which atomises it. The quantity of oil burned varies with the load, and is regulated by the fuel pumps, whose delivery is directly controlled by a sensitive governor, there being no "hit and miss" method, as with gas engines. Whatever quantity of oil is injected into the cylinder, it enters one or two degrees before the dead centre, when it automatically ignites and continues to burn during a portion of the stroke. The Diesel engine, again, unlike the gas engine, knows of no such thing as a "rich or poor" mixture, has no incandescent tube, electric spark, or other extraneous igniting device, and pre-ignitions and misfires are an impossibility.

The external appearance of a vertical three-cylinder set of the latest type is shown in Fig. 1, while Fig. 2 is a section of the standard slow-speed type of engine. [We are indebted to the Diesel Engine Co., Ltd., 179 Queen Victoria Street, E.C., for the loan of the original illustrations.]

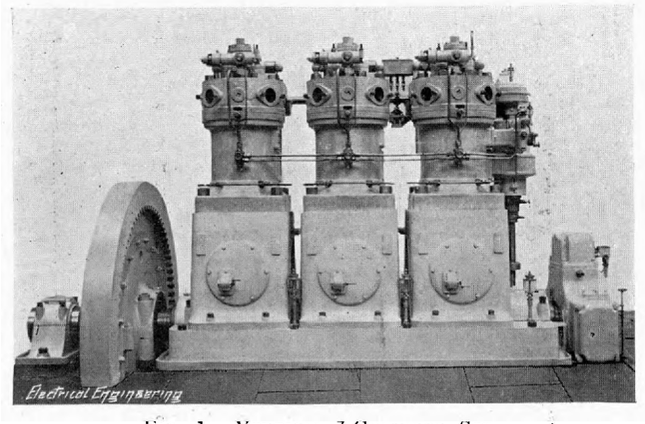

FIG. 1.—VERTICAL 3-CYLINDER SET.

The cylinder lining is of dense cast iron. This is set into the outer casing, the spacing between which and the lining forms a water jacket for the cylinder walls. This casing is cast in one, with the two legs of the standard A frame. This is heavily bolted to a stiff bed plate, carrying the main crank-shaft bearings. The cylinder is open at the lower end, the piston being of the trunk type. The different valves are arranged on the cylinder head, and are operated by cams and levers from the cam shaft.

The compressed air used for the injection of the fuel oil is stored in a steel air-bottle, at a pressure of about 800 lbs. per square inch, which is kept automatically charged with air by means of a two- or three-stage compressor, worked direct from the crank shaft. There are also two other air-bottles used for starting the engine.

A departure from the above standard engine is that put upon the market by the Nederlandisch Fabrik of Amsterdam. This engine is fitted with a cross-head and guide, and has a comparatively short piston. It is also provided with a distance piece, between the cylinder and the crank chamber. In the author's opinion, for high-power vertical engines, it is the line that will eventually be followed.

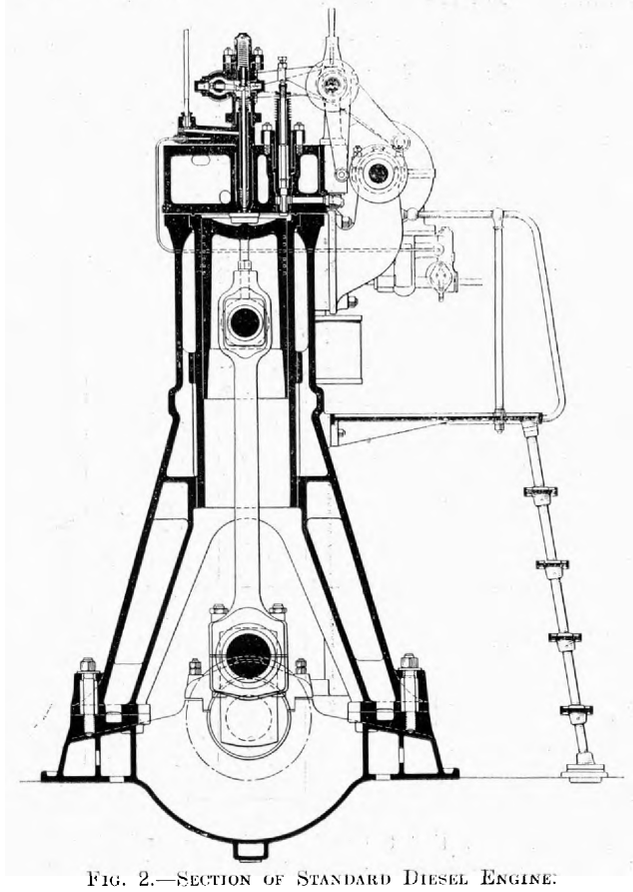

FIG. 2.—SECTION OF STANDARD DIESEL ENGINE.

One of the most interesting examples of high-power Diesel engines is the installation at Halle, where two 1,600 B.H.P. sets of the horizontal double-acting, four-stroke type, constructed upon the lines of the Nuremberg gas engine, have recently been started up.

The first question one is generally asked, when talking of this engine, is : "What is the possibility of the price of fuel oil fluctuating within wide limits?" and then : "What guarantee is there of a reliable and continuous supply?" The answer to both these questions is that, as petroleum is found in so many parts of the world, and as many new oil-fields are being opened up, the above factors cannot vary over very wide limits, and any such variation should compare favourably with the variations in coal. The oil fuel most generally used is the residue from crude petroleum, after the lighter spirits and oils have been distilled, and is commonly known as "petroleum residue." This oil runs about 240 gallons to the ton, and is generally either Texas or Roumanian oil. The author has recently fixed up a contract on behalf of his council, for a supply up to January 1st, 1913, at 37s. 6d. per ton, delivered into tanks at the Electricity Works, Barking.

Another factor in the fuel oil question is the possibility of using the by-products from the gasworks, viz., gas oil tar, and gas tar oil.

The former is the by-product from carburetted water gas plants, where gas oil is used to enrich the gas for illuminating purposes. It has a calorific value of about 16,500 B.Th.U. per lb., and is being extensively used on the Continent. The latter is the by-product from the distillation of gas tar. The author recently made a careful inspection of some plants using gas oil tar, including a large double-acting tandem four-cycle engine, and a twin-cylinder horizontal two-cycle engine, the sets working with a 10 per cent. addition of crude petroleum—and was perfectly satisfied as to the practicability of using such fuels; so much so, that a 600 B.H.P. engine is now being built to his specification by the Diesel Engine Co., Ltd., to run on either petroleum residue or gas oil tar, and will be in commission this autumn.

Some diagrams taken from the same engine running on different kinds of fuel are given in the Paper. In one the combustion was seen to be late, and to be attended by

Hosted by Google

violent explosions. This diagram was taken when running entirely off creosote oil. Another diagram gives the ordinary Diesel diagram, and is a clear illustration how good combustion and smooth running can be obtained by the special arrangements made for mixing 5 per cent. of crude oil residue with the creosote oil.

In dealing with fuel costs it will be well, perhaps, to take first the actual guaranteed consumption of the 600 B.H.P. engine mentioned above, using petroleum residue having a calorific value of 18,000 B.Th.U., at 37s. 6d. per ton.

Table I.

Guaranteed Fuel Consumption and Cost.

Load.	Lbs. per kw.-hour.	Pence per kw.-hour.
12½% over	0·58	0·112
Full	0·58	0·122
3/4	0·61	0·122
1/2	0·69	0·132
1/4	1·01	0·202

Table II. gives some details of Diesel plants that have been in operation some years.

pack, and such items as packings, gauge glasses, cocks, valves, fittings, etc., do not occur, excepting in a minor degree. The cost of engine-room stores, therefore, is reduced to a minimum, being considerably less than with either steam or gas plant.

There appears to be a feeling amongst engineers that although the Diesel engine can compete with other forms of prime mover for small outputs, it is quite out of the question when large power stations are under consideration. That this is an entirely erroneous idea will be seen by the following comparison.

The Brighton works is taken as an example of a large steam-driven station, and one of equal output for both Diesel and gas plant respectively is compared with it. The output in each case being 10,800,000 units generated, 9,000,000 units sold, with a load factor of 21·8 per cent., and a maximum load on generators of 5,900 kw. The present capacity of the Brighton works is 10,200 kw.

The capital spent on the existing buildings and foundations is £109,300. Reducing this to £37,162 to make allowance for the fact that the existing buildings are large enough to house 30,000 kw. of steam plant, and adding the capital spent on boilers, turbo-alternators, switchgear, etc., the author arrives at £19 52 per kw. as the capital expenditure, and 0·424d. per unit generated for the capital charges (estimated at 8 per cent. of the capital). Adding to this the works costs (0·70d.) per

Table II.

Table I. shows that the engine maintains its high efficiency until well below half-load. The average load upon the engine is somewhere between half and three-quarters of the full load, and a comparison of fuel consumptions at such loads brings out still greater the advantages of the Diesel plant. The fuel consumption is independent of the time during which the engine is run, being the same for half as for twenty-four hours per day. There are no stand-by losses whatever.

The engine can be started with absolute certainty in a simple manner by means of compressed air, without the least danger, at any time within a minute of entering the engine room, even after a legthy period of rest. Again, the fuel costs are in no way dependent upon any other factor than that of the price of fuel, and the guaranteed consumption per kw.-hour; there being no question of the price to be obtained for by-products to be considered, as with Mond gas plants.

The amount of cooling water used is extremely small. It is circulated round the cylinders at the rate of about 4 gallons per B.H.P. hour, the outlet temperature not exceeding 120° Fah. The make up water should in no case exceed 2½ per cent. This is a most important consideration to those engineers who, like the author, have to take town water from the main. Compare this item with steam plant, especially cooling water for the condensers of turbine plants, or, with producer plant, for gas engines.

The Diesel engine is entirely automatic in its action, preparing its own fuel, stoking itself, and rejecting the waste gases. One man per shift (exclusive of switchboard labour) can easily do all that is necessary in a Diesel power station, up to 1,000 kw. capacity.

The expenditure under this heading is found to be very small. Taking an actual case of three power stations, having installed 1,500 B.H.P., a sum of £117 was expended between them during the last completed year, some of these engines having run practically continuously. This sum corresponds to 1s. 6d. per B.H.P. per annum, which the author considers a very liberal allowance indeed, and it is certainly much too high an average for large sets.

Records of several years' working of engines under various conditions show a consumption not exceeding 4 grammes of lubricating oil per B.T.U. generated, which at 1s. 8d. per gallon amounts to 0·019d. per unit. There is no auxiliary apparatus, such as boiler house plant, condensers, fed pumps, etc., or gas producers, scrubbers, etc. There are no glands to

unit sold, total costs, exclusive of management, comes out at 1·124d. per unit sold.

To obtain approximately the same capacity as the above with Diesel plant, it would be necessary to instal seven sets, each of 1,450 kw. capacity, making a total of 10,150 kw. The author estimates the capital cost per kw. installed at £14·38, and on the same basis as before 0·311d. per unit sold. The works costs he estimates would be 0·262d. per unit sold, giving a total of 0·573d., as against 1·124d. for the steam plant. The corresponding figures per unit generated are 0·477d. for Diesel, and 0·927d. for steam.

For a comparison with gas plant, the same number and size of sets have been taken as for the Diesel plant. The particulars, costs, and other details have been taken from the Paper of Messrs. Andrews and Porter, read before the Institution of Electrical Engineers in February, 1909 (see ELECTRICAL ENGINEERING, Vol. V., p. 169). The capital cost per kw. installed works out at £17·68, and the works costs per unit generated at 0·312d., as compared with 0·218d. for the Diesel plant, and the total cost, exclusive of management, at 0·604d. per unit generated, as compared with 0·477d. for the Diesel plant.

The author next deals with the question whether the Diesel engine could with advantage take the place of motor-driven sub-stations. It cannot, he says, be seriously suggested that a Diesel sub-station is undesirable or impracticable in a large city. There is in London a 100-b.h.p. set in the basement of one of the largest drapery establishments in Oxford Street, also a 1,100-b.h.p. sub-station in the city at Cannon Street, and a still larger one at Charing Cross. There is also another large one in course of erection at Lambeth.

Finally, from a table compiled for the author by the Maschinenfabrik Augsburg-Nürnberg Co. upon the conditions appertaining to South Wales, on the basis of capital charges of 4 per cent. interest, 7 per cent. depreciation, and 1 per cent. maintenance in all three cases, and a load-factor of from 90 to 100 per cent., he arrives at the following comparisons for small plants:—Cost per b.h.p.-hour: Diesel plant, 0·1635d.; steam plant, 0·173d.; gas plant, 0·178d. This is assuming one engine of 600 b.h.p., and one of 150-160 b.h.p. engine in all cases.

In conclusion the author thanks the President, the Diesel Engine Co., and the M.A.N., and many other station engineers for their kind assistance, both with data and drawings.

INTERNAL COMBUSTION ENGINES FOR POWER STATIONS: GAS ENGINES AND PRODUCER PLANTS.

By R. M. Carr.
(*Chief Electrical Engineer, Leek.*)

In this Paper the author confined himself entirely to gas engines and producer plants, particularly with stations of comparatively small capacity. In small manufacturing towns, he pointed out, where there is a good demand for power, the average price obtained is so low that it is almost impossible for a small undertaking to cater for a heating and power load with steam plant. He admitted, however, that the advertised figures of some makers of gas engines, while they may possibly be true with the conditions under which the tests were taken, are seldom, if ever, realised under ordinary working conditions, and with the fluctuating load of the average central station. On the other hand, electrical engineers are inclined to magnify the troubles which exist with gas engines.

On the question of capital cost, he contended that, below a certain capacity, the gas-driven station costs less than steam, while, as the capacity increases, the figures are reversed in favour of steam, when everything is taken into consideration. For stations up to 500 kw. capacity he estimated that a steam station would cost £55·1 per kw. (including £19·1 for land, buildings, &c.), and a gas station £40 per kw. (including £12 for land, buildings, &c.). Between 500 and 1,000 kw. he gave the corresponding figures at £37·9 and £33·4 respectively, and from 1,000 to 2,000 kw., £29·5 and £30·5.

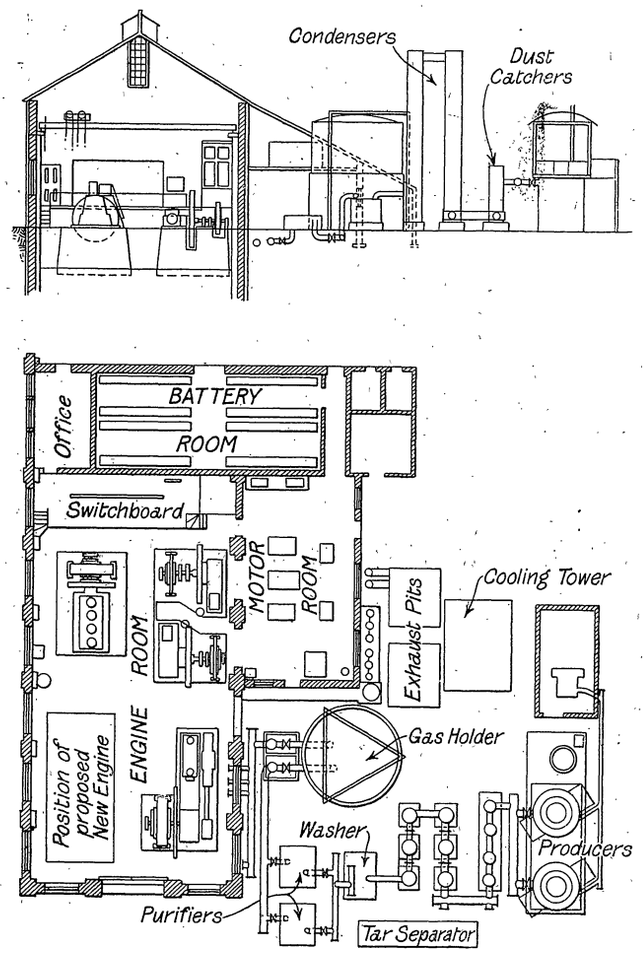

Fig. 1.—General Lay-out of Leek Station.

In the author's 420 kw. station at Leek, which is entirely gas driven, the capital expenditure was as follows:—

		£
Engines and dynamos		6,567
Producers and cooling and cleaning plant, including pipe-work		2,070
Switchboard and electrical auxiliaries ...		1,392
Accumulators		719
Travelling crane		189
		£10,937
Per kw. installed	£26	
Land, buildings and foundations		£5,413
Per kw. installed	£13	
Total cost per kw. installed	£39	

The gas plant is of the "Wilson" pressure type manufactured by the Horsehay Co., Ltd., and consists of two producers, each nominally of 300 b.h.p. capacity, but which are capable of 25 per cent. overload without forcing to the point of inefficiency. Water bottoms are provided for continuous running. The gas passes from the producers through an omnibus main into four cylindrical boxes where the greater part of the dust is deposited. The cooling operation is carried out by means of a series of concentric tubes, the gas passing between the outer and inner tubes. The cooled gas is then washed, the tar which is extracted flowing into a tar separator, and the gas passes through sawdust purifiers, leaving the last of the tar in the process. The purifiers are connected in parallel in order that one may be cleaned without shutting down. A small holder is provided, not as a reservoir, but merely as a mixer and governor. From the holder an 18-in. main is provided, and separate services connected to two horizontal, Otto cycle, single-cylinder gas engines, each of 100 b.h.p., one four-cylinder vertical engine of 200 b.h.p., and one Körting, two-cycle engine of 275 b.h.p. Each engine is coupled direct to a D.C. generator. The station is further equipped with a 400 ampere-hour battery, and the usual balancer, boosters, and other accessories.

Dealing next with running costs, the author pointed out that the fuel costs of a gas-driven plant are considerably below those of a steam plant, but repairs and maintenance of engines will be somewhat greater after a few years of running for gas engines than for steam. On the other hand, he maintained that the repairs to a well-designed producer plant should not be anything like so great as those of boilers. In the following table he compared the average figures of three gas-driven municipal undertakings, the averages of several other gas-driven undertakings, and the average of all the municipal undertakings of a capacity of under 1,000 kw. Where the figures given were per unit generated, 20 per cent. has been deducted from the number of units in order to allow for losses, &c., and to bring all to the basis of costs per unit sold.

Table I.—*Comparison between Gas and Steam Stations under 1,000 Kilowatts Capacity.*

	Averages of Municipal Gas Undertakings.	Averages of Other Gas Stations.	Averages of Steam Stations.
Capacity in k.w. ...	314	632	600
Units sold per annum	299,210	874,720	502,980
Costs per Unit Sold in Pence.			
Fuel	0·28	0·26	0·53
Oil, waste, water, and stores	0·06	0·04	0·06
Wages of workmen	0·26	0·16	0·30
Repairs and maintenance	0·19	0·22	0·28
Total works cost	0·79	0·68	1·17
Rent, rates, and taxes	0·10	not available	0·12
Management and establishment charges, insurance, etc.	0·41	not available	0·34
Total costs	1·30	—	1·63

The average price for fuel in the municipal stations quoted is 11s. per ton delivered, either coke or bituminous coal being used.

Regarding the general running of producer plants, a great number of the failures, the author thought, must be attributable to lack of knowledge and experience on the part of the attendants. For this, he said, manufacturers are somewhat to blame, as the rosy picture often presented of a suction plant, which takes care of itself, requiring only a few buckets of coal per hour, is not often realised. The secret of success in producer gas plants is systematic cleaning, particularly in bituminous plants. Suction plants, burning anthracite and coke, up to, say, 200 or 300 h.p., he continued, are now an acknowledged success where ordinary care is taken, and some thousands of horse-power are now in successful operation, but except in case of very small plants, they are not very desirable for central station work. Anthracite is expensive, except in districts in close proximity to the collieries where it is produced, and a suction plant is not very suitable for sudden variations in load. For a station of anything over 300 or 400 kw. capacity, a pressure plant with a small holder is preferable. On a fully loaded

Hosted by Google

suction plant 1 lb. of anthracite would be required per B.H.P. hour, which at 30s. per ton would cost, for, say, a 300 h.p. engine, 4s. per hour for fuel, while a pressure plant burning bituminous coal would require 1½ lbs. per B.H.P. hour, which at 10s. per ton for the same size of plant would work out at 2s. per hour. Another advantage which the pressure plant has over the suction type is that it is much more elastic in operation. When installing suction producers a separate plant should be installed for each engine, but with a pressure plant the producers can be connected in parallel through an omnibus main.

The disposal of the effluent from the washer of a producer plant often presents a difficulty, especially in inland towns. The Sanitary Authority often objects to its going into the sewer in the state in which it leaves the washer, and the County Council naturally objects to the pollution of rivers and streams. When the water is turned into a sewer care should be taken that it is not hot, otherwise vapours may arise from it and pass the gratings in the streets. The author has recently met with opposition from the County Council to the effluent finding its way into a stream, but is getting over the difficulty by circulating the water by means of a pump and tanks, and treating it with lime. This throws down the sulphur compounds in the form of mud, and only a very small quantity of the treated liquor will be allowed to flow into the drain from time to time.

The author finds no difficulty in dealing with the tar in settling tanks, and in selling it at from 6s. to 11s. per ton, according to the percentage of water it contains. The sawdust scrubbers are cleaned every week, and the tarry sawdust is burned under the vertical boiler; with the addition of about one ton of coke breeze dust per week, it is sufficient to raise all the steam required for the blower engine and the producers. The only trouble the author has experienced from tar in the engines was in one engine, the design of which caused the gas to pass through the valves at a very high velocity; this velocity had the effect of dropping what tar remained in the gas, and after a few weeks these valves became clogged. This was got over by fixing a cast-iron box containing a series of grids of fine brass gauze near the gas inlet, and these grids are changed and cleaned every week.

To silence the exhaust, the author recommended exhaust boilers, where the plant is large enough to warrant this. These boilers are at the same time able to raise sufficient steam for all purposes required on the producer plant. He deprecated the silencing of the exhaust by means of water in the exhaust pipes, as the sulphuric acid formed by the mixing of the water with the sulphur in the gas causes rapid deterioration of the pipes. At Leek a system of exhaust pits is employed.

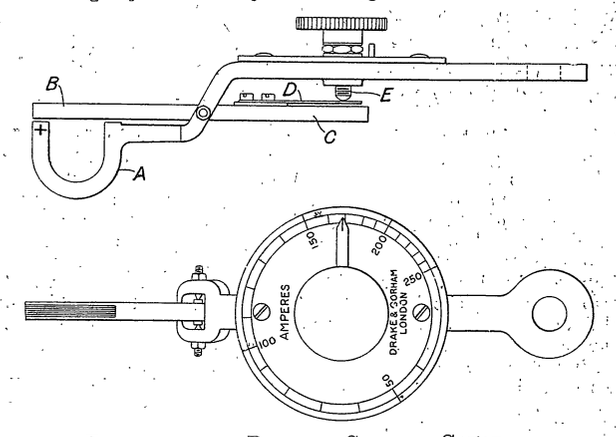
With most of the modern types of gas engine the author has found that a sufficiently good cyclic regularity can be obtained for alternating work, but close governing must be insisted upon, and this is a point the importance of which has not yet been fully realised by some manufacturers. He also criticised a tendency on the part of some manufacturers to overrate their engines slightly, an important thing to guard against, as a gas engine cannot be overloaded.

In conclusion the author drew up a statement of the capital and running costs of a gas driven station of 1,000 kw. capacity. The complete cost of this plant, based upon manufacturers' quotations, worked out at £30·6 per kw. installed, and the estimated works costs at 0·64d. per unit sold.

Our special correspondent wires us that a long discussion, chiefly devoted to Mr. Howard's Paper, disclosed considerable diversity of opinion. Mr. Charles Day, of Mirrlees, Bickerton & Day, Mr. Mulholland, of M. A. N. Co., and Mr. R. J. Kaula, of Messrs. Willans & Robinson, spoke for the makers. Mr. Day in particular said that the large consumption of lubricating oil noticeable in the early days no longer took place. Formerly some of the lubricating oil volatilised in the cylinders, and helped to lessen the apparent fuel costs. He admitted that engines exceeding 150 h.p. per cylinder introduced complications, increasing the cost of upkeep, a point which was subsequently taken up by engineers of large steam stations.

Mr. A. BLACKMAN (Chief Electrical Engineer, Sunderland Corporation), and Mr. S. E. FEDDEN (Chief Electrical Engineer, Sheffield), gave figures to show that their capital and works costs were enormously less than the figures given by Mr. Howard for Diesel engines in the Brighton example.

Mr. L. ANDREWS (Key Engineering Co.) complained bitterly that the quotation from his 1909 Paper was misleading, as Mr. Howard had included cost of ammonia recovery plant, but not credited revenue from sale of by-product. He gave curves to show that guaranteed consumptions for gas engines were lower than those for Diesel engines, even at half load.



Mr. HORACE BOOT had been disappointed with the results at Chichester. Repairs and attendance, he said, must be very high if engines were to last more than three or four years, and he complained of cost of replacement of parts.

Mr. H. L. DIXON (Chief Engineer and Manager, Leatherhead and District Electric Supply Co.), on the other hand said he had had four or five years' success with Diesel engines. Although he employed cheap labour, repairs were only about £2 per year.

The discussion will be reported at length in our next issue.

THE FRISBY CURRENT GAUGE

A DEVICE for the determination of the current passing in any cable or conductor without making any connections, has been brought out by Messrs. Drake and Gorham, Ltd. (66 Victoria Street, S.W.). The appliance, which is to be known as Frisby's Patent Mechanical Current Gauge, is remarkably simple in principle, and is illustrated here. The instrument is placed with the U-shaped bend A surrounding the cable carrying the current to be investigated, and the armature B shut down, when, if the screw E is screwed back to the position where the pointer attached to it is at zero on the scale, it will adhere to the pole piece on account of the lines of force set up in the surrounding iron by the current in the cable. The apparatus is then held steady, and the screw gradually advanced till the tension on the flat spring D is sufficient to pull it off. The pointer will then read direct on the scale the current in amperes. The magnetic circuit is built up of laminations. The size of the cable and the nature of the insulation has practically no effect, and the readings are but slightly affected by armouring on the cable. The instrument should be of considerable use in distinguishing between current-carrying cables in trenches, and for estimating the current in feeders at a feeder pillar. For this purpose it may be clipped round the cables themselves where they are single, or even round the porcelain tube fuses. The size at present made will take cables, &c., up to 1⅛in. external diameter, and is graduated up to 250 amperes. Other sizes are in course of preparation, and a simpler form is made without graduations, in which a permanent magnet is used in conjunction with a compass needle to detect the direction, as well as the presence of, a current. In this case the spring is set so as just to balance the pull of the permanent U-shaped magnet on the armature.

ELEVATION AND PLAN OF CURRENT GAUGE.

Coronation Honours.—The Hon. C. A. Parsons, F.R.S., and Prof. J. A. Ewing, F.R.S., Director of Naval Education, have been created K.C.B. on the occasion of the Coronation.

Junior Institution of Engineers.—The summer meeting of this institution is fixed for July 29th to August 5th, and includes visits to Felixstowe, Ipswich, Norwich, and Cambridge.

Obituary.—We regret to record the death, owing to an accident last week, of Mr. P. S. Sheardown, Electrical Engineer to the Dublin United Tramways Co., who was well known in the electrical circles in Dublin.

Junction Box Explosion.—A junction box explosion occurred in Trafalgar Square on Monday evening, and a small portion of the pavement was damaged. The occurrence had no connection with the catching fire of some decorations near by at about the same time.

Laying a Foundation Stone Electrically.—After the Coronation electrical communication was employed for the King to lay the foundation stone of a Fishermen's and Sailors' Home in Newfoundland, by pressing a button at Buckingham Palace. The current impulse which set in action the mechanism for laying the stone travelled over special Post Office lines and the Anglo-American Co.'s cable, which lands at Heart's Content, Newfoundland.

ELECTRICITY IN THE CORONATION ILLUMINATIONS

THE outstanding feature of the illuminations in London last Thursday and Friday nights was the enormous use made of electricity, far exceeding anything of the kind that has been attempted before, and it is chiefly due to the foresight and enterprise of a small group of electrical manufacturers and dealers, who prepared, in such large quantities, the special fittings, wiring material, and devices that were required. So great was the demand for current that over a week before the Coronation day the Westminster Electric Supply Corporation deemed that the capacity of their mains and feeders in the neighbourhood of Piccadilly would be fully taken up with the connections already applied for, and would not entertain further applications, and the same applied in the case of the St. James's and Pall Mall Electric Light Co. in the Pall Mall district. In the City, although the illuminations were on a grand scale, the position was more favourable, as in this case, of course, the special load was almost entirely in substitution for, and not in addition to, the ordinary private lighting load.

The brightest spot in the City was the space in front of the Bank of England, the Mansion House, and the Royal Exchange, which was illuminated almost entirely by lines and festoons of 8 c.p. lamps of various colours arranged in the specially made up forms of "strip" which have been so popular on the buildings, and outlining many handsome devices and mottoes. Probably the most ambitious scheme was the decoration of the Bank of England. Here there were three large gilded wreaths, two encircling the letters "G" and "M," and the third over the main portico enclosing the Royal cypher. At the ends of the building were two oval medallions mounted on scroll bases, with the Royal monogram in the centre. Each of these devices bore the imperial crown studded with 48 amber lights. There were 16 eight-pointed stars with 17 lights on each arranged along the coping of the roof, and the six central windows and the cornice of the main portico were outlined with ruby tipped lamps with white centres, the remainder of the festooning, outlining, and entwining being carried out with white-tipped lamps with ruby centres. The front columns were entwined with lamps fitted with white-petal floral reflectors, and ten large flambeaux projecting from the roof were illuminated with metallic filament lamps, the effect closely resembling the real flame. Altogether, there were about 5,000 lamps and four miles of cable fed by three special mains put in by the City of London Electric Lighting Co. These were divided into four main circuits, two one each side of the three-wire system, which supplied altogether 86 sub-circuits with an average of 46 lights on each, and the whole was controlled from a D.P. watertight distributing switchboard. This was the finest individual electrical display, and took only 150 kw. The work was carried out by Messrs. Piggott Bros., of Bishopsgate, who were also responsible for many other displays. The scheme for the Royal Exchange was divided, a certain amount of gas being used, but around the pillars and along the festooning electric lamps were prominent. The building occupied by the London and Liverpool and Globe Insurance Co., at the corner of Lombard Street and Cornhill, also had a fine display; large set-pieces depicting the national emblems on each side of the building and the dome were outlined with clear lamps. A view of this and the Royal Exchange from a short way down Poultry towards Cheapside was magnificent. The exterior of the Mansion House was very striking with electric torches as well as gas flambeaux on the roof and electric lamps were coiled round the Corinthian pillars in alternate colours of amber and purple. All the windows and cornices were outlined with electric lamps, and stretching right across the front of the building was a crystal device, "Long Live the King," with illuminated portraits of their Majesties on either side. Some very conspicuous clusters of red, white and blue flambeaux were to be seen on the Gresham Life Assurance Co. The London Joint Stock Bank was very much to the fore in Princes Street, the ground floor and the top cornice being lined with 120 frosted electric lamps spaced 12 in. apart. Four windows were also completely lined. The centre of the building was occupied by a large floral device measuring 6¼ ft. by 7 ft., with a green background and green lamps, the letter "G" being enclosed in the device, the total number of lights amounting to 115. Above this device a crown 3¾ ft. by 4½ ft. was erected, consisting of 57 frosted lamps with a gilded background, the jewels being picked out in their correct colours. Two smaller crowns 2 ft. square fixed on each side of the central device each contained 39 lights, the whole scheme consisting of 650 lights. Lombard Street was most picturesque; from end to end tall archways of amber lamps lining floral festoons hung across the street, while the walls on either side were festooned with lights, and many of the old signs of the Lombards were illuminated. The effect, which was very great, was added to by the narrowness of the street. The rival illuminants were to be seen fighting their battle over again on the City side of London Bridge, where the electrically illuminated Pearl Life Assurance Co. was one stream of light, and quite outshone its rival opposite in the Fishmongers' Hall. The former comprised two 6 ft. by 8 ft. crowns, each studded with 170 amber lights, and four letters with altogether 320 lamps. There were also eight double-light flambeaux. The whole building was lined out with about 3,000 ft. of Pixielite strip, supplied from 30 circuits and controlled from one switchboard containing four 100 ampere main switches with two double pole fuses per switch. This installation was executed by Messrs. S. Hammond and Co., 107 Cannon Street, and the power, about 40 kw., was taken from the City of London Co.'s mains.

London Bridge was artistically transformed in keeping with the other parts of the line of route by Messrs. Duncan, Watson and Co. At intervals of 20 yards on each side of the bridge 20 lattice columns were erected, with two Venetian masts between each two columns. Ruby lamps adorned the top of each mast, and a number of plain lamps lined the top of the columns. Festoons of 5 c.p. plain lamps about 12 in. apart hung between the columns and masts on twin strip, and below these were festoons of artificial wistaria. The current was supplied by the City of London Company at 220 volts A.C. from a peak load feeder, which is not in much demand during the summer. As the power was only available on one side of the bridge, a pair of 37/15 cables had to be taken under one of the arches to the other side. The current was distributed by a cable on each side of the bridge, supported by raw-hide suspenders hung from a steel wire which ran direct into a combined switch and fuse box at every second column, the two sides being balanced on the three-wire system. The arch at Temple Bar presented a sort of canopy lined with lights shining through lattice-work, and stretching on either side of the Griffin.

A very fine show was given by Messrs. Coutts' Bank in the Strand, where the firm's crest was very prominent in the centre of the building, its three crowns shining out like diamonds, and besides three glass medallions bearing initials, the doorway and the pillars were outlined with electric bulbs.

Beyond having to take away the Standard lamp columns from the centre of the road at the junction of Trafalgar Square and Whitehall, and replacing them with the "Beck" lamp, which was suspended across the road, the City of Westminster did very little illuminating. Of the shipping offices in the vicinity of Cockspur Street the display most prominent and pleasing to the eye was that of Oceanic House. There a model of the *Olympic*, the largest liner afloat, showed its port-hole and saloon window lights, with the footnote, "*Olympic*, 45,000 tons," in large gold letters. At the top of the building an enormous white star formed of many hundreds of white lamps shone out and had a luminous anchor on either side.

All the other shipping offices in this area were also aglow with various devices. A very picturesque display was that of Messrs. Hampton's, in Pall Mall East, where gilt lanterns of the seventeenth century with electric lamps shining through the talc material, hung from the first tier of seats, making a magnificent spectacle. Another feature was a large crown picked out at the top of the building in emerald, pearl and ruby lights, whilst incandescent lamps outlining the whole building gave a splendid finish to a really beautiful display. Visitors to Clubland were not disappointed after the brilliance of the City, for here, although perhaps on a smaller scale, a very high standard of artistic excellence was maintained. The Reform and Carlton Clubs were studded with lights, but for brilliance the new premises of the Automobile Club, which was completely outlined with frosted lamps, with a huge illuminated crown, was the most prominent, but for effect mention must be made of the new Oxford and Cambridge Club, which was outlined with lamps representing their colours. Another display to be noted was that given by Messrs. H. S. King, the Indian bankers, who exhibited two glowing mottoes, "Vivat Rex" and "Vivat Imperator." Although not on the line of route, we may here mention the Piccadilly Hotel, which was picturesquely outlined with about 3,000 ft. of Bro-ite strip. The main pillars were circled alternately with red, white and blue lamps, whilst a large crown on each side of the building and a number of flambeaux completed a scheme which was one of the many ably carried out by Messrs. Siemens Bros. Dynamo Works, Ltd. Especially noticeable also was the brilliant golden display of the Criterion Restaurant. Quite an original design was carried out by the Royal Academy, where, over the main entrance, was to be seen a crown of Chinese lanterns lit up with electric globes, and the inside of the archway was outlined with many rows of them. The line of route along Piccadilly from Hyde Park Corner to St. James' Street approached the City very closely for brilliance. The entire length was lined with 7,000 lamps, taking altogether about 2,000 amperes. These lamps hung in two rows between the masts on each side of the road. The top row, approximately straight, consisted of 16 c.p. lamps

SILVERTOWN MOTORS

AUTOMATIC PRESSURE REGULATORS

(British Patent No. 19992 of 1908.)

FOR A.C. AND D.C. GENERATORS BOOSTERS, ETC.

We are supplying these Regulators in large numbers, particularly for COLLIERY, STEEL WORKS and other POWER STATIONS where the FLUCTUATIONS in LOAD are RAPID and SEVERE, and where such apparatus is required to work for months on end without attention. Being PRACTICALLY FRICTIONLESS, these Regulators are ACCURATE, RAPID and CERTAIN in their action and are REASONABLE in Price.

enclosed in gold cloth balls of 7 in. diameter; the lower row, which formed the line for evergreen festoons, having 8 c.p. lamps. Each mast carried an evergreen garland and also a crown at the top, both of which were illuminated. The current was taken at about eleven different points from the Westminster Electric Supply Corporation, and fed direct into "Cantie" combined switches and fuses, of the cast-iron watertight pattern, fixed on to stout masts. The clubs and residences facing the Park along this route were all richly decorated and illuminated with equal effect, none standing out for special mention until Hyde Park Corner was reached. Here the windows and outlines of Apsley House and the adjoining residence of Lord Rothschild were picked out with electric lamps, the devices exhibited being a crown and the motto, "Long Live our King and Queen" on the former, and the Royal monogram and crown with electric torches on the latter. Of the buildings away from the line of route, Messrs. Wolland Bros., 95 Knightsbridge, was another for which Messrs. Siemens Bros. Dynamo Works was responsible. The installation comprised about 400 ft. of Bro-ite strip, which supplied the following devices: two large crystal medallions with Royal quarterings, four crystal stars, two transparencies of the King and Queen, all electrically illuminated. There were also twelve large gilt wreaths with central floral illuminations, and the complete line of lights had neat floral attachments. Beside these, there were 10 sets of shields with flags and tridents, and nine Colonial ovals. Selfridge's gave a patriotic display of shields bearing the arms of various monarchs of England. Above these were smaller shields bearing the arms of different Possessions of the Empire, which were draped with flags with a crown at the top, and surrounded with electric lights. A large gilt portcullis glowed between each of the columns. Numerous electric flambeaux about 6 ft. high extended round the building, and an enormous illuminated crown resting on a shield, with large initials studded with electric bulbs, towered above the building.

Accustomed as Portsmouth is to Naval displays, no finer sight has ever been witnessed than the illumination of the combined fleets at Spithead last Saturday night. The firing of a rocket gave the signal for switching on, when every unit all along the line simultaneously twinkled with light from hull to masthead, and in this case the reflection of the water produced that dancing effect so much admired by the advocates of gas. The flags at the top of the masts of the flagships glowed red, and the tripod masts of the Dreadnoughts showed up especially well. The "Eiffel-towers" of the American ship *Delaware* stood out with a weird effect. At the signal "All lights out," the most imposing spectacle of modern times, which will live long in the memory, especially of our foreign visitors, brought the Coronation festivities to a delightful and most fitting end.

In conclusion, it is interesting to note the advantages and disadvantages of electrical illumination compared with gas. The gas shimmering effects in crystal devices cannot be obtained by electricity, but on the whole the electrical designs were very much more effective, especially in exposed positions, where, in many cases, especially on Thursday night, half the gas-jets were blown out, and made a stronger appeal to the observer's nose than to his eyes. From an artistic point of view, moreover, electricity proved to be a more suitable medium for securing the individuality which was so noticeable in a number of instances. The gas effects appeared to be rather stiff and stereotyped.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ARC LAMPS.—A catalogue of arc lamps for photographic purposes has just been issued by the Globe Electric Co., Ltd. (11 Farringdon Avenue, E.C.). Special outfits are included for reproduction, projecting, and copying, with various accessories.

ALUMINIUM.—Some of the uses of aluminium in chemical industry are set forth in a leaflet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.)

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

HOLOPHANE GLASSWARE.—A card from Simplex Conduits, Ltd., gives in a convenient form the latest prices of holophane standard "Stiletto" prism reflectors.

ELECTRIC WINDING PLANTS.—A book in German from the Allgemeine Elektricitäts-Gesellschaft contains particulars and illustrations of a large number of main shaft electric winding plants which the firm have installed. A pamphlet accompanying this describes their latest form of depth indicator and safety device.

Turin International Congress for the Applications of Electricity.—The following have been appointed as delegates to represent the Institution of Electrical Engineers at the Congress which is to be held in Turin in September, 1911:—Mr. S. Z. de Ferranti, Colonel R. E. Crompton, Mr. W. Duddell, Dr. R. T. Glazebrook. Mr. R. Kaye Gray, Mr. R. Hammond, Major W. A. J. O'Meara, Mr. A. Siemens, and Dr. S. P. Thompson.

ARON ELECTRICITY METER

THE annual meeting was held at Winchester House on Thursday last week, Mr. H. Hirst, Chairman of the Company, presiding. After the notice convening the meeting had been read, the Chairman said:—

"I take it that you have read the report and balance sheet as presented to you (ELECTRICAL ENGINEERING, June 15th, p. 338). I hope you have looked at the figures with the same amount of pleasure that they have given to your directors. They show the healthy development and progress of our business. Comparing this year's report with last year's, I single out the following items for comment. First, the most interesting item of gross profit on trading, amounting to over £44,000. This is nearly £9,000 in advance of last year. The amount received from dividends on investments is reduced, owing to the fact that the expansion of our business drained our liquid reserves to the utmost previously to our debenture issue. We had to realise these reserves during the year, and, I regret to say, at a loss. No blame can be attached to your directors for this loss, as we kept these reserves in trust securities, and you are all familiar with the fact that all trust securities in this country have receded in their value to an unpleasant standard. I refer to it not only on account of the items on the debit side of the profit and loss account, namely, £87 6s. 5d. and £85, but more on account of the fact that we have had on a previous occasion to write trust securities down by an amount of between £700 and £800. On the debit side of the profit and loss account I wish to point out that we have depreciated this year more by about £1,600 than last year, and the additional expenses are due to the recent debenture issue, which necessitated calling in the old debentures, and paying the premium on them. The management charges are of course increased, but not out of proportion to the increased business. As regards the figures on the balance sheet, on the credit side we have increased stock and outstanding account; but your directors are satisfied that the increase is normal in proportion to the increase of business. The large amount of cash at our disposal is, of course, the residue of the recent debenture issue. On the debit side of the balance sheet I would like to refer to the increased nominal capital. We have not issued any additional capital; we have only asked for the power to do so. This was a necessary provision to meet the possible—I may say probable—desire of the new debenture holders in due course to avail themselves of their option of converting their debentures into ordinary shares. I am happy that we are at last in a position to pay a dividend to the ordinary shareholders, and I personally thank them for the patience they have shown. I think the outlook is such that they may enjoy continued participation in our prosperity. We shall continue to be conservative in our policy, and I hope you approve of our recommendation to put £5,000 to reserve account and use £7,000 of this year's profits in writing off a portion of the costs of the debenture issue. I personally hope, and I think I am justified in doing so, that the profits we are now making may continue, and that the business we have established may prosper further to enable the directors to distribute in the future satisfactory dividends to both classes of shareholders. As regards the business itself, there is very little now to say. The meter business is carried on on the same lines as before, and our increased output has strengthened our power to compete in the world's market; our organisation, thanks to the supervision and hard work of Professor Aron, is being more and more perfected every year, and the loyalty and interest in the business of our staff is an asset of which we can be proud. Concerning the taximeter business, we are pleased with the ever-increasing number of instruments that are being placed on the streets. It may be pleasant news to the shareholders to learn that we have hitherto used the total revenue from this branch of our business towards writing down the expenses and cost of the instrumnets we hire out, and none of the revenue has so far been used in arriving at the figure which we record as our trading profit. By this conservative policy, we hope in years to come to create a valuable annual contribution towards the dividends we hope to pay. I now have much pleasure in moving that the report and accounts for the year be received and adopted."

In reply to a question, the Chairman said that a subsidiary company had been formed to work the taximeter business of the Aron Co., as it was felt that the meters and taximeters formed distinct departments. The profits went to the Aron Co.

The report and accounts were then adopted.

The Chairman then proposed that a further dividend of 5 per cent. for the half year, making 6 per cent. for the year, be paid upon the preference shares, and a dividend of 6 per cent. on the ordinary shares for the period to March 31st, 1911. Mr. Roger Wallace, K.C., seconded, paying a tribute to the work of Prof. Aron, and the proposal was carried.

Col. R. E. Crompton and Mr. Barclay Heward were re-elected directors, on the motion of the Chairman, seconded by Mr. Harry Kahn.

The auditors having been re-elected, the Chairman announced that the dividend warrants would be sent out on the 24th inst.

Votes of thanks to the Chairman and Prof. Aron closed the proceedings.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 22, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

12,926/10. **Series Transformer Switchgear.** G. BERRY. A modification is described of the Berry series transformer system for saving light load losses (see ELECTRICAL ENGINEERING, Vol. III., page 197), designed to prevent the switch mechanism after acting automatically to short-circuit the supplementary transformer upon failure of the main transformer during low load, from being afterwards automatically moved into a position to open the short-circuit upon the relay re-assuming the position corresponding to low load. For this purpose, one winding of the main operating solenoid is arranged to be closed by a relay through a circuit that will be rendered non-effective upon failure of the main transformer, by being arranged to be closed across the secondary of the main transformer between the ends thereof, and the fuses in the conductors connecting such ends to the secondary mains. The other winding is connected across the low-tension circuit, and the fuses for the primary and secondary of the main transformer are weaker than those of the spare transformer. One figure.

13,224/10. **Motor Starters.** THE ADAMS MANUFACTURING CO. (*The Cutler Hammer Co.*) Improved means are afforded by this invention for retaining the contact arm of a solenoid starter in the "on" position after the operating solenoid has ceased to be energised, by the provision of a separate retaining magnet engaging directly with the contact arm. Three figures.

13,694/10. **Transformers.** THE BRITISH THOMSON-HOUSTON CO. (*General Electric Co. of America*). An improved method of winding transformers so that a maximum degree of ventilation is obtained between the windings, applicable to windings symmetrically arranged round the core. The inner layers of the winding are arranged with less radius of curvature than the outer ones, providing air ducts between the layers. Two figures.

27,174/10. **Suspension Insulators.** SOCIÉTÉ VEDONELLI, PRIESTLEY & CIE. A chain for the suspension of high-tension insulators, in which each porcelain insulator has a core perforated by two holes at right angles to each other and has downwardly sloping wings. The insulators are connected by rings of iron wires, so that the wings of one insulator react between those of the next below, giving protection against rain and minimising leakage. Five figures.

29,726/10. **Converters.** CROMPTON & CO., LTD., and H. BURGE. Alternating current is converted into continuous for the supply of variable speed motors by a motor-generator set consisting of a rotary converter driving a continuous-current generator wound for the same voltage, and connected in series with it and provided with a reversing field regulator, so that current can be delivered at any voltage from zero to twice that at the brushes of the converter. One figure.

132/11. **Lamp Filaments.** G. LÜDECKE and IMPERIAL WORKS (BRIMSDOWN), LTD. A method of decarbonising, consolidating, and sintering metal filaments carried upon a support in an open-tube furnace, supplied with a reducing atmosphere introduced into the furnace at such pressure as to completely drive out the air. The gases are mixed in such proportion as to effect decarbonisation, but not to permit of combustion either within the furnace or at the open end. The mixture may contain 90 per cent. of nitrogen or inert gas, and the reducing agent may be hydrogen freed from water and oxygen, or ammonia may be used in relatively small proportions. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: GILBERT ARC LAMP CO. and DOWDELL [Electrodes for] 21,157/10; SCHMIDT, 29,506/10; MOUL (*Korting*) 741/11.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: LARMUTH [Cable-making machinery] 21,101/11.

Dynamos, Motors, and Transformers: HEATHER [Safety methods of hoisting and lowering with induction motors] 11,336/10; HITCHCOCK and MUTTER [Self-acting motors] 13,984/10; AKT.-GES. BROWN, BOVERI, ET CIE. [A.C. commutator machinery] 14,391/10.

Electric Ignition: SIMMS [Distributors] 1,893/10; SBOROWITZ [Igniting devices] 10,978/10.

Electrometallurgy: BLASBERG [Electroplating apparatus] 19,236/10; PAULING [Electric furnace for treating gases] 3,251/11.

Incandescent Lamps: COWPER-COLES [Lamp bulbs, globes, &c.] 13,282/10; HALLIWELL and JEREMIAH [Means for locking lamps in their holders] 14,429/10; CITY OF LONDON ELECTRIC LIGHTING CO. and PEARD [Supporting, raising, and lowering apparatus] 19,795/10; WESTINGHOUSE METALLFADEN GLUHLAMPENFABRIK GES. [Metallic filament lamps] 22,852/10; MAYES [Lamp cap] 24,216/10; NEPLE [Inclinable lamp supports] 24,818/10; SMITH and KAATZ [Regulator for] 29,700/10.

Meters: SCHOTT and GEN [Electrolytic meters] 10,792/11.

Switchgear, Fuses, and Fittings: ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Motor-starting devices] 13,335/10; RANKIN [Electric controlling apparatus] 13,453/10; McGEOCH and W. McGEOCH & Co. [Switches]; PRICE [Prevention of sparking in controlling circuits] 14,380/10; BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Voltage regulation] 21,041/10; DR. PAUL MEYER AKT.-GES. and KUHNEL [Mercury contact electric switches] 28,657/10; LOHAY [Apparatus for electrical control at a distance] 29,378/10.

Telephony and Telegraphy: NEUHOLD [Automatic telephone systems] 22,959/10; AITKEN and BRITISH INSULATED & HELSBY CABLES, LTD. [Telephone switchboards] 25,502/10† SIEMENS and HALSKE AKT.-GES. [Automatic telephone circuits] 27,026/10.

Traction: SHAW and GREEN [Detachable power handle for controllers] 16,017/10; SEFTON-JONES (*Oesterreichische Daimler-Motoren Ges.*) [Conductor supports] 3,747/11.

Miscellaneous: HARRIS [Electric detonators for blasting] 10,717/10; ESSER and HODGKINSON [Electric lighting for cars, cycles, etc.] 19,532/10; WILLIAMSON [Electric alarms] 22,642/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Instruments: HARTMANN and BRAUN AKT.-GES. [Hot wire] 10,056/11.

Telephone, &c.: GIRARDEAU [Receiving and transmitting apparatus] 11,999/11; SOC. DES ÉTABLISSEMENTS GAUMONT [Phonic relays] 12,576/11.

Batteries: CHEMISCHE FABRIK GRIESHEIM-ELEKTRON [Regeneration of] 12,040/11.

Electric Ignition: KETTERING, 11,292/11.

Miscellaneous: SOC. DES ÉTABLISSEMENTS GAUMONT [Energy relays] 15,744/10; KREGLEWSKI [Regulating device for transforming diffusers] 3,146/11; AKTIESELSKABET HOVLANDS RADIO-TELEGRAPH [Electric condensers] 12,976/11; FRIEDREICH [Supporting devices for electric illuminating bodies] 13,026/11.

Restoration of Lapsed Patents

530/07. **Copper Refining.** L. JUMAN. This patent, which expired due to the non-payment of renewal fees, has been restored. The specification, which was abstracted in ELECTRICAL ENGINEERING, February 2nd, 1911, covers a chemical process for obtaining a copper precipitate from a copper salt solution.

Application for Extension of Term

809/98. **Telephone Exchange Automatic Calling Devices.** W. P. THOMPSON (*Strowger Automatic Telephone Exchange*). The Automatic Electric Co. will shortly apply for an extension of the term of this patent.

Opposition to Grant of Patent

30,602/09. **Separators for Primary Batteries, &c.** P. MARINO. Opposition has been entered to the grant of this patent, which deals with the construction of separators for primary batteries and secondary cells, by a process of treating the fibrous material for use as separators.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

15,838 of July 3rd, 1897. **Printing Telegraph Systems.** H. A. ROWLAND. This patent relates to improvements in telegraphy, and constitutes a method of transmitting messages by modifying the impulses of an alternating current so that the number and sequence of the impulses will represent a signal, which is then transmitted over a line and used in any desired form.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: J. BROCKIE, 5,555/06.

Distribution Systems, &c.: BRITISH THOMSON-HOUSTON CO. and E. B. WEDMORE [Electric distribution] 4,878/05; A. G. BLOXAM (*J. Goffin*) [Electric insulation] 5,049/05.

Dynamos, &c.: C. A. PARSONS [Dynamo electric machines] 5,907/02; H. PIEPER [Dynamo electric machines] 4,504/05.

Electrometallurgy, &c.: S. COWPER-COLES [Electro-deposition] 4,668/05.

Incandescent Lamps: J. McFARLANE and H. WATSON, 4,700/05.

Switchgear, &c.: R. C. CLINKER [Regulating electric currents] 5,831/02.

Telephony, &c.: M. KOTYRA [Telegraphs] 5,183/03; J. WILKINSON and J. D. LYNCH [Ships' telegraphs] 5,698/06.

Traction: F. E. WARD [Electric railways] 5,323/02.

Miscellaneous: L. W. YAGGY [Coin-freed apparatus] 4,990/99; J. & C. HOLT and J. W. POWELL [Lifts and cranes] 5,819/02; C. E. GROUSELLE and V. E. MANOUVRIER [Electric time alarms] 12,629/03; CROMPTON & Co. and C. CROMPTON [Electric fans] 4,727/05; W. C. HILL [Electric bells] 5,304/06; F. W. HOWORTH (*J. W. Holman*) [Electro-magnets] 5,371/06.

Hosted by Google

THE TELEPHONE TRANSFER

IN the House of Commons last week, in moving a formal money resolution upon which to found a Bill authorising the transfer of the National Telephone Company's undertaking to the State, Mr. H. Samuel, the Postmaster-General, gave a short history of the events which led up to the purchase agreement of 1905. In mentioning that the Company's undertaking is to be purchased upon what is generally known as "Tramway Terms," *i.e.*, without any sum for goodwill, he called attention to the special cases of Portsmouth and Brighton. In these two places, in respect of which municipal licences were granted, which will expire in 1926, the Company's licence was extended to expire at the same date. Consequently, the Company can claim goodwill payment in respect of the licences at Portsmouth and Brighton.

Continuing, the Postmaster-General stated that provision is being made for very large developments in the use of the telephone subsequent to the transfer to the State. At the present time the Treasury is authorised to spend £2,000,000, but he now asked for an additional £4,000,000, over and above the sum that will be required as the purchase price of the Company's undertaking. The Post Office had been watching very closely the development of the telephone system established in the United States, where all the chief officials of the Post Office telephone department had recently been visiting. A system of travelling scholarships had recently been established, which would enable Post Office engineers to go to the United States for considerable periods in order to make a minute study of the telephone there. Sweden also had been recently visited, and experiments were about to be carried out with automatic and semi-automatic exchanges. With regard to the telephone rates, no general revision would take place until the price which would have to be paid to the National Company was settled. It was hoped to arrange a tariff which would enable the system to show a moderate profit.

As to the staff, it had been decided to take over the whole staff, no matter what their length of service might be; their pay in many cases would be greater than that they were now receiving, and in no case would it be less, "unless their rate of pay had been abnormally raised by the Company in the last two years, in view of, or in connection with, the transfer."

He was opposed on several grounds to the suggestions that had been made that a telephone authority should be created on the lines of the Port of London Authority. One important reason was that such an authority could not be fully representative without being too large to be workable. It would be necessary for the small users to be represented as well as for the large, and again, it was not impracticable to work the telephone system as distinct from the telegraph system.

After a brief discussion, the resolution was agreed to, and the Bill is to be circulated with a memorandum dealing with the terms on which the staff will be dealt with on transfer.

Judgment by Court of Appeal

The Master of the Rolls and Lords Justices Farwell and Kennedy gave judgment yesterday in the appeal of the Postmaster-General against the decision of the Railway and Canal Commissioners, which appeared in our issue of June 1st, p. 307.

The Master of the Rolls, in allowing this appeal, thought that the notices with regard to plant, land, and buildings were good, and with respect to the word unsuitable, he thought, with all respect to Justice Lawrence, that he had put too narrow a construction on the case, and he agreed with Sir James Woodhouse that both parts of the notices were sufficiently indicated in general terms in the form of agreement, considering the early date on which they had to be given. He thought that with regard to the second part of the notice, the word quality did not stand alone, but that a quantitative meaning was also plainly understood in the text of the agreement. Lords Justices Farwell and Kennedy, who read separate judgments, concurred in the main with the above. The appeal was accordingly allowed.

LOCAL NOTES

Barrow-in-Furness.—We regret that the note in our last issue referring to the accounts of the electricity department at Barrow-in-Furness was not accurate. The gross profit for the year was £8,028, and after meeting interest and sinking fund, there was a net profit of £705 18s. The number of units sold increased from 1,130,092 to 1,249,163. The works costs were reduced from 0·912d. to 0·099d., and the total costs from 1·249d. to 1·231d. per unit.

Bexhill: *Electricity Accounts.*—There was a net profit of £561 upon the electricity undertaking last year, compared with £859 in the previous 12 months.

Chester.—A report has been prepared by Mr. J. E. Britton (Borough Electrical Engineer), recommending the utilisation of the old Dee water-mills for generation of current. Another expert is also to be consulted.

Clacton-on-Sea: *Electricity Accounts.*—There was a loss of £362 upon the working of the electricity undertaking last year.

Dawlish.—Electric supply from a small new generating station was inaugurated last week. At present the plant consists of one 40-h.p. engine and dynamo and a battery.

Dudley: *Electricity Accounts.*—After meeting capital charges and £500, the first instalment of the costs of the arbitration in reference to the price of tramway current, there was a loss last year upon the electricity department of £1,206.

Elland.—*Supply to Greetland.*—The Electricity Committee have refused the terms of the Greetland for the supply of electricity, but are willing to give a bulk supply at the boundary if a minimum payment is guaranteed.

Finchley: *Electricity Accounts.*—There was a net profit of £1,588 on the electricity department last year compared with £378 in the previous 12 months.

Halifax: *Price of Gas and Electricity.*—Some time ago a sub-committee was appointed to consider the possibility of a mutual arrangement as to prices of gas and electricity, but at the last meeting of the Corporation, it was announced that no decision was arrived at. The Chairman of the Electricity Committee expressed the opinion that there was not the slightest chance of the two Committees ever agreeing to any principle.

London: *L.C.C. Tramways.*—Traffic has been commenced on the new line from Battersea Park Road over Battersea Bridge to Beaufort Street, Chelsea.

Luton: *Electricity Accounts.*—The accounts of the electric lighting department for the past year show a net profit of £3,127 after meeting capital charges. The number of units sold was 2,360,009 and the total maximum supply demanded 1,310 kw.

Oldham: *Electricity Accounts.*—A net profit of £1,300 has been made against £2,203 for the previous year. There had been an increase in the lighting revenue but the units sold for traction had decreased. The gross profit was £20,143, of which £7,940 was absorbed by capital charges.

Shoreditch.—The Lighting Committee have recommended that the agreement with the Great Northern and City Railway for the auxiliary supply of electricity to the Council be extended for a further two years.

South Shields: *Electricity Accounts.*—Mr. J. H. Cawthra, Borough Electrical Engineer, in his report for the past year's working of the electricity undertakings, states that there is a profit of £1,414 15s. after meeting capital charges, compared with an adverse balance of £106 in the previous twelve months. The revenue from power supply increased by 70 per cent. during the year. The works costs were 0·57d. per unit against 063d., and the total costs, including capital charges, were 1·66d. against 1·85d. per unit in the previous year

Sunderland: *Electricity Accounts.*—The position in Sunderland is considerably improved this year owing to the recovery of the shipbuilding trades, &c., and reductions in the generating cost. A profit of £1,189 has been made against last year's deficit of £1,126.

Torquay: *Paignton Tramway.*—It is expected that the new tramway to Paignton will be opened in a fortnight.

OSRAM-LAMPS

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Aldershot.—The Council are inviting tenders for a 135-kw. Diesel engine and dynamo. Particulars from Borough Electrical Engineer, and tenders by July 4th.

Australia.—Tenders are invited by August 16th by the Deputy Postmaster-General, Brisbane, for 9,910 yards of paper-insulated, lead-covered cable, 3,960 yards of paper-insulated, lead-covered cable taped with brass ribbon, 3,520 yards of silk and cotton-insulated, lead-covered telephone switch-board cable; 320 miles of covered wire, etc. Copies of specifications at 72 Victoria Street, Wesminster, S.W., or 73 Basinghall Street, London, E.C.

Battersea.—Tenders are required for 440 street lanterns for metal filament lamps. Particulars from Borough Engineer, Lombard Road.

Belfast.—A circulating water pump and motor driven air pump are required by the Electricity Committee. (See advertisement on another page.)

Bispham.—A Local Government Board inquiry was held last week into an application for a loan of £9,180 for electric lighting. Mr. W. J. Speight has prepared a scheme for the Council.

Canada.—There is an opening for electrical machinery in connection with the water power scheme at the North Saskatchewan River, near Prince Albert. The name and address of the engineers to the work is on file at 73 Basinghall Street, London, E.C.

Cardiff.—The Electricity Committee require cables, economisers, induced draught plant. Particulars from Mr. Ellis, City Electrical Engineer, and tenders by July 14th.

Carlisle.—Application is to be made to the Local Government Board for a loan of £3,000 for the purchase of a chapel to be converted into an accumulator sub-station.

Eccles.—Tenders are required by July 17th for an electrically driven centrifugal pump. Particulars from Borough Electrical Engineer, Patricroft, fee one guinea.

Halifax.—A loan of £2,000 is to be taken up for new services.

Hammersmith.—Cable extensions to Messrs. Clark's lead mills are to be put in hand at an estimated cost of £868.

Leyton.—Tenders are required by July 6th for the construction of a condenser pit, foundations, cooling towers, &c., for the electricity works. Particulars from Town Clerk.

Mansfield.—The Council have under consideration the question of extending the supply of electricity to the urban district of Mansfield Woodhouse.

Salford.—Tenders are required for a 35 kw. belt-driven continuous-current generator, by July 3rd. Particulars from Borough Electrical Engineer, Frederick Street.

Swinford.—The Council invite tenders by July 10th for suction gas engine plant and dynamos, storage battery and accessories, switchboard, overhead lines, and street lamps. Particulars from Consulting Engineer, Mr. L. J. Lawless, 27 Castlewood Avenue, Rathmines, Dublin.

Torquay.—Application has been made for a loan of £5,000 for additional plant.

Worcester.—A Local Government Board inquiry was held last week into an application for a loan of £3,375 towards the cost of substituting polyphase plant for part of the single-phase plant in view of the increasing power load.

WIRING

Ayr.—Additions to Academy buildings at an estimated cost of £12,000

Belfast.—New buildings for Queen's University. W. H. Stephens & Sons, 13 Donegal Square.

Cardiff.—National Museum. Architects, Smith & Bremer, 2 Gray's Inn Square, W.C.

Chelmsford.—Tenders are invited for electric lighting of St. Mary's Church. Particulars from Chancellor & Son, Duke Street, Chelmsford.

Dundee.—New Training College, Park Place. T. Martin Cappon, 32 Bank Street.

Dunfermline.—Additions to the Townhill School.

East Cowes.—School buildings. County Education Office, Newport, I.W.

Edinburgh.—Alterations at Royal Infirmary, Lauriston. W. Thorburn, Works Department.

Haslingden.—The Board of Guardians have decided to apply for borrowing powers for £1,480 for the installation of electric lighting in their buildings at Pikelaw. New Council School.

Hemel Hempstead.—Public elementary school for 250 scholars. W. R. Locke, Town Hall.

Heston and Isleworth.—Tenders are invited by July 5th for the electric lighting of certain schools. J. G. Carey, Surveyor, Council House, Hounslow.

Hull.—New hospital for the Guardians.

Wigan.—Elementary School at Billinge.

TENDERS RECEIVED AND ACCEPTED

Carlisle.—The tender of the Premier Accumulator Co. (£1,755) for a battery, booster and switchgear and £77 per annum maintenance for ten years has been accepted.

London: *Hammersmith.*—The tender of the Alphons Custodis Chimney Construction Co., Ltd., for a chimney stack at the electricity works at £392 15s. has been accepted.

The following tenders were received for the supply and erection of high-pressure steam and feed-water pipes, exhaust steam feed-water heater and circulating pipes, steam valves and feed-water heaters:—E. Danks, £1,192; Foster Bros., £1,405; J. Spencer, £1,458; Babcock & Wilcox, £1,560; Aiton & Co., £1,568; Stewarts & Lloyds, £1,625; Edward Le Bas & Co., £1,635; Stewarts & Lloyds, £1,685; J. Wilson & Co., £1,699 10s.; Ashwell & Nesbitt, £1,980; Wembley Heating Co., £2,160. The tender of Messrs. Aiton has been accepted at £1,568.

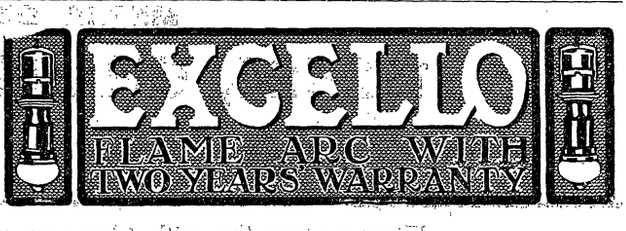
Mansfield.—The tender of Messrs. Bertram Thomas for switch-gear has been accepted at £166.

South Shields.—We are informed by Mr. J. H. Cawthra, the Borough Engineer, that the figure given under the heading of South Shields on page 337 of our issue for June 15th, is not quite accurate.

Worcester.—Subject to the Local Government Board sanction, the Electricity Committee recommend the acceptance of a tender of the Electric Construction Co. for a 200-kw. motor generator at £640, and that of the Phœnix Dynamo Co., for a 125-kw. alternator at £250.

Messrs. Siemens Bros. Dynamo Works, Ltd., in addition to those already published, have obtained the following orders for illuminations:—P. & O. Steam Navigation Co., Northumberland Avenue, W.C.; Fitch & Son, Bishopsgate Street, E.C.; Russian Bank, 61/62 Gracechurch Street; Royal Institution of Great Britain, 21 Albemarle Street; Thames Iron Works; Royal Yacht Club. As usual, all the fixing and erecting was sublet to electrical contractors.

MISCELLANEOUS BUSINESS NOTES



Price of Copper.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £58 15s. to £59 5s. per ton (last week same).

Bankruptcies.—The public examination took place last week of W. H. Illingworth, Electrical Engineer, of Pellon Lane, Halifax. No arrangement was come to and the matter was left in the hands of the official receiver.

Dissolution of Partnership.—S. A. Sillem, F. A. Donnison and W. Sillem, carrying on business at 17 Morwell Street, Tottenham Court Road, as the Phœnix Electric Heating Co., have dissolved partnership. Debts by S. T. Cox, who will carry on the business.

Coronation Arrangements.—Messrs. Siemens Brothers Dynamo Works, Ltd., inform us that their energetic move in keeping their Supplies Department at 39 Upper Thames Street, E.C., open all night on Wednesday last was much appreciated by contractors, who kept the staff busy right through the small hours. We may safely say that more than one of the large shows would have been incomplete if there had not been some electrical supply firm to turn to in the dead of night.

Sociedad Anonima "La Electricidad."—A new company has just been formed under the above title in Sabadell, Spain, for the purpose of taking over the business of "Frêne Agazzi y Cia," and manufacturing all classes of electrical material, gas engines, pumps, mill-machinery, water-turbines, &c. The

Hosted by Google

capital is 1,000,000 pesetas: Don Emilio Frêne becomes managing director of the new company.

The Linolite Company.—The annual outing of the works and office staffs was held on Saturday last. Mr. Ackermann (engineer and manager), Mr. R. L. Matthews (assistant manager), and Mrs. Ackermann being present. The party journeyed to Chertsey-on-Thames, and luncheon and tea were served at St. Anne's Hill by permission of Sir Albert Rollit, who kindly conducted the party round his grounds, and over his residence. The party drove back *via* Staines, Hounslow, and Hammersmith.

APPOINTMENTS AND PERSONAL NOTES

Mr. E. Taylor, Fourth Engineer in charge of the Hammersmith Electricity Works, has resigned upon receiving an appointment under the Board of Trade. A successor is to be advertised for at a salary of £130 rising to £150 per annum.

The Council of the National Electrical Manufacturers Association have elected Mr. F. H. Nalder to the post of Chairman, as, in consequence of Mr. W. H. Butler having for a time severed his connection with the Electrical Manufacturing Industry, he has resigned the Chairmanship of the Council, which resignation the Council accepted with much regret.

An experienced electrical engineer with a knowledge of English and German is required for estimating work for large contracts. See an advertisement.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Thames Ironworks Co.—The report for 1910 states that the company's electrical department has been kept busy throughout the year in the manufacture of the "Thames Snap" switch which has been adopted by the Admiralty, and with other Admiralty orders for electrical fittings. An electrical installation for the Metropolitan Water Board at their Walton pumping station has also been completed. The work on the electrical installation of H.M.S. *Thunderer* is much advanced.

R. Waygood & Co.—At the recent annual general meeting, the chairman stated that the past year had been an exceptionally busy one, and it would have been possible to pay a higher dividend than the 6 per cent. proposed in the report. But the Board thought it better to conserve the profits rather than divide up to the hilt. The contracts recently completed or received include six lifts for H.M. the King of Siam, the Bank of England, Crystal Palace, British Museum, Harrod's Stores, Holborn Restaurant, and William Whiteley & Co.

Marconi's Wireless Telegraph Co. (New York).—The report of this company for the year to January 31st states that, after providing for the usual 10 per cent. depreciation on stations and experimental work, the result shows that the company is more than self-supporting, in spite of fierce and undue competition. A reference is made in the report to the judgment of Mr. Justice Parker in the Chancery Division here, which decided that the British Radio-Telegraph & Telephone Co. had infringed the Marconi Patent No. 7,777, and the opinion is expressed that if a similar judgment to the above was obtained in America, the position of the company would be greatly strengthened. An identical patent is held in America, and the American Marconi Co. are taking steps to sustain it.

Hobart Electric Tramway Co.—A dividend of 6 per cent., free of tax, is recommended.

Provincial Tramway Co.—Interim dividend of 8d., less income tax, on the ordinary shares for the June half-year.

J. G. White & Co.—The accounts for the year to Feb. 28th show a net profit of £91,466, against £64,802 in the previous year. The sum of £15,000 is transferred for the formation of a dividend equalisation reserve, and a dividend of 12 per cent. is declared on both ordinary and preference shares, compared with 10 per cent. for the previous year. This is the maximum dividend to which the preferred shares are entitled. An extra dividend of 10s. per share is recommended on the ordinary shares.

Canadian General Electric Co.—A quarterly dividend of 1¾ per cent. is declared on the ordinary shares for the three months to June 30th.

Victoria Falls & Transvaal Power Co.—At the annual meeting on Tuesday last week, the report and accounts given in our last issue were adopted. The Marquis of Winchester, who presided, stated that the new station at Vereeniging will have a total capacity of 30,000 h.p., and he hinted at the possibility of further extensions owing to the increasing use of electricity in the mines, in spite of the large amount of current now used there. The Rosherville station is now almost completed. The Chairman stated that the company now supply electric power for dealing with nearly 63 per cent. of the total output of the Rand mines.

Marconi International Marine Communication.—The report records a profit of £10,765 for the year, after meeting debenture interest. A dividend of 5 per cent., with £5,118 carried forward, is recommended. Mr. G. C. Isaacs has been appointed managing director in place of Mr. G. Marconi.

National Electric Supply.—A dividend of 3s. per share, payable July 1st, is announced.

Bombay Electric Supply and Tramways.—A 17·5 per cent. increase in receipts, and a 6·09 per cent. increase in expenses, is reported. £64,164 profit remains after meeting debenture charges. Of this £32,748 is absorbed by arrears of dividend on 6 per cent. cumulative preference shares, £15,000 is to be placed to depreciation, and £6,000 to sinking fund, leaving, including last year's balance, £11,748 to be carried forward. £50,000 second debentures have been created to provide for the new Kussara power station, &c.

Rio de Janeiro Tramway, Light and Power Co.—A dividend of 1¼ per cent. on the issued capital, payable August 1st, is declared.

London Electric Railways.—An issue will be made next week by Messrs. Speyer Bros. of about £2,000,000 Metropolitan District & London Electric Railways, Joint Powerhouse Rent Charge 4 per cent. stock at par.

NEW COMPANIES

CANADIAN P. J. MITCHELL CO., LTD., Caxton House, Westminster. Capital, £21,000. Exporters and importers of electrical and general engineering machinery, tools, and plant. Directors, Colonel A. Durand, P. H. Brown, and P. J. Mitchell.

TITAN TRACKWORK.—Capital, £5,000. Tramway and railway track manufacturers and layers. Registered by Jordan & Sons, 116-117 Chancery Lane.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

SUMMARY

Our monthly supplement on Electrical Engineering in Mines is included in this issue. It opens with an article on Prof. Redmayne's report on the Hulton colliery disaster, and contains some notes on electric power in the Kent colliery works.

Particulars are now available concerning the position of the National Telephone Co.'s staff on being taken over by the Post Office at the end of this year, and the pensions which they will be entitled to when they ultimately retire from the Post Office service.—The arbitration proceedings with regard to the transfer of the business have been resumed, and the matter now under discussion is what portions of the plant the Postmaster-General is entitled to exclude for the purchase. (Page 379.)

A conference on the education and training of engineers was held by the Institution of Civil Engineers last week. (Page 380.)

A complete list of firms who have signified their intention of exhibiting at the Electrical Exhibition at Olympia in September is given. (Page 381.)

The Annual Dinner of the Electrical Contractors' Association was held last Monday. (Page 381.)

We conclude our report of the meeting of the Incorporated Municipal Electrical Association. On Wednesday last week the discussion at Portsmouth was chiefly devoted to Diesel engines. Mr. C. Day emphasised the low fuel costs and the improvement in lubricating oil consumption, and recommended that sizes corresponding to 150 h.p. per cylinder should not be exceeded. Mr. Andrews pointed to serious errors in Mr. Howard's estimate of gas engine costs, and also said that over half load better fuel costs could be guaranteed for the gas engine than for the Diesel engine. Mr. Boot emphasised the importance of skilled attendance. Mr. Mulholland referred to the work that had been done by the M.A.N. Co., and Mr. Kaula mentioned a small and comparatively high-speed engine which Willans & Robinson are developing. Mr. Blackman attacked the figures given for steam station costs in Mr. Howard's Paper, and quoted the Sunderland costs to show that steam turbines were preferable to Diesel engines for large stations. Mr. Dixon gave an account of his success with Diesel engines at Leatherhead, and Mr. Fedden joined Mr. Blackman in condemning Mr. Howard's estimates, and expressed the opinion that Diesel engines were most suitable for intermittent use and light loads.

On Thursday at Brighton a discussion on the purchase of fuel was opened by Mr. Shawfield, and he and several other speakers expressed their opinions as to the utility of chemical tests and boiler tests, and other matters connected with the purchase of coal. In many cases interesting details were gone into, and the whole discussion was of a most practical nature.

Mr. A. H. Seabrook then opened a discussion upon shop front lighting, and Mr. Haydn Harrison followed upon the question of street lighting. Both dealt with

Hosted by Google

the methods of gas companies, but whereas Mr. Seabrook was uncompromising in his attitude towards the gas companies, Mr. Harrison favoured co-operation as a means of keeping up prices. Mr. Seabrook and also Mr. Cramb claimed that a proper business organisation was the means of keeping up the prices of electric lighting, even in competition with gas, the latter putting it as high as £1 per lamp per annum more for shop front lighting. Mr. Watson gave particulars of the change from arc lamps to metal filament lamps for street lighting in Bury, and Councillor Crowther and Mr. Cramb urged the Council of the Association to make serious efforts to obtain wiring powers for all municipalities, as without them it was impossible to meet gas competition for shop front lighting.

AT the Annual Dinner on Thursday, some sensation was caused by Mr. Ferranti expressing his view that as municipal trading in electricity supply was an accomplished fact, local authorities should be afforded precisely the same power to extend their business as any private enterprise.

ON Friday, Mr. G. Wilkinson was elected President of the Association for the coming year, and it was decided that the Convention should be held in Harrogate. Messrs. Shawfield (Wolverhampton) and Chattock (Birmingham) were chosen as Senior and Junior Vice-Presidents respectively. A long discussion (from which the Press were excluded) took place upon municipal wiring powers. (Pages 383–388.)

PROFITS are reported on the Electricity Departments at Belfast, Bradford, and Hull, but the year's working at Kendal has resulted in a deficit. Increased profits have been made on the tramway undertakings at Glasgow, Manchester, and Plymouth. The bulk supply scheme for Wood Green has been rejected. (Page 389.)

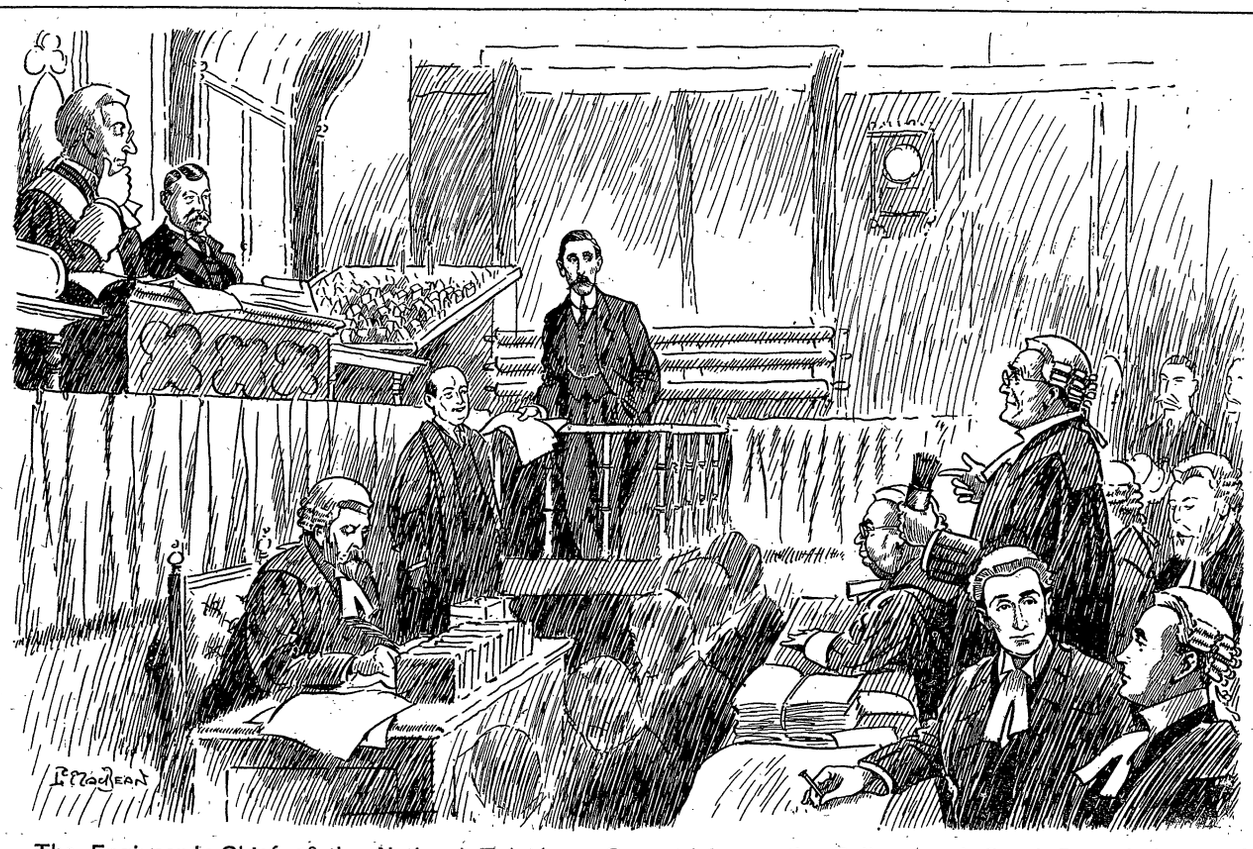
LOCAL GOVERNMENT BOARD inquiries have been held at Gloucester (£14,000) and Hornsey (£9,600), and loans have been allowed at Broxburn (£2,000), Dublin (£50,000), Eccles (£3,294). Tenders are required for switchgear at Govan, and coal-handling plant at Poplar. (Page 390.)

THE NATIONAL TELEPHONE Co. have declared a dividend of 6 per cent. on the deferred shares for the June half-year, and the General Electric Co. 5 per cent. on the ordinary shares for the past year. (Page 390.)

AMONG the specifications published by the Patent Office on Thursday last was one by W. R. Shaw and G. H. Green for an improved detachable controller handle.—An electric lamp cap was described by F. C. Mayes, and E. H. Smith and E. A. Kaatz have introduced a device for regulating the brilliancy of lamps. —Another by H. Sefton-Jones relates to railless traction.—Application has been made for the restoration of the two following patents, one by S. M. Young dealing with the operation of electric signals, and the other by Saltpetersäure Industrie Gesellschaft G.M.B.H. referring to arc furnaces. One of Sir Oliver Lodge and A. Muirhead's patents on wireless telegraphy has expired after the full term of fourteen years. (Page 391.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, JULY 6TH.



National Electrical Manufacturers' Association.

2.30 p.m. Council meeting at Offices of Association.

Institution of Electrical Engineers.

9 p.m. Conversazione at Natural History Museum, South Kensington.

Obituary.—We regret to state that Mr. John Gilley, who was with the Foster Engineering Co., Wimbledon, from the commencement, and was their first outside representative, died from consumption on June 14th.

The Engineer-in-Chief of the National Telephone Co. explains to the Railway and Canal Commissioners the difficulty which would be involved in selling some of the wires in an underground cable to the Postmaster General and removing the remainder.

Hosted by Google

THE TELEPHONE TRANSFER
Position of the Staff

ALL members of the staff of the National Telephone Co. should purchase from Wyman & Sons, Ltd. (Fetter Lane, E.C.) copies of the Telephone Transfer Bill and of the "Memorandum" issued by the Government in connection with Part II. of the Bill. The cost of these is 1½d. and ½d. respectively. These Papers set forth the position of the transferred staff with regard to their re-engagement by the Post Office, pensions, &c.

All members of the staff who have been with the company since January 1st, 1909, with the possible exception of some of those earning £700 a year or more, will be taken into the service of the Post Office, and "except in the case of any persons whose salary may have been abnormally increased during these two years," the initial pay will not be less, and in many cases will be greater than what they are now earning. Those with less than two years' service will also be taken over subject to a satisfactory certificate being forthcoming.

The great majority of those who have contributed to the company's pension fund will also come in the pensionable class, and the younger members who had not yet reached the age to join the pension fund of the company will also come on, and their two years' previous service will rank. The sufferers, so far as we can see, will be those in the Solicitors' Department of the company, who will not come in the pensionable class (and possibly also the Contract Managers). They will have their contributions to the company's pension fund returned to them, and will also be given a slight increase in initial salary. The amount of pension which will be receivable in every case is explained in the Bill.

The Bill also makes provision for the sum of money that will be required for the transfer.

The Arbitration Proceedings.

The second stage of the arbitration proceedings in connection with the telephone transfer was commenced on Monday, and is likely to continue for several days. It will be remembered that the Post Office, in purchasing the National Telephone Company's plant at the end of this year, has the right to object to take over such plant in competitive areas (*i.e.*, London, Cardiff, Newcastle, Hull, Portsmouth, Brighton, &c.) which is unsuitable for the actual requirements of the telephonic service of the Postmaster-General at that date. Under the conditions of the agreement, the Postmaster-General was to send the Company particulars of the plant which he deemed unsuitable, and if the Company considered that any of this was wrongly so described, it was open to them to appeal to the Railway and Canal Commissioners. This they did, and decision was first given on two points: first, as to whether plant or lines which might duplicate the Post Office plant was to be regarded *ipso facto* as unsuitable, and secondly, whether or not the Post Office notices of the plant which they wished to reject were invalid, owing to the want of proper definition. The Railway and Canal Commissioners decided in favour of the National Telephone Company, but this was reversed on appeal, so that the position now is that the notices were valid, and that plant which is redundant may be deemed unsuitable.

The second stage of the proceedings now is to argue before the Commissioners whether or not the plant objected to by the Post Office is unsuitable, owing either to its construction, or to its being redundant. The London plant was taken first, and Mr. Frank Gill, Engineer-in-Chief to the National Telephone Company, was put in the witness-box, and was examined by Sir Alfred Cripps, K.C., on behalf of the company. He said that 68 per cent. of the total mileage of the company's wire in London is underground. The London telephone area covers 640 square miles, and includes ninety-five exchanges, of which sixty-two are owned by the National Telephone Company, and thirty-three by the Post Office. On December 31st last, the company had 70,700 exchange lines, and 122,680 exchange stations in London, as against 47,896 lines and 71,323 stations owned by the Post Office, so that the company owns roughly two-thirds of the London system. He pointed out that the company's system was more highly developed in that there were the larger number of exchange stations per line.

Notices of objection to take over twenty-three of the Telephone Company's exchanges have been put in by the Post Office, these exchanges including the Avenue, Bank, and Westminster. The Post Office also objected to take over all lines connecting any exchange subscriber's office or call-office or other exchange, with any of these exchanges, and it was pointed out that spare lines and private subscribers' lines leading to these exchanges were not covered by the notice, and would, therefore, be presumably taken over. The question whether lines which passed through the exchanges, and are connected to the test-board, but not to the switchboard, are to be included, is one which will have to be argued.

Mr. Gill instanced the removal of the Hillhead Exchange, at Glasgow, as a case in which it had not been necessary to take out any of the cables, as practically every wire had been diverted or made temporarily spare, and he was of opinion that a considerable portion of the lines leading to the Avenue exchange ought to be retained and transferred to the new exchange, which the Post Office is building in Creechurch Lane, to take the place of the Avenue exchange. He also said that when the Post Office moved its trunk exchange from St. Martins-le-Grand to Carter Lane, there could not have been this wholesale scrapping of wires such as they contemplate in this case. He further said that he did not know a single case in which cables leading to the condemned exchanges did not contain other wires than the subscribers' and junction wires to those exchanges, and the same applied to pole lines. According to the definition of "telegraphic line" in the agreement, this includes not only the conductors themselves, but also the poles and supports. As an example, a case was mentioned near New Eltham station, in which a pole carries two pairs of exchange wires, connecting the "condemned" Bank exchange with the Sidcup exchange, and also carries twenty other junction wires, and forty-two exchange lines, eight spares, and a fifty-pair cable, all of which will be wanted to carry on the service, but will, of course, have to be removed if the pole were removed, while, in addition, the wires to the condemned exchange should still be wanted for connecting the Sidcup exchange to the Central exchange, which is the one which will absorb the Bank exchange. Another instance was given in which a cable carrying wires to some of the condemned exchanges, was used to connect up two cables owned by the Post Office, and leased to the company, so that if the company's cable were removed, these two latter lengths of cable would be left disconnected. Again, in the subway leading to the Gerrard exchange, which is not one of the condemned ones, there are thirty-three 600-pair cables, and 496 circuits objected to, which are distributed over thirteen of these cables.

On Tuesday the examination of Mr. Gill was concluded, and during part of the time, as Sir Alfred Cripps had been called away, Mr. Forbes Lankester, K.C., took his place. The evidence was partly devoted to the time required to change over from an old exchange to a new one, and it was elicited that in the case of the Paddington, Dalston, Manchester City, and Aberdeen Exchanges, it took about thirty weeks in each case from the time the installing of the plant was commenced in the new exchange. Mr. Gill pointed out, however, that there would be far greater difficulties when it was a question of changing over twenty-three exchanges simultaneously, as would have to be the case in London at the end of this year if the "condemned" exchanges are not taken over by the Post Office. The question of what was meant by the Post Office definition of metallic circuits was also gone into. The Post Office object to take over any but metallic circuits, and apparently it was not quite clear under the terms of the notice whether the objection might not be taken to extend to any lines which were used with an earth return. This would, of course, condemn a large number of lines used as speaking circuits which are used with an earth return for signalling purposes, but during the examination of Mr. Gill on this point, the Attorney-General, Sir Rufus Isaacs, K.C., interposed the remark that the Post Office would not object to any metallic speaking circuits.

Mr. Gill was still under cross-examination when we went to press yesterday. The Court will not sit to-day (Thursday), and it is not improbable that a compromise on certain points will be announced on Friday.

Among the experts who have been retained on the two sides, and who may or may not give evidence in addition to the permanent officials of the National Telephone Company and the Post Office, are:—For the National Telephone Company, Sir Alexander Kennedy, Mr. S. Z. de Ferranti, Mr. J. Swinburne, and Dr. H. F. Parshall; for the Post Office, Professor Silvanus P. Thompson, Mr. Dugald Jackson, Mr. Robert Hammond, and Mr. A. H. Preece. Sir John Gavey, K.C.B., was also retained for the Post Office, but is at present suffering from an attack of pneumonia.

International Electrotechnical Commission.—In conformity with the wishes of the Brussels Conference of August, 1910, the delegates of the British, French, and German Electrotechnical Committees met at Cologne in May last. Those present were:—Prof. Eric Gerard (President of the Belgian Committee), M. E. Brunswick (Delegate of the French Committee), Dr. E. Budde (President of the German Committee), Dr. Silvanus Thompson (Delegate of the British Committee), and Mr. C. le Maistre, General Secretary of the Commission. A suggestion was outlined by Dr. Budde dealing with the international unification of symbols. The German-speaking nations, as represented by the Elektrotechnischer Verein of Berlin, would, he said, be prepared to abandon the use of "W" for resistance and adopt "R," if the English-speaking nations, on the other hand, would adopt "I" instead of "C" for current. They were ready to exclude "J" as synonym for "I," as "J" was already employed to represent other quantities. Dr. Thompson, on behalf of the British Committee, concurred in this suggestion, and as the American Institute already employs "I," and the National Electric Light Association of America is being approached in the matter, it is anticipated that at Turin the symbols "I," "E," "R" will be universally adopted. The work of the various committees on the German list of terms put forward at Brussels was considered, and a list of some 50 industrial terms and definitions was agreed to in French and English. The delegates will meet again at Turin early in September.

CONFERENCE ON THE EDUCATION OF ENGINEERS

A CONFERENCE was held, somewhat on the lines of the engineering conferences on previous occasions, by the Institution of Civil Engineers on Wednesday and Thursday of last week, dealing with the education and training of engineers. The subject for the purposes of discussion were divided into three sections dealing respectively with general education, scientific training and practical training, but as explained below, joint meetings were held by more than one section. At the formal opening, Mr. Alex. Siemens, President of the Institution, made some introductory remarks dwelling upon the representative nature of the conference, and was followed by Sir William White, who mentioned the work of the Institution's Committee on training of engineers, and Sir J. Wolfe-Barry, who expressed the strong hope that the advantages of good general education and culture should not be lost sight of.

Sections I. and II. met jointly on Wednesday morning, and after opening remarks by Mr. A. G. Lyster, a discussion on "The extent to which mathematical and scientific subjects should share with other subjects of literate education the attention of schoolboys who intend to enter later the engineering profession," was introduced by Dr. J. Gow (Headmaster of Westminster School) and Prof. Silvanus Thompson (Finsbury Technical College). Dr. Gow defended the retention of classics in the very necessary literary studies forming part of the general education, emphasised the desirability of due development of the critical faculty and delight in reading, and sounded a warning against too early specialisation. Prof. Thompson dwelt on the lack of system and organisation of education in this country and the futile nature of such examinations as the London Matriculation. Science teaching in schools was in danger of becoming "fossilised," but there had been, largely due to the efforts of Prof. Perry, considerable improvement in late years in the methods of teaching mathematics. He was inclined to regret, however, the departure from the curriculum of our dear old friend Euclid. The selection of subjects to be taught was of less importance than the manner in which they were presented. The speakers in the discussion, which was continued by Sir J. Wolfe Barry, were in agreement with the main principles expressed, and Dr. Rouse, in particular, condemned the methods of conducting examinations in this country, which, he said, produced "hotbeds of cram." The question of specialised entrance examinations for university or college courses of study in engineering science, with a view to the curricula to be followed, and also of the inclusion in the latter of courses in modern languages, was then introduced by Prof. Schwartz (Manchester Municipal School of Technology). He took the view that entrance examination should have for its object testing the fitness of the candidate to pursue the contemplated course of specialised study, and should not be specialised in themselves; he was in favour of a due inclusion of modern languages, especially German, a point which was particularly emphasised in the discussion by Mr. W. H. Patchell. Dr. W. C. Unwin and Prof. E. W. Marchant (Liverpool University) held that some degree of specialisation was advisable, and the latter said that the great defect in the modern school system was the attempt to teach too many subjects.

Section III. also met on Wednesday, under the chairmanship of Mr. R. Elliott-Cooper. The first discussion, on "The requirements of practiced training and of scientific study, and the apportionment of time to them," was introduced by communications from Mr. A. F. Yarrow and Mr. W. H. Allen. The Chairman, in his introductory remarks, dwelt on the fact that real practical training could only be obtained under conditions which necessarily could not be found in educational establishments. The old custom of pupilage was just as important as in former days, the only difference being that the young engineer of to-day was better equipped to take advantage of it. Mr. Yarrow dealt with the "sandwich" system of training, and advocated an arrangement whereby the student spent the six summer months in the shops, living in lodgings, and in the six winter months took up studies at colleges while living at home. There should be in works where such apprentices were taken a member of the staff, whose special business was to look after them. Mr. Allen, in his remarks, favoured college training preceding workshop experience. The discussion largely turned on special conditions of railway and civil engineering. Mr. A. H. Preece summed up the whole situation by saying that the school training was to teach the student how to absorb knowledge; the college training to teach him how to appreciate knowledge; and the workshop training to teach him to apply his knowledge. Without the college training the student was unfit to be let loose in a workshop. Prof. Dalby said that the colleges would welcome Mr. Yarrow's proposed system, but the difficulty was with the employers.

Communications on practical training in workshops or on works of construction, with special reference to training in the the engineer's office by Messrs. W. B. Worthington and H. F. Donaldson, were then discussed. The latter, for the training of electrical engineers, recommended, besides three years' theoretical study, four years' practical training, consisting of two years in ordinary mechanical workshops, one year in electrical workshops, and one year of office experience.

Thursday morning commenced with a joint meeting of Sections II. and III., with Dr. W. C. Unwin in the chair. A discussion on the relation of engineering employers and colleges from the point of view of the practical training of college students was initiated by Prof. Petavel (Manchester University) and Mr. J. W. Horne. The former favoured a year in works between school and college, and said that although the engineering employer should not anticipate that a university graduate would be of much assistance to him during the first few months, he should require him to reach a satisfactory standard of efficiency before the end of the first year, and expect him to deserve some reasonable remuneration during his second yea. Mr. Horne favoured a college course preceding workshop experience, and regretted that there was not more co-operation between colleges and employers. He outlined a system of committees for the purpose. Prof. Kapp (Birmingham University) defended the sandwich system, but said that, as a rule, the slices were too thin. Mr. J. F. C. Snell, on the other hand, thought that the theoretical training should be completed first without a break. Prof. Silvanus P. Thompson, however, preferred to have students who had had one year in the shops, so that with the practical work in their minds they could better understand the college lectures.

Sections II. and III. then met separately. In Section II. Prof. S. M. Dixon (Birmingham University) and Prof. C. F. Jenkin (Oxford University) opened a discussion on the value of a university degree in Engineering Science in relation to professional competence Prof. Dixon defended the value of a university training to engineers, and regarded the degree as the natural conclusion of it and evidence of its completion; and Prof. Jenkin looked upon the degree as of greater value than the examination result, as being evidence of having gone through a course containing much that would not be included in the examination at all. In the discussion Prof. J. A. Fleming railled bitterly at the evils of examinations, and Mr. A. P. Trotter also spoke of their harmful effects, but Mr. Dugald Clerk, as an employer, had had good experience of men with degrees, but thought that, especially as regards Oxford men, they were usually much too conceited at first and apt to think they knew better than their employers. Prof. S. P. Thompson saw no value in degrees as degrees. The subject of the position and uses of engineering laboratories in relation to education at college was then introduced by Prof. W. E. Dalby (Central Technical College), Prof. J. Goodman (Leeds University), and Prof. B. Hopkinson (Cambridge University), and discussed by one or two speakers. The value of doing things at the laboratory as well as hearing them in the lecture-room was generally agreed upon, for, as Prof. Dalby said, a student often remembered what he did and forgot what he heard. Equipment should be simple, and a variety of small engines, &c., were of greater value than one large one, and facilitated the student being in charge himself of the machine under test.

In Section III. Prof. A. Barr (Glasgow University) and Prof. H. Louis introduced "The relation of practical training to college study: whether, or to what extent, before, sandwiched, or after its conclusion." Prof. Barr thought that it was well that different systems should be used in different districts, as the most suitable system for a particular case depends largely upon the nature of the student in question. Prof. Louis recommended that directly on leaving school the student should pass a matriculation examination, go to a works for three to six months, then come to college for his three years' course, returning to the same or to a different works for some three months during each long vacation, and then finally serve a two or three years' apprenticeship. Some speakers in the discussion thought that the sandwich system broke the thread of both parts of the work, and Prof. Turner favoured a certain amount of practical knowledge before attending lectures. Sir Alex. Binnie wished for the widest training possible, and thought that most college courses were too specialised.

The next subject was workshop training as a preliminary to practical training in other branches of engineering. Mr. J. A. Brodie recommended three years in works as a preliminary to college education, Mr. J. M. Moncrieff referred to the value of mixing with the workmen and seeing the practical conditions as well as the actual manual work, and Prof. J. J. Welch was in favour of the year in the workshops before the college course. Several speakers in the discussion preferred the works' experience after the college course, and Mr. Read was of opinion that the college training should be supplemented by about three months in an engineer's office before going into works.

Electrical Fatality.—The inquest on J. Peat, a wireman in the employ of the British Westinghouse Co., who lost his life owing to electric shock on June 20th, was concluded last Thursday. Deceased had been working on an electric crane, and the driver had switched the current on again under the impression that he had finished and gone away. A verdict of accidental death was returned.

ELECTRICAL ENGINEERING

IN

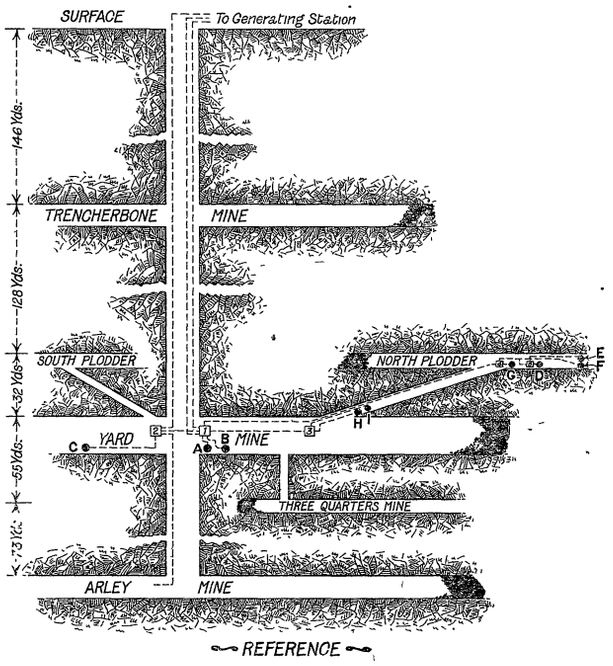
MINES

THE HULTON COLLIERY DISASTER

WE referred briefly in ELECTRICAL ENGINEERING IN MINES of June 1st to the findings in Prof. R. A. S. Redmayne's report as Chief Inspector of Mines on the explosion which occurred at the No. 3 Bank Pit of the Hulton Colliery on December 21st, 1910. The report does not attribute the disaster in any way to electricity, but contains a good deal of interesting comment, information and investigation on the electrical equipment of the mines in question.

Electric power was used extensively in the group of mines for haulage on the endless rope system, and electrically driven coal cutters of the fan type were in use at the Nos. 1 and 2 faces of the North Plodder pit. All cutting was carried out during the night shift, and the breaking down and filling away of the coal so cut was done during the morning shift, the mechanical conveyor, also electrically driven, being worked during the latter period. A large electrical power plant, capable of generating 2,500 h.p., serves all the mine groups comprising the colliery, the power being generated and transmitted at 2,500 volts three-phase. Exhaust steam from the winding engine is used to supply the turbines. At each pit the current is transformed down to medium pressure for use in the workings. Electricity was in use in the Yard seam level at the shaft sidings in the neighbourhood of the downcast shaft, and in two of the five main districts, viz., the Bottom Yard (two electrically driven pumps), and the North Plodder (haulage, coal cutters, and coal conveyor). There was also a motor in course of erection in the South Plodder section, but it had not been set to work at the time of the explosion, and the cable to it had never been made live.

The accompanying figure shows the positions of the motors in the neighbourhood of the explosion. Motors A, B, G, H, and I appear to have been running at the time of the explosion. Motors A, B, and C were placed in intake airways, and they were all relatively close to the downcast shaft bottom. Motors D, E, and F were at or near the coal face, and motors H and I were in return airways, both being fixed in a place at a distance of, approximately, 400 yards from the shaft bottom. Motor G was fixed at a point in the return 600 yards from the shaft bottom, but the motor house was ventilated by a fresh air split.



In addition to the above, there were 60 or 70 lamps at and near the shaft bottom, 16 lamps near motor C, and four lamps near motor G.

All the cables in roadways were armoured, and many of them lead-sheathed and armoured. There were, however, lengths of unarmoured mains between switches and motors in every case. In the downcast shaft was one set of bare cables supported on insulators, otherwise the shaft cables were insulated, lead-covered and armoured.

Prof. Redmayne reports that the electrical staff appears to have been sufficient and efficient. It consisted of a thoroughly competent electrical engineer, who had control of the entire electrical arrangements at the colliery under the general manager, and in each mine there was an underground electrician, so that in the case of the No. 3 and No. 4 pits there were three such persons. It was the duty of the electrician to examine daily the electrical plant, and to report defects to the electrical engineer, and generally to keep the electrical plant in proper order. In addition to this, the firemen examined the electrical plant and reported thereon, but it was admitted that this examination was external only, and that they could not be expected to detect an internal defect.

A good deal was said, both at the inquest and inquiry, as to the heading in the North Plodder having been the point of origin of the explosion, and the igniting cause sparking of the conveyor switch which was stationed there, but after a careful examination of the evidence, it is finally concluded that no real external sparking was caused by this switch, although possibly a glimmer of internal sparking, probably under the oil, may have been seen through an aperture covered with copper gauze. The subject is finally dismissed with the remark that whether the switch sparked on the morning of the explosion or not, the chief inspector is satisfied that No. 1 heading, where the switch was placed, was not the point of origin of the explosion. The conclusion arrived at is that the explosion originated at the point where the persons were engaged in working at a fall at the furthest in-bye point of the intake airway of the No. 2 face of the North Plodder. In all probability a second fall took place immediately before the explosion, accompanied by the liberation of a quantity of gas, and this gas was ignited by a safety lamp becoming overheated, falling through the gas, or by its being damaged by the fall of stone.

This leads up to the subject of safety lamps generally, and the report continues: It would seem as if the time had come when something safer may be used. The electric lamp, in that it provides a light which is absolutely shut off from the atmosphere, would seem to present possibilities in this respect, but the matter is one which requires further and very careful consideration. I merely adumbrate the possibility of the replacement, or partial displacement, of the gauze lamp in fiery mines by the electric lamp (for it would still be necessary to provide the deputies, firemen, and shot lighters with either a gauze lamp, or some other means of detecting the presence of gas), as a subject worthy of the most serious consideration of mining engineers and others connected with the working of gassy collieries. There are already in use 2,155 miners' electric portable hand lamps; and at Murton Colliery, in the County of Durham, miners' electric hand lamps have been in use since the year 1897, when 500 were introduced; these have since been increased to 1,840. The disadvantages that have militated against their extensive use have been: Their greater weight; trouble in respect of the batteries; greater first cost and greater working costs. The detection of the presence of gas by them is impossible. The advantages in respect of these lamps are—The risk of ignition of an explosive mixture can be eliminated; the lamps give a better light than that afforded by "safety" lamps, and hence allow of a better examination of the roof and sides.

SECTION SHOWING POSITIONS OF MOTORS IN NEIGHBOURHOOD OF EXPLOSION.

Dealing in general with the electrical equipment of the mine, Prof. Redmayne writes as follows :—"The electrical plant was, generally speaking, mechanically and electrically strong, properly erected, and well maintained. There were some deficiencies, however, which might have been remedied, and although I have come to the conclusion that any sparking which may have occurred at the conveyor switchbox had no bearing on the explosion, nevertheless, I think it unwise to use electricity at the coal face in a gassy mine, such as this undoubtedly was, and I am satisfied that under the Electrical Special Rules just proposed by the Secretary of State, its use under such conditions would be prevented. I am perfectly satisfied that the explosion did not originate in the No. 1 North Plodder, and that the use of electricity in the mine had no bearing on the disaster. It is a noteworthy feature in respect of the electrical plant that armoured cables were in use throughout the mine, and that these satisfactorily resisted the effects of the explosive blast, heat, and heavy falls of ground, and were in every case found afterwards to be mechanically and electrically perfect—a more convincing argument in favour of the use of armoured cables it would be hard to find. So far as I observed, and so far as Mr. Nelson observed, no breach of the Electricity Special Rules can be alleged against the management. The improvements which might be made in the plant are confined to points of detail, as follows, namely :—(1) The removal of open-type switchgear from the pit. (2) The protection from abrasion of all insulation (except that on flexible cables) by an earthed metallic outer covering. (3) The provision of a better design of plug and socket connection for use with flexible cables. The most frequent causes of accident in underground conditions are :—(1) Live parts left uncovered by insulating material, and insulating material left unprotected from the risk of mechanical damage; and (2) the absence of a sound connection to earth for metallic outer coverings. The first point had received due consideration except at the down cast shaft bottom, and at several places where short lengths of unprotected cable were used for connecting to switches and fuses. The second point had received consideration, so far as I observed, everywhere in the pit. It is generally agreed that pressure should be cut off from electrical apparatus as a precautionary measure upon the first appearance of firedamp. That duty is, indeed, imposed by the Electricity Special Rules, but apparatus can, and should, be designed so that if gas should unexpectedly appear, unknown to the workmen, there is still no risk of its ignition. This is not, however, equivalent to saying that such apparatus may be installed or used where gas is likely to occur, for there is always the risk due to want of vigilance. The conclusion which I suggest may be drawn from the evidence submitted at the inquiry as regards the electrical plant, is the importance of its proper supervision. A daily report as to the condition of the electrical apparatus was made at the mine, but it is not sufficient merely to say that the condition of apparatus was found to be 'good.' If the apparatus is intended to be completely enclosed, then it would be better for the report to say that it was completely enclosed in fact at the time of the inspection; that is to say, that all joints were found to be sound, and that the mechanism, both electrical and mechanical, was found to be in good order. If a switch is oil-immersed, the person making the inspection should satisfy himself as to the level of the oil. Other points suggest themselves, *e.g.*, the continuity of cable armouring. Such an inspection and report should clearly be made by a competent man. I was greatly impressed in the course of the inquiry by the importance of the proper apparatus, its safety may still be dependent upon constant *maintenance* of electrical plant. However well designed the apparatus, its safety may still be dependent upon constant supervision and efficient maintenance."

Opposition to Electricity in Mines.—At a meeting last month of the Derbyshire Miners' Association, an alarmist attitude was taken up with regard to electricity in mines, and it was urged that the electricity must "come out of the mine where there is no room for it."

Testing of Mining Motors.—At the German Siemens-Schuckert Works, a special chamber is provided where all motors intended for mining work can be tested in a gaseous atmosphere. The chamber is closed by a paper wall on one side, and all switches and gas-control apparatus are placed in an observation house some distance away.

Electrical Mining Accidents.—An inquest was held at the end of May on a man named J. McPherson, who was found dead beside a motor in the Lumley third pit. Deceased had complained of shocks when touching the motor. Examination showed that some strands of one connecting lead had projected and touched the motor-case, and it is presumed that the earth connection had become loosened by vibration. A man was also killed recently at Sherburn Hill by a shock from a main cable, the insulation of which had been damaged by a tub coming off the rails. Considerable sparking was reported at the inquest between the cable and the rails. A fatal case of accidental contact with a cable that had become live is reported to have occurred recently at Auchengeich Colliery, Kilsyth.

ELECTRIC POWER IN THE KENT COLLIERIES

THERE is considerable activity in the coalfield of the Kent Coal Concessions and Allied Companies, and although the coal-raising stage has not yet been reached, electric power is already used to some extent in the sinking operations at the five collieries already actually commenced. At the Snowdown Colliery about nine miles from Dover, generating plant has been put down consisting of a Westinghouse 50-kw. 220 volt dynamo, direct driven by a Browett Lindley high speed steam engine. This supplies the lighting both underground and on the surface, and is also to be used for workshop driving.

At the Tilmanstone Colliery, five and a half miles west of Deal, there has been trouble with water bearing strata at a depth of over 1,000 ft. immediately above the coal measures, and to deal with this electric sinking pumps are being put in. These consist of two vertical shaft high lift centrifugal pumps, each capable of raising 1,200 gallons per minute against a head of 660 ft. They will be suspended by a rope 2 in. diam. handled by a 40 ton single drum winch. These pumps are in addition to a considerable amount of steam pumping plant. For this and other future purposes a generating plant is being installed consisting of two Westinghouse turbo-alternators for an output of 1,200-kw. of 3,000 volts, three-phase, 50 cycles. The condensing plant is of the Westinghouse Le Blanc type. Steam will be supplied by two Babcock and Wilcox water tube boilers, each with 4,020 sq. ft. heating surface and fitted with integral superheaters and Green economisers.

For the power load that will ultimately arise, a power company known as the East Kent Power Co. has been formed, and is promoting an unopposed Bill in Parliament. The collieries mentioned above and other sinking and boring works were visited by members of the Institution of Mining Engineers during their annual meeting at the end of May.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during June.

June 1st.—Monthly supplement on Electrical Engineering in Mines, opening with a report of a Paper by Mr. H. J. S. Heather on the driving of winding engines by induction motors, discussed at a recent meeting of the Institution of Electrical Engineers. Notes are given of the principal patents relating to electrical mining work published during May, and attention is drawn to some of the exhibits at the recent mining exhibition in Manchester. A publication on modern mining switchgear is reviewed, and a short article deals with a new system of electric winding. Notes are also given on some recent accidents. An illustrated article gives particulars of some new mining switches, and a report is included of a meeting of one of the Scottish branches of the Association of Mining Electrical Engineers.

June 8th.—Discussion at the Institution of Electrical Engineers on the heating of cables with current. Tests of a 5,000-kw. turbo-alternator.

June 15th.—Discussion on cable laying and jointing. Description of a generating station for power supply.

June 22nd.—Illustrated descriptions of a large generating station with turbo-generator and an electrically driven railway works. Notes on the report of the Electrical Inspector of Factories and Workshops.

June 29th.—Papers and discussions on Diesel engines and on gas engines for generating stations. Description of a simple current gauge.

Luminous Shaft Signalling.—In the course of a paper read last month before the Manchester Geological and Mining Society, Mr. J. C. Eadie described a new system of electrically illuminated shaft signals.

Compensation Claim Refused.—At Alfreton, last month, a case was heard where a miner named J. Fearn, of Wellington, claimed compensation in view of injury by electric shock from a defective coal-cutter. The evidence was to some extent contradictory, but finally the view was favoured that the accident would not have occurred had not a heavier fuse than allowed been placed in the fuse carrier, and the application was dismissed.

Electrical Mining Patents of June.—Among the patents published during the past month of interest to mining engineers was one (No. 25,991 of 1910) by J. C. Rutter relating to hand-lamps intended for use in mines, and is arranged so that it can be used with perfect safety. The accumulator and the switch are enclosed and locked within the body of the lamp. The locking device comprises a ratchet carried by one part of the lamp adapted to be engaged by a spring-pressed rod or pawl carried by another part of the lamp, so that screwing the lamp parts together effectively locks them against separation until the pawl or rod is withdrawn from the ratchet by means of a magnet or a particular form of key.

THE ELECTRICAL EXHIBITION AT OLYMPIA

WE give below a preliminary list of firms who have signified their intention to exhibit. Intending exhibitors are reminded of the rule that exhibitors the nature of whose displays necessitates their showing goods of other manufacturers, must agree not to advertise such makers' names either upon the article shown or upon their stands, unless such goods are manufactured by a fellow-exhibiting firm or are specified on the space contract. Any contravention of this rule will render the offending exhibitor liable for any damage that the Committee or the Management may incur.

Abbey Electric Co.; Adams Manufacturing Co.; Aerators; G. H. Alexander; Allen & Simmonds; Armorduct Manufacturing Co.; Aster Engineering Co.; Auto Recorder Co.

J. Barker & Co.; Bastian Electric Heating Syndicate; Bastian Meter Co.; Bat Meter Co.; Bell Heslop; Benjamin Electric; E. Bennis & Co.; Berry Construction Co.; Berry, Skinner & Co.; Bonnella & Son; W. E. Boosey & Co.; Braun & Co.; The Bristol Co.; British Aluminium Co.; British Electric Transformer Co.; British Metal Engraving Co.; British Prometheus Co.; British Thomson-Houston Co.; British Vacuum Cleaner Co.; E. Brook; Brook, Hirst & Co.; Bruce, Peebles & Co.; Brunner, Mond & Co.; Brush Electrical Engineering Co.; J. Buckton & Co.; Bullers; C. W. Burton, Griffiths & Co.

Callender's Cable & Construction Co.; Louis Cassier & Co.; J. L. Cateaux & Co.; Chamberlain & Hookham; Chas. Churchill & Co.; Concordia Electric Wire Co.; Consolidated Pneumatic Tool Co.; Corona Lamp Works Co.; Coventry Chain Co.; Credenda Conduit Co.; Crypto Electrical Co.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ALUMINIUM.—Two new leaflets from the British Aluminium Co., Ltd., show respectively, by striking illustrations, examples of the extensive use that is being made of aluminium for interior fittings in the new carriages on the District Railway, and for switchboard connections.

SILVERTOWN CABLES, PLANT, AND APPARATUS.—We have received from the India Rubber, Gutta Percha, and Telegraph Works Co., Ltd., 100–106, Cannon Street, E.C., a collection of price lists, &c., conveniently bound in a cover. These are too numerous to deal with separately in detail, and cover the following branches of the firm's manufactures:—Guttapercha, indiarubber, silk and cotton-covered wires, jointing tools and materials; primary batteries of the Leclanché and other types, including the Bleeck-Love battery, electric bells, pushes, &c.; telegraph instruments, testing sets, resistance boxes, &c.; water level indicators, railway signalling apparatus, &c.; the Rymer-Jones patent mica-tinfoil condensers and universal shunts; insulators, fittings and tools for telegraph and telephone lines; dynamos and motors, and electric light cables and wires.

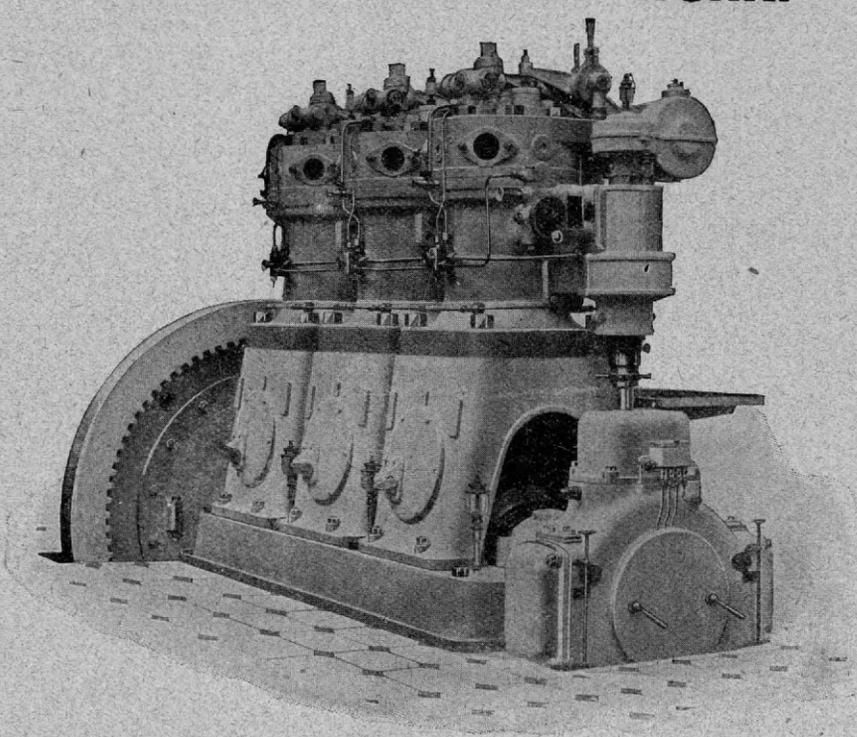
Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

AIR HEATERS.—A handsome illustrated pamphlet from the Underfeed Stoker Co. (Coventry House, South Place, E.C.) describes the "Usco" air heater for placing in boiler flues to heat the air supplied to the furnace. The heater is built up of sections in a manner to give very large heating surface in a compact piece of apparatus.

ELECTRICAL DRIVE IN TEXTILE MILLS.—We have received from the British Westinghouse Electric and Manufacturing Co. (Trafford Park, Manchester) an advance proof of an interesting little booklet which they are bringing out on loom motors, pointing out the advantage of individual motor drive and the improvement both in the quantity and quality of the work turned out, rendered available by the steadiness and flexibility of electric drive, in addition to the reduced cost of power, where conditions are favourable. A series of photographs gives an idea of the large amount of work of this nature already accomplished by the company.

SINGLE-PHASE MOTORS.—A letter from E. Brook, Ltd (Huddersfield), deals with this firm's slip-ring type single-phase induction motors from 3 to 50 h.p., with ball bearings.

ANNUAL DINNER OF THE ELECTRICAL CONTRACTORS' ASSOCIATION



THE Electrical Contractors' Association held their annual dinner, with Mr. G. Harland Bowden, President, in the chair, on Monday last at Frascati's Restaurant, when over 100 members and guests enjoyed a pleasant evening. After the loyal toasts had been duly honoured, the toast of the Houses of Parliament was proposed in a witty speech by Mr. R. Tweedy Smith. Mr. H. Terrell, K.C., M.P., who was to have replied, was unfortunately unable to be present. The toast of the Electrical Contractors' Association was proposed by Mr. H. H. Berry, who referred to the special fund which had been got together largely through the instrumentality of their President, and would, he hoped, enable them to maintain their rights and oppose such Bills which were not what they thought they should be. In his reply, Mr. Harland Bowden mentioned that the membership of the Association had increased by 20 per cent. during the year. In reference to the vexed question of municipal trading, he regretted that more had not come of the recent Conference, but although their real interests were identical, unfortunately the policies of the municipal engineers and themselves were opposed. It was necessary to educate the public in the matter, and he thought that they would ultimately agree with the contractors' point of view. The toast of the Institution of Electrical Engineers, the National Electrical Manufacturers' Association, and Kindred Associations was then proposed by Mr. W. R. Rawlings, who expressed their thanks to the Institution of Electrical Engineers for the use of their rooms and their work in connection with the wiring rules. Among other associations he mentioned with appreciation the work of the Cable-makers' Association and the National Electrical Manufacturers' Association. The toast was replied to by Messrs. L. B. Atkinson and F. B. O. Hawes, and finally the President was proposed in well-chosen words by Mr. E. C. Wallis. Between the speeches an excellent musical and humorous programme was performed, in which Miss Mary Lund, Mr. J. Prout, Mr. C. F. Wood, Mr. C. W. Wrexford, and Mr. R. Triggs took part.

Power from Coke Oven Gas.—Considerable developments in the utilisation of waste heat for power purposes are reported to be about to be undertaken in the Barnsley district. At the Stanhope Silkstone Colliery a 2,000-kw. generating station is to be put down, run entirely on coke oven gas, and supplying power to assist the system of the Yorkshire Electric Power Co.

SIXTEENTH ANNUAL CONVENTION OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION

IN our last issue we reported the first two days' proceedings, concluding with two Papers on "Internal Combustion Engines," and a brief telegraphed report of the discussion on them at Portsmouth. We now publish a fuller report of the discussion.

DISCUSSION ON INTERNAL COMBUSTION ENGINES.

Mr. CHARLES DAY (Mirrless, Bickerton, and Day), who opened the discussion, said that his own experience in the manufacture of Diesel engines extended over nine years, and his company's experience in the same direction extended over fourteen years. Engines built by them fourteen years ago were still running in his company's works. The average of figures given to him during the past few months by station engineers of the saving in fuel effected by the adoption of Diesel engines was over 40 per cent. In some of the early Diesel engines the consumption of lubricating oil was rather heavy, and particularly so in the high speed type. He remembered a case in which with the new type of engine they expected the fuel consumption to be rather higher than with the slow speed ordinary type, but were surprised to find that it had dropped from about 0·42 to a little over 0·3 lbs. per b.h.p.; the explanation was that they consumed lubricating oil to cover the difference. This difficulty had, however, been entirely eliminated, and the lubricating oil consumption was now about the same as with very good steam plant. Whilst with steam or gas plants the average actual result over a year or two differed very considerably from the guarantee or the best figures, with the Diesel engines, owing to the absence of outside accessories, and owing to the fact that there was nothing to adjust and control outside, the real results had been very much better than were obtained with other plants giving equal guarantees. With steam, the larger the unit, the better the result; but the case was entirely reversed when they dealt with internal combustion engines, and every investigation that he had made showed that the gross cost of working with internal combustion engines went up as the size went up. When they exceeded 150 h.p. per cylinder, they introduced complications, such as water-cooled pistons and other things, resulting in a distinct increase in the cost of oil, and, in addition to that, the capital expenditure per h.p. tended to increase rather than to diminish as the size increased. About eighteen months ago, Sir Marcus Samuel wrote him saying that the outlook was that the visible supplies of oil were very considerably in excess of the visible likely demand. Sir Marcus had repeated this statement in public lately, and he thought there was not the slightest fear of any scarcity for many years to come.

Mr. LEONARD ANDREWS (Key Engineering Co.) did not think anyone would accept Mr. Howard's steam engine figures, and pointed out that the gas engine figures had been wrongly quoted from the paper by Mr. Porter and himself. Mr. Howard had assumed a total output of about half the output taken in the Institution paper (11,000,000 units per annum instead of 21,000,000 units), but had assumed a coal consumption considerably more than half, viz., 14,000 tons. Mr. Andrews, however, was quite

sure that any gas engine maker would be prepared to guarantee to generate the output specified with about 11,000 tons of coal. Then Mr. Howard had included the cost of the ammonia recovery plant and accessories, and there were other ammonia recovery items lower down in his estimates, and the costs included extras for the ammonia recovery plant in the way of oil, repairs, &c., and finally an item for handling the ammonia. But Mr. Howard had quite forgotten to credit the costs with the sale of the by-product. Allowing for these two items, the gas engine costs would be brought down to about £1,000 less than Diesel engine costs. Turning to the guaranteed results, Mr. Andrews exhibited the curves below, based on Diesel engine and gas engine makers' guarantees, the former being the dotted line, and the latter the full line. The gas figures were based upon the cost of coal at 12s., and oil was taken at 40s. per ton. At half load it would be seen that the costs per unit exactly coincided, and that above half load up to full load the figures for the Diesel engines were about 20 per cent. higher than the gas figures. At quarter load the Diesel figures were about 10 per cent. lower than the gas figures. With regard to the question of the supply of oil, he was afraid that the cost of oil would follow the natural law of supply and demand. In a recent tour in the Colonies, he came across a number of Diesel engines working satisfactorily, and, in one case, a cotton factory, where there was 200 h.p. running, there was no one about the engine-room, and he was there a quarter of an hour before the attendant came in. He entirely agreed that there was a very great future in front of the Diesel oil engine, but did not by any means look upon it as the competitor of the gas engine. Referring to Mr. Day's remarks, he said he could not agree that the cost of internal combustion engines went up as the size went up. The capital cost certainly went down, the efficiency increased, and all costs went down. A large German station, which had started with engines of 500 or 600 h.p., had extended with 1,300 h.p. and 3,000 h.p. units, and was finally putting in a 4,000 h.p. set.

Mr. G. SEATON (Willans and Robinson) said that a few years ago gas engine men only worried about little places like Leek and Hebden Bridge, and so forth, but now the man who was selling big gas engines was fancying his chance at places like Manchester, where Mr. Pearce had been making enquiries about large gas engines, and had been holding out the carrot to the donkey. The difficulty was to get any really accurate information about the working of big gas engines, but in March of this year, a paper was read before the Manchester Association of Engineers, by Mr. A. L. Chorlton, of Messrs. Mather and Platt. He rang up Mr. Carr, to ask him to come, but he said he could not—he was busy at home. He had heard other men that used big gas engines say the same thing. It seemed that a big gas engine was the equivalent to a six-foot wife for keeping a man at home. Two evenings were devoted to the discussion; all the speakers were prominent gas engine makers, they went for each other bald-headed, and he had no idea until then that there was so much trouble with big gas engines. Mr. Day was absolutely correct when he said that the bigger the internal combustion engines the bigger the troubles. He was not so much concerned about the costs; it was the trouble that choked people off. He had been through the steam turbine business in the early days, and knew what it was, and the troubles with big gas engines were much worse than those with steam engines.

Mr. H. L. P. BOOT said that some years ago, he put down Diesel engines in a small town not far from Portsmouth, and depended entirely upon them without any battery, relying more or less on the excellent figures which the Diesel engine would give when running very lightly loaded. He wanted to sound a warning note to those engineers who were thinking of rushing headlong and madly into Diesel oil engines, because he was convinced that in the future Diesel oil engines were likely to be installed in places where they would be unsuitable. He had found that the wages for skilled attendance which was necessary, and the repairs which were also necessary if the engines were to be kept in an efficient state, were serious items. Of course, it was possible to talk of an engine running for three or four years without any repair bill, but at the end of that time it would probably be necessary to scrap the engine altogether. If such an engine was well maintained it would probably have run for many years longer. In the first year of the installation to which he referred, the fuel costs came out at 0·291d. per unit, wages 0·543d., and repairs 0·210d., but these figures would be very much reduced as the output rose. As to oil supply, although there would always be plenty of oil, the difficulty was to get it landed in this country at a reasonable rate. When he was in Mexico last year, he was told that the whole of the National Railways of Mexico had changed over their locomotives for the use of oil fuel, but on account of the difficulty of getting the oil they were actually changing their locomotives back to fire-boxes for burning coal. For small powers, undoubtedly the Diesel engine was better than any other form, as far as economy went, but he warned them to get particulars from the makers of all spare parts and repair parts that were likely to be necessary. He also warned them to have at least twelve months' guarantee of maintenance. He advised the testing of the calorific value of the oil, and gave other advice from his experience with Diesel engines. In conclusion, he said that if any members cared to inspect the Chichester station, he would be only too pleased to make arrangements for them to do so.

Hosted by Google

Mr. G. WILKINSON (Harrogate) related in considerable detail the costly experience obtained with three or four of the early types of German Diesel engines put down in 1902. The repairs had been very formidable, the consumption of lubricating oil had been nearly half the consumption of fuel oil, and the latter had at one time cost £4 7s. 6d. per ton, delivered at the works. He could never understand how it was that these engines took such an enormous amount of lubricating oil, until he found out that it was going into the cylinder, and helping to work the engines. He was very pleased to find, on visiting Messrs. Mirrless, Bickerton, and Day's works during the Manchester Convention, that they had a very simple and thoroughly practical device for getting over that very expensive trouble. It was his opinion that for large sizes, the single acting cylinder type of Diesel engine, put back to back, would have to be developed. At present this type was only used for marine purposes, and had to be run at rather a slow speed.

Mr. J. MULHOLLAND (M.A.N. Co.) said that of the 1,600 b.h.p. Diesel engines, at the electricity works, Halle, mentioned by Mr. Howard, only one engine was at present working, whilst the foundations for two further engines had been built. Mr. Howard had stated quite correctly that at the present time the single-acting four-cycle engine was the standard engine, but in future, especially for engines of 1,000 b.h.p., upwards, the double-acting four-cycle, or the two-cycle engine would take its place. It would be possible to build a safe and cheap single-acting two-cycle engine up to about 2,000 b.h.p., whilst the limit for a really reliably working single-acting four-cycle engine ought to be reached at 1,000 b.h.p. For land purposes, the engine would be built preferably of the horizontal type. On the question of oil supply, he quoted some statistics, which showed, he contended, that an artificial raising of the price of crude oil would be impossible. The M.A.N. Co. had installed, in more than twenty small rural electricity works, Diesel engines which supplied a number of villages and farms with power and electric light. It had been the experience of the M.A.N., which built Diesel engines, steam engines, steam turbines, and gas engines, and could, therefore, form an impartial judgment, that the repairs of a substantially-built slow-speed Diesel engine were not larger than those of a first-class steam engine. Diesel engines which, with an output of above 200 b.h.p., exceeded a speed of 200 r.p.m., cost more for maintenance and lubrication, and should be used only in special cases where there was lack of space. He concluded his remarks by giving a long list of large stores and restaurants in which M.A.N. Diesel engines were used.

Mr. R. J. KAULA (Willans and Robinson) endorsed the opinion that the single-acting four-cylinder engine was the standard engine for land practice. There seemed to be a demand, however, for a small, low-price engine of the two-cycle type which must be economical in fuel consumption whilst running at the highest speeds, and his firm had designed an engine on these lines. The engine was at present running at Norwich, and it was only 50 k.w., but it was hoped that the results would be sufficiently satisfactory and that they would be able to extend the sizes considerably.

Mr. A. S. BLACKMAN (Sunderland) found fault with the statement in Mr. Howard's paper that the Diesel engine was not subject to violent stress because of the slow nature of the combustion of the gas, and pointed to the indicator diagrams of the engine and instances of breakage of crank shafts. A more damning admission could not have been made than that by Mr. Day, who had said that the mechanical difficulties would enormously increase with the larger sizes. Mr. Day had also said that the lubrication difficulties were not greater than were met with in steam practice, but he did not see how that could be the case, because the higher temperatures in the cylinder of Diesel engines meant lubricating difficulties, and, with steam turbines there was no internal lubrication at all. He refused to accept Brighton as a typical case for comparing costs. At Sunderland, which was by no means a modern station, the actual works costs for the last half year, with a smaller output than that taken by Mr. Howard, were 0·2104d. per unit, as against 0·583d. given by Mr. Howard for Brighton, and the capital figures taken were also far higher than were represented by modern practice. Mr. Andrews had said that he could beat Diesel figures by £1,000 a year with gas engines, and he (Mr. Blackman) claimed to be able to beat Diesel figures with modern steam plant by at least £4,600 a year. They had also to bear in mind that the Diesel had a very small overload capacity indeed as compared with the overload capacity of a turbine plant.

Mr. H. DIXON (Leatherhead Electricity Supply Company) said that perhaps a few remarks from a satisfied user of Diesel engines would be of interest. He had had five years' experience with two 120 k.w. sets, at Leatherhead, and was just putting in a third. His experience was just the opposite to Mr. Boot's. The engines ran very satisfactorily, with cheap labour, and the repairs had only cost £2 a year for the last five years. In a modern Diesel engine, the wearing parts were arranged to be easily renewable. The fuel costs for the very small station at Leatherhead for the whole year worked out at 0.22d. per unit, whereas formerly they were like a large number of other steam stations of the same size, in the neighbourhood of one penny. The makers had guaranteed him 0·64 lbs. of fuel per unit generated; he was running the engines at quarter full load, and, taken for the whole of the year, the consumption was 0·7 lbs., which was exceedingly good when the poor load factor was taken into account. The price of oil had gone down steadily from 77s. to 48s. 6d. per ton (the latter on a two years' contract), whilst he had been using these engines. Where the Diesel engines scored more heavily, was in connection with the large number of stations which were struggling to produce cheap units from poor coal and inefficient steam engines. It would pay them to give their steam plant away and put in Diesel engines.

Mr. W. G. PICKVANCE (Wrexham) said that, reading between the lines, it was possible to form the impression that Mr. Carr would be happier with steam plant of average efficiency and reliability than his present gas plant, although with engines of the slow horizontal type, similar to the Nuremberg engines, he would have been more exuberant in his praises of gas plant.

Mr. S. E. FEDDEN (Sheffield) spoke in the same strain as Mr. Blackman, and said that the figures of capital expenditure and works costs for steam plant given in the paper were absolutely wrong. At the Neepsend station, at Sheffield, the capital expenditure had been only £13 per kw., and the coal costs, on the whole Sheffield undertaking (which included 4,000 kw. of obsolete engines), only 0·17d. per unit last year. He had come to the conclusion that the internal combustion engine must have an intermittent use, and it must be very much under-loaded. Mr. Dixon's success, he was convinced, was due to his underloading the engine. Figures such as those in the paper would mislead very many councillors and young engineers.

Mr. I. V. ROBINSON (Richardsons, Westgarth, and Co.) said that his firm had now taken up the manufacture of the Diesel engine. His firm had built, for marine purposes, a 1,000 h.p. four-cylinder double-acting engine, similar to those manufactured on the Continent by Messrs. Carels Frères, and after they had got this engine working, they would probably turn their attention to Diesels for land purposes. He thought that the Diesel engine was an excellent one for stations of 500 to 1,000 kws. capacity. For larger power stations, when they could give gas engines, say, an average of 80 per cent. of their full load throughout 130 hours per week, these should be used, with a spare engine as well, and a steam turbine to deal with the peak load. Manufacturers of the Diesel engine were prepared to go up to 6,000 h.p. four-cylinder engines, and he had seen cylinders of that size (1,500 k.w.) working very satisfactorily. He disagreed with the suggestion that repairs to a gas engine were heavy, and gave instances, both in this country and the Far East, to prove his point.

Mr. J. E. EDGCOME (Kingston-on-Thames) asked Mr. Carr whether, in getting out the extension of the Leek station, which was proposed, he intended to use gas engines, steam engines, or Diesel engines. [We understand that a Diesel engine is contemplated for the next extension.—ED., *E.E.*]

The authors reserved their reply for the *Proceedings*.

PURCHASE OF FUEL.

A discussion on this subject was opened by Mr. C. E. C. Shawfield (Wolverhampton) when the members met again in Brighton on Thursday.

Mr. SHAWFIELD first pointed out that it was very necessary to take into account the position of the stations and the cost of carriage, *e.g.*, a cheap fuel of, say, 10,000 B. Th. U. calorific value might be the best in some cases, whereas it did not pay a station far from the coalfields to purchase any fuel of a lower value than, perhaps, 13,500 to 14,000 B. Th. U. Another important matter to be taken into account was the type of boiler-house plant and the method of firing. Hand-fired boilers usually necessitated purchase of a higher class fuel. The boiler doors had to be opened so much for cleaning purposes in the case of an inferior class of fuel, that the strains thrown upon the boiler were very considerable, and, moreover, in hand cleaning the boiler there was always a good deal of good fuel brought out along with the clinker, and, consequently, the less the amount of incombustible material to start with, the less the loss which was occasioned from this source. The question of the percentage of incombustible contents in any fuel had a very important bearing upon its commercial value. Ash and clinker appeared to have a more deleterious effect than moisture. The reason was probably that the fire-clay or shale had to be raised to the furnace temperature, and, in the case of internally fired boilers, at all events, these were frequently removed at very nearly furnace temperature every time the boiler was cleaned. On the other hand, the heat expended in evaporating the moisture was partly given back to the heating surface of the boilers by the steam. This had a very considerable bearing when considering the relative value of washed and unwashed fuels. He had some interesting particulars of an experiment which he had made upon a certain class of fuel before and after it was washed. The fuel in question was a very fine and dirty pit bank sludge, which had practically been of no commercial value, for the calorific value per pound of dried fuel was 9,500 B. Th. U., the moisture contents 5 per cent., and the ash contents about 28 per cent. When tested in a calorimeter it gave about 9,900 units

Hosted by Google

per pound, but that could not be taken quite as the criterion of its commercial value, because in the calorimeter the ash contents are raised to the temperature of combustion, but subsequently give back their heat to the water in the testing apparatus. The price of this fuel was about 4s. 5d. per ton; by the calorimeter test this worked out at 397,000 B. Th. U. per penny, but, if allowance were made for the heat lost in the ash and clinker, it was brought down to about 290,000 B. Th. U. per penny. The same fuel, when washed, gave an average B. Th. U. per pound of dried washed fuel of 11,700. The cost delivered was 5s. 6d. per ton, the moisture contents 13 per cent., but the ash was reduced to about 11 per cent. That would give an apparent heat value per penny exactly the same as by the calorimeter test for unwashed, namely, 397,000 B. Th. U. per penny, but if they took into account the heat required to raise the clinker and ash to furnace temperature and also, in this case, the heat required to raise the excess of moisture, they got a figure of 350,000 B. Th. U. per penny, as against 290,000. Mr. Shawfield next described the process of washing such fuel, as employed by one of the collieries in the South Staffordshire District. The principal difficulty in using the fuel, however, was that, as it had come entirely by boat from the colliery, there was very little opportunity for it to dry, and it frequently arrived with as much as 25 per cent. of moisture, but that might be improved by allowing, say, twenty-four hours or forty-eight hours of storage in a perforated bunker.

Mr. Shawfield next spoke on the relative advantage of purchasing direct from the collieries or through agents. He had found it better in every way to contract directly with the colliery, and the Wolverhampton contracts had been placed with the same colliery for practically the same class of fuel for the last eight or nine years. On the other hand, he believed that in the North of England it was the practice to contract almost exclusively with agents. Agents had command of perhaps a larger range of collieries, but they could not be so certain of getting a regular quantity of fuel. For several years it had been the practice at Wolverhampton to obtain their supplies annually; but for the last five or six years the practice had been followed of purchasing say, 20,000 to 50,000 tons, according to the state of the market and the requirements of the station. That method might be said to be to a certain extent speculative, but it often enabled them to cover their requirements for a period of, say, three years, and it was a great advantage to know that they were covered for several years ahead. He thought, also, that collieries usually preferred that a definite quantity should be contracted for rather than a period of time.

Purchase on the basis of net calorific value was the ideal method, but he was afraid there were many difficulties in the way at present. When dealing with agents and not with collieries direct, these difficulties seemed insuperable, but it was, perhaps, feasible when they were dealing directly with one or perhaps more collieries, and colliery owners would have to be educated up to it. He thought a contract might very easily be entered into in which the payments were based entirely upon the net commercial value of the coal as it left the colliery. He believed Mr. J. H. Rider had entered into contracts on something like that basis, with quite satisfactory results, at the Greenwich Power House. In that case the contract was for the coal as delivered at Greenwich, and not as it left the colliery. He thought it was of the utmost importance that every station should possess an adequate coal-testing department, and that regular tests should be made of the fuel actually fired into the boilers. At Wolverhampton there had been one in operation for eight or nine years; the first cost of the apparatus had been about £10 or £12, and the annual expenditure in time and material for taking daily tests of the fuel delivered was about £20 to £25. Without exaggeration, he estimated that the net result was an annual saving in fuel costs in the first two years of something like £500 per year. The colliery was practically content to take the word of the Corporation as regards the calorific value of any consignment of fuel that was sent, and, as a matter of fact, they not infrequently sent along a trial boat to know whether it was worth while placing it on the market. He thought that a further development of fuel-testing might be the establishment of a testing laboratory, jointly controlled by the producer and the consumer, that every consignment of fuel, as it left the colliery, should be tested for calorific value, moisture, and ash percentage, and that the payment for the fuel should be based entirely on these tests. He hoped to have such an arrangement in operation in a few months.

He had found it necessary to have the following wage clause in his coal contracts: "The prices quoted in this contract are to be based upon the present standard rate of wages, as agreed upon between the colliery owner and the Miners' Federation in the federated area in England. This standard is hereby declared to be 50 per cent. above the minimum. For every 2½ per cent. in the minimum variation above or below the present standard, it is agreed that there shall be a corresponding increase or decrease upon the contract price of the fuel, such increase to be calculated as 2d. per ton upon fuel Class I. and Class II., and 3d. per ton upon fuel Class III. for each 2½ per cent. alteration in the rate of wages." A clause of that kind facilitated contracts being made for long periods or large quantities, because the colliery owners were covered to a large extent from loss in the event of there being any considerable rise in their labour costs.

The Eight Hours Act, passed about two years ago, had affected not the price of fuel, but the quality. Immediately after the Act came into operation in the South Staffordshire district, he had noticed an increase of from 5 per cent. to 7 per cent. in the amount of incombustible contents in all fuel delivered; apparently the miners had not the time to be so careful in sorting out the inferior class of fuel when shovelling in the trucks below ground. He had had serious trouble with the colliery people for some two or three months before he could get this matter rectified.

Another question which affected the price of fuel was the condition of trade, and it appeared probable that there would tend to be an increase in price during the next year or two. The price of low quality slack had appeared for some years past to rise and fall in cycles of four years. There had been just over three years of comparatively low prices, and there might be a continuous slow increase for the next period of three or four years.

Mr. R. A. CHATTOCK (Birmingham) differed from Mr. Shawfield as to the influence of the ash percentage as being more important than the influence of the moisture in the fuel, for whilst a lot of the heat was carried away with the ash in the furnace gases, a large amount was returned to the boiler through the incandescent ash in the form of radiation. He had tried both washed and unwashed fuel in his station, and preferred the latter. He had found it difficult to get washed fuels dry, and had even had to pass 20 to 25 per cent. of moisture. There was a lot of moisture passing over with the furnace gases, which condensed on the economiser tubes, and tended to corrode them very badly. His experience showed that, when purchasing a very large quantity of fuel, it was better to deal with agents. He could not get any better prices from the collieries direct, and in most cases the best collieries would not quote direct, and when he had been able to obtain a quotation from a colliery, it was generally higher than that from agents. This might, of course, only happen in large towns. Moreover, in buying from agents, they had a bigger range of collieries to deal with. As to purchasing coal on the basis of calorific value, he had found that two coals of identical calorific value, and practially identical percentages of ash, gave very different results on the same boiler. One coal might be more suitable for a certain type of mechanical stoker than the other. In Birmingham they had instituted a very careful testing department. They had their own chemist and staff of men continuously testing; every boat-load of coal was tested, and every week they tested two clases of coal for performance in the boilers. In that way they saw that they were kept up to the original records on which the coal was purchased. They also tested one boat-load of new coal every week, and in that way they were able to obtain information about new coals for helping them in deciding on the contract when it came up annually. He now had complete information of about 130 different classes of coal in the Birmingham neighbourhood (it was not much use going outside the coal district round Birmingham, on account of the railway rates), and they had been able to reduce the average cost from 8s. to an average of 6s. 10d. per ton; the percentage of ash from 21 to 14; and the cost of coal per unit from 0·18d. to 0·14d.—a decrease of 22 per cent. in about three years. They also checked the efficiency of the boiler-house, and had been able to obtain a thermal efficiency of about 65 per cent. over each 24 hours, and 75 to 80 per cent. on the full load test on the boiler over a fixed period. The 65 per cent. was a very near approach to that when they considered that it included all banked boilers and cleaning at night time. The cost of his testing department was approximately £400 per annum, and that included the wages of the chemist and assistants in carrying out the boiler tests. The boilers were tested every day. The cost of this testing only represented 7 per cent. of the cost of the coal burned, which was very small compared with the reduction of 22 per cent. that had been obtained in four years in the cost of the coal per unit generated. He did not think that a testing laboratory could be jointly owned by the colliery and the consumer, unless the consumer was content to obtain the whole of his coal from one colliery, in which case there would not be sufficient competition to ensure getting the best price.

Mr. F. A. NEWINGTON (Edinburgh) said that at Edinburgh they went very carefully into the question of moisture in fuel. They took samples from every truck-load of coal delivered through the twelve months, had it dried, and the amount of moisture determined. The coal contractors thought that he was baking the coal too much, and taking more than the surface moisture, and they objected. From what they said, it was clear that this testing would increase the price of the coal considerably for the next contracts, and, therefore, for the following year, he asked for two prices, one with the moisture, as delivered, and another with not more than 9 per cent., as specified. The result was that the price of the dried coal was about 6d. per ton more than for the coal as delivered, and it was not thought worth while to pay this. He thought that it was very much the same question as buying by calorific value. He believed that the coal owners knew just as much about coal as electrical engineers—probably rather more; and if they tied them down to laboratory tests of calorific value, they would probably artificially increase the price. If everybody bought at calorific value it might work out better, but he was afraid that this would never come to pass. In Scotland they did not get into touch with the collieries at all, and purchased entirely

Hosted by Google

through agents. One point which had not been mentioned yet was that if they were dealing with one colliery, and there was a strike, they were in rather a hopeless position. He doubted the reliability of the testing apparatus purchased by Mr. Shawfield for only £10 to £12. He had not very much faith in calorimeter tests, because the amount of coal tested was so extremely small that there were very grave doubts whether they got a representative sample. Boiler tests were much more reliable, and very large users of coal—he had not tried it himself—might find it well worth while to have a specially constructed boiler in which to make all their tests.

Bailie-Willock (Convener, Glasgow Electricity Committee) said that many districts in England were about thirty years behind Scotland in their methods of handling coal. Scotch coal was used so generally, both in Scotland and England, that sometimes the price rose so high that it was impossible to buy locally. At Glasgow they burned about 80,000 tons of "single nuts" per annum. Recently, however, Mr. Lackie and his assistant engineer had come to the conclusion that they could buy a coal called "pearls"; it was washed, and held a greater percentage of water than the singles, but it answered their purpose equally well, and cost about 6d. a ton less. He happened to be both a coalmaster and an agent, and, from his experience in this dual capacity, he thought the purchaser was likely to get the best coal, at the cheapest price, from the agent, and was not in such a risky position in the matter of strikes, as the agent had several strings to his bow. There was a motion before the Glasgow City Council recently that no agents need apply. There were several non-coalmasters on the Council, and three coalmasters, but happily the majority was in favour of leaving it open.

Mr. F. Ayton (Ipswich) favoured purchasing through coal merchants. He had ascertained the opinion of one of the large coal merchants on the London Coal Exchange as to purchasing on calorific value, and he had pointed out to him that the handling of the coal is quite beyond the control of the agents, as they have to buy at the pit's mouth, and, further, the inevitable variations in the various seams of coal are also beyond their control. Merchants, therefore, added a considerable margin to the price to cover themselves for this risk, and the advantage given to the consumer having a guarantee is, more often than not, nullified by this. The coal-owners who had been asked their opinion on this method of purchasing had replied that they "had no opinion to offer on the matter." They evidently did not care, as long as they could sell their coal as it was raised at the pit. He thought they must leave it for the present to the larger undertakings to go forward with this educational policy. In London there were two large undertakings, both dealing with about 150,000 tons per annum, who purchased on the heat unit basis. One was the London County Council Tramways Generating Station, at Greenwich, and the other was the Underground Electric Railways Co., of London, whose generating station was at Lots Road, Chelsea. By the courtesy of Mr. A. L. C. Fell, of the London County Council, and Mr. Stanley, of the Underground Railways Co., he had received copies of these specifications. That of the London County Council occupied eleven pages; it was splendidly prepared and everything was covered. On the other hand, the specification of the Underground Railways Co. consisted of only 159 words. He thought he would be a bold man who would decide as to which of the two undertakings was getting the better terms. In the London County Council specification, the coal had to be tested by the L.C.C. chemist in their special laboratory. This coal came in in large cargo loads of about 700 to 1,000 tons at a time, and, by the terms of the contract, the Council could reject the coal if it did not come up to a certain minimum of heat units, but he found that by the time the actual results were obtained from the laboratory, the coal had probably been half used. The only test made at the generating station was to determine whether the coal was of a right size, and that there was a minimum amount of dust. The Underground Railways Co. got the heat units which they stipulated for in their small specification. Mr. Towle, the Chief Engineer at the Lots Road station, had told him that he did not use a calorimeter, as it took too long, and he did not regard it as giving sufficiently accurate results under the conditions of a power station. The method Mr. Towle used occupied twenty minutes, and cost 1½d. Mr. Towle wrote him that he found it as accurate as any calorimeter methods, and of much more value, as they got the results before they unloaded the coal. When the average B. Th. U. per ton fell below the specification, they got a rebate, and if it were above they paid nothing. The test, which was known as the Berthier's method, or the litharge method, was as follows :—

Weigh out 1 gramme of finely powdered dry coal, mix this with about 60 grammes of litharge (free from silver), also mix, say, 15 to 20 grammes of glass powder (coarse); put this in a Battersea clay crucible, and cover with a layer (table-spoonful) of common salt, and heat in a forge fire or otherwise for about twenty minutes, at a bright red. When cold, break crucible, and extract the lead button from the bottom, clean off slag, then weigh and multiply its weight in grammes by 483. This will give the calorific value of the coal in British Th. Units per lb.

In his own opinion, the test should only be used to see that they got a uniform quality of coal, but, for deciding which coal would suit their particular conditions, the only test of any use was the actual test in the boiler-house, and, owing to changes in atmospheric conditions, unless they had a test of some days' duration, they were liable to get results which were altogether inaccurate, and he went upon that method of taking a continuous test when he was dealing with different fuels to decide which was the best. In purchasing fuels, he dealt with big London firms, and his chairman had himself had the authority of the committee to close with any suitable offer they got, and report to the committee afterwards.

Mr. H. Faraday Proctor (Bristol) pointed out that Mr. Shawfield's sliding scale in regard to wages would tempt the coal-owner to increase wages, as he would then obtain more by the increased price of the coal than he paid in extra wages. Mr. Proctor also stated that he had issued a specification for coal on the calorific basis some years ago, but all the colliery owners tendered simply at so much per ton notwithstanding, and said nothing about calorific value.

Mr. E. E. Hoadley (Maidstone) said that some years ago he had sample barge-loads of several coals for testing purposes. Similar samples were sent to three laboratories for calorimetric tests, but the results all differed considerably. He also found that samples of coal which gave results within 1 or 2 per cent. in the number of heat units as tested by the calorimeter gave widely varying results on a 24 hours' test in the boilers under actual working conditions.

The President [Mr. Christie (Brighton)], before calling upon Mr. Shawfield to reply, spoke as to the arrangements in Brighton. He said that they had gone very carefully into the matter, and had found that Scotch washed singles, such as Bailie Willock had referred to, served their purpose very well. They came down in 700-ton boats, and the passage in the boat freed the coal from any excess of moisture. They bought on the bills of lading, and checked the weight as it came out of the boat. He had an elaborate system of getting the calorific value of coal, which was done regularly on six samples from each cargo. He had found it very useful in a general way, but he relied upon the pounds of coal actually fired per unit generated as the true criterion. In order to avoid the corrosive effect of moist coal upon the bunkers, Mr. Wright, in designing the station, had abandoned the use of steel, and adopted reinforced concrete, which had given no trouble whatever, nor did it crack from expansion.

Mr. E. C. Shawfield, in reply, said that if this fuel discussion had done nothing else, it had served a useful purpose in bringing out from Mr. Ayton the particulars of that very interesting test which was practised by the Underground Electric Railways Co. of London. At the same time, he was rather surprised to find that so many central station engineers were doubtful as to the wisdom of making sure that the coal agent or coal owner was delivering what he was being paid for. With regard to the question of purchasing from colliery owners or agents, it was quite obvious that in Birmingham, Glasgow, Liverpool, or Manchester they could not possibly purchase the whole of their coal supply from one or even two or three collieries, but comparatively small stations such as his own would find no difficulty whatever in making contracts direct with collieries so far as the question of quantity was concerned. Mr. Faraday Proctor had raised a rather interesting point on the wages clause. This merely represented the best terms that he could secure from the particular colliery, and as the wages in the Federated area were controlled by the Coal Owners' Association, he hardly thought that the wages would be raised through the entire area of Great Britain on his account. Replying to Mr. Hoadley and others, he said that he had tested coal regularly for nearly ten years, and had found, although there might be a personal difference up to 5 per cent. in the results of two observers, any one person should be able to reproduce his own result within 1 or 1¼ per cent.

STREET AND SHOP FRONT LIGHTING.

Mr. A. H. Seabrook (Marylebone Borough Council), who opened a discussion on this subject, said he proposed to leave the first part of the discussion to Mr. Haydn Harrison, the street-lighting expert. With regard to shop-front lighting, he would confine himself to the serious competition of high-pressure gas. In West Ham some years ago they attempted to deal with this proposition by bringing an inclusive hiring scheme of £2 1s. per 500-watt lamp per quarter, but the gas company had since been doing the same thing all over London, with the additional trouble that they had been cutting prices. He knew that on the basis of £2 1s. per quarter, including current, maintenance, supply of lamps, and depreciation in two years, it was a remunerative business. After the first two years, when they had written off the lamps, there was a very handsome surplus. He contrasted the rapid progress made in West Ham compared with East Ham, in spite of the lower charge per lamp in the latter district, and attributed it to the absence of an efficient business-getting department in East Ham. It was more expensive to cut their prices to ridiculously low figures than to employ an efficient business-getting department to look after the consumers and maintain prices. In Marylebone they had to charge considerably more than £2 1s. per lamp per quarter. At 3½d. per unit it was possible to supply a series of four arc lamps giving a total of 10,000 to 11,000

Hosted by Google

c.p. at a cost to the shopkeeper of 2d. per hour per lamp, or a total cost per year for 900 burning hours of £30, *i.e.*, £7 10s. per lamp, inclusive of everything except hire of the installation and wiring. To give the same amount of light it would be necessary to install at least 10 high-pressure gas lamps, which at 30s. per quarter would give a total cost of £60 per annum. The gas people in London generally averaged about 30s. per quarter for a 1,000 c.p. high-pressure gas lamp, although sometimes the charge was as low as 25s., or even 20s. A most useful lamp had recently been put upon the market, viz., a 4½-ampere direct-current flame lamp, which would enable them to cut their costs considerably, and to put in a flame arc lamp of more nearly the equivalent candle-power of the gas lamps. These gave a candle-power of roughly 1,200. At 3½d. per unit they could be trimmed, supplied with current and carbons, maintained and kept clean at a total cost not exceeding 1·35d. per hour, which cost £5 per 1,200 c.p. lamp for a use of 900 hours per annum, against £6 for 1,000 total c.p. of high-pressure gas. From some years' experience in the cost of maintaining lamps, each 450 to 500-watt lamp at 3½d. per unit cost 1·4d. per hour for current, and for carbons, including wastages, breakages, &c., 0·3d. These figures were based on 100 lamps or more. Trimming and cleaning was 0·17d.; establishment, supervision, and repairs, 0·13d., making a total of 2d. per hour for 2,300 c.p., burning for 900 hours a year, and not including hire of lamps and installation. For the 4½-ampere lamp, with current at 3½d. per unit, the cost of current was 0·19d. per hour; carbons, 0·24d.; trimming and cleaning, 0·17d.; establishment, supervision, repairs, and incidentals, 0·15d., making a total of 1·35d. per hour. In these figures no allowance was made for current wasted in line resistance, because in modern lamps they did not want these. Mr. Haydn Harrison had told him what he was going to say in one direction upon street lighting. Mr. Harrison had evidently in mind the joint arrangement between the gas company and the electric supply companies for the lighting of Holborn, and intended to suggest that electric supply authorities should keep up their shop lighting and private lighting prices by some similar co-operation. He himself was absolutely against anything of the sort; he preferred to keep his opponent where he could see him, and had no sympathy with the sloppy, imbecile amiability with which a lot of people were inclined to regard their opponents. The gas companies' business-getting departments were superior, and electrical engineers were not sufficiently equal with their competitors to be able to play fast and loose, or give them an inch in any way. In the present position it was safer to keep them at arm's length.

Mr. HAYDN HARRISON said that providing conditions were equal at the start, *i.e.*, if a town were being laid out with electric light and gas lighting, and mains were being laid for both, electric light could give an equally good light in the streets at a very much lower cost. But when the streets had been lighted by gas for a considerable time from the start, without any competition, and at the gas company's own prices, and they had paid off practically every pennyworth of capital in connection with it, it was more difficult for electric light to compete now, especially as in many cases loans had been refused, and the work had to be carried on out of revenue, and the whole cost was being repaid in five years. In spite of this, however, they had still been able to put in prices for equal lighting equal to those for gas. In Marylebone, for instance, but for this they could have given 50 per cent. better illumination than at present for the same charge. The loans in Marylebone, however, would soon be repaid, and the lighting there would soon be cheaper than in any other district in London for the same illuminating value. Mr. Harrison then explained the position with regard to the street lighting in Westminster. He pointed out that half the streets were lighted by electric light still. There were long contracts running with two of the electric light companies, but the third company had had a short contract, which terminated at the same time as the gas company's contract. The recent successful tender of the gas company had not been for the whole of the lighting of the Westminster district, but for the lighting of that part which was already carried out by gas, and also for a small part which was lighted by seventy arc lamps. The electric lighting companies in London found that they could not allow this sort of thing to occur again. For the public lighting of the Borough of Holborn, in the first place, the gas company alone were asked to send in a price. Then it was suggested in council that the electric lighting companies ought to be allowed to tender, and they had put in a price, on the same specification, which was considerably below the gas company's. But the Council were still not satisfied; a new specification was drawn up, and the two companies were asked to tender again. The conditions were so onerous, however, that the managers of the electric lighting and gas companies came together and decided to submit a joint tender to carry out the street lighting between them, practically dividing the work between the two. They also said that if all these onerous conditions were to be maintained, such as the penalties for the light being below a certain standard, &c., they would be perfectly prepared to accept them, but they would want an extra 10 per cent. per annum. The result was that now that particular Council was going to pay to the electric lighting company and the gas company a sum per annum for the lighting of the streets of Holborn greater than the price originally tendered for gas, but which was remunerative to both companies. The work in front of both parties, he contended, was sufficient for them to look forward to being able to make arrangements by which they each took on the particular work for which they were particularly suited, at prices which would be remunerative. The most efficient grouping of lamps was of the greatest importance. A committee had been formed by the Institution of Electrical Engineers, which included surveyors, representatives of the Gas Association, and the Illuminating Engineering Society, and this committee was formulating a standard specification for public lighting, and it was nearly certain to be based on minimum illumination. Leaving out the most important streets, such as some of the main streets in London, where the illumination in the City had been got up to 0·8 candle-feet, he had found it most economical to employ units between 100 c.p. and 500 c.p. For the smaller streets, where the illumination was down to 0·002 or 0·001 candle-feet, 100 watt lamps placed in the existing lamp-posts or placed the same distances apart gave by far the most economical result. The next unit above that was probably 200 to 300 c.p., and that could be obtained equally well by still using 100 watt lamps with high efficiency reflectors, and the same thing applied up to 600 or 700 c.p. It would be found, with the usual rates of 1½d. or 1d. per unit for public lighting, plus all the incidental charges of maintenance and so on, that the prices would come out very nearly equal to high pressure gas, excluding the question of capital charges.

Mr. J. R. DICK (Lucy & Co.) did not recommend the employment of metal filament lamps in existing street gas lanterns, which, he said, militated against bringing street electric lighting to the notice of the passer-by. At the present time it was possible to purchase a fitting with an efficient diffusion at practically the same cost as the price of a simple conversion fitting, and they could purchase a good-looking design of lamp-post and suitable bracket at a figure which did not exceed 30s. to 35s. There was one great hindrance in municipal working to the extension of public lighting, and that was the curious antipathy of the Local Government Board to the granting of loans for street lighting fittings. It would be desirable that the Association should make representations to the Local Government Board to remove this extraordinary bias on their part. There was a good field for the extension of automatic lighting and extinguishing, but the time switches now in use were too dear. If they could get a good reliable time switch at about 20s. or 22s., the case for automatic control would be very strong. Mr. Dick concluded with some remarks on the design of fittings, pointing out that they must satisfy the eye of the man in the street as well as the photometer.

Mr. S. J. WATSON (Bury) dealt with the question of street lighting from the point of view of those places where arc lamps of the old patterns are now in use, and the suitability or otherwise of changing them to suitable groups of metallic filament lamps. In Bury they had some thirty open type arc lamps in use, and as they were getting somewhat old and dilapidated, they replaced them, after making considerable experiments with different types of lamps and fittings, with groups of three metal filament lamps, each of about 300 c.p. (in some cases 200 c.p.). Much to his surprise, he found that three 300 c.p. lamps, spaced about 70 yards apart, gave an equal illumination on the street to one of the latest type of flame arc lamps. The lamps were fitted in many instances to brackets on the tramway poles, and they had experienced no difficulties through vibration. The cost of altering these old lamps to metal filament lamps in groups was comparatively small. The fitting he had adopted was a conical open shade inverted, with three lamps arranged inside, and the lamp-holders were sunk in the fitting so that only the globe of the lamp itself projected. The fittings were not enclosed, as he considered that there was no necessity for an extra covering of glass. The annual sum paid per arc lamp was £11 10s., and he charged the same amount for these groups of metal filament lamps.

Mr. A. C. CRAMB (Croydon) was in general agreement with Mr. Seabrook. The competition of high pressure gas for outside private shops, he said, was getting a very serious matter in London and the surrounding districts. The pipes were run up outside the shop to the lantern, so that the whole of the installation could be under the control of the gas company. They offered the shopkeeper to guarantee the light and take all responsibility and trouble off his shoulders for an inclusive charge —usually £5 per 1,000 c.p. lamp. He was told in every case that if the electric light people would supply the lamps, clean, repair, and maintain them, and take the worry off their shoulders, the shopkeepers would have electric light, as they preferred it to high pressure gas. He had lost several consumers for this reason; if he had only had powers to wire premises he could have kept every one. If they had proper hiring and wiring powers they need not be afraid of gas competition, especially if they had a proper sales department to look after consumers, and, in fact, they could get £1 per lamp per annum more than the gas people if they had a proper business organisation. The gas companies were not making a big profit on this outside lighting, but they just wanted to knock the arc lamp out. Electric supply undertakings could not compete in this way if they had to employ contractors and pay them their 10 per cent. profit. They must have power to do wiring; the present position might satisfy some, but it did not satisfy him.

Hosted by Google

Councillor CROWTHER (Vice-Chairman of the Sheffield Electricity Committee) strongly disagreed with what the President had said on the previous day as to the desirability of putting the whole of the wiring into the hands of private contractors. He had not the slightest animus against the contractor, but he was of the opinion that electric light undertakings ought to have exactly the same freedom of wiring premises and dealing with consumers as the private contractor and the gas company had.

Mr. A. H. SEABROOK, in the course of a brief reply to the discussion, said that it was a curious thing that a large number of undertakings which had surpluses and renewals and reserve funds and were contributing to the rates were at the same time trying to raise loans for things which they had far better pay for out of revenue. He thought Mr. Watson's idea of changing over their arc lamps to groups of metal filament lamps was a very good idea, for instead of giving away a lot of money to the carbon makers they kept it for themselves, as they got a bigger revenue from the sale of current.

THE DINNER.

The annual dinner of the Association was held in the Banqueting Rooms of the Dome Pavilion, and was exceptionally well attended. A new feature was the presence of ladies. The toast of the Brighton Corporation, proposed by Mr. G. Wilkinson, of Harrogate, was responded to by the Mayor of Brighton, Mr. C. Thomas Stanford, M.A. Alderman E. Geere, the Deputy-Mayor of Brighton, proposed the Association, which was acknowledged by the President, Mr. Christie. The toast of "Our Guests," including the ladies, was allotted to Mr. C. E. C. Shawfield, and was replied to by Mr. S. Z. de Ferranti, President of the Institution of Electrical Engineers.

Mr. FERRANTI said that although, as they knew, he objected broadly to municipal trading, yet as municipal trading was an accomplished fact he held strongly that it should have every facility to make it as successful as with the best commercial institutions. Nothing should be withheld from it which any private enterprise dealing with a similar business would be allowed to enjoy. He hoped that the Institution of Electrical Engineers and the I.M.E.A. would work closely together to get whatever concessions and rights were necessary to further and prosper their business. He also hoped to extend the scope of the Institution, so that it would be a place, not only for technical men, but for all interested in the business of electricity.

THE ANNUAL GENERAL MEETING.

The annual meeting was held at the Royal Pavilion at 10 a.m. on Friday, June 30th, Mr. Christie being in the chair. The first business was the election of officers, and filling the vacancies on the Council. The ballot resulted as follows:—

PRESIDENT: G. Wilkinson (Harrogate).
VICE-PRESIDENTS: C. E. C. Shawfield (Wolverhampton) (*Senior*), R. A. Chattock (Birmingham) (*Junior*).
PAST PRESIDENTS: S. L. Pearce (Manchester), W. W. Lackie (Glasgow), J. Christie (Brighton).
HON. SOLICITOR: Alderman G. Pearson (Bristol).
HON. TREASURER: J. E. Edgcome (Kingston-on-Thames).
HON. SECRETARY: H. Faraday Proctor (Bristol).
COUNCIL: A. C. Cramb* (Croydon), F. Ayton* (Ipswich), W. Wyld* (Birkenhead), H. Richardson* (Dundee), F. M. Long* (Norwich), Councillor Rowntree* (Harrogate), Councillor Crowther* (Sheffield), Bailie Willock* (Glasgow), Alderman Bruce (Sunderland), Councillor German (Brighton), A. H. Seabrook (Marylebone), Alderman C. West (Coventry), S. J. Watson (Bury), C. Furness (Blackpool).

New members of Council and those re-elected are marked with an asterisk. Mr. A. C. Cramb (Croydon), Mr. F. M. Long (Norwich), Mr. H. Richardson (Dundee), Alderman Sinclair (Swansea), Alderman J. P. Smith (Barrow-in-Furness), Bailie Willock (Glasgow), and T. P. Wilmshurst (Derby) retired from the Council in the ordinary course, whilst a further vacancy was created by the election of Mr. R. A. Chattock as junior Vice-President.

It was the general wish of the meeting that next year's Convention should be held in Harrogate, if the necessary arrangements can be made.

REPORT OF THE COUNCIL.

The following were the principal points dealt with:—

Joint Publicity Committee.—Two representatives of the Association, Messrs. Christie and Ayton, have been appointed as members of the Joint Publicity Committee, in addition to two members of the Council already members of such Committee on a different representation, Messrs. Cramb and Seabrook.

Wiring Rules.—The Association has been represented upon the E. E. Wiring Rules Committee by Mr. Christie and Mr. Edgcome, in addition to Mr. Pearce, who was appointed a member of the Committee by the Institution, and the Council have carefully considered and approved of the amended rules.

Travelling Studentship.—Two papers were received from Associates for the Travelling Studentship, and the Council have awarded the first place to the Paper on "The Motor Meter as Applied to the Measurement of Single-phase Alternating Current," by Mr. V. F. Bush, of Tunbridge Wells. The subject of the other Paper was "Steam Power Generation: the Advantages of Mechanical Draught," by Mr. J. R. Campbell Murray, of Motherwell, who has been awarded a special premium of two guineas.

Charges for Current for Traction Purposes from Combined Stations.—Messrs. S. L. Pearce (Manchester) and T. Roles (Bradford), on behalf of the Association, have held a large number of meetings with the representatives of the Municipal Tramways Association, Messrs. J. M. McElroy (Manchester) and C. J. Spencer (Bradford), and a comprehensive and valuable report is now being dealt with by a committee of the Council, previously to consideration by a joint Committee of the two Associations.

MR. GEORGE WILKINSON.
(Borough Electrical Engineer, Harrogate).
THE NEW PRESIDENT.

Engineering Standards Committee—Lamp Standard Sub-Committee.—This sub-committee has recognised that the ordinary standard bayonet socket lamp-holder is not well adapted for use with radiator lamps taking 250 watts at 100 volts, due to failure of the springs and contacts. The Committee are therefore making further investigations in this direction, and it is hoped that the result will be the production of a lamp-holder which can be used with uniform satisfaction with currents up to $2\frac{1}{2}$ amps.

Standard Specifications.—The Institution of Electrical Engineers have been engaged for some time past in revising the form of model general conditions recommended for use in connection with contracts for plant, mains and apparatus for electricity works. The Council are strongly against a clause, often found in municipal contracts, appointing the engineer of the local authority as sole arbitrator in cases of dispute.

General.—The membership shows a slight falling-off, due partly to the unusual number of engineers leaving municipal employ, but traceable also to the action of the Local Government Board in disallowing subscriptions paid to the Association by local authorities. This is a matter which the Council has under consideration. Other matters which the Council are dealing with include the suggestion for the establishment of an information bureau and the desirability or otherwise of enlarging the Council with a view of securing wider representation of the smaller undertakings. The Council and its Committees have held more meetings than usual, and are still dealing with several matters of importance, in connection with which it is deemed inexpedient at the moment to report progress.

Before the report was discussed, the student's premium was presented to Mr. V. F. Bush.

A long discussion took place upon what action the Council is taking in regard to municipal wiring powers, which the Press was requested not to report. Subsequently Mr. A. H. Shaw (Ilford) asked when the report upon current for traction purposes might be expected. Mr. S. L. Pearce said it was quite impossible to say, as the Joint Committee had only met once since the preparation of the draft report, and so far they were only one-third through the draft. A suggestion was made by Mr. W. G. Pickvance (Chief Electrical Engineer, Wrexham) that there should be included on the Council three engineer members and one Councillor representing stations up to and including 1,000 kw., and one engineer member and one Councillor representing stations from 1,000 kw. to 2,500 kw. On the suggestion of Councillor Crowther, of Sheffield, the matter was referred to the Council for consideration.

Votes of thanks to the Brighton Corporation, the President, and to the honorary officers of the Association closed the meeting.

Hosted by Google

LOCAL NOTES

Aberdeen: *Tramway Extensions.*—The question of tramway extensions has been deferred pending reports on the working of the railless systems in Leeds and Bradford.

Accrington: *Tramway Assessment.*—The result of the arbitration concerning the tramway rating is that the tramways, which have been previously assessed at £800, and were valued by the Union valuer provisionally at £1,650, are to be assessed at £2,548. The Corporation contended that the figure should have been £650.

Australia: *Newcastle.*—In consequence of an unfavourable report by an independent expert, Mr. J. E. Donoghue, on the electricity undertaking, stating that the steam piping in the station was defective and that the arrangement of the high tension feeders was dangerous, the City Electrical Engineer, Mr. Prydon, has resigned. The post is now vacant at a salary of £350 per annum, and Mr. Donoghue has been appointed Consulting Engineer.

Bedford: *Coronation Illuminations.*—Elaborate illuminations of the Town Hall and river were carried out under supervision of Mr. R. W. L. Phillips, Borough Electrical Engineer. The installation is to remain up all the summer, and will be lighted up on special gala nights.

Belfast: *Electricity Accounts.*—The net profit on the undertaking is reported to be £13,766, of which £5,000 is to be devoted to relief of rates.

Birmingham: *Tramways.*—The cable tramways to Handsworth and King's Norton have been taken over by the Corporation. The electrical equipment is already completed, and the existing track which has been provided will be used temporarily.

Bradford: *Electricity Accounts.*—The year shows a surplus of £8,980 against £7,399 for the previous year; the income was increased by £4,117 and the expenditure by £2,537.

Croydon: *Tramway Accounts.*—There was a net profit of £8,458 from the working of the Corporation tramways last year, of which £4,800 has been transferred to relief of rates, and the balance to renewals fund. The number of passengers carried, 19,476,576, is an increase of 770,972 over the previous year. Chamberlain and Hookham meters have been fitted to all the cars, and Mr. T. B. Goodyer, the tramway manager, reports a saving of 24·77 per cent. in current consumption since the meters were installed, or £4,984 18s. The tramway employees' sports will be held at the Brighton Railway Athletic Club's ground on Wednesday, July 26th, at 2.30 p.m.

East Kent: *Light Railway.*—The Board of Trade have confirmed the East Kent Light Railways Order authorising railways from Sheperdswell to Sandwich Haven, with branches from Eythorne to Coldred and to Tilmanstone, and from Eastry to Wingham.

Edinburgh: *Railless Traction.*—The Burgh Engineer has been deputed to visit Bradford and Leeds to report on the working of the trolley omnibuses.

Glasgow: *Tramway Accounts.*—The total income for the year ended August 31st was £949,488 and the receipts £533,179. Of the balance, after rental of leased lines, &c., and capital charges had been met, a net profit of £68,678 remained, which is handed over to the "Common Good" against £53,028 for the previous year. The revenue per car mile averages 10·461d.

Guildford: *Lighting of Workhouse.*—Mr. Lankester Burne is to be retained to advise the Board of Guardians on the question of electric light at the Workhouse.

Hull: *Electricity Accounts.*—A larger profit than has previously been made is reported for the last year, amounting to £8,223 after meeting capital charges. The total revenue was £61,439, and the expense £28,687, and the working costs averaged 0·88d. per unit.

Kendal: *Electricity Accounts.*—A deficit of £568 is reported on the electricity undertaking. The total output was 88,131 units, and total costs averaged 2·87d. per unit.

Leeds: *Tramways.*— A large site is being secured for extension to the tramway department.

London: *Hackney Tramways.*—The Borough Council have approved of the proposals of the L.C.C. for the conversion to electric traction of the tramways in Dalston Lane and Graham Road.

Manchester: *Tramways.*—The annual report of the tramways gives the total mileage as over 182 miles of track. The receipts for the year were £799,079 and the expenses £519,142. After meeting capital charges and placing £86,249 to reserve, renewals and depreciation, £75,000 has been handed over to relief of rates. The traffic revenue averaged 11·043d. and the working expenses 7·174d. per car mile.

New Zealand: *Water Power.*—The first steps towards harnessing the Waira Falls for the generation of electricity are about to be taken. A survey party is presently engaged in defining the line between Kaikhoe and Horeke, and is to continue the work between the Falls and Whangerie and the Falls and Dargaville. The Government has made a grant to cover the survey.

Plymouth: *Tramways.*—A profit of £1,377 has been made as compared with £953 for last year.

Wood Green: *Electricity Supply.*—The Council have finally rejected the scheme of the North Metropolitan Electric Power Supply Co. for a bulk supply.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Broxburn.—An application for a loan of £2,000 for extension has been granted.

Dublin.—The Electric Lighting Committee has received sanction of the Local Government Board for a loan of £50,000 for an extension of the Electricity Works.

Eccles.—A loan of £3,294 for extensions has been sanctioned by the Local Government Board.

Gloucester.—A Local Government Board inquiry has been held into a loan of £14,000 for extensions.

Govan.—Tenders are invited by August 1st for H.T. switchboard extensions. Particulars from Burgh Electrical Engineer.

Jerusalem.—The time for tenders for electric tramways, etc, has been extended to September 3rd. Turkish Ministry of Public Works, Constantinople.

London: *Bermondsey.*—Extensions to the value of £18,563, including boilers, generating plant and condensers, with extensions to the boiler house, are under consideration.

Hornsey.—A Local Government Board inquiry was held last Thursday respecting an application for a loan of £9,600 for extensions to the generating station. There was no opposition.

Poplar.—Tenders are required by July 15th for coal handling plant. (See an advertisement.)

Shoreditch.—The L.C.C. have approved the grant of a loan of £11,236 for mains and house services.

York.—Tramway extensions are contemplated at a cost of about £17,000.

WIRING

London.—The L.C.C. invite tenders for the electric lighting of the trade school for girls, Belvedere Place, Borough. (See an advertisement on another page.)

Marylebone.—Municipal buildings.

St. John's Wood.—New fire station.

Wandsworth.—Church and parish hall, Garrett Lane.

PROVINCES.

Andover.—Isolation hospital.

Axminster.—New cottage hospital.

Brecon.—Two schools. Surveyor, County Hall.

Bristol.—Extension to workhouse.

Cardiff.—Electric theatre, Union Street. A. Phillips.

Edinburgh.—New training college.

Enfield.—Public library, Council offices.

Hinckley.—New workhouse infirmary.

Hull.—Rebuilding Town Hall.

Hyde.—Extensions of municipal buildings.

Leeds.—Hostel for women students, Leeds Training College. J. Graham, Secretary, Education Department, Calverly Street.

Hosted by Google

Nottingham.—New Veterans and Union Jack Club, Earlton Road. Architect, A. Marshall, King Street.
Plymouth.—Two new churches at Old Taira Road and Alvington Street, Cattedown.
Portsmouth.—Extension to infirmary.
St. Helens.—New schools.
Sunderland.—Additions to Bede Collegiate School.
Torquay.—New municipal buildings and pavilion.

TENDERS RECEIVED AND ACCEPTED

Ashton-under-Lyne.—Venner & Co. have received the contract for meters over 10 amperes.
Barnstaple.—The tender of the D. P. Battery Co. (£1,370) for a battery at the electricity works has been accepted.
Blackpool.—Two single-deck open cars are to be purchased from the United Electric Car Co., of Preston.
Haslingden.—The tender of Siemens Brothers & Co. for light and power cables has been accepted.
London.—The tender of Dick, Kerr & Co. (£2,093) for overhead equipment of L.C.C. tramways from Brixton to Herne Hill has been accepted. The tender of the British Westinghouse Co. for checking meters for the Greenwich power station (£113) has been accepted.
Norwich.—334 new time switches have been ordered from Venner & Co., bringing up the total in use to 400.
Rugby.—The tender of the British Thomson-Houston Co. for feeder equipment and rearrangement of switchboard has been accepted.
Stoke-on-Trent.—The tender of the British Westinghouse Co. for switchgear (£6,651) has been accepted.
Worthing.—The tender of Mirrlees, Bickerton & Day for additional plant (Diesel engines) at £3,965 has been accepted.

APPOINTMENTS AND PERSONAL NOTES

Mr. A. J. Hutchinson, engineer and manager, Farnworth Electricity Works, has been presented with a marble timepiece by the staff on the occasion of his marriage.

The salary of Mr. C. Till, Sales Engineer, Hackney (£150) is to have added to it a commission of 2½ per cent. per annum on all sales in excess of £4,000.

A clerk in the sales department of the Hackney Electricity Works is required at a salary of £100 per annum, rising to £150.

A meter tester is required at Stoke-on-Trent. (See an advertisement on another page.)

Osram Lamps by Aerial Transport.—An interesting and novel experiment was carried out on Tuesday. The General Electric Co. sent a consignment of Osram lamps from Worthing to Messrs. Page & Miles, Ltd., of Brighton, by means of a "Valkyrie" monoplane. The flight, which was to have been carried out on the previous Thursday in honour of the I.M.E.A. Convention, but had to be postponed on account of the wind, was made on Tuesday with conspicuous success, and a perfect descent was effected at 8 o'clock in the Hove Marine Park (by arrangement with the Corporation); a messenger with a cart awaited the arrival of the flying machine, and immediately conveyed the case of Osram lamps to its ultimate destination. This we believe is the first time that aerial transport of merchandise has ever been attempted. A crowd of over 5,000 people had quickly gathered at the Park upon learning the news, and heartily cheered the aviator, Mr. H. Barber. Mr. Barber, who is an amateur, proposes to give any proceeds from the display to a prize fund. The feat is all the more meritorious when it is realised that the enclosure is only a very small one, measuring a little over 250 paces from corner to corner. We understand that none of the lamps were broken during transit, and, in fact, all the filaments were intact.

Electricity in Agriculture.—Mr. Emilio Olsson, of Buenos Aires, writing from 19 Southampton Buildings, London, W.C., sends us a pamphlet in which he gives some general notes of a method of applying "electrified" water in the form of "artificial rain" with the object of increasing the production of crops from an area under cultivation. It appears that the water to be employed is placed in an iron tank through which a current is passed, using the tank as the anode and a copper wire as the cathode. This, it is claimed, reduces the hardness by precipitating the calcium salts. An arrangement of sprinklers is employed to produce the "artificial rain." In an experiment described, the current employed was 0·5 ampere at 110 volts, and it was passed through the tank for half an hour, but as the size of the tank is not given in the report, no useful deductions as to the cost of application of the method can be made. It is also stated that the treatment prevents ravages by locusts, but no explanation of this is given.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £58 10s. to £59 (last week £58 15s. to £59 5s.)

Patent for Sale.—A patent for a device of starting and cutting out electric motors is for sale. (See an advertisement on another page.)

Change of Address.—Messrs. Marsh, Son & Co., Ltd., manufacturers of and dealers in electrical supplies, have removed from 15 Gerrard Street to 167 and 169 Wardour Street, London, W. Messrs. C. H. Davies & Co., of Francis Street, Birmingham, are moving to 153 Bracebridge Street, which will be their address on and after Monday next.

Bankruptcies, Liquidations, &c.—T. C. Thomas, Electrical Engineer, of 66 Liverpool Road, Stoke-on-Trent, has been adjudicated bankrupt.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Chilian Electric Tramways & Light.—The report states that a dividend of 6 per cent. is declared on the preference shares, with £11,553 carried forward. The business shows satisfactory increase, notwithstanding some labour troubles, and new rolling stock is on order.

Mexican Light & Power.—A dividend of 1 per cent. is declared, payable July 15th.

National Telephone.—The directors recommend a dividend at the rate of 6 per cent. on the deferred stock for the half-year, carrying £200,000 to reserve and £18,000 forward.

Madras Electricity Supply.—The report for the first complete year's working of the generating station records a gross profit of £28, and, after payment of interest, &c., a final deficit on the year of £1,041, which is carried to suspense account.

Chile Telephone.—A final dividend of 4s. per share is recommended, with £3,225 carried forward.

General Electric Co.—The report for the year to March 31st, 1911, shows a net trading profit of £119,146, in addition to £8,919 brought forward. A dividend at the rate of 5 per cent. for the year is recommended on the ordinary shares, £43,615 are transferred to reserve, and £7,431 appropriated for managing-directors' and employees' bonus; carry forward, £12,214. The reserve fund stands at £202,103, and out of this it has been decided to write down goodwill and patents by £92,103.

Edmundson's Electricity Corporation.—The report gives the net profit for the year, after payment of debenture interest, &c., as £16,138, compared with £10,768 for the previous year. Including the amount brought forward from last year, £41,715 is available, which the directors recommend should be carried forward.

Electric Railway in the Pyrenees.—The new electric mountain railway from Mont Louis in France to Puigcerda in Spain, across the Pyrenees, was opened for traffic on Wednesday of last week.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 6, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

16,017/10. **Power Handle for Controllers.** W. R. SHAW and G. H. GREEN. An improved detachable power handle for electric controllers is described in this patent. It comprises a detachable casting with an elliptical bored hole having a neat sliding fit on a casting, which is permanently fixed to the controller handle, and carries an elliptical boss, so shaped to take the detachable casting. The action of the two-part power handle is such that on each cylinder spindle a permanent casting is fixed, and takes the wear, which is distributed over the whole surface of the elliptical boss when the detachable and fixed castings are in contact. The cylinder is then ready to be rotated on either the power or brake sides of the controller. Three figures.

21,157/10. **Arc Lamp Electrodes.** THE GILBERT ARC LAMP Co. and A. T. DOWDELL. In an arc lamp using two or more pairs of electrodes, the deposit due to the burning of the first pair frequently completely insulates the other pairs, so that the electrical and mechanical pressure is not sufficient to break down this insulation. An addition is therefore made to the tips of the second and subsequent pairs of electrodes of a suitable point or cutting edge of metal, which will cut through any insulating deposit left by the previous pair, and so secure the initial lighting up of the others to follow. Nine figures.

24,216/10. **Electric Lamp Cap.** F. C. MAYES. This invention has for its object to prevent the breaking of filaments in incandescent lamps, and consists of a flat, coiled spring fixed at its centre to the fixed brass cap for holding the lamp bulb, the two being secured in an auxiliary lamp cap. Two guide and lock pins are fitted to the brass cap, which ride in two slots in the lamp cap, when fixing into a lamp holder. The lamp being so fitted with suspension means within a loose auxiliary cap, enables it to oscillate freely in every direction without vibrating the filament. Two figures.

29,700/10. **Lamp Regulator.** E. H. SMITH and E. A. KAATZ. Provision is here made in a regulating device, for adjusting the brilliancy of incandescent lamps. A plug, which can be connected to an electric circuit, has a lamp socket mounted on it, and a rotatable, hollow, ventilated rheostat ring is mounted on the socket. The ring consists of an inner cylinder wall of insulating material, and an outer casing with apertures. A single coil of wire encircles a number of contact plates and the inner wall, but is insulated from the contacts, which are electrically connected at intervals with the coil, and a spring contact mounted on the plug is arranged to be brought successively into contact with the plates by the rotation of the ring. Seven figures.

3,251/11. **Electric Furnace.** H. PAULING. It is well known that when treating gases with electricity it is desirable to reduce the loss of heat by radiation to a minimum, and for this purpose the flames have been kept close to the furnace walls. If this is carried too far the furnace walls get too hot, and become conductors of electricity with the electrical pressure usually employed. In the present case this is obviated by subdividing the inside surface of the furnace wall into separate areas by channels, which penetrate to such a depth that the wall cannot act as a conductor when heated by the electric flame. Four figures.

3,747/11. **Supports for Overhead Conductors.** H. SEFTON JONES (*Oesterreichische Daimler-Motoren-Ges.*). This patent deals with the suspension and tension of the wires in a railless traction system. The conductors are suspended on U-shaped supports, one limb being surrounded with an insulated layer and provided with a head-piece, placed in a screwed-in protected bell, to prevent it from slipping out, the whole being fixed to the stirrup; the other limb is bent upwards to support the conductor. A special stirrup is designed for bends, one side being provided with a projecting arm in which there are several holes, for a tension wire to be connected, so that an inclined pull can be obtained at bends, making it possible to lay one conductor somewhat higher than the other, and so preventing the trolley from slipping off. Three figures.

Application for Restoration of Lapsed Patents

13,746/03. **Electrically Operated Signals.** S. M. YOUNG. An application has been made for the restoration of this patent, which expired due to the non-payment of renewal fees. The specification covers certain improved methods for operating signals on electric railways.

7,320/07. **Improvements in Arc Furnaces.** SALTPETERSÄURE INDUSTRIE-GESELLSCHAFT G.M.B.H. have made an application for the restoration of the above patent, which expired owing to the non-payment of the renewal fee. It relates to improvements in arc furnaces for the electrical treatment of gases.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: BRITISH THOMSON-HOUSTON Co. (*General Electric Co.*) [Electric insulating material] 13,946/10; STANILAND [Terminals for wires and cables] 14,045/10.

Dynamos, Motors, and Transformers: PRICE [Electrical machines] 14,499/10; PARSONS and LAW [Dynamo-electric machinery] 14,680/10; BUCHER [Rotary motors] 4,243/11.

Electrometallurgy and Electrochemistry: MARKS (*Langbein-Pfanhauser-Werke Akt.-Ges.*) [Manufacture of detachable electrolytic iron deposits] 25,092/10.

Heating and Cooking: SERPEK [Revolving electrical furnaces] 29,299/10; WILKINSON [Resistances] 14,912/10.

Incandescent Lamps: SPECHT and BEIGE [Lamp holders for] 19,033/10; JONES [Hand signal lamps] 25,160/10.

Instruments and Meters: NORTH [A.C. electric meters] 15,170/10; LANDIS and GYR [Electricity meters] 1,056/11.

Storage Batteries: HARDY and HUNGERBUHLER [Separators for secondary batteries] 7,086/11.

Switchgear, Fuses, and Fittings: ADAMS MANUFACTURING Co. (*Cutler Hammer Manufacturing Co.*) [Controllers for motors] 14,946/10 and 14,956/10; HOPE [Switches] 25,923/10; WIMMER [Speed-controlling device for motor-driven sawing machines] 28,683/10; SIEMENS BROS. DYNAMO WORKS, LTD. and BOLTON [Switches] 2,594/11.

Telephony and Telegraphy: SIEMENS BROS. & Co. (*Siemens and Halske Akt.-Ges.* [Circuits for telephone exchanges] 14,196/10.

Miscellaneous: FRANZ MÉGUIN & Co. [Electro-magnetic apparatus for crushing machinery, &c.] 6,212/10; BILLITER [Electrolysis of liquids] 11,693/10; HARRIS [Apparatus for actuating bells] 12,047/10; LOMAX [Earthing devices] 14,057/10; HIRST and MAURICE [Electrically-illuminated letter signs] 14,349/10; CASTLE, RIDDIFORD, BIDWILL, and MCDERMOTT [Electric alarm systems] 14,383/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electrometallurgy, &c.: RODECK [Electro-deposition of metals] 13,808/11.

Heating and Cooking: SCHNEIDER [Electric heat-regulator] 11,548/11; SOC. ANON ELECTROMETALLURGIQUE (*Procedes Paul Girod*) [Triphase current supply to electric furnaces] 13,731/11.

Switchgear, &c.: DUNNING [Electric circuit control] 13,830/11. SIEMENS SCHUCKERTWERKE GES. [Speed regulation of polyphase series motors] 13,877/11.

Traction: ALLGEMEINE ELEKTRICITÄTS GES. [Railway signalling systems] 13,985/11.

Miscellaneous: SCHMIDT [Spark plugs] 13,524/11.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

16,405 of July 10th, 1897. **Telegraphy.** OLIVER J. LODGE and A. MUIRHEAD. This invention relates to the utilisation of Hertzian waves emitted by oppositely charged conductors, sparking into one another, for telegraphing without the aid of conductors, and consists of putting in the receiving circuit a siphon recorder as receiving instrument, a coherer in direct circuit with the recorder, and arranging that the current flowing in the receiving circuit shall, after an impulse in the coherer, bring about its decohesion, and restore it ready for another impulse.

16,651 of July 13th, 1897. **Electric Railway Signals and Points.** J. A. TIMMIS. In connection with his patents 5,718/83, 7,827/91, and 21,496/93, the last two dealing with the working of signals and points electrically and automatically, the author, in this invention, introduces a track circuit, so that the train itself can put signals to danger.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: C. E. FOSTER, E. R. GROTE, and M. V. ELY, 6,110/04.

Incandescent Lamps: W. NERNST, 6,135/98.

Switchgear, &c.: BRITISH THOMSON-HOUSTON Co. (*General Electric Co.*) [Switches] 6,006/06; [Electric resistances] 6,089/06 and 6,193/06.

Telephony, &c.: W. L. WISE (*J. H. Peirce*) [Telegraph systems] 5,944/02.

Traction: G. A. TRUBE and W. CHAPMAN [Tramway brakes] 6,295/02.

Miscellaneous: C. MILDÉ, A. COURTANT, E. MINVIELLE, and C. MILDÉ [Electric bells] 6,216/06.

SUMMARY

The large new generating station which has been put down by the Newcastle-upon-Tyne Electric Supply Co. at Dunston-on-Tyne was inaugurated last week. The generating plant at present installed consists of two turbo-alternators giving up to 9,000 kw., and one up to 7,000 kw. The station has several interesting points of design, and the switchgear is contained in an entirely separate building. (Page 395.)

Among interesting exhibits at the Royal Agricultural Show at Norwich were the new two-stroke Diesel engine of Messrs. Willans & Robinson, and the Petter "semi-Diesel" engine. (Page 398.)

Our monthly article on new electrical supplies and accessories contains notes on two recent forms of arc lamp, a new current limiter, and a motor starter and speed regulator. (Page 399.)

An illustrated article describes the Brown-Boveri automatic voltage regulator, in which the multiple contact switches are rendered almost frictionless by an arrangement of rolling contacts. (Page 400.)

The Post Office has now agreed to take over the whole of the National Telephone Co.'s plant at the end of the year, including the 23 "condemned" exchanges, instead of leaving these and other parts of the plant on the Company's hands. The price paid will be determined having regard to the relative suitability of the plant under the new conditions. (Page 401.)

Two interesting communications have been received with regard to Diesel engines, replying to some of the points raised in the recent discussion. (Page 402.)

We are able this week to publish an illustration of the aeroplane by which the first aerial delivery of merchandise, in the shape of a package of Osram lamps, was made last week. (Page 404.)

Mr. Cridge, in some remarks on the recent discussion on shop-front lighting, instanced a case in Sheffield in which a leaflet was issued saying that the cost of running a flame arc lamp was 2d. an hour, and the Town Clerk had held that this constituted a contract so that the consumer was entitled to refuse to pay more. (Page 397.)

Some interesting statistics relating to the use of meters on tramcars have been collected by Mr. T. B. Goodyear, Tramways Manager, Croydon Corporation. (Page 404.)

Among the specifications published by the Patent Office last week was one covering a new insulating compound by the British Thomson-Houston Co. Mr. H. Hirst and Mr. G. Maurice have patented a form of electric sign, and a form of inverted rectifier patented by Mr. W. A. Price enables induction motors to run off continuous-current circuits. A specification by Sir C. A. Parsons and Mr. A. H. Law describes methods of securing end connections of turbo-generator armatures, and a locking device for isolating switches is protected by Siemens Brothers' Dynamo Works, Ltd. (Page 406.)

The Bradford Corporation contemplate extensions of their trolley omnibus system, and the Brighton and Sheffield Corporations have such lines under consideration.—Profits are reported from the Belfast, Birkenhead, Glasgow, Gloucester, Fulham, and Wolverhampton electrical undertakings for last year.—A scheme for supplying electrical energy for heating and cooking at 1d. per unit, through the electric lighting wires at Glasgow, is meeting with considerable success. (Page 407.)

Large extensions to the electricity works at Sheffield (£61,000) and Wolverhampton (£19,700) are contemplated. Bradford Corporation require water-tube boilers, superheaters, travelling crane, &c.; Southampton Corporation, motor generator and condenser; and the following extensions are also under consideration:—Aldershot, £2,500; Leigh (Lancs), £6,300; Torquay, £5,000; Turton, £4,500. Overhead mains are required at Barrow. (Page 407.)

Hosted by Google

MARCONI'S Wireless Telegraph Co. propose to pay a dividend on the ordinary shares for 1910. A dividend at the rate of 1¾ per cent. per annum is recommended by the City & South London Railway, and 2½ per cent. by the Electric Construction Co. (Page 409.)

Tramways & Light Railways Congress.—The annual Congress of the Tramways and Light Railways Association will be held at the Carlton Hotel, Edinburgh, on Thursday and Friday, July 13th and 14th. On the first day, the following Papers will be read :—(1) "Transfer Fares," by C. W. Shepherd, General Manager, Edinburgh & District Tramways Co.; (2) "A Few Reasons why Electric Traction in England Remains Stationary," by G. H. J. Hooghwinkel. In the evening the chairman and directors of the Edinburgh & District Tramways Co. entertain the Association to dinner. On Friday, July 14th, two Papers will be read :—(1) "Notes on Tramway Problems," by C. W. Mallins, General Manager, Liverpool Corporation Tramways; (2) "Tramways and Light Railways Legislation of the Future," by Alderman W. Ivey, West Ham Corporation Tramways Committee. In the evening there will be a joint dinner with the members of the Royal and Imperial Automobile Clubs of England and Germany, at the Royal Hotel.

Parliamentary.—A House of Lords Committee has passed the Central London Railway Bill which provides for the construction of a short length of railway between the present terminus of the line at Wood Lane and the existing Great Western Railway at Wormwood Scrubbs. It is the intention to run a through service of trains between the Bank and stations on the Great Western Railway to Ealing.

The London County Council (Tramways and Improvement) Bill and the Metropolitan Electric Tramways Bill were read a second time in the House of Lords last week. The East Kent Electric Power Bill has been read a second time in the House of Lords, and the Nottinghamshire and Derbyshire Tramways and the South Lancashire Tramways Bills a third time.

The Brighton Corporation have been refused a *locus standi* to appear in opposition to the Bill of the Brighton, Preston and Hove Omnibus Company, which gives powers for the running of trolley omnibuses between Brighton and Rottingdean. The Bill has already passed the House of Commons. The Corporation, while prevented from opposing the Bill on preamble, may oppose on clauses in respect of the protection of their electricity and water mains.

METERS FOR TRAMCARS

AS stated on page 389 of our last issue, considerable success has attended the use of meters on the tramcars at Croydon, and a saving of 24·77 per cent. in current consumption representing nearly £5,000 per annum has been effected since their introduction. Mr. T. B. Goodyear (Tramways Manager, Croydon Corporation) has also issued an interesting analysis of information on this subject elicited by inquiries from the tramway undertakings throughout the country. Out of eighty-eight systems forty-two now have meters fitted to all cars, seventeen have them fitted to some cars, and of twenty-nine with no meters at present fitted, seven propose to adopt them. In fifteen cases, watt-hour meters are employed; in six cases, time meters; while the rest use ampere-hour meters. In thirty-four undertakings a definite saving in current consumption is reported, but in a number of cases the information is not available. The value of meters in the detection of faulty cars is endorsed by thirty-four tramway managers, while nine state that they do not find them serviceable in this way. The saving at Croydon is the largest recorded, and in addition to the reduction of units consumed per car mile, a saving of 26 per cent. in brake shoe costs is reported. In only one case mentioned, that of Southampton, have meters been abandoned.

Wireless Telegraph Notes.—It is reported that great success has attended the trials by the Royal Engineers near Dorking of a new receiving apparatus known as War Office Secret Patent No. 5.—Tests have been in progress on the Wannsee Lake, near Berlin, of an unmanned motor-boat controlled by wireless transmitting apparatus. Complicated evolutions were performed.

Telegraph Traffic.—There has recently been some trouble with the lines in Teheran, Bagdad and Bassorah, which were down for a short while. The Falmouth-Bilbao Cable of the Direct Spanish Telegraph Company, was restored on July 2nd. The Indo-European Telegraph Company had to repair some of their lines, but the interruption was not of long duration, and the same must be recorded of the lines between Rome and Constantinople.

The success of the Osram lamp Aeroplane Flight has led to other suggestions for new and effective advertising. One of these is the cinematograph film.

Hosted by Google

THE DUNSTON POWER STATION OF NEWCASTLE-UPON-TYNE ELECTRIC SUPPLY CO.

THE continued growth of the North East Coast power system, which now covers over 1,000 square miles and supplies some 150,000 horse-power, has necessitated the erection of a further large steam-driven power station at Dunston-on-Tyne, in addition to the principal generating station of the Newcastle-on-Tyne Electric Supply Co. at Carville, and the stations utilising waste heat from coke ovens, blowing engines, &c., at Blaydon, Newport, Weardale, Bankfoot, Bowden Close, and elsewhere. The Dunston station was formally inaugurated last week, although it has been practically complete for some time. Its construction was decided upon about three years ago. Although there was still spare land at Carville, it was considered better to put the next instalment of generating plant higher up the Tyne, partly in order to obtain in the neighbourhood of the station plenty of land for further new processes which are being attracted to the district as a result of the cheap price of electrical power, and partly for the sake of practically doubling the capacity of the cable network on both sides of the Tyne by having a station at each end. The site is directly opposite the western end of the Elswick works of Armstrong, Whitworth & Co., and the frontage to the Tyne is some 900 feet. Coal supplies are available from either the Durham or the Northumberland coal-fields, and condensing water is obtained from the river. The station is laid out so as to accommodate eventually six 8,000 kw. generating units, but the engine room has so far been built for four units, of which three are already installed. For every two units there will be a boiler house, or three boiler houses in all, of which one has so far been completed. On each side of each boiler house there are four boilers—three of which are capable of driving one generating unit at full load—or eight boilers per house, so that eventually there will be 24 boilers in the station. The general arrangement of the station can be seen from the section in Fig. 1.

The boiler house consists of a roomy basement, with ash bunkers under each boiler, only requiring to be cleared once in every twenty-four hours. The ashes are removed by trucks and electric lifts to a large overhead ash bunker, with a capacity equivalent to two to three days, over a railway siding. The boilers themselves are eight in number, of the marine water-tube type, manufactured by Messrs. Babcock & Wilcox, who were the main contractors for the boiler equipment. Each has 6,725 sq. ft. of heating surface, and a normal evaporative capacity of 30,000 lbs. per hour at a pressure of 200 lbs. per sq. in. They are grouped together in pairs, each boiler having its own superheater, of the return-tube type with 1,156 sq. ft. surface, and economiser, but the gases from each pair of boilers are dealt with by one separately driven induced draught fan and one chimney, both placed immediately over the corresponding boilers. The economisers have each 2,880 sq. ft. surface, and are arranged overhead in pairs; and down the centre of the boiler house there are placed extensive coal bunkers, which are capable of holding a week's supply of coal.

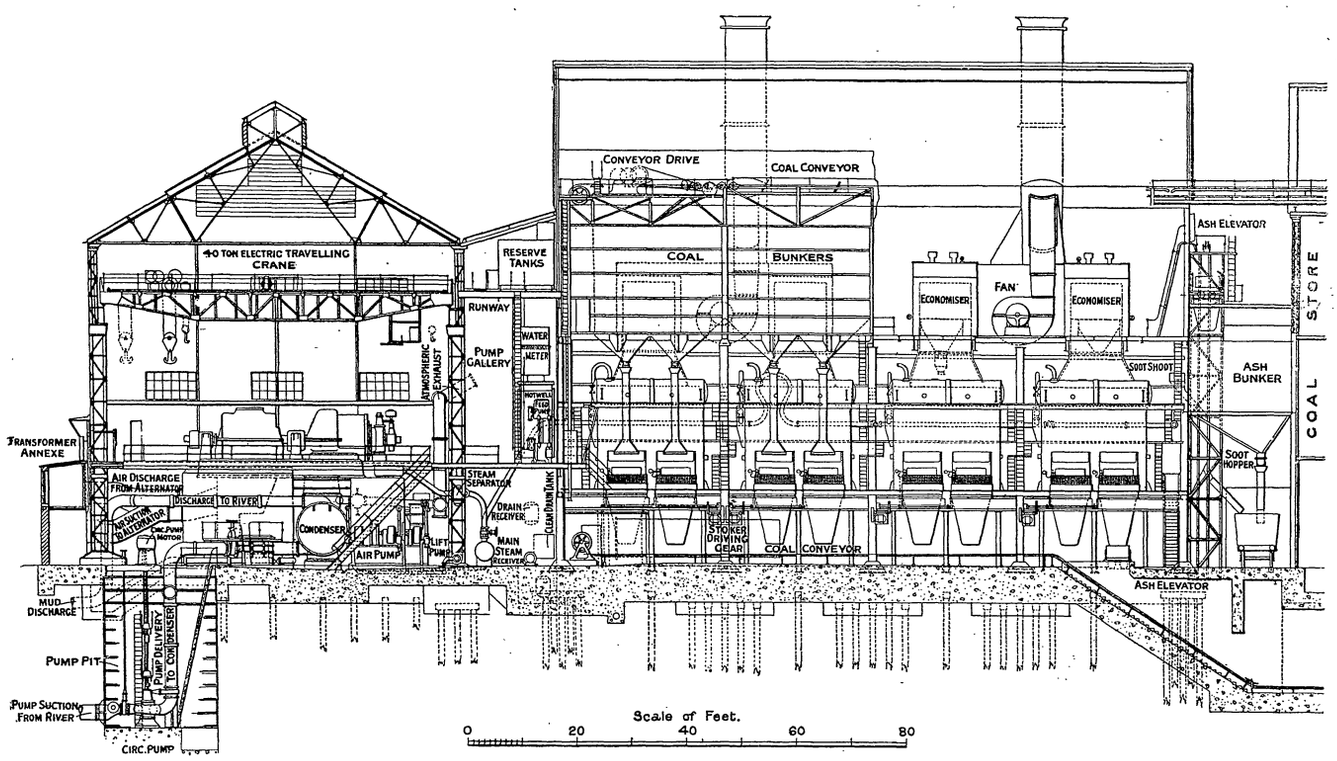

FIG. 1.—SECTION THROUGH ENGINE ROOM AND BOILER HOUSE, SHOWING GENERAL ARRANGEMENT OF PLANT.

The coal is delivered to the receiving hoppers by bottom dumping trucks, and lifted by a Babcock & Wilcox conveyor capable of dealing with 40 tons of coal per hour. There is a large coal store at the end of the boiler house, capable of accommodating some three weeks' supply of coal, in addition to that in the bunkers over the boilers themselves. This receives coal, when desired, from the same conveyor as that which feeds the boiler-house bunkers. Underneath the coal store there is a tunnel, in which there are filling hoppers, which again feed into the same conveyor. The coal from the bunkers is led by shoots direct into hoppers of the chain-grate stokers, which have an area of 168 sq. ft. per boiler.

The complete scheme involves one coal store, boiler house, and set of coal-handling plant for each set of eight boilers, and one boiler house to each two turbo-alternator units. There is one main steam pipe, feed-water pipe, hot-well feed pump, and set of ash-conveying plant for each set of four boilers. The auxiliary motors are 28 in number, all for 440 volts three-phase, ranging from 1 to 20 h.p. Two steam feed-pumps, each with a capacity of 200,000 lbs. per hour, and supplied by Messrs. Clarke, Chapman & Co., are installed.

What has been aimed at in the design of the engine room itself is to have as compact an arrangement of

Hosted by Google

machines as possible, but to have everything, including all the auxiliary machinery, accessible to the overhead crane. This even applies to the circulating water

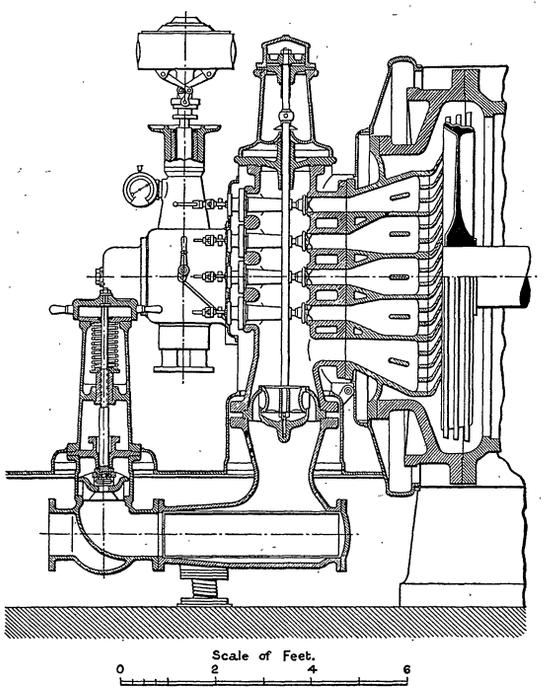

FIG. 2.—SECTION OF GOVERNOR END OF A.E.G. TURBINE, SHOWING ARRANGEMENT OF NOZZLES.

sumps, of which there will eventually be three, one for every two units. They are situated in the engine room, midway between each pair of turbines, and go down to a depth some 30 feet below the engine room floor-level. In each there are two main vertical spindle centrifugal pumps, one for each generating unit, placed at such a depth that they are drowned at all states of the tide, and driven by motors on the engine room floor-level. The suction of each pump communicates by a 24 in. cast-iron pipe direct with the in-take sumps at the river. A salt-water pump is also installed in each sump for supplying water for general cleaning purposes. Contrary to Continental practice, which in general adopts a basement design of engine room with tile or brick floors round the turbines, at Dunston the necessary access to the turbines themselves is secured by means of an open-work cast-iron floor plate and galleries. Behind the turbines on the same level and between them and the boiler house are the feed pumps, hot-wells, water-meters, &c. Beneath this pump gallery are various smaller pumps, &c., on the same basement level are the condensers and electrically-driven air pumps. The feed-pump exhausts can be taken either to the hot-well tanks or to the water softener, or direct to atmosphere.

Two of the turbo sets at present installed are of the Allgemeine Electricitäts Gesellschaft single-flow impulse type, with wheel-type rotors running at 1,200 r.p.m., and coupled to alternators capable of a continuous output of 8,000 k.v.a., or an overload output of 10,000 k.v.a. at a power factor of 0·9 at 5,750 volts three-phase 40 cycles, when the sets are supplied with steam at 190 lbs. per sq. in. superheated to 19° C. A section of one of these turbines is shown in Fig. 2, and some details of the alternators are seen in Fig. 3.

The other set is of the two-cylinder Brown Boveri-Parsons reaction type. This turbine was made by Messrs. Richardsons, Westgarth & Co. The h.p. cylinder is single flow, and the l.p. cylinder partly single and partly double flow. This is coupled to a Brown-Boveri alternator rated at 7,000 k.v.a. continuously, and overloads up to 7,800 k.v.a. at the same power factor, voltage, &c. The general arrangement of the Brown-Boveri alternator is seen in Fig. 4.

The alternators are designed to stand the severest short circuits which are likely to come upon them in practice. The exciters are arranged on the ends of the alternator shafts. Ventilation is by fans on the alternator motors themselves, and the air is drawn in through special filters, there being a separate duct and filter for each alternator. The outlet air ducts are so arranged that the hot air can either be discharged direct outside the building or into the engine room.

Each set has condensing plant, supplied by the makers of the turbines, with electrically-driven pumps. The motor-driven

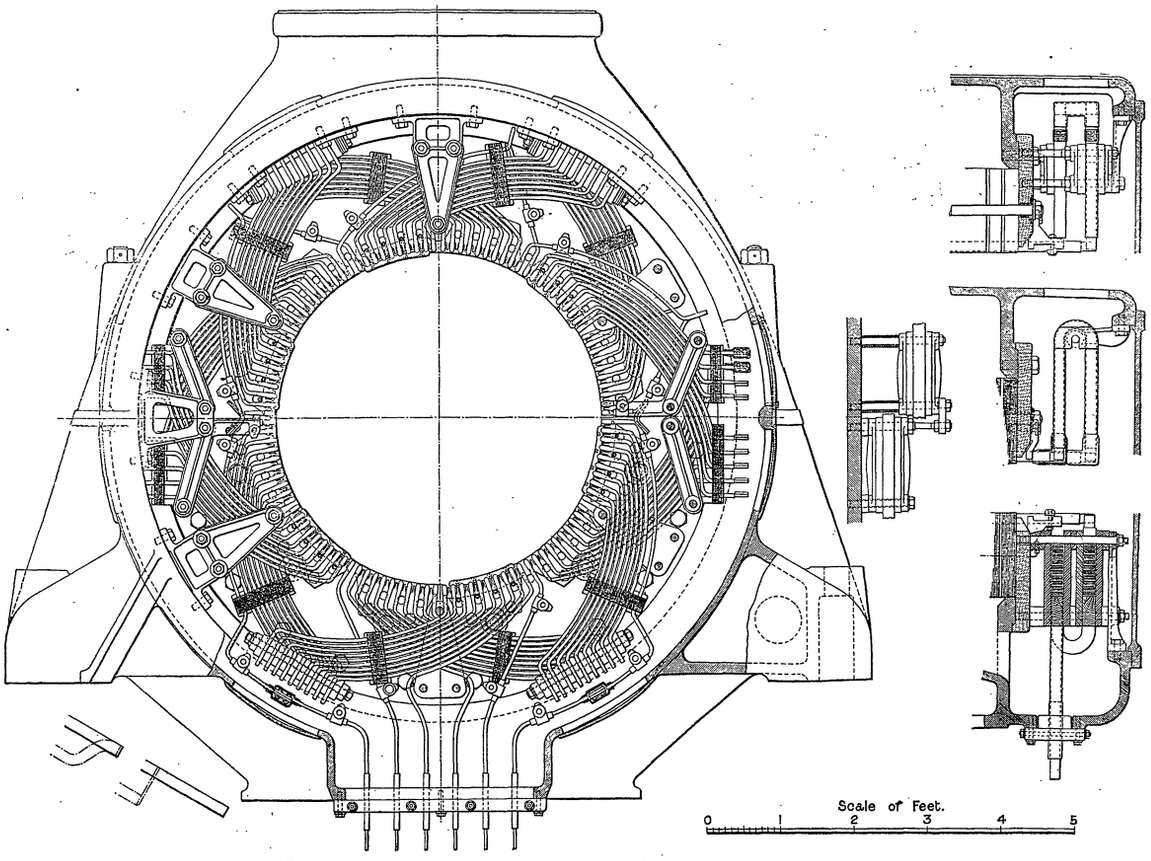

FIG. 3.—DETAILS OF END CONNECTIONS A.E.G. 8,000-KW. ALTERNATOR.

Hosted by Google

auxiliaries belonging to each unit are normally fed from a separate 500-kw. "unit" step-down transformer, in a fireproof compartment opposite each alternator. There is also a common low-tension three-phase system fed from the main high-tension 'bus-bars in the switch-house through two 500-kw. three-phase step-down transformers. A supply can be given for starting up from these 'bus-bars to the auxiliaries belonging to each unit; normally these 'bus-bars only supply the motor-generators, rotary converter, and isolated motors, such as crane motors, throughout the works. The fields of the exciters can be separately excited. Two 50-kw. motor-generators provide a supply of direct current at 100 volts for lighting the station and charging the station battery, which is kept in circuit to ensure an absolutely independent supply of lighting. A smaller motor-generator is also used for charging two control batteries used for operating the high-tension switchgear. There are three batteries in all, the larger for lighting, giving 1,000 amps. for one hour, the two smaller 100 amps. each. A 250-kw. Westinghouse six-phase ball-bearing self-starting rotary converter supplies the power for the electric locomotives.

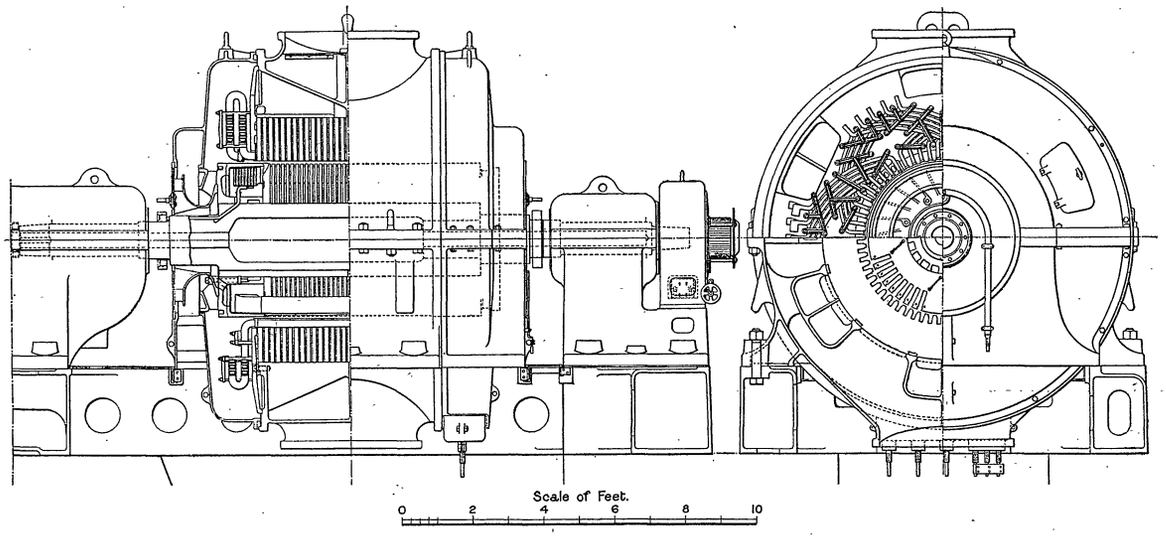

FIG. 4.—BROWN BOVERI 7,000-KW. TURBO-ALTERNATOR.

The switchgear arrangements at Dunston are perhaps the most interesting part of the station. The engine room contains practically no high-tension switchgear, as, with the exception of the ironclad panels controlling the transformers for the auxiliaries, and an indicating wall ammeter for each generator, all the high-tension gear and instruments are installed in a separate switch-house 150 yards away from the engine room. The contractors for the main high-tension switchgear were the British Thomson-Houston Co.

The switch-house is a building with concerete roof 135 ft. long by 33 ft. broad by 32 ft. high. It has two floors, and is divided into two divisions. The front of the building contains on the ground floor offices, &c. The control room containing the operating boards is on the first floor. The back part of the building, shut off by iron doors, is devoted to the switchgear itself, the main oil-break switches and 'bus-bars being on the upper floor, the isolating switches, current and potential transformers, &c., being in brickwork cells on the lower floor. The bare high-tension connections between main switches and 'bus-bars, &c., are on the underside of the roof of the lower room. The control room is 40 ft. by 30 ft., with part glass roof. It is mainly occupied by the semi-circular feeder switchboard and the smaller generator board. The operating board of black slate is divided into sections, the generator and transformer panels and 'bus-bar switches being placed separately from those controlling the feeders. The control gear is operated by means of direct current at 100 volts from two small batteries specially used for this purpose.

Each generator panel has a main ammeter and voltmeter, power factor indicator, indicating wattmeter, field ammeter, integrating wattmeter, &c. It has also a switch for controlling the governor of the turbine, and a rheostat hand-wheel in front, as well as a Chadburn telegraph to each generator. Loud-speaking telephones, supplied by Messrs. A. Graham & Co., are also used. At each end of the generator board is a synchronising panel with rotary synchronoscope. Each feeder panel on the feeder control board has a separate set of instruments, and a set of synchronising and voltmeter plugs for synchronising any other generating station with the machines at Dunston. The feeders are protected with Merz-Price balanced protective gear, supplied by A. Reyrolle & Co. Both the feeder and generator panels have chop-over control switches arranged to make or break the main oil-break switch immediately contact is made. The position of the main oil-break switch is indicated by the lighting of a red or blue lamp, and the operation last performed is automatically indicated by the position of a small coloured pin on the switch handle.

The switch-room itself has two storeys. The 'bus-bars and main oil-break switches are in the upper storey, the connections and isolating switches and current and potential transformers in the lower storey. In the upper room three moulded stone tables run along the room. The main 6,000-volt 'bus-bars rest upon insulators on the central table, and are protected by a cage of expanded metal. The 'bus-bars are divided in the middle of the room by means of a main oil-break switch, capable of carrying 20,000 kw. continuously, and opening under any load likely to be met with. On the two side tables are fixed the oil-break switches, the left side of the room being entirely devoted to feeders. The main oil-break switches are of the British Thomson-Houston Co.'s type. Each of the three cylinders containing the actual switch is in a separate cell, and in front of each cell is a hinged "uacolite" door. The motors operating the switches are arranged to wind up a spring immediately the switch has operated, so that the make or break is instantaneous on the closing of the control switch on the control board. Suitable isolating switches are provided, and all the high-tension panels are provided with balanced protective gear, made by Messrs. A. Reyrolle & Co. There is an air-compressor and set of compressor piping throughout the switch-house for cleaning purposes.

In addition to the switchgear already described, there is in the engine room a neutral isolating switch for each generator and a set of emergency tripping gear, by which the main generator switch in the switch-house can be opened from the engine room. Each generator has also an ammeter, and each generator also has its own "unit" transforming set in the transformer annexe. The leads for these transformers do not pass through the switch-house, but are taken directly from the generator terminals through "Ironclad" switchgear of the Reyrolle type, which is placed in chambers on the northern side of the engine room.

The direct-current switchgear principally consists of a 500-volt traction board, a 100-volt power and lighting board, and the main lighting distribution fuseboard.

The whole station was constructed from the designs of Mr. C. H. Merz, of Messrs. Merz & McLellan, to whom we are indebted for the materials from which this description has been compiled.

The Telephone Position.—We have received a long letter from Mr. A. R. Bennett dealing with the Postmaster-General's speech in the House of Commons on the telephone position. He takes exception particularly to the statement that there was no demand for municipal control of telephones except from Glasgow, and points out that it was only last February that a deputation representing some 300 Councils and Chambers of Commerce pressed the matter. Mr. Samuel stated that of only six municipal telephone systems which were started only two survive, but Mr. Bennett corrects this to three by the inclusion of Guernsey, as well as Hull and Portsmouth, and gives some particulars of the Guernsey system, stating that it possesses the largest exchange in the kingdom in proportion to the population. He also goes into the causes of failure of those which did not survive, and argues that these were chiefly due to conditions imposed by the Government.

THE ROYAL AGRICULTURAL SHOW

THE electrical features at Norwich are almost entirely confined to apparatus for country-house lighting and electric supply for country estates. Very few motors are in evidence owing to the absence of power circuits, hence many exhibitors have been compelled to drive their machinery-in-motion by oil or steam engines where electric motors would have been preferred had a supply of current been available.

One of the most interesting exhibits of country-house installations are two automatic petrol-driven equipments by Messrs. R. A. Lister & Co., Ltd., of Dursley, on the system mentioned in ELECTRICAL ENGINEERING, May 18th, p. 266. Each of these sets consists of a slow-speed vertical petrol engine, with water-tank, a belt-driven dynamo, and an automatic starter all mounted upon a steel frame, the complete equipment being sent out ready for work. There is also a switchboard, upon which is mounted the "Lister" patent relay, in addition to the usual instruments and switches. The switchboard is carried upon a cabinet containing a small battery of accumulators of the "ignition" type. This battery is kept charged automatically, and its function is to maintain a limited number of lights until the relay has had time to start up the engine. Current is also taken from the battery to turn the engine when starting by running the dynamo as a motor. When first switched on, the lamps are lit direct from the battery, but if any considerable amount of current is required, the relay operates the automatic starter and starts up the engine. As soon as the dynamo begins to generate, it takes over the lighting and charges up the battery. Similar results follow the use of even one lamp for a long period, as a fall of voltage will cause the relay to operate. When all lights are switched off, the plant is automatically shut down, leaving the battery fully charged ready for the next start up. In connection with the auto-

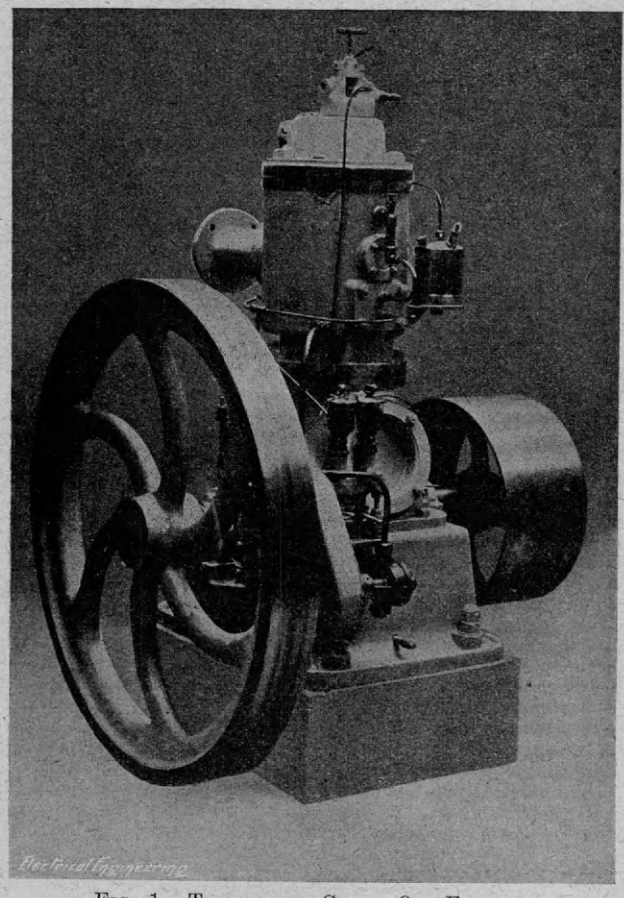

FIG. 1.—TWO-STROKE CRUDE OIL ENGINE.
(Messrs. Petters, Ltd.)

starter is an attachment which relieves the compression in the engine cylinder for starting and stopping by lifting the exhaust valve. This system was exhaustively tested by Messrs. Lister before placing it on the market, the experimental plant being started and stopped several thousand times in succession. Furthermore, each plant is started and stopped more than fifty times in succession before being sent out. The advantages of the system are too obvious to need mention.

A complete electric lighting plant is also shown by Messrs. Boulton & Paul, Ltd., consisting of a petrol engine direct coupled to a dynamo, and including the usual battery and accessories. Combined generating sets driven by oil or petrol engines are shown by eight other firms, and three dynamos direct coupled to gas engines are in evidence, one by Messrs. Tangye's, Ltd., being of 35 b.h.p., and having its own producer. Motors are to be seen driving pumps, fodder machines, and a straw press.

Although not exactly an electrical exhibit, the crude oil "semi-Diesel" engine shown by Messrs. Petters, Ltd., is of great interest in connection with private installations, owing to the remarkably low oil consumption obtained. This engine is of the two-stroke type with the comparatively low compression of 150 lbs. The oil is injected into the vaporiser by a pump under

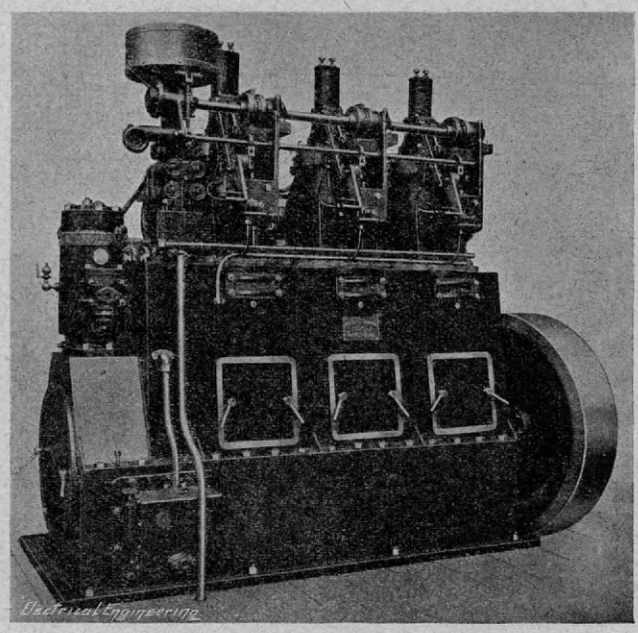

FIG. 2.—NEW DESIGN OF TWO-STROKE DIESEL ENGINE BY MESSRS. WILLANS AND ROBINSON.

the control of the governor, air only being compressed. At the end of the down stroke exhaust ports are uncovered by the piston, and the exhaust gases are blown out by pure air which has been previously compressed to a light pressure in the crank chamber. Lubrication is by rings to the main bearings and by force pump to other parts, whilst the cooling water is circulated by a rotary pump. As regards consumption, the makers are prepared to *guarantee* the low figure of half a pint per b.h.p. hour of crude or residual oil. A view of this engine is given in Fig. 1.

Another exhibit to which interest attaches for similar reasons is the two-stroke Diesel high-speed engine shown by Messrs. Willans and Robinson, Ltd., which is illustrated in Fig. 2. In this engine the piston works in a sleeve in which suitable air and exhaust ports are provided. This sleeve is moved up and down by separate cranks, and the lower end is provided with a ring piston which works in an air cylinder, and supplies air for scavenging at about 2½ lbs. pressure. At the bottom of the stroke of the piston exhaust and air-inlet ports are uncovered, and the exhaust gases are swept out by pure air, the latter being compressed on the up stroke ready for the next oil injection. Excepting for the fuel-injection and starting valves the engine is valveless, and the impulse at every revolution makes it particularly suitable for electric generating purposes. The remainder of the engine consists of the usual Diesel equipment. This engine has three cylinders which develop 75 b.h.p. at 450 revolutions a minute.

Metropolitan Association of Electric Tramway Managers.—A meeting of members of the above was held at the offices of the London United Tramways, Chiswick, on Wednesday of last week. The following were present:—Messrs. A. H. Stanley, Managing Director, London Electric Railways and London United Tramways (Chairman of the Association), Coveney (Erith), Mittelhousen (Bexley Heath), Schofield (Leyton), Ullmann (East Ham), Murray (Walthamstow), Balfour (Dartford), Hammond and Pott (Metropolitan Electric), Mason (South Metropolitan), and Goodyer (Croydon), hon. secretary. There were also present Messrs. Verdon Smith; Secretary Knapp, assistant to the Managing Director; Rozier and Baker, of Messrs. Stanley Wasbrough; Doggett and Baker, solicitors, London United Tramways. The party travelled by special car to Isleworth, where they inspected the Falk system of rail welding. A business meeting was held after tea at Chiswick. The repair shops and car-sheds were visited, and the members made a subsequent inspection of the moving staircase under construction at Earl's Court Station, and were afterwards entertained to dinner at the Welcome Club, Earl's Court Exhibition, by Mr. Stanley and Mr. James Devonshire, Managing Director, Metropolitan Electric Tramways.

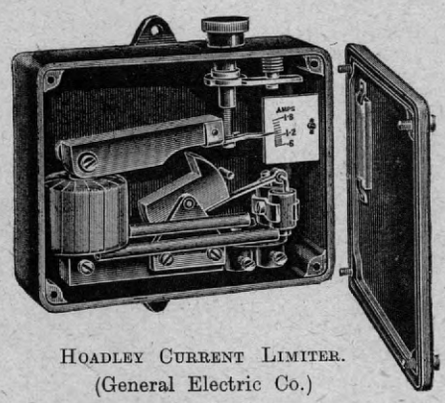
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

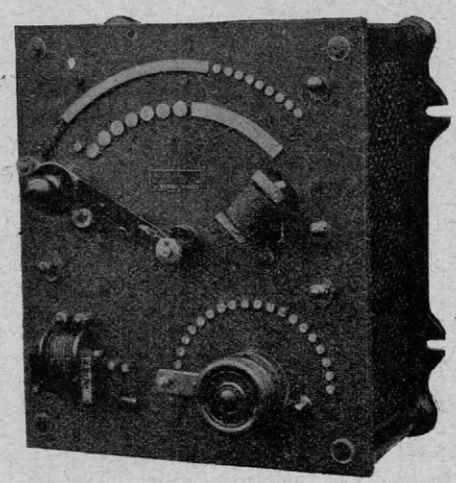


Arc Lamps.

Particular interest attaches to the line of "Arcoflamme" flame arc lamps introduced not long ago by Messrs. J. & H. Grevener (40 Southwark Street, S.E.) as these lamps are made in case of continuous currents in sizes down to 4½ amperes. This sized lamp burns for ten hours and has 16 in. inclined carbons, one with a fixed angle and the other movable. The mechanism consists of a pair of series wound coils above and a pair of shunt wound coils below, which exert a pull differentially on a face armature connected to a locking arm. This arm, which is damped by a dashpot with graphite plunger, operates a horizontal striking gear at the bottom of the lamp by means of a striking rod connecting the rocker arm direct to the bottom of the striking gear. The striking gear consists of a brass plate through which drop the positive carbons, which plate slides in a vitreous porcelain slipper-block allowing perfectly free operation. The sliding plate is connected direct by a right angle crank arm working in a wide bearing standard to the striking rod. The negative carbon merely drops through a porcelain guide plate at the bottom fixed to the arc chamber. The carbon holders are suspended by cords passing over pulleys at the top of the lamp and round drums geared to and worked by a lever escapement. Among special features are the use of a malleable iron casting for the arc chamber, the mounting of the substitutional resistance inside the top cone, and the good mechanical design of the carbon break-switch controlling it. Attention should also be drawn to the fact that the striking rod instead of being rigid is in two parts connected by a spring sleeve coupling which allows the armature free play, even if dirt should hold up the sliding plate. This arrangement removes a possible source of burn-outs.

Our attention is called in a leaflet from the Globe Electrical Co. (11 Farringdon Avenue) to their "Standard" 10 hour and 16–18 hour flame arc lamps for continuous and alternating currents. The clockwork of the feed mechanism is particularly substantial in these lamps, and enamel insulated wire is employed in the shunt coils. Special attention has been paid to the details of the insulation. Every point of attachment, whether current carrying or otherwise, is insulated, double insulation being employed on all current carrying parts. Thus the brass plate which carries the base plate and carbon guides, is first insulated from the base plate by sheet mica, and all guide rods entering this plate are porcelain bushed. The arc chamber is of cast iron. Five sizes are made from 6 to 15 amperes. Metal corded carbons are used.

Switches, Fittings and Accessories.



The accompanying illustration shows the "Hoadley" current-limiter, which has just been put on the market by the General Electric Co. (67 Queen Victoria Street). The instrument contains a laminated electro-magnet, one limb of which is pivotted and by means of a screw adjustment fitted to the end, can be moved round the pivot. The coil

HOADLEY CURRENT LIMITER.
(General Electric Co.)

of this magnet is in series with the consumer's lamps, and the magnetic circuit is completed by means of a Z shaped armature carrying a pair of contacts dipping into two mercury cups. On the current through the coil exceeding a predetermined limit the armature tends to revolve and lifts the contacts out of the mercury cups. The circuit is thus broken and the magnet de-energised. The contacts then fall back into the mercury cups and the cycle is repeated, producing a very decided flicker on the lights until the current is reduced to such an extent that the armature is no longer attracted. The flicker may also be stopped by turning the milled knob at the top of the instrument clockwise. This increases the air gap, and increases the amount of current necessary to attract the armature, and consequently the number of lights which can be lit without causing a flicker is also increased. This alteration can be effected by the consumer without having to send to the supply authority. Once, however, the number of lamps or amount of current required has been raised by means of the milled knob, this cannot be again decreased until the instrument has been reset by the supply authority.

We illustrate here a new patent combined starter and regulator, with overload and no-voltage releases and with speed-limiting device, for use with shunt or compound wound motors, which has been brought out by the Adams Manufacturing Co. For controlling motors driving machine tools, when shunt field regulation is employed, it is desirable to have a ready means of limiting the highest speed attainable during any given operation. In these starters the field resistance contacts are inter-connected with a supplementary field regulator, which is mounted on the starter front.

ADAMS-IGRANIC COMBINED STARTER AND REGULATOR.

When starting up a motor by one of these starters, the handle is always moved right over into engagement with the hold-on magnet, the amount of resistance inserted in the shunt field circuit being predetermined by the position of the supplementary regulator handle. The regulator is readily set for any desired speed, and when once set, the speed attained by the motor in repeating any given operation will be the same every time it is started up. The overload device (when fitted) and the no-voltage release are always operative, and the motor always starts on full load.

Some very attractive designs of switch plates for flush-type switches in a variety of styles in metal, wood and ivory, are contained in a catalogue just issued by D. H. Bonnella & Sons, Ltd. (58 and 60 Mortimer Street, W.), which also contains a selection of switch movements, plugs, sockets and bell pushes.

Miscellaneous.

Messrs. Girldlestone & Co. (23 Davies Street, W.) are agents for the Elworthy-Kolle system of ozone ventilation and air purification. The apparatus in this system, including its electrically driven fan, ozoniser, &c., is compactly arranged in a cabinet. The arrangement of the apparatus is such that draughts are claimed to be avoided, and the air indrawn through the ozone producer gives a high efficiency. A report by Sir W. Ramsay states that there is remarkably little rise of temperature, and that no oxides of nitrogen are produced.

Batti-Wallahs' Society.—Arrangements have been made for the Batti-Wallahs' Society to visit and inspect the R.M.S. *Olympic* at Southampton on July 29th. The party will be subsequently entertained at lunch by the president, Mr. W. Slade Oliver, on board the Royal Motor-Yacht Club's yacht *Enchantress*.

THE BROWN, BOVERI AUTOMATIC PRESSURE REGULATOR

CENTRAL station engineers and others to whom the satisfactory automatic regulation of the pressure of the supply systems under their control presents more or less of a problem, will be interested in the automatic voltage regulator developed recently by Messrs. Brown, Boveri and Co. We understand that a number of these regulators are already in operation, both in England and on the Continent, and that very satisfactory results are being experienced with them. The makers inform us that these instruments are guaranteed to keep the pressure constant within 1 per cent., irrespective of the variations of the speed or load of the generators. On account of the special type of rolling contacts, which form a particular feature of their construction, they are practically frictionless, and hence operate exceedingly rapidly.

As will be seen from Fig. 1, the regulator, in the case of alternating currents, consists of a "shaded pole" electro-magnet, acting upon a light cylindrical aluminium rotor. The electro-magnet is wound with a fine wire winding in series

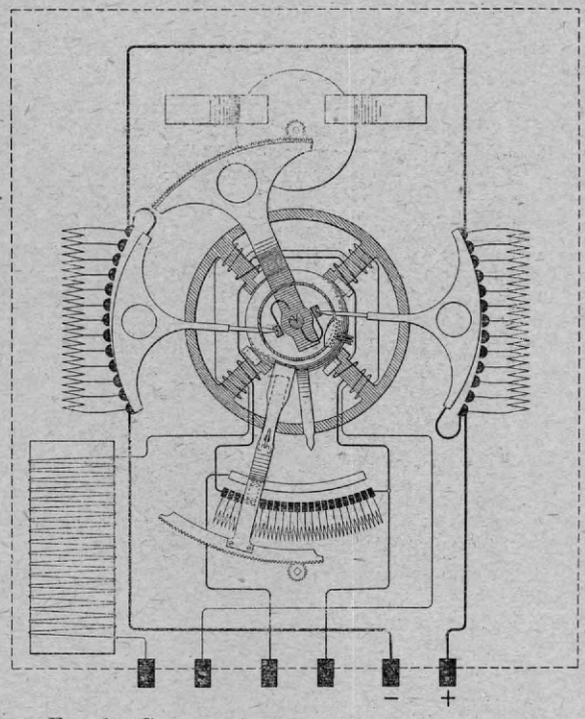

FIG. 1.—GENERAL ARRANGEMENT OF CONNECTIONS.

with an external resistance, and connected to the secondary of a pressure transformer placed across the mains (or directly across the main circuit, if the pressure does not exceed 500 volts), and also a heavier winding connected to a current transformer in the main circuit.

The field produced by the fine wire winding is dependent upon the pressure of the circuit, and for a definite value of the pressure, a certain torque is produced on the moving system. This torque is opposed by a flat spiral spring, the tension of which can be varied, while an additional spring is provided, so adjusted that the resisting torque has a constant value for any position of the armature. The movements of the armature caused by the pressure variations on the circuit are communicated to an almost frictionless contact system, which comprises two or more contact sectors, centred in jewelled bearings, mounted on springs, carried by the armature spindle. These sectors are so suspended that they roll over the contacts, disposed radially, relative to the centre of the armature.

In order to make the action dead beat, an eddy current damping arrangement, as shown at the top of the diagram, is provided. The sector geared to this is connected to the armature through a spiral spring by a sleeve arrangement, so that there is a small time lag between the movement of the armature and the movement of the damping sector. Thus if the full load is thrown suddenly on the alternator, the exciter field current will be increased by the regulator to a value higher than that which actually corresponds to full load, on account of the short circuiting of the resistance, since the contact sectors will momentarily take up their extreme position. A little consideration will make it clear that this is essential, for, owing to the self-induction of the exciting circuit, and the inertia of the turbine or engine-governor, it is necessary to increase the exciter pressure by an amount which more than corresponds to that required for the alternator when running steadily at full load. As soon as the alternator pressure tends to increase, however, the regulator automatically inserts resistance into the field circuit of the exciter until the contact sectors take up the correct position, at which point the period of regulation is at an end. Similarly, when the whole load is suddenly taken off, the contact sectors first move in the opposite direction, causing a large amount of resistance to be inserted in the exciter field circuit, after which they go back to the normal position. The damping arrangement is so effective that there is always a dead beat return to the correct position. It will thus be seen that the regulator is able to follow very rapidly every variation in pressure, and to control it in such a manner that the maximum variation seldom exceeds 1 per cent. from the normal pressure. The regulator can be set for any definite pressure by varying the spring control by the screw adjustment provided.

The regulator can be used to over-compound the machine if desired, so that the pressure drop in the external circuit can be compensated for. This over-compounding is effected by the action of the current winding already mentioned, which is wound in opposition to the pressure winding, and thus has the effect of increasing the exciting current over and above that required to keep the generator pressure constant by an amount dependent upon the magnitude of the load. Provision is made for adjusting the amount of over-compounding which can be effected by additional series of contacts, seen at the lower part of the regulator, connected to a diverting resistance.

The regulator can be adapted for hand operation by a device which locks the whole moving system to the lower contact arm, so that it can be controlled externally by a key on the shaft of a small pinion, gearing with the toothed sector carried at the end of the contact arm. The regulator can be

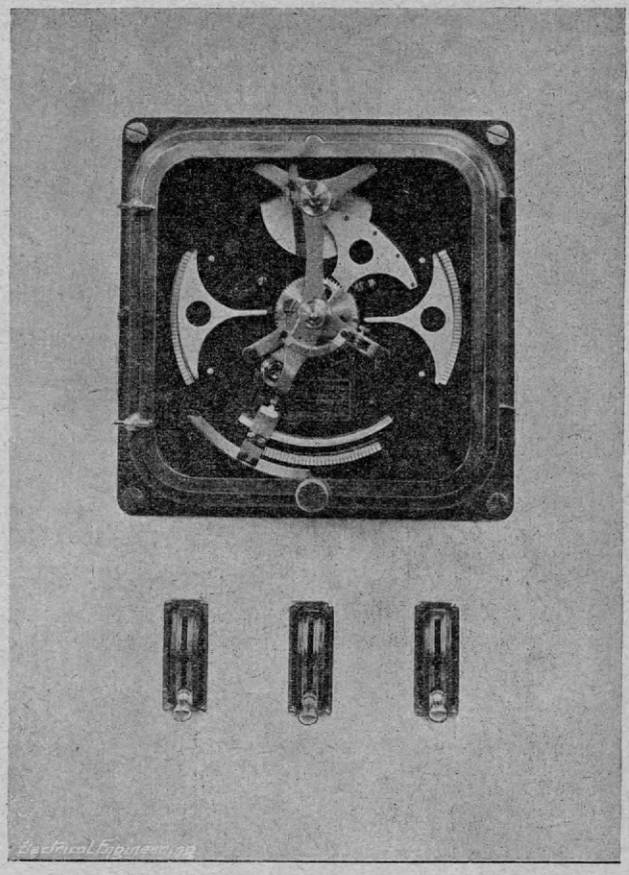

FIG. 2.—REGULATOR FOR EXCITING CURRENTS UP TO 10 AMPERES AT 125 VOLTS.

connected up to regulate the pressure of one or more similar alternators with direct coupled exciters, and by means of switches it can be made to control any one of the machines separately, or, if desired, the one regulator can be made to control two or more similar machines in parallel. When the machines working in parallel differ in size or in construction, it is sometimes preferable to regulate the bus-bar pressure by carrying out all the automatic regulation on one machine only.

Hosted by Google

Thus, for instance, in the common case of a station in which reciprocating and turbine plants are installed, the requirements of the case are generally fully met by automatically regulating one or more of the turbo-alternators, the better governing of the latter enabling them to take up all the peaks of the load, which are carried at constant pressure, with the help of the regulator.

Fig. 2 shows the type of regulator for exciting currents up to 10 amperes, at 125 volts, corresponding to exciter outputs up to about 50 K.W., and an aggregate alternator output up to 5,000 K.W.

The pressure regulator for continuous current work differs from the alternating current instrument in that a wound armature is used in series with the pressure winding of the field, instead of the aluminium drum. The "shading" coils are also, of course, omitted. Messrs. Brown, Boveri inform us that the D.C. type has been employed with very satisfactory results in connection with boosters and buffer batteries, and for controlling the speed of large direct current motors, the pressure at whose terminals varies considerably, as is frequently the case on power circuits supplying current to a number of works or for traction. In this case a very small dynamo or magneto is driven either from the motor shaft or from the line shaft belted to it, the terminals of the magneto being connected to the pressure terminals of the regulator and the regulator resistances in series with the field circuit or the motor. In this way the slightest difference in speed causes a variation in the pressure at the terminals of the exciter, which, in turn, causes the regulator to operate and decrease or increase the amount of resistance in the motor field circuit to the extent necessary to maintain the speed of the motor at the correct value. Quite a number of these regulators are now being employed for this purpose, and experience shows that the speed of the motor or line shaft can be kept constant irrespective of temperature, pressure, or load variations.

THE TELEPHONE TRANSFER

Post Office agree to take over all the Company's Plant

CONSIDERABLE progress has been made with the arbitration proceedings with regard to the transfer of the National Telephone Co.'s system to the Post Office at the end of this year. The Postmaster-General, it will be remembered, had given notice that he did not propose to take over certain portions of the plant in London and other competitive areas owing to its being unsuitable for his requirements, and the question as to its suitability or otherwise was being fought out before the Railway and Canal Commissioners.

In our last issue we gave an account of Mr. Gill's evidence on Monday last week, and a portion of the evidence he gave on Tuesday. Among the other points which he dealt with on Tuesday and Wednesday last week, in addition to those reported in our last issue, was proposed scrapping of subscribers' instruments and lines. It was acknowledged by the Solicitor-General that the Post Office have been engaged for some time in installing telephones in the subscribers' offices in the areas of the 23 metropolitan exchanges which they object to take over from the Company, as they also object to take over all subscribers' lines and instruments connected to these exchanges. This, Mr. Justice Lawrence, the presiding judge, characterised as a creation of plant for the purpose of evading the purchase agreement, and he expressed the opinion that this was not the natural excess of plant occurring when there were two competitors in the field, which had been dealt with by the Court of Appeal in its recent decision. But, even if the complete exchange with distributing wires attached to the subscribers' instruments were ready by the end of the year, Mr. Gill maintained that the Post Office would need the National Telephone Co.'s plant to tide them over the transfer. Besides the subscribers' lines and junction lines leading to these 23 exchanges, Mr. Gill explained that there were 880 C.B. instruments, 6,852 "convertible" instruments (made for initial use on the magneto system and subsequent use on the C.B. system), and 13,266 local battery instruments, which could easily be converted for use on C.B. exchanges, as had been done by the Company itself in similar cases. He next dealt with the questions of operation, and said that the average time taken to answer calls on the condemned 23 exchanges varied from 4·9 seconds (at Croydon) to 9 seconds at Harlesden, while the average on the 17 metropolitan C.B. exchanges owned by the Company was 5 seconds. The cost of working the local battery exchanges was 156d. per 1,000 effective calls as against 127d. on C.B. exchanges. At an inquiry to ascertain similar figures in 1908 in order to arrive at an arrangement with the Post Office for joint working—particularly in Glasgow—the agreed figure for the cost of working the National system was 118·64 and the Post Office at the time 216·68.

As stated in our last issue, a discussion as to the meaning of the definition of metallic circuits, elicited from the Attorney-General a statement that the Post Office would not consider subscribers' speaking lines subject to objection on the ground that they were used for signalling with earth return, nor would he object to power circuits for the same reason. In the case of the Post Office objection to iron wires, it was also stated that although the definition in the notice might imply objection to practically all lines on account of induction coils with their iron wire cores being associated with them, the objection was, in fact, only to be taken to apply to actual iron-wire circuits; but it appears that there are altogether only 57 miles of plain iron-wire circuits, and in addition 29 miles of copper-clad iron wire put up with the consent of the Post Office.

The next point discussed was the objection taken to lines placed upon, along, or across any railway worked, or about to be worked, by electric power. Mr. Gill said that all proper precautions were taken, and that the only accident he could remember was the simultaneous fire which took place in 1905 at the Bank Exchange and Oxford Court. In this case, the electrification of the District Railway was under construction, and the positions of the telephone lines in the tunnel were being altered; although the railway company had agreed not to make their rails live without giving notice to the Company, this had been done in one instance, and a railwayman had left a piece of steel troughing lying against the rail and a telephone wire which had occasioned the fire alluded to. Wires on railways could be adequately protected by fuses, and the Post Office had since 1907 taken powers to attach their wires to tramway trolley poles. Mr. Gill also explained the unreasonableness of the objection taken to lines connected to lines on railways, as they would in any case be quite suitable as soon as the line on the railway had, if necessity really arose, been diverted or rendered safe.

In cross-examination by the Solicitor-General, Mr. Gill admitted that the Avenue exchange had reached its ultimate capacity, and that, if he were planning an entirely new system for the area served by the Avenue, Bank, and Westminster exchanges, he would employ C.B. entirely; and that, if the enterprise of the National Telephone Co. were not coming to an end this year, he would have gone much further than he had in transferring magneto to battery. On the other hand, even if the licence had been non-terminable, he would certainly not have converted all the area by now. A scheme was put to him in which the closing of the Avenue, Bank, and Westminster exchanges had been suggested by the Company in March, 1903, but he explained that this was merely drafted for a preliminary discussion, that part of the scheme was carried out, but that, when they came to close quarters with it, it was modified in a number of places. He admitted that there were no magneto exchanges in New York city.

In the course of this cross-examination the Solicitor-General said that even if the Post Office had to purchase the overhead cables, they would abandon them. He also said that the objection to junction wires to and from the "condemned" exchanges to others referred only to the part from the exchange to the first point of call if they passed through other exchanges on the way.

An interesting answer was given to a question asked Mr. Gill with regard to operating. He said that Westminster and Bank could certainly be worked with fewer operators if on the C.B. system, but Avenue was working particularly economically, and he was not sure that he could work it cheaper on the C.B. system: "I am perfectly sure the Post Office could not," he added.

Mr. W. W. Cook, Assistant Engineer-in-Chief to the National Telephone Co., was the next witness. He said that he had experienced no trouble with telephone wires laid a little distance from electric railways or under rails, and said that there were cases in which the Post Office had bare wires both alongside and crossing railways.

Mr. Cook was still under examination when the Court adjourned on Wednesday. On resuming on Friday, no announcement was made as to agreement having been arrived at on further points, and the examination of Mr. Cook was continued. On Mr. Gill's point as to the large and unnecessary scrapping of subscribers' instruments proposed, he said that in an investigation with regard to Westminster—not for the purpose of this case—it had been found that the cost of local battery instruments was almost identical with that of C.B. instruments, owing to the various auxiliary apparatus and extensions many subscribers had; only about one-third of the subscribers had merely simple instruments, and probably the same proportion would obtain in Bank and Avenue. The average time taken to answer a call on Bank, Avenue, and Westminster exchanges was 5·5 seconds, and he would be very surprised if the Post Office could show a better result. He regarded the Post Office scheme of wholesale and immediate replacing of exchanges as an unsound one, which would only be justified on emergency; and no emergency existed as none of the exchanges were worn out. A large amount of the plant was actually of the type used in the P.O. exchanges, *e.g.*, there were numbers of central battery jacks and C.B. type relays. He also explained the difficulties the Post Office would experience under their scheme, by their not being acquainted with the traffic con-

Hosted by Google

ditions; it was necessary to distribute the subscribers so that those with the greatest frequency of calls were evenly spread out among the operators, and it was also necessary to know the calling rates of the various subscribers in order to arrive at the correct number of junctions. He was of opinion that the Post Office carried underground distribution too far, as it gave greater flexibility if the lines were run underground to distributing points, and thence wires were used along the sides of the houses and overhead.

Cross-examining Mr. Cook, the Attorney-General read a passage from the 1906 edition of Mr. Poole's "Telephone Handbook," in which the magneto system was referred to as obsolete. Mr. Cook agreed that Mr. Poole was a member of the company's technical staff, and said that while agreeing generally with his point of view, he thought that the word obsolete was too strong.

Mr. H. F. Parshall then gave evidence with regard to telephone lines on railways. He said that on the Central London Railway their power cables, distribution cables, and telephone cables are carried on common hangers and had never given trouble. He had experienced more trouble with cables in ducts than in tunnel. On the Lancashire Power Co.'s system the crossings of the 11,000-volt overhead lines with telephone lines were very numerous, and they had had no danger or inconvenience.

Mr. Parshall was followed by Mr. S. Z. de Ferranti and Sir Alexander Kennedy, both of whom were very emphatic on the point that any plant removed for a condemmed exchange could, in the main, be taken to store and used again with very little expense. Mr. Ferranti regarded the objection of the Postmaster-General to lines near railways as unreasonable, as the development of electric railway and power supply cables in the future would be so enormous that it would be inevitable that all classes of cables must be laid in close proximity to one another. At the present time, it was pointed out, there are a considerable quantity of telephone cables along the District Railway which are working satisfactorily, and the difficulty of getting satisfactory routes in towns would necessitate the use of the railways for this purpose.

Both these witnesses have carried out a test reproducing the condition at the time of the fire at the Bank exchange, which has already been mentioned. A cable at a voltage equal to the traction voltage was short circuited on to a model telephone exchange, but no damage was done; the protective devices acting perfectly. At the time of the Bank fire referred to, the protective devices had not yet been installed. Sir Alexander Kennedy also gave evidence on the question of the change over. He failed to see how every National subscriber could be changed over on December 31st, and that, therefore, a large part of the plant objected to would have to be used by the Postmaster-General until the change actually took place.

On Monday a long discussion subsequently took place as to the position of cables containing one private wire, and a larger number of wires which the Postmaster-General objected to. The Company's contention is that the existence of one private wire, which the Postmaster-General is bound to take over, brought the whole cable within the category of "suitable" plant, owing to the difficulty of separation. The Attorney-General, on the other hand, said that such a cable should be declared unsuitable always with the reservation that the full price, as a going concern, would be paid for the private wire. He went further, and offered to pay for all private wires existing in such cables, but to give the Company the whole cable, and to lay new private wires himself.

Mr. Hammond Hayes, who was for twenty-two years with the American Telegraph and Telephone Co., and their predecessors, until 1902 in charge of the experimental department, late assistant and chief engineer, was next called on behalf of the National Telephone Company. He said that in New York City all the exchanges are on the central battery system, but the local battery exchanges, which were displaced, are used in other parts of the States where the traffic conditions are not so dense. Mr. James Swinburne followed on the lines of the evidence given by Mr. Ferranti and Sir Alexander Kennedy, and his examination had not concluded when the Court rose on Monday.

On Tuesday morning a conference took place between the parties, which kept the Court waiting until 1.30 p.m. The Attorney-General then announced that an agreement had been come to which would put an end to the part of the proceedings then before the Court. He asked the Court to make a declaration as to the points raised in the notices of objection by the Postmaster-General in a form which had been agreed, which would clear the way for the valuation, subject to the reservation of the right to the Postmaster-General to argue the degree of suitability of any particular piece of plant.

Mr. Justice Lawrence announced that the Court would give an order in the terms asked for, and made no order as to costs.

We have reason to know that the agreement arrived at is briefly that the Post Office will take over the whole of the National Telephone Co.'s plant, including the "condemned" exchanges, and that the price to be paid for it will be determined, having regard to the relative suitability of the plant for the requirements of the service under the new conditions. Instead of certain parts of the plant being ruled out as unsuitable for the requirements of the service at the end of the year and being left on the Company's hands to dispose of as best they can, and the remainder being sold to the Post Office at its actual value, the whole of the Company's plant will be transferred and the price will be determined in proportion to the degree of suitability of the various items of plant. On the other hand, it is not likely that this price will be agreed between the two parties without further recourse to arbitration before the Railway and Canal Commissioners.

It is unlikely that there will be any change in the Post Office plans for reorganising the service, plans which involve dispensing with some of the older exchanges of the National Telephone Co. in districts in which the Post Office has exchanges or is building new ones. The new exchange which is being built in Creechurch Lane, near to the present Avenue exchange, will take the place of and be called "Avenue," and the Bank and Westminster exchanges will ultimately be closed, and the subscribers chiefly transferred to the Central and Victoria exchanges respectively, where, we believe, there is a large amount of spare equipment, and whose ultimate capacity is quite double their present capacity. It is to be hoped, however, in the interests of the subscribers, at any rate, that no real attempt will be made to transfer the whole of the 23 "condemned" exchanges simultaneously at midnight on December 31st, but that the transfer will be made gradually, so that the service can proceed with absolute smoothness during this critical period.

DIESEL ENGINES

MR. G. E. HEATH, of the Diesel Engine Co., Ltd., has sent us some observations on the discussion on Diesel engines at the Convention of the Incorporated Municipal Electrical Association (see last week's ELECTRICAL ENGINEERING, p. 383). Mr. Heath was down to speak, but shortness of time and the large number of other speakers prevented him from being called upon. Mr. Heath says that throughout the discussion the remarkable fuel consumption was not questioned, and refers to engines which have been in continuous daily operation during some six to seven years, throughout which time the consumption per unit generated was for all practical purposes the same as the figures obtained upon the test-beds. It is well known, he says, that any Diesel engine will run with a consumption of something under half a pound of fuel per b.h.p.-hour, or it will not run at all. The low consumption is just as much a factor of the engine as the cycle and principles upon which the engine works. He points out once more that the engine is a self-contained producer of power, which can be readily started at a moment's notice, and that the elimination of stand-by losses makes the fuel costs independent of load factor. A further point of importance, he says, is that the consumption of fuel is in no way dependent upon the attendant labour, being entirely automatic in its action, so that when the fuel contract is settled for a number of years, the engineer can say with certainty that for such time his fuel cost will be a definite figure.

He points out that the Diesel engine differs from the gas engine in two main points; first, compression of air only and not an explosive mixture, thereby obviating all possibility of pre-ignition, back-firing, &c., and secondly, the automatic burning at constant pressure of the fuel injected, such combustion being supported by the heat of compression of the air previously mentioned. There is no explosion, and an indicator card from a Diesel engine gives a very close approximation to a card from a steam engine. The absence of any explosion gives freedom, and consequently smoother working. It is mainly due to this fact that Diesel engines can be built with large cylinders with every degree of certainty and confidence. There is no evidence, he maintains, that the state of affairs predicted by Mr. Day regarding repairs and maintenance exists in the larger cylinders in actual practice. There are, he says, a geat number of engines with cylinders considerably larger than 150 b.h.p. which have been working in different parts of the world for some years, and with the most satisfactory results. A two-stroke engine has been built, and has been running for the last twelve months, with a capacity of 1,200 b.h.p. in the one cylinder; and if proper attention is given to the design of the cylinder-covers and piston-heads, there is no reason whatever why these larger engines should not work equally as well as small engines of 50 or 60 b.h.p. per cylinder.

Hosted by Google

Mr. Heath characterises Mr. Boot's experience of repair costs as abnormal. With a modern engine supplied by the writer's firm, he maintains that without exception the figures given in Mr. Howard's Paper would more than cover the repair costs, and in no case have such results recorded by Mr. Boot been approached within 50 per cent. The standard set of spares supplied with each engine is considerably less than that mentioned, and such a set is sent to Chili, South Sea Islands, and up-country stations in India, where only native labour is available; and, with an exception here and there, no requisition for further spares have come through for a number of years. Provided attention is given to the design and construction, and, most important of all, to the rating, no such costs will occur.

With engines of larger cylinders, if the rating is kept low, Mr. Heath contends that all complication of water-cooled pistons can be avoided.

Lubricating costs may in some cases be high, particularly where forced lubrication has been adopted. In such cases the difficulty of keeping the lubricating oil from the fuel in combustion has led to this system of lubrication being superseded by returning to the ordinary ring lubrication for bearings, whilst the small end and piston only have forced lubrication. As a rule-of-thumb guide, it may be stated that lubricating oil costs do not exceed 1/10 to 1/12 fuel oil costs. In view of disappointing experiences with early engines using forced lubrication, the Diesel Engine Co. have reverted to the original form of lubrication.

With regard to horizontal engines, the greatest drawback appears to be probable wear on the liners due to the weight of the pistons, and owing to the high compression this seems likely to give trouble, which can be avoided by the use of vertical engines. There are difficulties in the fuel injection owing to the position in which this valve has to be placed, and general inaccessibility of the valves will be very apparent to those responsible for the upkeep. The floor space required is greatly in excess of that for a vertical engine, and overhauling is certainly more difficult to carry out. Only one example of this type of engine was referred to, and it will be interesting to see how the results come out in the way of maintenance and repairs in a few years' time.

Mr. Heath concludes:—The new type of engine designed by the writer's firm for electric lighting purposes embodies many special features; the greatest success has attended this engine, and in several recent cases it has superseded gas plant. The results obtained at the works of Messrs. Hoffmann, of Chelmsford, are especially of interest, as in that case two Diesel engines, supplied by the Diesel Engine Co., of 330 b.h.p. each, run continuously during the week for 120 hours, the fuel costs amounting to 0·134d. per unit, as against 0·34d., which was the cost for gas engines, working under exactly the same conditions, previous to the Diesel plant being installed. It is obvious that it is impossible to lay down any hard and fast rules for the comparison between steam, gas, and oil, as each case has to be considered entirely on its own merits, taking into consideration all the various factors. Provided this is properly done, it can be safely claimed that in 95 cases out of 100 the figures for Diesel engines will be the lowest. It is worthy of note that in no single instance where Diesel engines have been installed in central stations or elsewhere have they ever been replaced by either gas or steam engines, and when extensions have been necessary the policy of installing Diesel engines has been continued.

We have also received the following letter from Mr. P. von Miaskowski, Manager of the London office of the M.A.N. Co.:—

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The doubts so strongly expressed in the course of the discussion of Mr. Howard's Paper on Diesel engines, read before the I.M.E.A. Convention at Portsmouth last week, about the possibility and advisability of high-power Diesel engines, are, according to the experience of my firm—the M.A.N. Co.—only in so far justifiable, as it would certainly be a mistake to enlarge single-acting four-cycle cylinders above a certain limit, which may be put at about 250 b.h.p., and not at 150 b.h.p., as mentioned by Mr. Day, or to increase the number of cylinders without limit. The high-power Diesel engine must be built as a two-cycle engine, either single or double acting, or as a double-acting four-cycle engine.

To substantiate the above figure of 250 b.h.p., I may mention that quite a number of M.A.N. Diesel engines, consisting of 2, 3, or 4 single-acting four-cycle cylinders of an output per cylinder of 200-220 b.h.p., have been running satisfactorily for years. The high-power Diesel engine of the double-acting four-cycle type is represented up to the present by one engine of 600 b.h.p. (*i.e.*, 300 b.h.p. per cylinder), which has been running for 2½ years at the Augsburg Works of the M.A.N. Co., and by one engine of 1,600 b.h.p. (with 400 b.h.p. per cylinder), which was built also by the M.A.N. Co., and has now been running for some time at the Municipal Electricity Works of Halle, in Germany. These engines are, in general, designed on exactly the same lines as the double-acting four-cycle gas engine, only instead of the ignition plugs fuel needles are provided, and the small fuel pumps and the air-compressor are additional parts. Hundreds and hundreds of such high-power gas engines, representing more than a million b.h.p., have been running satisfactorily for years all over the world.

My own firm alone received during the year 1910 orders for 43 such engines of an average output of 1,891 b.h.p. per engine, and has orders for 8 double-acting Diesel engines now in hand.

Large two-cycle Diesel engines, either double-acting or single-acting, of 1,000 b.h.p., or of a good deal larger output, have also been already constructed, and have been running satisfactorily on the test-beds of a number of makers all over the world. To say—as several of the speakers did—in the face of such facts that an internal combustion engine cannot be built in larger units is either a deliberate shutting of the eyes or shows an astonishing ignorance of what has been going on in the engineering world outside this country. The absolute confidence which my firm has in the future of the high-power Diesel engine refers, of course, only to carefully and substantially built engines, which are not overrated and run at moderate speeds.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

CALENDAR.—A very convenient aluminium revolving waistcoat-pocket perpetual calendar, available up to 1927, is to hand from Barry, Head & Co., iron, steel, and metal merchants, 110 Cannon Street, E.C.

DYNAMO TENDERS' ACCESSORIES.—Messrs. Haslam & Schontheil (11 Windsor Place, Cardiff) have sent us a leaflet giving particulars of a useful line of cylindrical bellows for blowing out armatures, and "National Electric Compound" for cleaning and preserving commutators.

ALUMINIUM.—A leaflet from the British Aluminium Co. (109 Queen Victoria Street, E.C.) contains a reprint of an interesting article on the use of aluminium wire in traction motors, and some excellent photographs of aluminium overhead lines and welded central station connections.

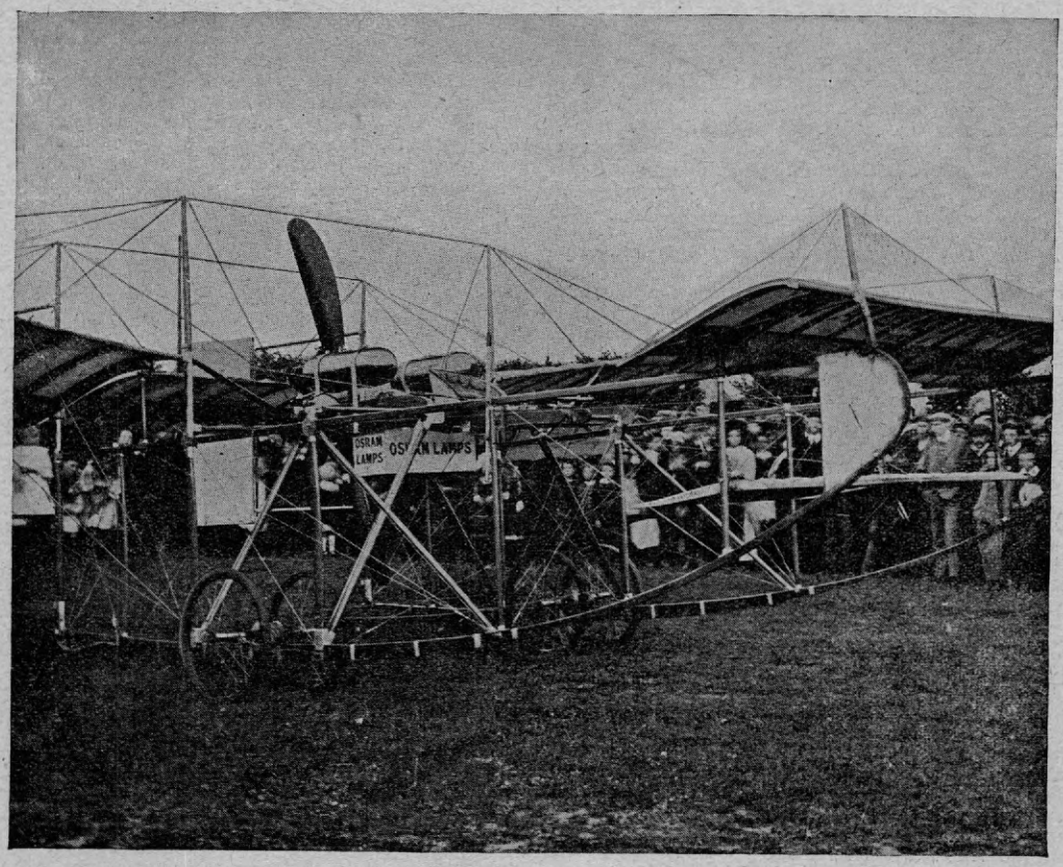
METERS.—A new ampere-hour meter, which the Union Electric Co. (Park Street, Southwark) are putting on the market, is described in an attractive booklet. This is for continuous current, and is known as the Fortiter meter, being manufactured by the same firm as the Excello lamp. The meter is of the commutator type with extremely light moving parts, with the armature coils laid flat on the brake disc, which is strengthened by a turned-up edge. The brushes are of phosphor-bronze faced with gold, and bearing on a silver commutator. With a high torque and small watt loss, a very good curve of accuracy is obtained.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

FITTINGS, &c.—A well-illustrated catalogue of electric light fittings, signs, plates, and other metal work applied to the electrical trades is to hand from Messrs. Cranmer & Cheshire (Steward Street, Spring Hill, Birmingham). Some very artistic fittings in a variety of styles are included, and some representative drawings of architectural ironwork, billiard pendants, signs, &c. Ornamental switch-plates and radiators are also illustrated, and the list concludes with some well-chosen examples of cast-iron bulkhead and other fittings, arc lamp winches, &c.

THE WHOLESALE HARDWARE CLUB.—We have received a booklet containing prospectus, list of members, &c., of the Wholesale Hardware Club (Royal London House, 14 Finsbury Square), which was founded in 1906, and deals in many ways with the interests of the wholesale hardware trade, besides having social avantages. The membership embraces about 200 firms.

SMALL TOOLS.—A handsomely got-up booklet of over 200 pages, forming a catalogue of small tools, gauges, and standard parts manufactured by Ludw. Loewe & Co., is being issued by G. Goodchild & Partner (30-32 Farringdon Road). The catalogue is not only particularly well illustrated and arranged, but has a completeness especially as regards milling cutters rarely found in such publications. The book does not exceed a size conveniently carried in the pocket, and should be of great use to all connected with machine-shop equipment.



The Iron and Steel Institute.—Arrangements are well advanced for the October meeting in Italy. Among the papers to be read is one by Cav. Ing. Remo Catani, on the application of electrical energy to the manufacture of iron and steel in Italy. The tour will include visits to Savona, Genoa, Pisa, Rome, Naples, Terni, Florence, and Milan, with excursions to Elba and Piombrino.

The Home Office Mining Rules.—Owing to the number of objections raised by mine-owners to the proposed new special rules relating to the use of electricity in mines, the Home Office announces that Mr. J. Swinburne, F.R.S., has been appointed as arbitrator in the matter. It is hoped that arbitration will not be necessary, but as objections have formally been made, the appointment of an arbitrator is required by the Act.

OSRAM LAMPS BY AERIAL TRANSPORT

WE are now able, through the courtesy of the General Electric Co., to give an illustration of the aeroplane referred to in a note on page 390 of our last issue, by which a consignment of Osram lamps was delivered by aerial transport last week. The lamps in question were being sent from Worthing to Hove to Messrs. Page & Miles, whose cart met the aeroplane at the Hove Marine Park. The illustration shows clearly the position of the package of lamps on the machine. Mr. Barber, when the lamps had been removed, ascended again and returned to the flying ground at Shoreham. There was a considerable amount of wind at the time, and the flight was made at an altitude of about 1,000 ft. at a speed of 70 to 80 miles per hour.

VALKYRIE MONOPLANE BY WHICH A DELIVERY OF OSRAM LAMPS WAS MADE LAST WEEK.

SHOP FRONT LIGHTING

MR. A. J. CRIDGE, of the Electrical Co., Ltd., has sent us some remarks with regard to the discussion on shop front lighting at the Convention of the Incorporated Municipal Electrical Association (see ELECTRICAL ENGINEERING of July 6th, p. 386). Mr. Seabrook, in his opening remarks, had referred to the figure of 2d. per hour as a charge which could be made in respect of supply to arc lamps. Mr. Cridge says that if Mr. Seabrook charges by means of a time meter, he would not have any trouble; but cites a case in Sheffield, in which the circulation of a leaflet saying that the cost of running a flame arc would be 2d. per hour, led to difficulties with a consumer. The energy was charged at 4d. per unit in the ordinary way, and the consumer's installation in this case consisted of one arc lamp only. The consumer had noted the hours of use, and had refused to pay more than the equivalent of 2d. per hour for the supply. It was held by the Town Clerk that it was necessary to accept the sum offered, as the leaflet constituted a contract to which the Corporation was bound to adhere.

Mr. Cridge also emphasised the usefulness of a business-getting department. He had had charge of one at Sheffield, which, he says, was evidently respected by Mr. Seabrook, who had annexed several members of its staff. He lays stress on the necessity of taking publicity and business-getting seriously, and not playing at it. One frequently sees advertisements requiring men for a few months only—some spasmodic trial being in the air. How on earth, says Mr. Cridge, can anybody expect to get hold of a good man unless they offer him continuity of employment as one of his prospects? In such circumstances, undertakings would only secure a poor specimen, and in consequence, would vote publicity no good. He wonders, from reading the gas papers, whether there really is any distinct idea of business-getting in the gas companies. The gas publicity committee is new, and he thinks that if they had men in the gas industry who made the serious and well-sustained effort which some of the electric supply undertakings do, the gas people would go forward much more rapidly than they had done. He advises electrical men to take in a gas paper and read it carefully week by week, as a means of bringing them to a wholesome state of humility.

Long-distance Telephony.—Experiments have been made in the early part of this week in telephonic communication over the new London-Paris telephone circuit, which includes a "loaded" channel cable (of which full details were given in ELECTRICAL ENGINEERING, March 17th, 1910, page 167) between Edinburgh and Paris, and subsequently between Aberdeen and Paris, as well as Glasgow and Paris. Conversations were easily maintained with the *Daily Mail* Paris office.

Deaths from Electric Shocks.—James Byers, an apprentice at Messrs. Palmer's Shipyard, Jarrow, was killed on Friday from electric shock. The verdict of the Coroner's jury was that the death was in consequence of a motor frame and drilling machine at which he was working not being earthed in accordance with Rule 21 of the regulations made under the Factories Act regarding the use of electricity.

A young man named Robert Anderson received a fatal electric shock on Monday in the Jarrow sub-station of the County of Durham Electrical Power Distribution Co.

Dispute between London Electric Supply Companies.—The dispute between the London Electric Supply Corporation and the Westminster Electric Supply Corporation, concerning an agreement entered into under the London Electric Supply Act, 1908, was before an Appeal Court consisting of the Master of the Rolls, and Lords Justice Farwell and Kennedy, this week. The details of the case were given in ELECTRICAL ENGINEERING, March 9th, p. 132, and April 13th, p. 190. Under the agreement in question, the London Company handed over to the Westminster Company the management of their business in the Westminster area, under certain conditions. The London Company supplied only alternating current, and the complaint was that the Westminster Company were endeavouring to secure all the London Company's customers, and supply them through the Westminster mains. Mr. Justice Joyce, who heard the case, held that in effect the Westminster Company had purchased the Westminster portion of the London Company's business, and that in the absence of any specific clauses in the agreement to the effect that they were not to induce the London Company's consumers to change over, they had not broken the agreement. The Appeal Court upheld this decision.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 6, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

13,946/10. **Insulating Material.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co. of America*). Insulating material which increases in disruptive strength with rise of temperature, made from condensation products of phenols and aldehydes dissolved in alcohol and paraffin oil dissolved in amylacetate. This compound can be used for impregnating cloth.

14,045/10. **Terminals.** C. N. STANILAND. Terminals or connectors consisting of an externally threaded metal base, recessed internally, into which fits a loose metal sphere held in position by an internally threaded metal cap. One figure.

14,349/10. **Electric Signs.** H. HIRST and G. MAURICE. Electrically illuminated signs or letters in which the cells or recesses are made integral with or attached to the front of the sign, and not projecting, each carrying a lamp-holder arranged so that the lower part of the filament is below the surface of the device, whereby the lamps are supported by the front with their illuminating portions close to the surface to be illuminated. Three figures.

14,499/10. **Conversion of Currents.** W. A. PRICE. This describes means for converting continuous currents into currents suitable for driving alternating-current motors, comprising relatively moving parts for rapidly interrupting the current or changing the connections, and one or more electrolytic condensers acting in conjunction with auxiliary inductive and non-inductive circuits to obviate sparking. Six figures.

14,680/10. **Turbo-Generators.** SIR C. A. PARSONS and A. H. LAW. A method of securing end connections of turbo-generator armatures by bolts passing through the coils and screwed into the shaft or into a massive steel ring fitted over the shaft, or fitted into such a ring by caulking into dovetail grooves, or with T-shaped heads slipping into undercut grooves. Seven figures.

14,912/10. **Electric Heating Apparatus.** F. A. WILKINSON. Resistance elements for electric heating apparatus comprising an earthenware or similar frame, open at the front or back, in which a row of helical coils of wire in series are suspended by tightening springs in conjunction with strips of mica or other insulating material slotted at intervals, and attached to the ends at convenient points. Three figures.

15,170/10. **Meters.** G. NORTH. Induction-type alternating-current meters in which a magnetic core forming a nearly closed magnetic circuit is used for the flux induced by the shunt coil, and has three polar projections adjacent to the moving disc, each traversed in the same direction by a portion of the shunt flux, the return path being through the support of the core. Series coils are wound on two of the projections, so that the series flux traverses them only in opposite directions. Four figures.

25,923/10. **Enclosed Switches.** V. HOPE. These switches are enclosed in a casing with a hinged cover, and the handle shaft is mounted on the cover and the switch shaft in the base. The shafts, which are parallel to the hinges of the cover, are connected together by levers and links in such a way that when the cover is open it is impossible to close the switch. Three figures.

1,056/11. **Meters.** H. LANDIS and K. H. GYR. A variable rate meter of the class comprising in combination with two sets of counters, an electromagnetic device whereby the two sets are alternatively put into operation according to the strength of the current passing. In order to obviate the error due to the different values of the current at which the magnet picks up and releases, the armature is periodically pulled off mechanically. Two figures.

2,594/11. **Isolating Switches.** SIEMENS BROTHERS DYNAMO WORKS, LTD., and R. A. R. BOLTON. To prevent accidental opening on heavy short circuit, these isolating switches of the ordinary knife form are fitted with a spring locking catch which can only be disengaged by a pull on the ring provided to open the switch by a hooked pole or otherwise. The ring is attached to a lever mounted on the blade which pushes up the catch when it is pulled. One figure.

7,086/11. **Separators for Secondary Batteries.** F. W. HARDY and E. H. HUNGERBÜHLER. Secondary battery separators in the form of baked plates made from compressed powdered material consisting of an aluminium silicate such as China clay, Cornish stone, or ball clay with or without strengthening material.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: KLOSTERMANN, 15,143/10; QUINT [Enclosed, inverted type] 15,710/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: KRANNICHFELDT [Insulating device for twisted ends of electric wires] 7,511/11.

Dynamos, Motors, and Transformers: NEWTON [Constant voltage machines] 15,423/10.

Electric Ignition: SAUERBREY [Means for finding the correct position of the current distributor in] 790/11.

Electrometallurgy and Electrochemistry: HIGGINS (*Higgins*) [Electrolytic reduction of organic bodies] 18,969/10.

Incandescent Lamps: THOMPSON [Construction of small lamps] 15,004/10.

Batteries: JOHN and BERRY [Primary battery] 19,729/10.

Switchgear, Fuses, and Fittings: JOHNSON [Electric switch] 12,184/10; COMPAGNIE DE L'INDUSTRIE ELECTRIQUE ET MECANIQUE [Combined speed and current regulator for series machines] 14,766/10; ADAMS MANUFACTURING Co. (*Cutler Hammer Manufacturing Co.*) [Motor controllers] 14,851/10; THOMAS [Control of series dynamos] 15,388/10; PATON [Interlocking switchbox] 16,486/10; GRAY [Controlling devices for dynamos] 28,246/10.

Telephony and Telegraphy: SMITH (*Huth*) [Receiving method for wireless telegraphy] 24,421/10; GIRARDEAU [Wireless sender with direct excitation] 3,949/11.

Traction: MATHIESON [Automatic device for overhead equipment] 14,534/10; SEFTON-JONES (*Oesterreichische Daimler-Motoren Ges.*) [Collectors for overhead conductors] 25,012/10.

Miscellaneous: MORRIS, ELLIS, and MURPHY [Method of obtaining rapidly varying currents] 14,588/10; KRANNICHFELDT [Production of incandescence bodies] 26,045/10; APOZNANSKI (Manufacture of accumulator plates) 27,176/10; FRISBY [Electric current gauges] 28,994/10; SIEMENS BROS. & Co. and RIBER [Means for fixing and insulating contact springs] 6,736/11 and 6,737/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: LYON, 1,828/11.

Incandescent Lamps: MÖLLER [Manufacture of] 1,162/11.

Telephony: STEINBERGER [Telephone mouthpieces] 13,641/11.

Switchgear, &c.: SIEMENS-SCHUCKERTWERKE-GES. [Automatic regulators for electric circuits] 14,432/11.

Traction: DESCUBES [Control of points and signals] 14,059/11.

Miscellaneous: LOWRY and LEIMBACH [Terrestrial exploring by induction] 14,057/11.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

16,718 of July 14th, 1897. **Electrical Recording Instruments.** H. L. CALLENDAR. An electrical recording apparatus, in which the recording device is attached directly to the sliding contact of one terminal of a galvanometer or relay on a straight bridge wire, the sliding contact being automatically maintained always at the balance-point by means of a pair of clock motors controlled by a relay, and connected to the recording point through a differential gear.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: F. J. GERARD and L. FIEDLER [Electrodes] 6,972/04.

Distribution Systems, &c.: W. E. BURNAND [Transformers] 6,095/01; J. S. PECK [Distribution] 25,330/02.

Electric Ignition: F. R. SIMMS, 7,195/98.

Electrometallurgy, &c.: J. S. MORRISON [Electro-plating] 6,451/98.

Storage Batteries: W. FENNELL [Secondary batteries] 6,145/03; E. COMMELIN and R. VIAN [Secondary batteries] 6,619/04.

Telephony, &c.: J. G. HOLMSTRÖM [Telephones] 6,605/03.

Traction: A. NEELEMANS [Railway switches and signals] 6,546/03; H. W. LAKE (*Hall Signal Co.*) [Railway signals] 6,598/06.

Miscellaneous: O. IMRAY (*Industriewerke Kaiserlautern Metall-und-Porzellan Fabrikation Ges.*) [Lighting and extinguishing gas] 6,625/98; C. ILGNER [Rolling mills electrically controlled] 7,188/02; W. BEST [Miners safety lamps] 6,376/03; E. and E. VACHERON [Illuminated signs] 5,996/05; BRITISH THOMSON-HOUSTON Co. (*General Electric Co. of America*) [Vapour electric apparatus] 6,818/06.

Hosted by Google

LOCAL NOTES

Belfast: *Electricity Accounts.*—There was a net profit of £13,766 upon the working of the electricity undertaking last year. The total number of units sold increased by 8 per cent. The profit has been allocated as follows:—Depreciation of motors on hire, £1,500; renewal suspense account, £7,266; in aid of rates, £5,000. A proposal by the Electrical Engineer for the extension of the electricity works has been postponed until the next meeting.

Birkenhead: *Electric Lighting Accounts.*—The net profit of £952 upon the electric lighting undertaking for last year has been transferred to relief of rates, the amount in the previous twelve months being £1,000. The renewals fund now stands at £13,899, and the outstanding debt is £127,357, against which there is the sum of £2,794 in hand for sinking fund and stock redemption fund, at present unapplied..

Bradford: *Trolley Omnibuses.*—The Tramways Committee recommend that application be made for a Provisional Order authorising the running of trolley omnibuses on two new routes in the city.

Brighton: *Trolley Omnibuses.*—The Tramways Committee recommend that a deputation visit Leeds to inspect the trackless trolley system there, and that consideration be given to the question of establishing a similar system of traction along the Preston Road.

Carnarvon: *Electric Lighting of Castle.*—Among the considerable alterations which have been made to Carnarvon Castle in connection with the investiture of the Prince of Wales to-day is the introduction of electricity. Supply is being given from the local electricity works, and altogether some 10,000 c.p. have been installed. The installation work was carried out by the National Electric Construction Co., under instructions from the Office of Works.

Chittagong, India.—A licence has been granted by the Municipal Commissioners of Chittagong to the agents of the A. E. G. Lahmeyer Company for the supply of electric lighting and power to that town. Chittagong is the headquarters of the Assam Railway, and it is understood that the Railway is supporting the scheme. The main streets are to be lighted, and the power will be used for the driving of the punkahs, or fans, so much used in that part of India. The preliminary scheme is being drafted by Mr. H. R. Speyer.

Dewsbury: *Dispute with Tramways Company.*—The Council have referred to a special Committee a dispute with the tramways company with regard to suggested tramway to Dewsbury Moor. The tramway company have refused to construct a line in this direction, as they do not think it will be a financial success within a reasonable period.

Glasgow: *Electricity Accounts.*—The accounts of the Electricity Department for the year to May 31st show a net surplus of £6,680, after meeting capital charges and £44,552 for depreciation. The surplus has been transferred to reserve, which now stands at £27,468. The cost per unit has been reduced by 0·1d. During the year the scheme whereby domestic consumers can obtain a supply of energy for cooking, heating, and other domestic purposes at a flat rate of 1d. per unit, without separate wiring, has been adopted with favourable results. Although the scheme was only put into operation in October, up to the present 300 consumers have availed themselves of it.

Gloucester: *Electricity Accounts.*—The electricity accounts for the past year show a surplus, after meeting capital charges, of £1,077. After meeting a sum for the purchase of meters, a balance of £941 is carried forward. It has been decided in future to purchase all meters out of revenue. The number of units sold increased by 181,842, and the increased revenue from private consumers amounted to £750.

Linlithgow: *Electric Lighting.*—Mr. George Balfour, of London, has given notice of his intention to apply for an Electric Lighting Provisional Order.

London: *Fulham: Electricity Profits.*—There was a net profit of £3,861 upon the electric lighting undertaking last year, against £4,551 in the previous twelve months.

Oulton Broad: *Electric Lighting.*—The Oulton Broad Electricity Co., Ltd., have agreed to sell their undertaking to the Council, and to enter into a contract to carry on the electricity works which are to be erected. The agreement is, of course, subject to the approval of the Board of Trade.

Sheffield: *Trolley Omnibuses.*—The Tramways Committee have presented a report, in which considerable extensions of the tramways are contemplated. They also recommend the introduction of trolley omnibuses along the new Rivelin Valley Road, and back to Manchester Road.

Torquay: *Tramway Extension.*—Trial runs have been made over the extension of the Torquay tramways to Paignton. Everything went off satisfactorily, and the line now awaits the Board of Trade inspection.

West Ham: *Electric Tramway Accounts.*—There was a net profit of £8,513 upon the working of the tramways last year, after the payment of £5,071 in rates and taxes, against £6,972 in the previous year. The sum of £977 has been set aside for additional top covers to cars; alterations for running cars on the conduit system at Mile End absorb £612; and £6,923 are added to renewals fund.

Wolverhampton: *Electricity Accounts.*—There was a net profit of £5,231 upon the working of the electricity undertaking for the past year. The gross profit was equal to 8·4 per cent. on the capital expenditure. The new 2,000-k.w. generating set is not completed and is nearly nine months overdue. The loss of the services of this set placed the undertaking in a very serious position during the last winter, the actual load upon the station at times being considerably in excess of the normal capacity of the generating plant. As a result of heavy and continuous overloads, certain breakdowns occurred which involved abnormal expenditure in repairs and maintenance. Mr. Shawfield estimates the abnormal expenditure under various heads during the year at £2,838. In spite of this the cost per unit has been reduced from 0·562d. to 0·557d. It has been decided to allocate in future all expenditure on free wiring to revenue instead of raising further loans for this purpose. There was an increase of 2,528,369 in the number of units sold for all purposes during the year; the total number of units sold being 10,818,089. The bulk of the increase is for power purposes, but the Committee report with satisfaction the largest increase in the lighting units since 1903.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

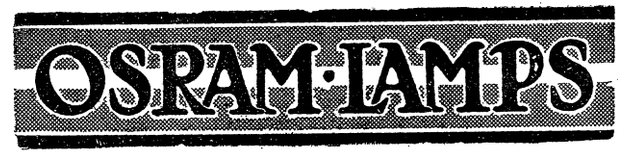
Aldershot.—An inquiry was held last week concerning a loan of £2,500 for extensions to the electricity works. It is proposed to instal a Diesel engine.

Barrow-in-Furness.—Overhead mains extensions are to be carried out at an estimated cost of £407.

Bradford.—Tenders are invited for two water-tube boilers, stokers, and superheaters, and one 12-ton electrically-operated overhead crane. (See an advertisement on another page.)

Bradford.—It is proposed to extend the electric supply mains to Apperley Bridge at an estimated cost of £4,145.

Leigh, Lancs.—The Corporation have applied to the Local Government Board for permission to borrow £6,300 for extensions to the electricity works.



London: *Islington.*—The L.C.C. have sanctioned a loan of £5,500 for extensions to the electricity works. A proposed loan of £1,500 for transformers has been reduced by the Finance Committee of the L.C.C. to £500.

Sheffield.—Extensions to the electricity undertaking at an estimated cost of £61,000 are recommended by Mr. S. E. Fedden, the Chief Electrical Engineer. The new plant will include three boilers, economisers, a 6,000-kw. turbo-alternator, and switchboard.

Southampton.—The Corporation invite tenders for a motor-generator, also a condenser. (See an advertisement on another page.)

Torquay.—An inquiry has been held concerning a loan of £5,000 for electrical extensions.

Turton, Lancs.—The district Council have decided to spend £4,500 on its electricity undertaking. The Board of Trade has consented to the use of overhead wires in certain parts of the district.

Hosted by Google

Wolverhampton.—Tenders are invited for a 264-cell 6,000-ampere storage battery, &c., two motor-driven boosters, and switchgear and instruments. (See an advertisement on another page.)

The Electricity Committee recommend a scheme of extensions at the Commercial Road generating station at an estimated cost of £19,700.

WIRING

Aberdare.—Drill hall and caretakers' quarters for Glamorgan Territorial Force Association. Architects, Messrs. Evans, Williams & Evans, Pontypridd.

Acton.—School at Rothschild Road, Acton Green. Education Department.

Bacup.—Tenders are invited for the electric wiring and fitting of the baths and other Council premises.

Belfast.—New buildings at Queen's University. Architect, Mr. W. H. Lynn, Belfast.

Bolton.—Extensions to Townleys Hospital. Architect, J. Ward, 24 Mawdsley Street.

Edinburgh.—Hall in East London Street. John Hope's Trustees. Proposed new police headquarters.

Glasgow.—Church and offices at corner of Battlefield and Cathcart Roads. Architect, J. Galt.—New bobbin mills, by Gibb Timber & Bobbin Co.

Huddersfield.—New school at Woodhouse. Architects, Messrs. J. B. Abbey & Son, 34A New Street.

London.—New premises for the Royal Geographical Society.

Maidenhead.—Proposed town hall.

Newcastle-on-Tyne.—New hall near Northumberland Street.

Shipley.—Extensions to public slaughter house. Architect, Mr. W. Illingworth, Market Street, Bradford.

MISCELLANEOUS

Australia.—Specifications may be seen at 73 Basinghall Street of telegraph, telephone and electric light material for which tenders are required by August 23rd at the office of the Deputy-Postmaster-General, Sydney.

London: *L.C.C.*—The Highways Committee recommend the extension of the tramways in East India Dock Road to the county boundary at Barking Road Bridge, upon the conduit system, at an estimated cost of £27,880.

In connection with the purchase by the L.C.C. of the trolley lines belonging to the Metropolitan Electric Tramways, Ltd., between Manor House and Finsbury Park, an expenditure of £31,600 is recommended upon reconstructing this line for working also upon the conduit system.

Melbourne.—Tenders are required by August 8th for measuring instruments for Melbourne G.P.O. Particulars from Commonwealth Office, London.

Northwich.—Inquiries are being made as to the relative cost of electricity and gas for street lighting.

Russia.—Tenders by August 1st for tramway construction by the Municipality of Stavropol, Caucasus.

Spain.—According to the *Board of Trade Journal*, tenders will be received up to July 24th at the office of the *Gobierno Civil de la Provincià de Terida*, Terida, for a telephone system at Cervera, and by July 26th at the office in Santander for telephones at Torrelavega.

Torquay.—Network fuses are to be installed at an estimated cost of £340.

York.—Extensions to the city tramway system are under consideration.

Case under the Home Office Factory Regulations.—The Charing Cross, West End & City Electricity Supply Co. have been summoned at West Ham for failing to comply with the Home Office Rules at their Bow generating station. The case arose from the fact that a man named G. C. Avent received a severe shock from 10,000-volt connections behind the switchboard, and, although he was not killed, received injuries necessitating the amputation of one arm. It appeared from the evidence that the man acted contrary to instructions in entering the H.-T. chamber, and the summons was eventually withdrawn.

Electrical Trades' Benevolent Fund.—The following have been received since the last list was published in ELECTRICAL ENGINEERING. Subscriptions:—J. Y. Fletcher, £1 1s.; Brook, Hirst & Co., £1 1s.; Frederick Smith & Co., £2 2s.; Breedon, Joseph & Co., £2 2s.; R. Lynen, £1 1s.; Pritchetts & Gold, £1 1s. Donations:—Eckstein, Heap & Co., £5 5s.; J. & H. Grevener, £3 3s.; J. W. Mumby, 6s.; H. Lotery & Co., £2 2s.; Gillespie & Beales, £1 1s.; T. W. Lench, £2 2s.; Morgan Crucible Co., £1 1s.; Brown Bayleys Steel Works, £1 1s.; Robert Kearsley & Co., £1 1s.; J. Yates & Co., £1 1s.; Vacuum Oil Co., £1 1s.; Martin, Earle & Co., £3 3s.; Walter Scott, £2 2s.; Brecknell, Munro & Rogers, £1 1s.

TENDERS RECEIVED AND ACCEPTED

Blackburn.—The Electricity Committee have placed the following contracts:—Messrs. John Stirk & Sons, Ltd., a lathe; Messrs Yates & Thom, a boiler; and the British Westinghouse Electric and Manufacturing Co., Ltd., a 2,000-kw. turbo-generator and two rotary converters.

Bolton.—The tender of W. Townson & Sons for a new car shed with electricity works by J. Booth & Sons has been accepted.

Dudley.—The tender of Messrs. Belliss & Morcom for a new steam engine at £675, plus £30 for alterations to the foundations of the discarded engine, has been accepted.

Gloucester.—The tenders of Messrs. Siemens Bros. & Co. for the supply of feeder and distributor cables at £1,211 10s., and that of the British Insulated & Helsby Cables, Ltd., for cables at £817 3s. and distribution pillars at £199 10s., have been accepted.

London: *L.C.C.*—The Highways Committee recommend the acceptance of a tender by Messrs. Gardner, Locket, & Hinton, Ltd., for 150,000 tons of washed small nuts steam coal from the Grangerigg Coal Co.'s pits, Lanark, at 10s. 11d. per ton.

The following tenders have been received for four car traverses for the Streatham, Camberwell and Hammersmith car sheds:—Brush Electrical Engineering Co., £2,297; Dick, Kerr & Co., £2,452; Hurst, Nelson & Co., £2,525; Cowans, Sheldon & Co., £2,592; S. S. Whiteley & Co., £2,768; S. H. Heyward & Co., £2,780; Heenan & Froude, £2,962; Stothert & Pitt, £3,822. The first named tender is recommended for acceptance.

Battersea.—Contracts are to be entered into with Mr. Haydn Harrison and the Foster Engineering Co. for street lantern and metal filament lamps respectively.

Nottingham.—The Stanton Ironworks Co., Stanton, near Nottingham, has placed an order with Messrs. Fraser & Chalmers for two turbines and blowers to work in conjunction with existing reciprocating engines in connection with their extensive blast furnaces.

Among important orders recently received by the British Westinghouse Co., we note the following:—Greenock Corporation, two 2-450-k.w. rotary converter sets D.C. switchgear, &c.; Sir William Arrol & Co., for Admiralty Portsmouth, 4-50, 2-5, 2-10-h.p., 440 v. type A. motors, control gear and spares; Cowan Sheldon for Imperial Japanese Navy, 3-60 h.p., 1-25 h.p. 220 v. 500 r.p.m. G motors, control gear and spares; Ransomes & Rapier, Ltd., for Admiralty, Devonport, 1-2, 1-4, 1-6 1-7, 2-15, and 2-20 h.p. D.C. motors 440 v. and control gear and spares; B.A.G.S. Railway, Co., Ltd., 4-20 h.p. 440 v. 1450/1500 r.p.m. three-phase 50 per 50 CB, and starters 1-25, 3-15, 3-10, 1-5 h.p. 550 v. 950 r.p.m. G motors and starters; Cjers, Mills & Co., Ltd., one Westinghouse Rateau blower to deliver 25,000 c.ft.. free air per min. against terminal pressure of 6½ to 8 lbs. per sq. in. direct driven by 900 h.p. 3,000 r.p.m. single-velocity wheel turbine; Manchester Corporation, 50 magnetic brakes; Blackburn Corporation, one 2,000-kw. 3,000 r.p.m. A.C. turbo-generator set with surface condensing plant, &c.; one 800-kw. rotary; South Shields Corporation, one 1,500-kw. high pressure turbine (impulse type) coupled to one 1,000-kw. D.C. generator and one 1,100-kw. A.C. generator in tandem with surface condensing plant, Lea recorder and Brown Boveri regulator; East Indian Railways, Co., two 400-kw. D.C turbo-generators and spares; J. Howden & Co., one 1,000-kw. turbo type alternator; Randfontein Mines, one 265 and one 40 b.h.p. A.C motors; La Plata Trams, ten 200 tram-car equipments.

Annual Conversazione of the Institution of Electrical Engineers.—A large number of guests, including several distinguished visitors, were received by the President and Mrs. Ferranti at the conversazione last Thursday at the Natural History Museum, South Kensington. Musical selections were given by the band of the Royal Engineers and the Alexandra Ladies' Quartette. The function was very successful, even if, owing probably to the heat, it was not quite so well attended as in former years.

APPOINTMENTS AND PERSONAL NOTES

An additional commercial assistant is to be engaged in the Battersea Council's electricity department at a salary of £2 per week and commission.

Mr. Guy Campbell has recently resigned his position with Holophane, Ltd., and is now sales manager for the Benjamin Electric, Ltd., of 117 Victoria Street, Westminster, S.W.

The Beckenham Electricity Committee recommend that the salary of Mr. J. E. Tapper, Borough Electrical Engineer, be increased from £300 to £350 per annum.

The Ealing Electricity Works' staff have presented Mr. R. Golding, shift engineer, with a watch on the occasion of his leaving to take up a position in Australia.

The Marylebone Electric Supply Committee call the attention of the Council to the termination, in March, 1912, of the agreement with Mr. Arthur Wright as Consulting Engineer, and recommend that the six months' notice provided for in the agreement be given.

The following increases of salary have been sanctioned by the Dover Corporation :—Mr. L. W. Woodman, Chief Electrical Engineer, from £425 to £475 per annum; Mr. R. C. Harpur, Mains Superintendent, from £200 to £225 per annum; and Mr. E. W. Smith, Works Superintendent, £200 to £225 per annum.

The late Mr. E. Boulnois, Chairman of the Central Electric Supply Co., left estate valued at £55,157.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night was £58 15s. to £59 5s. (last week £58 10s. to £59).

Change of Address.—Messrs. J. & H. Grevener, formerly of Eldon Street House, E.C., and 7 and 9 Finsbury Street, have removed to a commodious six-floor building at 40 Southwark Street, S.E

Bruce Peebles & Co.—The annual works outing was held this year at Crieff. A party numbering over four hundred left Edinburgh soon after seven in the morning. Sports, drives, walks, golf, &c., were enjoyed to the full. Lunch and tea were served in the Porteous Hall, the party returning to Edinburgh late in the evening.

The Benjamin Electric.—This firm have opened new offices and showrooms at 117 Victoria Street, S.W., and have purchased the stock and goodwill of C. F. Trippe, of 36 Brooke Street, Holborn. The works and warehouse remain at 1a Rosebery Avenue.

Reduction in Cable Prices.—Owing to the fall in the market price of rubber, reductions are being made by the India-rubber, Gutta Percha & Telegraph Works Co., British Insulated & Helsby Cables, and the members of the Cable Makers' Association in the prices of 2,500, 600, and 300 megohm 600-volt C.M.A. and Association pure Indiarubber flexibles, the discounts on which are now, as from Monday last, 27½ per cent.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Marconi's Wireless Telegraph Co.—The report for 1910 states that during the year the business of the Company showed considerable expansion, the net profit amounting to £60,513. It is proposed to recommend a dividend upon the ordinary shares, but the amount is not stated. Mention is made of the fact that Mr. Marconi has applied for a patent for a duplex system of wireless telegraphy, the invention having already been submitted to a successful test at the Clifden station. Reference is also made in the report to the new company which will fit all vessels flying the German flag. Both the Marconi and the Telefunken companies hold shares in this, but the work of installation will be carried out exclusively by the Deutsche Betriebsgesellshaft für Drahtlose Telegraphie m.b.H. under licences from the other two companies.

Puebla Tramways, Light & Power.—A net profit of £61,678 has been made, out of which, after paying interest, &c., £5,440 has been carried forward.

Electric Construction Co.—The net profit for the year to May 31st was £15,042 after meeting debenture interest and crediting £5,000 to depreciation. The directors recommend a 2½ per cent. dividend on the ordinary shares, the transfer of £5,327 to general reserve, and to carry forward £6,131. The directors report a better demand for electrical machinery, and a marked increase in net profit during the past year, although little improvement has taken place in prices.

SUMMARY

An article by Messrs. F. J. Moffett and N. B. Rosher describes an alternating current lift installation, in which use is made of a special form of centrifugal slipping clutch. (Page 413.)

In a Paper read recently before the South African Institute of Electrical Engineers, Mr. L. B. Woodworth described some forms of magnetic separator suitable for the concentration of tin ores. (Page 413.)

Brief particulars are given of the large single-phase locomotives now being constructed for the Dessau-Bitterfeld section of the Prussian State Railway system. The Allgemeine Elektricitäts-Ges. and Siemens-Schuckertwerke Ges. are each supplying electrical equipments with Winter-Eichberg and compensated series motors respectively. (Page 414.)

We give some notes on the electrical equipment of the new White Star liner *Olympic*. The generating plant aggregates 1,600 kw., and extensive use is made of electricity for power as well as lighting. (Page 404.)

An original communication to the Institution of Electrical Engineers, by Mr. W. R. Cooper, describes a new primary battery in which the electrolyte is continuously forced through a porous carbon electrode. (Page 415.)

Mr. Horace Boot, consulting electrical engineer, was unsuccessfully sued in London on Monday for a "quid pro quo" in connection with an introduction to members of the Chichester District Council which resulted in the formation of the Chichester Electric Light & Power Co. (Page 415.)

Among the specifications published by the Patent Office on Thursday last week was one by J. G. Mathieson describing an automatic contact device in connection with the overhead equipment of tramways. B. A. Quint has patented an enclosed arc lamp of the inverted type, in which the striking mechanism is effected by a shunt coil. A receiving method for wireless telegraph work by W. O. Smith makes use of a periodic alteration of the capacity and self-induction. A portable insulator for wire-ends in connection with ignition work is protected by J. Krannichfeldt, and a novel process for the manufacture of highly porous composition accumulator plates is covered by J. Apoznanski. (Page 416.)

Among our "Electric Traction Notes" this week the case for the single-deck tramcar as against the double-decker is alluded to. (Page 417.)

Experimental Automatic Telephone Exchanges are being established by the Post Office at Epsom and Caterham Valley on the Strowger and Lorrimer systems respectively. A further statement with regard to the position of the National Telephone Co.'s staff was made by the Postmaster-General on Friday.—Legal proceedings are pending between the Marconi Co., Ltd., and the Lodge-Muirhead Syndicate, each side alleging that the other has infringed its patents. Other notes on telephone and telegraph matters will also be found on p. 417.

It is proposed that the Corporation should acquire the whole of the British Electric Traction Co.'s tramways in Birmingham.—Complaint is made in the annual report of the West Ham borough electrical engineer at the short period allowed for loans for the Sales Department.—An arbitrator is to be appointed to deal with the purchase by the L.C.C. of the London

Hosted by Google

United tramways in London.—An unsuccessful libel action was taken against the Bootle Council's electrical engineer last week.—The L.C.C. have allowed the Stepney Council to suspend for three years the repayment of a loan of £15,700 for mains. (Page 418.)

ELECTRIC lighting schemes are under consideration at Biddulph, Cardigan, Rugeley, and Douglas (I.O.M.). —Local Government Board enquiries have been held at Doncaster (£12,000) and Luton (£13,000).—A loan of £8,000 has been sanctioned at Ilford, a 1,000-k.w. generating plant is required by a firm at Wolverhampton, plant extensions are to be carried out at Newcastle-under-Lyme, and lead-covered cable is required at Wednesbury. (Page 419.)

UNDER a new agreement, Edmundson's Electricity Corporation are to finance the Urban Electric Supply Co. to the extent of a further £100,000. (Page 420.)

CATALOGUES AND PAMPHLETS, &c., RECEIVED

AUTO-TRANSFORMERS.—A list from Messrs. Carney & Pearn, Ltd. (Nutsford Vale Works, Manchester, S.E.; London Office, Record Electrical Co., Caxton House, Westminster), gives particulars of "C. & P." auto and double-wound transformers from 0·5 to 10 kw. These are designed for low voltage drop, and are claimed to be quite silent in working.

FANS.—The new electric fan list of the Sun Electrical Co., Ltd. (118–120 Charing Cross Road), besides containing a full range of all the more ordinary forms of fans, includes some interesting novelties in the shape of a combined fan and table lamp, and a combined table fan and fruit dish.

TRANSFORMERS.—The Foster Engineering Co. (Morden Road, Wimbledon) have put on the market a special heavy-current step-down transformer for supplying electric furnaces used in lamp filament manufacture. The output is 2,000 amperes at 6 or 8 volts. This piece of apparatus is illustrated on a new leaflet, which also shows a group of regulating transformers recently completed for a metal filament lamp works.

METAL FILAMENT LAMPS.—A new edition of their list of Foster metal lamps is to hand from the Foster Engineering Co. (Morden Road, Wimbledon, S.W.). These lamps are made entirely at the Wimbledon works, and range in size from the 10-c.p., 25-volt lamp to the 600-c.p. lamp made for voltages up to 260. They are made in a variety of different bulbs, and exceptional strength is claimed for the filaments.

SIGNS.—A leaflet from Simplex Conduits, Ltd. (113–117 Charing Cross Road) illustrates several attractive patterns of illuminated signs which they are making up in their works in various metals and finishes, according to individual requirements. They are so designed as to combine advertisement and window lighting, and several alternative arrangements of lamps may be used.

WATERTIGHT WALL PLUGS.—Messrs. A. Reyrolle & Co., Ltd. (Hepburn-on-Tyne) have sent us a new leaflet describing a pattern of 50-ampere watertight wall plug, which they have introduced to meet the demand for a strongly-made plug for crane work, docks, shipyards, &c. An extra pin is provided for the earth connection, and the design is such that this pin makes contact before the current-carrying pins, and breaks after them.

CENTRAL LONDON RAILWAY.—A most handsome Coronation Souvenir in the form of a book illustrated with three-colour reproductions of sketches of London, and with the letter-press printed in gold, has been issued by the Central London Railway, with the title of "Some London Views," interesting particulars of the railway and the districts through which it runs are given.

CONVERTERS, MOTOR GENERATORS, METAL FILAMENT LAMPS.—Leaflets dealing with the above, and embracing particulars of small double commutator converters and motor generators, driven by A.C. motors, for cinematographs and other purposes, and the "Leanda" metal filament lamp, are to hand from the Electrical Engineering & Agency Co., Ltd. (Bank Buildings, 109-111 New Oxford Street, W.C.). This is the first time we have mentioned the name of the company in this column, and our readers will be interested to know that the managing director of the company is Mr. Charles Leven, who was formerly manager of the Lahmeyer Electrical Co., Ltd., whose offices have been taken over by the new company.

Association of Consulting Engineers.—Since the draft rules, drawn up by the Provisional Committee, were circulated in December last, a number of meetings have been held to deal with points that have been raised by various engineers, and negotiations have been in progress, which, however, were not completed in time to call a general meeting to consider the rules and formally to enrol members during the present month, as had been hoped. Meantime, Mr. Dykes, the honorary secretary, would be obliged if all letters were sent to his new address, 11 Victoria Street, Westminster, S.W.

FOREMAN:—We are nearly ready, mum. We are plugging the wall ready to put up the fuse board to-morrow.
LADY OF THE HOUSE:—Fuse board! I won't have such a thing in the house. The young man from the Gas Company says that there are sometimes fires from the fusing of electric wires.
FOREMAN (*with great presence of mind*):—Very well, mum. Shall I put in a distributing board instead? It will cost very little more and we always use them in the best houses.

A.-C. MOTORS FOR LIFTS

By F. J. Moffett and N. B. Rosher

ALTHOUGH it is now coming to be recognised fairly generally that there is no serious difficulty in driving an ordinary lift-gear by means of an A.-C. motor, there is still a certain amount of hesitation on the part of many engineers in adopting this type of motor. It may, therefore, be of use at the present juncture to give a short description of some lifts which have been equipped with three-phase motors to our specification.

The lifts in question are three in number, and are intended for an average load of 5 cwt., but can deal with a load of 8 to 10 cwt. without any difficulty. The speed is 80 ft. per minute in the case of two of the lifts, and 100 ft. in the case of the third. In each case the motor is a 5 h.p. 440 volt, 25 cycle, 750 r.p.m., three-phase squirrel-cage motor, which drives the worm of the worm-gear by means of a patent slipping clutch, both motor and slipping clutch being supplied by the Lancashire Dynamo & Motor Co. There are two reasons for the employment of this slipping clutch: firstly, because squirrel-cage motors possess a bad starting torque, and secondly, the cage requires to be started without shock.

This type of slipping clutch, which is shown in the accompanying figure, depends for its action on the centrifugal effect. The part of the clutch which is fixed on the motor spindle consists of two or more slipper blocks, which slide on radial arms moving outwards in a radial direction against the action of springs as soon as the motor gets up speed. The other part

CENTRIFUGAL SLIPPING CLUTCH FOR LIFT DRIVE (ONE-FIFTH SCALE).

of the clutch consists of a hollow pulley keyed on the worm shaft. The slipper blocks are not in contact when the clutch is at rest, but fly outwards when the motor reaches a certain speed, and bear on the inner surface of the pulley with a pressure depending on the speed, the weight of these blocks, and the strength of the springs controlling same.

The current taken by a squirrel-cage motor when at rest is several times as much as the current taken when developing full load torque at normal speed, and the torque which this type of motor is capable of exerting when starting from rest is usually only a fraction of its full-load value. If, however, the rotor is free to rotate without load until it reaches, say, 50 per cent. of its normal speed, the case is entirely different. The time during which a heavy starting current is demanded is reduced enormously, and the load comes on gradually only after the predetermined speed point has been attained. At 50 per cent. normal speed and above this the torque, which can be exerted by the motor, may rise as high as twice the normal torque corresponding to full load or even more. With the motor spindle coupled to the worm shaft by means of this device, the complicated controller, with arrangements for inserting resistance in circuit at starting and cutting out same as the motor gains speed, becomes unnecessary and the power lost in heating these resistances is saved. The controller used in the lifts in question is a simple oil-immersed reversing switch of the barrel type, operated by means of the usual hand rope passing through the cage. The starting-current is, of course, heavy, but only lasts for a second or two, and has no disturbing effect on the rest of the power system.

It will be of interest to give the power taken by one of these lifts as compared with those operated by direct-current: we are in a position to give these figures as one of the lifts was converted from direct- to alternating-current working. It may be mentioned in passing that the reason for the adoption of alternating current for these lifts was that the supply for power and lighting throughout the works was of this nature, and it was in consequence inconvenient and expensive to have a supply of direct current merely for the purpose of the lifts; also the price per unit for alternating current was less than half that for direct current.

Lift Driven by 5 h.p. 220-volt D.-C. Motor.

Cage empty: Down, 2·5 E.H.P.; up, 2·05 E.H.P.
Cage+5 cwt.: Down, 1·75 E.H.P.; up, 3·70 E.H.P.
Average, 2·5 E.H.P.

Lift Driven by 5 h.p. 440-volt Three-phase Motor.

Cage empty: Down, 2·25 E.H.P.; up, 0·5 E.H.P. (generating).
Cage+5 cwt.: Down, nil; up, 2·5 E.H.P.
Average, 1·06 E.H.P.

It will be seen that the result of the conversion is remarkable from the point of view of the consumption of energy, the units used in the case of D.-C. working being more than twice as many as those required when working with three-phase current. Part of this economy is, of course, due to the fact that under certain conditions the three-phase motor is running as a generator slightly above synchronous speed and returning power into the mains, and part may be due to the D.-C. motor not being so efficient and requiring more energy for field excitation. In the powers given no account is taken of the C^2R. losses in the resistances, so that the total economy is even greater than is indicated by the above figures. The conversion to A.-C. working consisted in removing the D.-C. motor and brake magnet, and substituting for them a three-phase motor and single-phase brake magnet: no alteration whatever was made in the gearing, cage, balance-weight or guides.

In the case of two of the lifts which were equipped for three-phase working, single-phase solenoid brakes were used, but it was found that these caused considerable vibration owing to the low periodicity of the supply, which was 25 cycles per second. In the third lift a three-phase solenoid brake was employed, and this entirely removed the vibration.

MAGNETIC SEPARATORS

A PAPER on this subject by Mr. L. B. Woodworth, read in January at a meeting of the South African Institute of Electrical Engineers, is contained in a recent issue of the Transactions of this Institute. Magnetic separators are in extensive use in South Africa in connection with diamond and gold mines, but the author deals particularly with forms suitable for application in concentration of tin ores. He summarises the requirements of a good separator as follows: Simple in design, low power consumption, easy to repair, and flexible as regards adjustment, and speed; it should introduce the mixture to be separated into the magnetic field slowly and at a constant speed; the strength of the magnetic field

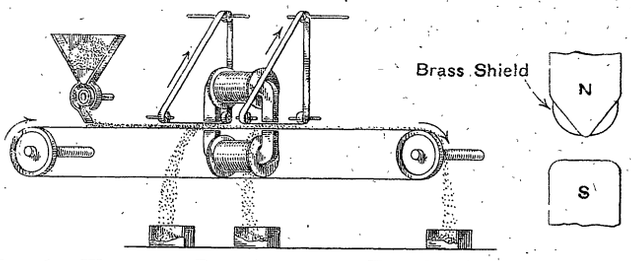

FIG. 1.—WETHERILL-ROWLAND SEPARATOR.

FIG. 2.—ARRANGEMENT OF POLES.

should be adjustable, and should act with uniform intensity throughout the separating zone; mechanical design of throw-"off" horns, chutes, conveyor, and cross belts should be so arranged as to permit an easy removal of the magnetic particles from the separating zone.

The adjustment of the field can be made either by series or parallel grouping of the coils, by rheostat or voltage variation, or by variations in the length of the air-gap. He then proceeds to describe the Wetherill-Rowland separator shown diagramatically in Fig. 1. In this apparatus the upper-pole field is bevelled and has brass shields, and the lower-pole piece is flat, as shown in Fig 2.

This arrangement gives a highly concentrated field along the lower edge of the upper-pole piece, which is necessary in the separation of feebly magnetic minerals. The ore is fed from the hopper (Fig. 1) upon the conveyor belt. As the magnetic

Hosted by Google

particles pass through the separating zones they are attracted to the upper pole-pieces, and are held to the under side of the cross belts by the magnetic field. The cross belts travel at right-angles to the conveyor belt, and carry the magnetic particles away from the separating zone.

The gaps are usually so set that the strongly magnetic oxides of iron will be thrown off by the first and the more feebly magnetic impurities by the second. A two-zone machine can deal with 25 cwt. of ore per shift of ten hours, and the precentage of metallic tin can be raised from 30 to 74

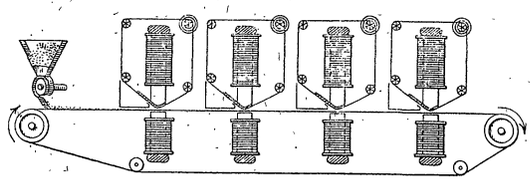

FIG. 3.—IMPROVED SEPARATOR SUGGESTED BY THE AUTHOR.

with a consumption of 17 amperes at 65 volts. Four-zone machines are also described, which can remove all but 3 per cent. of the feebly magnetic matter on cross belts. A certain amount of this, which falls back on to the side of the main belt, can be removed by a deflecting scraper or by an electrostatic separator. Suitable adjustment of the speed of the belts is important. Separate variable-speed motors should be employed for the conveyor and feed gear and for the cross belts, as it is advisable to be able to control the relative belt speeds during operation.

One disadvantage in operation of a separator of the cross-belt type is that the particles change their direction of motion when entering a separating zone. The particles travel at a certain speed and direction when on the conveyor belt, and the instant they come under the influence of the upper magnetic pole they are drawn against the under side of the cross belt and travel at increased speed and in a direction at right-angles to their former direction. In the separation of tin ore the tin particles have a tendency to move over on the conveyor belt to the side where the throw-off horns are, and in many cases it will be found that tin is carried over.

To meet this objection the author proposes the design shown in Fig. 3, where, during separation, the magnetic particles are drawn up against the under side of the take-off belt of the upper-pole piece, and without change in direction of motion are drawn up the throw-off shoe until carried out of the influence of the magnetic field. Further separation can be effected on the spray-pole system in the case of some classes of ores.

A form of tube separator was also described, in which a brass drum revolves on rollers between the poles of a magnet, with one pole of small surface and one of larger surface. Inside is a fixed inclined trough, down which the ore travels. The magnetic particles are lifted out of the trough and are held against the side of the tube, being carried over until they are out of the influence of the magnetic field. They then fall into the launders and are washed away.

Death on South London Single-Phase Railway.—An employée in the telegraph department of the London, Brighton, & South Coast Railway was engaged near the overhead traction wires last week at the Crystal Palace Low Level Station, when a steel tape which he was using came in contact with them. He received a severe shock and fell from the ladder upon which he was standing, and when picked up was found to be dead.

Osram Lamps in Siam.—We are informed by the General Electric Co. that the funeral rites for the late King Chulalonkorn were conducted in the light of Osram lamps, aggregating upwards of 100,000 c.p. The Eastern agents of the G.E.C. state that the Siamese papers referred to the brightness of the scene as indescribable.

The Institution of Mechanical Engineers.—The following Papers are down for reading at the Zürich meeting of the Institution of Mechanical Engineers on Tuesday and Wednesday, July 25th and 26th. Electric Traction in Switzerland, by M. E. Huber-Stockar (Zürich); Results of Experiments with Francis Turbines and Tangential Turbines, by Dr. F. Prásil (Zürich); Some New Types of Dynamometers, by Dr. A. Amsler (Schaffhausen); Rack-railway Locomotives of the Swiss Mountain Railways, by Mr. T. Weber and Mr. S. Abt (Winterthur); Steam Turbines, by Mr. H. Zoelly (Zürich); Modern Diesel Oil Engines, by Mr. F. Schubeler (London); High Pressure Water Power Works, by Mr. L. Zodel (Zürich).

ELECTRIC LOCOMOTIVES FOR THE PRUSSIAN STATE RAILWAYS

SOME particulars of the single-phase locomotives for the Dessau-Bitterfeld section of the Prussian State Railway system are given in *Elektrische Kraftbetriebe und Bahnen*. These are of the now almost universal design, in which one, or at most two, large motors are raised well above the frame, and drive the wheel axles through coupling-rods and an intermediate shaft or false axle. This construction gives better running qualities owing to the high centre of gravity of the whole locomotive, and enables the motors to be readily inspected and repaired. Two different patterns are being constructed, one for the express and normal passenger trains, and the other for the heavy goods service. They were designed by the Königliche Eisenbahndirektion, Halle, with the co-operation of the Hanover Maschinenbau A.-G., Siemens-Schuckertwerke Ges., and the Allgemeine Elektricitäts-Ges.

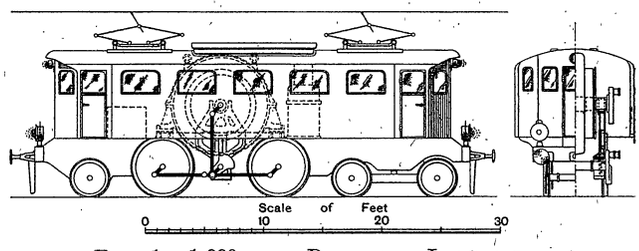

FIG. 1.—1,000 H.P. PASSENGER LOCOMOTIVE.

The general design of the A.E.G. passenger service locomotive is illustrated in Fig. 1. It has a four-wheel bogie, four coupled driving-wheels, and a pair of trailing-wheels. The driving-wheels are 5¼ ft. in diameter, and thus run at 365 r.p.m. when a speed of 68 miles per hour is reached. The bogie and trailing-wheels are 3·3 ft. in diameter. The total weight of the locomotive is 70 tons, and the useful adhesive weight is estimated at 28 tons. As shown in the figure, there is only one motor. This is a 1,000 h.p. A.E.G. Winter-Eichberg single-phase commutator motor, and will develop 700 h.p. continuously. Power will be supplied to the locomotive at 10,000 volts 15 cycles, and will be transformed down to about 600 volts for the motor. A maximum tractive effort of 13,000 lbs. at the driving-wheel periphery is developed, and the maximum speed is specified at 81 miles per hour. The motor drives a false axle, which is coupled to the driving-wheels. The mechanical portions of these locomotives have been constructed by the Hanover Maschinenbau A.-G., and Siemens-Schuckertwerke and the Allgemeine Elektricitäts-Ges. will each supply electrical equipments. In the former case, the motor will be of the Siemens-Schuckert compensated series type.

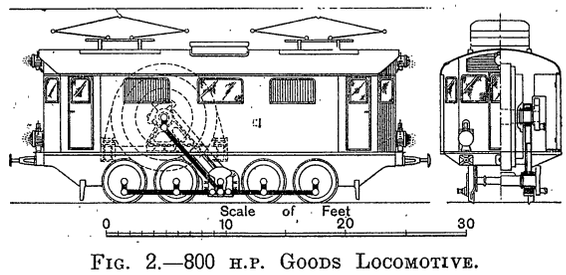

FIG. 2.—800 H.P. GOODS LOCOMOTIVE.

Fig. 2 shows the general design of the A.E.G. goods locomotive. The four axles are coupled together, and to the false axle driven by a single 800 h.p. motor. In this case the motor is not perpendicularly above the false axle, but some 4·5 ft. to one side, in order to give a simple arrangement of the remainder of the electrical equipment. The continuous output of the motor is about 600 h.p., and the maximum speed 37 miles per hour. A tractive effort of 20,000 lbs. at the driving-wheel periphery is developed. The total weight is about 58 tons. Four of these locomotives are being constructed, the other three electrical equipments being supplied by the Lahmeyer-Ges., the Maffei-Schwarzkopffwerke, and the A.G. Brown, Boveri et Cie. The motor of the last-named firm will be of the Deri type, in which all the control is effected by altering the position of the brushes on the commutator. The Lahmeyer motor will be a compensated series motor, and that of the Maffei-Schwarzkopffwerke a series motor with double commutator.

Hosted by Google

ELECTRICAL EQUIPMENT OF THE "OLYMPIC"

ELECTRICITY will be largely employed, both for lighting and power, in the two new 45,000 ton White Star liners, *Olympic* and *Titanic*, the former of which has already been launched from the yard of her builders, Messrs. Harland and Wolff, Ltd., of Belfast. Among the purposes for which electricity will be employed, in addition to lighting, are: the deck cranes; cargo, boat, and engine-room winches; passenger elevators; stores, mail, and pantry lifts; ventilating and stokehold fans; cabin fans; motors for the cylinder-lifting gear, turbine-turning and lifting gear, and condensor sluice valves; the workshop machine tools; conveyor for marconigrams; gymnastic apparatus; kitchen and pantry machinery, such as the ice-rocker, dough-mixers, potato-peelers, roasters, knife-cleaners, mincers, hot plates, and electric irons; electric heaters; electric baths; main steam whistles; sounding machines; stoking indicators; boiler room telegraphs; clocks; watertight doors; helm indicator; illuminated pictures; chimes; bells; loud-speaking and service telephones; submarine signalling; and wireless telegraphy.

The generating plant on the *Olympic* consists of four main 400-k.w. 100-volt continuous current generator, driven by reciprocating engines manufactured by Messrs. W. H. Allen, Son, and Co., of Bedford. The generators, also by Messrs. Allen, are of the ten-pole type, compound wound, fitted with interpoles, and run at 325 r.pm. They are in a compartment below the orlop deck, adjoining the after end of the turbine-room. There are also two 30 k.w. auxiliary sets above the water-line, which can be supplied with steam from either of several boiler rooms.

The main switchboard is on the orlop deck level, commanding a view of the machines below. Illuminated signals to the engine-room are provided. There is a 25 panel feeder board, distinct from the machine board, supplied by Messrs. Dorman and Smith. Forty-eight feeders, up to 61/12 in size, radiate to various parts of the ship. In general, the single wire system is employed, but a certain amount of bonded return leads are provided to avoid stray currents. The power and lighting bars can be kept separate or coupled as required. The main feeders pass up steel trunkways, one on each side of the ship, to distributing fuse-boards, on each deck. In the machinery spaces, lead-sheathed armoured cables are used, and in the boiler-rooms the cables are run in steel pipes. All wires leading through a watertight bulkhead are collected together in a steel tube filled with bitumen. More than 200 miles of cable have been used.

About 10,000 lamps are fitted, ranging from 16 to 100 c.p., and Tantalum lamps have been employed almost throughout. A carefully planned system of emergency lamps, on separate circuits, are placed at suitable points. The fittings include some of the most artistic character.

Some 520 Prometheus electric heaters, taking in all over 5,000 amperes, are installed, and there are 150 motors, from ½ to 40 h.p., in use for various purposes. No less than seventy-six of these, taking some 5,250 amperes, drive ventilating fans. Eight electric cranes have been supplied by Messrs. Stothert and Pitt, and there are also four 3-ton electric cargo winches, and four 15 cwt. electrically driven boat hoists, made by the Sunderland Forge and Engineering Co. Electric winches are also in use in the engine-room. The passenger and service lifts were all installed by Messrs. R. Waygood and Co. Electric bells, involving 1,500 pushes, are employed throughout, and forty-eight Magneta electric clocks are installed.

A very complete telephone exchange system, connected to a 50-line switchboard, is provided, and Messrs. Alfred Graham and Co.'s loud-speaking Navy telephones are employed throughout. There are also numerous service lines between definite points on the ship. The wireless telegraph outfit is a standard 1½ k.w. Marconi equipment. For the above details we are indebted to a special issue of *The Shipbuilder*.

THE BENKO PRIMARY BATTERY

AN original communication to the Institution of Electrical Engineers, by Mr. W. R. Cooper, describes the Benkö primary battery and its applications. This cell depends essentially on the idea that if the layer of electrolyte on the positive plate (that is, electro-negative element) is removed as fast as polarisation sets in, the E.M.F. will be maintained constant. A carbon electrode is used sufficiently porous to allow the electrolyte to flow through it, thus continually providing a fresh supply to the surface that is tending to polarise. The carbon is a flat tube surrounding the zinc plate and suitably closed at the ends with lead caps. The whole is enclosed in a sealed outer chamber, and the electrolyte enters the inner chamber formed by the carbon through a pipe, and is removed by a pipe connected to the outer chamber. The supply of the electrolyte (which is a mixture of sulphuric acid and sodium bichromate) is from a lead-lined tank above the battery. A single cell measures 1¾ by 6¼ by 9¼ ins. high, weighs 8·8 lbs., and has a continuous output of 26·25 watts (17·5 amperes). The open circuit E.M.F. is 2·0 volts. Results of a number of tests are given in the communication, showing good constancy of output, and the maximum current is given as 90 amperes per sq. ft. of zinc continuously. Four watts can be given per lb. of cell, or 670 watts per cubic foot total volume. Apart from laboratory and miscellaneous uses, such as charging of ignition batteries, the cell is recommended for telegraphy, and the author makes quite a good case for its use for small lighting installations, taking as an instance a country-house installation of fifty 10 c.p. 25-volt metal filaments, for which the battery would cost about £20 and the total cost of making would be about 2s. per unit. This is compared with a generating plant and accumulators costing about £200, which, including interest and depreciation, is calculated to give total working costs of 1s. 10d. per unit.

A CONSULTING ENGINEER'S "QUID PRO QUO"

AT the Westminster County Court on Monday, His Honour Judge Woodfall heard an action in which Mr. Horace Boot, consulting electrical engineer, was sued by Mr. George Bartlett, solicitor, of Chichester, in connection with the introduction of electric light into the town. Mr. Bartlett introduced Mr. Boot to some members of the Chichester Council, with the view to developing the electric lighting provisional order. As the result, the Chichester Electric Light & Power Co. was formed, with Mr. Boot as consulting engineer. Mr. Bartlett put in a claim for twenty guineas for introducing Mr. Boot, but the latter disclaimed any agreement to pay cash for the introduction, and offered twenty fully paid shares in the Chichester company. Mr. Bartlett argued that a cash payment was "the usual *quid pro quo*," and that £100 was the ordinary fee. The reply of Mr. Boot was that he understood Mr. Bartlett would raise capital for the new company, and in return he would have been offered a seat on the board. In the absence of any agreement between the parties judgment was given for Mr. Boot.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Hydro-Electric Practice." By H. A. E. C. von Schon. 383 pp. 9¾ in. by 7½ in. 140 figures. Second edition. (London: J. B. Lippincott Co.) 25s. net; abroad, 26s. 2d.

"The Ventilation of Electrical Machinery." By W. H. F. Murdoch. 79 pp. 7¼ in. by 4¾ in. 30 figures. (London: Whittaker and Co.) 3s. net; abroad, 3s. 2d.

"Whittaker's Arithmetic of Electrical Engineering." 166 pp. 7¼ in. by 5 in. 11 figures. Second edition. (London: Whittaker and Co.) 1s. net; by post, 1s. 2½d.

"Steam Turbines." By J. W. Roe. 143 pp. 9¼ in. by 6¼ in. 77 figures. (New York: McGraw-Hill Book Co.) 8s. 6d. net; abroad 8s. 11d.

"Mathematics for the Practical Man." By G. Howe. 143 pp. 5¼ in. by 7½ in. 42 figures. (London: Constable & Co.) 5s. net; abroad, 5s. 3½d.

"Quarternions." By A. Latham Baker. 92 pp. 5¾ in. by 8½ in. (London: Constable & Co.) 6s. net; abroad, 6s. 3½d.

"A Text-book of Heat." By R. W. Stewart and J. Satterby. 480 pp. 6¾ in. by 5 in. 210 figures. (London: W. B. Clive.) 4s. 6d.; abroad, 4s. 10½d.

The British Association.—Arrangements are now well in hand for the meeting of the British Association at Portsmouth, from August 30th to September 6th. This year's President is Sir William Ramsay, and Section G (engineering) will be presided over by Prof. J. H. Biles. The vice-presidents of the Section are Prof. W. E. Dalby, Mr. C. Hawkesly, and Prof. J. E. Petavel, Prof. E. G. Coker is Recorder, and the other sectional secretaries are Messrs. A. A. Rowse, H. E. Wimperis, and H. Ashley. A full list of the Papers is not yet available, but according to *The Times*, one of the discussions will be on the relative merits of superheated steam, gas, and Diesel engines, on which subject Papers will be read by Capt. H. R. Sankey, Mr. Tookey, and Mr. C. Day. Prof. T. W. Howe and Capt. Sankey are to show experiments in wireless telegraphy. Electric steering gear will be dealt with by Mr. B. P. Haigh; electric propulsion by Mr. H. O. Moon. Dr. T. S. Owens will put in a plea for smoke abatement, and Mr. Worby Beaumont will give his views on rail corrugation.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 13, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

14,534/10. **Automatic Contact Device.** J. G. MATHIESON. An automatic contact device for use in connection with the overhead equipment of tramways for operating signals or automatic points is covered by this patent, and consists in supporting a fixed bracket having arms projecting towards the cable from the span-wire insulator; also two downwardly projecting arms pivoted to bracket, and a contact rod carried by the free ends of the arms for operation by the trolley pulley, with set screws for adjusting the contact-rod arms, so as to allow the rod to be operated to complete or break an electric circuit, with or without springs for assisting the downward movement of the rod. Three figures.

15,143/10. **Arc Lamps.** F. KLOSTERMANN. This invention relates to a device for regulating arc lamps, and comprises the combination with a balance frame and a loose pulley, of a pivoted brake, and a spring arranged so that when the balance frame is moved by a series electro-magnet the action of the spring on the pivoted brake locks the loose pulley to the frame, and moves the carbons apart. Four figures.

15,710/10. **Enclosed Arc Lamps.** B. A. QUINT. In an enclosed arc lamp of the inverted type the striking mechanism, which is effected by a shunt coil, comprises a clutch device carried upon a hollow armature operated by a shunt solenoid, the movable carbon being mounted within the armature. The carbon is arranged so that when released by the clutch upon the coil being energised, it can be travelled forward by a spring placed in the hollow armature. A dashpot device is provided, adapted to allow the armature to be moved freely in one direction against gravity, and to come into operation to retard the armature when the solenoid is de-energised. Four figures.

16,486/10. **Interlocking Switchbox.** W. PATON. Interlocking devices are provided for automatically locking the cover of the switchbox by the action of moving the switch lever and closing the circuit, so that the box cannot be opened while the lever is in the "on" position. Means are also provided for covering and uncovering the terminals, by fitting within the switchbox a sliding protector which is connected to the switch lever shaft. Five figures.

19,729/10. **Secondary Battery.** D. W. JOHN and J. H. BERRY. It is well known that whenever anything goes wrong inside ordinary portable accumulators, it is necessary to strip off the lid, thus necessitating a certain amount of trouble in making an acid-proof joint when the lid is replaced. In this patent the cell is made circular and the lid screws in place and has a flange bearing on the top of the cell, so that there is some certainty of getting the plates properly located, as the lid always comes true. Three figures.

24,421/10. **Receiving Method for Wireless Telegraphy.** W. V. SMITH (*Dr. Eric F. Huth*). A method of receiving continuous electrical oscillations is covered by this patent, which makes use of the periodical alteration of capacity and self-induction. It consists of putting one of the receiving circuits periodically out of tune to such an extent that its frequency is below 40,000 per second, and that simultaneously the circuit containing the detector is tuned electrically, and the interrupter which causes the disturbance is tuned mechanically to the lower frequency. Three circuits are provided and arranged so that neither the antenna nor the detector circuit is periodically altered in frequency. Three figures.

27,176/10. **Accumulator Plates.** J. APOZNANSKI. A novel process for the manufacture of highly porous composition plates for electric accumulators, in which the paste-filled plates are dried at a high temperature, is carried out, by arranging the filled plates between acid-proof cover plates, so that the gas which is generated at the raised temperature is utilised for producing innumerable pores and at the same time hardening the mass.

6,736/11. **Fixing and Insulating Contact Springs.** SIEMENS BROTHERS & CO., LTD., and C. R. RIBER. This specification describes means for fixing and insulating contact springs used in telephone jacks and relays. The springs are assembled within a metal holder and isolated from one another by pieces of insulation, which also serve as distant pieces, the holder being shaped in such a manner that the whole can be clamped rigidly by altering its exterior form by pressure or other means. Six figures. Another method by the same authors, and described in their patent 6,737/11, consists in sealing the springs within the metal holder, and at a suitable distance, with insulating cement. In order to prevent them from being withdrawn they are notched at the end, which is sealed within the holder, and to stiffen them they may be dished or fluted. Three figures.

7,511/11. **Portable Insulator for Wire-ends.** J. KRANNICHFELDT. When using electric ignition for exploding detonators in moist earth, especially in sinking shafts, when the wire connections are often under water, short circuits frequently occur, and it is to avoid the trouble of wrapping the ends of the twisted wires with insulating tape or ribbon that this insulator has been devised. The twisted naked ends of the wires are pressed into a tube containing a viscous, water-tight insulating material, such as a mixture of asphalt with tar or wax. The tubes are preferably made of paper, closed at one end and open at the other, and are impregnated. Three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.
Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: PECHIN [Couplings for] 15,789/10; KORTING and MATHIESON AKT.-GES. [Enclosed arc lamps] 3,891/11.

Dynamos, Motors and Transformers: AKT.-GES. BROWN, BOVERIE, ET CIE. [Voltage regulation of alt-current machinery] 15,415/10; JUSTON and BUNZLI [Magneto-electric current generators] 28,177/10.

Electric Ignition: REDRUP [Ignition devices] 15,134/10; BROOKS and ALSTON [Electric contact breakers for ignition systems] 19,525/10.

Electrometallurgy and Electrochemistry: MASSIP [Electric furnaces and the manufacture of steel] 22,777/10.

Heating and Cooking: HIRST and ARCHER [Electric heating apparatus] 24,238/10.

Instruments and Meters: LAMBOT [Automatic electric recording devices] 15,619/10; CHAMBERLAIN and HOOKHAM, LTD., and JAMES [Electricity motor meters] 10,816/11.

Switchgear, Fuses, and Fittings: ELECTRIC AND ORDNANCE ACCESSORIES CO. and COLLINS [Electric switches] 19,182/10.

Traction: CHRISTIAN [Trolley poles for electric traction] 15,414/10.

Miscellaneous: JAMES [Electrical arrangements for protecting ships' bottoms] 14,181/10; BRITISH ELECTRIC AUTOMATIC MACHINES, LTD. (*Internationale Abel'sche Brief-marken-Automaten-Vertriebsges*) [Regulation device in coin-freed apparatus] 15,178/10; WHITE [Electrically controlled ejector vacuum-cleaning apparatus] 15,695/10; FRANKENBURG & SONS, LTD., and FLEMING [Electric lighting] 28,724/10; STILL [Reflux condensers] 3,269/11; ALLGEMEINE ELEKTRICITÄTS-GES. [Coin-freed mechanism] 9,942/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distributing Systems: WESTINGHOUSE [Power transmission mechanism] 12,574/11.

Instruments, &c.: ALLGEMEINE ELEKTRICITÄTS-GES. [Prepayment apparatus with maximum tariff device] 14,527/11.

Miscellaneous: ELEKTRICITÄTS AKT.-GES. HYDRAWERK [Electric elements] 6,664/11; WEINTRAUB [Production of varying high-frequency currents] 14,504/11.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

17,523 of July 26th, 1897. **Coin-freed Electric Meters.** F. J. BEAUMONT. In these meters, in order to show when the current value of the coin is getting exhausted, an arrangement of a resistance in connection with the supply mains, and a suitable appliance operated by the usual meter mechanism is adopted, whereby the main circuit is broken, causing the current to flow through a resistance, and thus lowering the light as a warning that another coin is required.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. BREMER, 6,615/01; P. HÖGNER, 7,383/02; CROMPTON & CO. and A. E. SPENCER [Supporting lamps] 7,587/06.

Dynamos, &c.: J. T. MOULD [Electromagnetic motors] 7,590/03.

Electric Ignition: J. A. TORRENS [Sparking plug] 6,337/05.

Electrometallurgy, &c.: A. J. M. THIROT and L. A. MAGE [Electro-deposition] 28,342/06.

Switchgear, &c.: A. S. and G. C. LUNDBERG [Electric couplings] 6,647/99; C. F. HILKIER [Electric switches] 6,863/05.

Telephony, &c.: A. J. BOULT (*E. K. Gruhn*) [Autographic telegraphs] 6,271/01.

Traction: L. MANNSTAEDT [Electric conduits] 7,818/06; BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Railway signals] 7,831/06; A. C. BOUNEVIALLE [Railway signals] 19,378A/06.

Miscellaneous: W. H. SCOTT [Electrical apparatus for hoisting] 5,860/00; C. L. WALKER [Fire alarms] 6,899/03 and 6,899A/03; S. H. THOMAS [Vapour electric apparatus] 6,557/06; O. A. BRUNN [Electric lighting] 27,684/06.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A FURTHER announcement with regard to the position of the National Telephone Co.'s staff on the transfer of the telephone system was made by the Postmaster-General on Friday, when the Telephone Transfer Bill was read a second time without opposition. He said that 10,000 of the staff would for the first time have pensionable rights. Those who could not be put upon the "Establishment" and be entitled to pensions would be granted an equitable allowance. With regard to the twelve senior members of the company's staff who were receiving salaries of over £700 per annum, the company were at present unwilling to part with five, as they needed their services in connection with the arbitration, and of the others some had nearly reached the age limit. The remainder he hoped to get into the Post Office service in order to have the advantage of their large experience and ability. He assured the House that no exaggerated desire to maintain the dignity either of himself or of his department would keep him from approaching these members of the company's staff with regard to the actual terms of their remuneration.

It has been known for some time that the Postmaster-General has had the intention of giving automatic telephone systems a trial. We are now able to announce that orders have been given for two 500-line full automatic exchanges, with which experience will be gained as to the relative cost of installation and working and reliability of two different systems under British conditions. At Epsom an exchange will be equipped on the Strowger system (see ELECTRICAL ENGINEERING, May 25th, page 293) by British Insulated & Helsby Cables, Ltd.; while at the Caterham Valley exchange apparatus on the Lorrimer system will be installed. There is a good deal of difference in the two systems. In a Lorrimer exchange a power plant is necessary, for the apparatus contains parts which are continuously revolving, and which are arrested in suitable positions when the call is originated; while in the Strowger system no movement takes place until the actual calling current impulses are sent. Again, in the Lorrimer system the figures composing the call are, so to speak, stored up in the calling apparatus when a button is pressed, and the complete call is signalled. In the Strowger system the subscriber sets his apparatus successively for the units, tens, hundreds, &c., sending separate impulses which actuate the step-by-step electromagnetic switches in the exchange. It may be mentioned that the Strowger system, although newer than the Lorrimer, in more in use, there being upwards of 280,000 stations already equipped on the American continent.

Correspondence has passed between the Postmaster-General and the Liverpool Cotton Association with regard to the future administration of the telephone system. The Association had suggested that a Standing Advisory Committee upon the commercial development of the telephone business should be formed, made up of representatives of the Chambers of Commerce of London, Liverpool, Manchester, Glasgow, Birmingham, Newcastle, Bristol, Hull, Belfast, and Cardiff, two representatives appointed by the Government, and under the chairmanship of the Postmaster-General or the Assistant Postmaster-General. The Association, however, have now expressed themselves satisfied with the Postmaster-General's reply, in which he says that a scheme is being introduced for decentralising the administration of the telephone service in order to place responsible officers more closely in touch with the commercial bodies.

In answer to a question in the House of Commons on Thursday, the Postmaster-General said that at present telephone calls are registered by the operator, but he was obtaining samples of an automatic device which would distinguish between effective and non-effective calls.

Marconi's Wireless Telegraph Co. have commenced proceedings against the Lodge-Muirhead & General Telegraphy Syndicate, alleging infringement of patents, and the Lodge-Muirhead Syndicate has retaliated by instituting similar proceedings against the Marconi International Marine Communication Co.

According to *L'Electricien*, the French Government, although sending out wireless time-signals twice daily from the Eiffel Tower, have refused to license receiving stations on the premises of clockmakers in the Navarre district. There is, however, a receiving station at La Chaux-de-Fonds, over the Swiss border, to which the Navarre manufacturers refer their chronometers.

The July issue of the *Post Office Electrical Engineers' Journal* is largely devoted to telephone matters, containing articles on telephones in England and the U.S.A., advertising the telephone, the telephone in British East Africa, and the London telephone system in 1920: a forecast. Other articles deal with the fire-alarm systems at the General Post Office, mechanical analogies applied to radio-telegraphy, telegraph construction on the Canadian Pacific Railway, lead-covered aerial cables, and the preservation of timber, besides other articles, notes, and news.

The half-yearly report of the National Telephone Co. shows a net profit of £576,278, compared with £544,516. Dividends at the rate of 6 per cent. per annum are recommended on the first and second preference shares, 5 per cent. on the third preference shares, and 6 per cent. on the preferred and deferred stocks. No mention is made in the report of the purchase by the Government.

The cable between Zanzibar and Mombassa failed on the 11th inst., followed closely by that between Bathurst and Bissao. Both these cables form part of the Eastern group. The most important breakdown, however, is that of the cable between Guam and Manila on the 12th inst., belonging to the American Pacific Cable Co.

ELECTRIC TRACTION NOTES

AMONG the Papers read at the Congress of the Tramways and Light Railways Association at Edinburgh last week was one by Mr. G. H. J. Hooghwinkel, in which he strongly advocated the use of the light single-decked cars, almost universal on the Continent, instead of the existing heavy double-deckers which he characterised as "two-storied monstrosities expressly designed to pound and damage our expensive tracks." He considered single-deck cars, in combination where necessary with trailers, would be quite capable of meeting our traffic conditions, especially if, as abroad, passengers are allowed to stand on the platforms; and he emphasised the saving in the cost of line construction owing to the much lighter track required. A large number of small cars also gave a better load-curve at the generating station. Mr. Hooghwinkel also recommended in this connection the bow contact instead of the trolley wheel, one of its advantages being that it permitted much simpler overhead construction.—Mr. C. W. Mallins (General Manager, Liverpool Corporation Tramways), in a Paper dealing with a variety of subjects, also spoke in favour of the single-deck car, and among other topics mentioned the high cost of Parliamentary powers, and the hardship suffered by promoters of tramway schemes in being made to bear the cost of road widenings.

In this connection, a reply by the President of the Board of Trade to a question in the House of Commons on Monday is of interest. The London County Council are, as an experiment, running coupled cars during certain busy hours, and already the Board of Trade are advised that the coupling of double-deck cars should not be permitted owing to their great weight. Before any general permission can be given to the running of coupled cars, it is felt that further experience is necessary.

The use of trolley omnibuses has been very favourably reported upon by a sub-Committee of the Dundee Tramways Committee. A trolley omnibus scheme, at an estimated cost of £14,500, is contemplated at Heimatstal, Austria-Hungary.

The Bradford tramway accounts for the year ended March 31st, 1911, show a large increase in net revenue, which has enabled £20,000 to be allocated to relief of rates, and £19,374 to be added to the renewals fund.

The Metropolitan Railway has declared a dividend for the half-year at the rate of 2 per cent. per annum, as against 1¼ per cent. a year ago, when, however, £10,000 was placed to electrical renewal fund. The City & South London Railway has also declared a higher dividend than during the corresponding period last year (partly owing to "Coronation traffic"), viz., at the rate of 1¾ as against 1¼ per cent. per annum.

We regret to report the death of Mr. R. B. Goodyer, which occurred on Saturday last from heart failure. Mr. Goodyer had had a long connection with tramway systems, having held managerial appointments with the Edinburgh, Rothesay, and Paris tramways, and for over twenty years was manager of the Cardiff branch of the Provincial Tramways Co., Ltd. Mr. Goodyer's son is the Tramways Manager to the Croydon Corporation.

An interesting announcement concerning the scheme for converting the East London Railway to electric traction may be anticipated at the meeting on Tuesday.

A dividend at the rate of 3 per cent. per annum is declared by the Chatham & District Light Railways Co. for the June half-year, carrying forward £1,706.

Hosted by Google

LOCAL NOTES

Birmingham: *Tramways Purchase.*—A proposal for the acquisition of the whole of the British Electric Traction Co.'s lines in Birmingham at an estimated cost of £151,500 is before the Corporation.

Bootle: *Libel Action.*—Mr. H. D. Clothier, the Borough Electrical Engineer, was sued at Liverpool last week for libel by an employee in the Electrciity Department. It appears that a report was presented to the Council by the Electrical Engineer stating that a certain mishap at the electricity works was due to the action of the employee in question, who was subsequently dismissed. The defence was that the report was made on a privileged occasion, and that the only action was against the Corporation. The jury took this view, and a verdict was entered for Mr. Clothier.

Carlisle: *Electricity Accounts.*—There was a net profit of £3,346 upon the electricity undertaking last year, an increase of £296. Two 500-kw. generating sets were installed during the year, and two water-tube boilers and accessories. There was a large increase in the power demand, 768 additional horse-power being installed.

Dawlish: *Street Lighting.*—The Council have decided to give the gas company three months' notice to terminate the existing street lighting contract, and is to give consideration to the whole question of street lighting.

East Barnet: *Street Lighting.*—The Council are dissatisfied with the high price of gas, and have threatened to introduce electric lighting into the streets unless substantial reductions are made by the gas company.

Higham Ferrers: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Electric Lighting Order granted in 1906 for the districts of Higham Ferrers, Rushden, and Wellingborough (Rural). A Northampton firm have given notice of their intention to apply for a Provisional Order for the borough of Higham Ferrers.

Ilford: *Hospital Carnival.*—The Council's Electricity Department sent two decorated cars to take part in the local hospital carnival recently, named "Electricity in the Mansion" and "Electricity in the Cottage" respectively. These cars, which were accompanied by six collectors dressed in suitable costumes representing various makes of lamps, were awarded two out of the four certificates given for this class of entry. We congratulate Mr. Shaw and his staff on the result of their effort.

London: *L.C.C. Tramways Purchase.*—The Highways Committee report that they have been unable to come to terms with the London United Tramways, Ltd., as to the price to be paid for the purchase of the company's lines in the County of London. Arrangements are therefore being made for the appointment of an arbitrator under the Tramways Act, 1870.

Poplar: Electricity Accounts.—There was a net profit of £3,877 upon the working of the electricity undertaking last year, compared with £4,425 in the previous twelve months, which it is recommended should be carried forward. The average price obtained per unit was 1·2d., compared with 1·6d. During a period of three years the output has increased 73·6 per cent.

Stepney: Repayment of Loan.—After considerable negotiation, the Finance Committee of the London County Council have agreed to allow the Council to postpone for the first three years the repayment of a loan of £15,700 for mains. The loan is for thirty years, and the repayment is to be made only during the last 27 years.

Madeira: *Diesel Engines.*—The British Consul at Madeira in his report for 1910 states that the Madeira Electric Light Co. have extended its mains in many directions. The company is substituting Diesel oil engines for its present steam plant, and the distribution system will be gradually changed to the three-wire system.

Portrush: *Electric Lighting.*—Messrs. Miller, Wilson & Pegg, who have placed an electric lighting scheme before the Council, are urging the desirability of applying for an Electric Lighting Order, but the Council has further delayed the matter pending negotiations with the gas company.

Swansea: *Electricity Profits.*—The Tramways and Lighting Committee recommend that the electricity supply profits shall be transferred to reserve fund.

Weymouth: *Electric Lighting Accounts.*—There was a net profit of £387 10s. upon last year's working of the electricity undertaking. The number of consumers was increased by 140

during the year. This is a larger increase than the three previous years together.

West Ham: *Electricity Accounts.*—The total revenue of the electricity undertaking for 1910-11 was £93,235, compared with £79,262 in the previous year. The average price obtained per unit was 0·93d. The total costs were 0·888d. per unit. There was a marked improvement in the revenue from power supply, which amounted to 29·7 per cent. Mr. H. H. Couzens, the Borough Electrical Engineer, complains that the Sales Department is only allowed three years in which to repay its loans, and that in consequence the capital charges for the first six months of the new loans amount to £1,582. Eliminating these capital charges, there is a profit of over £1,000 for the first year on the Sales Department. Revenue has been debited with £3,070, in respect of improvements at the power-house and the purchase of meters. The net profit for the year, after charging £5,671 rates and taxes, is practically £4,000, compared with a loss of £2,807 in the previous year. This balance is to be applied to the special writing down of the battery, rectifiers, and 300-kw. set at the generating station.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Biddulph.—An electric lighting scheme is under consideration. It is proposed to take a supply in bulk from a private generating plant in the district.

Cardigan.—A deputation from the Council has been visiting a number of places with a view to the introduction of an electric supply scheme.

Doncaster.—A Local Government Board inquiry was held last week concerning a loan of £12,000 for extensions to the electrical undertaking. Evidence was given of certain amounts expended in anticipation of the loan being sanctioned, and the Inspector intimated that the Electricity Department would receive a somewhat strong letter from the Local Government Board on the subject.

Douglas (I.O.M.).—A special committee has been appointed to consider an electric lighting scheme for the town.

Ilford.—Sanction has been received by the Council to a loan of £8,070 for mains, meters, switchboard, &c.

Luton.—An application for a loan of £13,150 has been inquired into.

Newcastle-under-Lyme.—Extensions to the electricity works are to be carried out. Messrs. Lacey and Sillar are consulting engineers.

Rugeley.—A committee has been formed to investigate the question of an electric supply undertaking.

Southport.—Application is to be made for a loan of £1,500 for mains.

Wednesbury.—The Electricity Committee invite tenders for 150 cells, and 2,400 yards 0·25 sq. in. concentric lead-covered paper-insulated cable and joint boxes.

Wolverhampton.—The Knowles Oxygen Co., Ltd., of Wolverhampton, a 1,000-kw. generating plant complete with buildings. The load factor will be 95 per cent.

WIRING

Accrington.—Church. Architect, H. Ross, 15 Cannon Street, Accrington.

Belfast.—Additions to Purdysburn Hospital. Architects, Young & Mackenzie, Scottish Provident Buildings.

Croydon.—Fourteen houses, Aurelia Road. C. S. Banks, 16 Oakfield Road.

Dublin.—Wagon and carriage shops for Great Southern and Western Railway Co. Particulars from Secretary.

Glasgow.—Home for Boys at Rutherglen. Whitevale Refuge.—District Library at Possilpark.

Hastings.—Electric lighting of Clive Vale and Tower Schools.

Johnstone (N.B.).—Public slaughter house.

Lancashire.—Annexe at Whittingham Asylum. Builders, Messrs. E. Taylor & Co., Ltd., Littleborough.

Manchester.—Considerable additions to Eccles and Patricroft Hospital. Architect, J. Knight, Haworth Buildings, 5 Cross Street, Manchester.

Pembroke (Ireland).—Electric lighting of artisans' dwellings on the Old Mill and Auburn Road sites. Particulars of contract from Town Clerk.

Weymouth.—Secondary school. Architects, Crickmay & Sons, St. Mary Street.

MISCELLANEOUS

Australia.—The Deputy Postmaster-General, Melbourne, invites tenders by September 5th for 10,000 telephone protectors, and sundries. Specifications, &c., from 73 Basinghall Street, or 72 Victoria Street, London.

Birmingham.—The Light Railway Commissioners have granted the Corporation an Order for the construction of a line to Quinton.

Brazil.—Tenders are invited by September 25th for the supply of electrical fittings, fans, &c., in connection with the electric lighting of the new postal telegraph building in Porto Alegre. Local representation is necessary, says the *Board of Trade Journal.* Tenders to the "Directoria Geral do Expediente, Ministerio da Viaçao e Obras Publicas," Rio de Janeiro.

British Columbia.—Owing to the increase in the trade and population of the cities and districts served by the British Columbia Electric Railway Co., an additional £600,000 capital is to be issued.

Bulgaria.—Some particulars of interest in connection with the installation of electric tramways in Philippopolis (Bulgaria) are, says the *Board of Trade Journal*, at the disposal of British firms on personal application at 73 Basinghall Street, E.C.

Rome.—A Central News Cable states that the Rome Municipality have decided to consider a scheme for the construction of tube railways, embodying the best features of such lines in London and Paris.

China.—An extensive programme of telegraph and telephone extensions in China is to be carried out during the next financial year.

Italy.—A scheme for the construction of new tramways in Rome is under consideration.

Madeira.—H.M. Consul at Madeira, Capt. J. Boyd, in his report for 1910, states that a telephone service would be a great boon.

Tasmania.—A ratepayers' meeting has passed a resolution in favour of the purchase of the local tramway system now worked by the Hobart Electric Tramway Co.

A proposal has been made to construct an electric railway from Hobart to Huon. It is estimated that this line would open an area of about 100,000 acres of Government land, and Mr. W. G. T. Goodman, Chief Engineer and General Manager of the Adelaide Municipal Tramways Trust, is to be asked to report. The estimated cost is £223,000.

TENDERS RECEIVED AND ACCEPTED

Aberdeen.—The D.P. Battery Co., Ltd., have secured the contract for the renewal of the Cults sub-station battery of the Aberdeen Corporation.

Barrow-in-Furness.—Orders for steel poles, bases, and trimmings and overhead trolley wire have been placed with Messrs. John Spencer, Ltd., and the British Insulated & Helsby Cables, Ltd., respectively.

Bolton.—The Electricity Committee have accepted the following tenders:—Foster Engineering Co. and Messrs. W. E. Burnand & Co., single-phase transformers; Messrs. Ferranti & British Westinghouse Co., three-phase transformers; British Insulated & Helsby Cables, Ltd., service-boxes, cable-boxes, &c.; British Thomson-Houston Co., incandescent lamps; British Westinghouse Co., Bat Meter Co., and Messrs. Chamberlain & Hookham, A.-C. meters; Electrical Co. and Bastian Meter Co., direct-current meters; Messrs. Ferranti, Ltd., motor starters; British Westinghouse Co., continuous-current motors.

L.C.C.—The tender of Messrs. Dick, Kerr & Co., at £2,810 11s. for stoneware ducts is recommended for acceptance.

The tender of Messrs. Le Carbone has been accepted for tramway parts and equipments.

Hackney.—The Electricity Committee recommend that the contract for 100,000 pairs of yellow flame arc lamp carbons be given to Messrs. Geipel & Co. at £2 15s. per thousand pairs. It was originally recommended that the contract be split up as to one-third to Messrs. Ship Carbons, Ltd., Messrs. Underwood, Ltd., and Messrs. Geipel & Co. at £3 per thousand pairs. It was pointed out to the Council that Messrs. Underwood are agents for Ship Carbons, and that this proposal involved placing two-thirds of the order for Ship Carbons. When approached in this connection Messrs. Geipel offered to reduce their price as mentioned above.

Swinton and Pendlebury.—The Council have accepted the

OSRAM·LAMPS

Hosted by Google

tender of Messrs. Callenders Cable Co. for an overhead cable to Messrs. Hollands' mineral water works at Moorside.

Worthing.—Subject to the Local Government Board sanctioning the necessary loan, a tender for additional generating plant at the power station, at a cost of about £4,000, has been accepted. We understand that the scheme includes a Diesel engine.

The Mirrlees Watson Co., Ltd., have received the following orders for condensing plants :—Surface Condensing Plant : Two sets for Stoke-on-Trent Electricity Works, per Messrs. Jas. Howden & Co.; three condensers for Messrs. Gwynnes; Nova Scotia Steel Co.; Torquay Electricity Works, per the B.T.-H. Co.; repeat order for the Govan Corporation, per Messrs. Jas. Howden & Co. Jet Condensing Plant : St. Helens Corporation; Messrs. Bolckow Vaughan, Leasingthorne Colliery; Lancashire & Yorkshire Railway, Formby Power Station, per the B.T.-H. Co.

Mr. Haydn Harrison informs us that he is supplying large numbers of his special grouped H.C.P. lanterns to replace open type arc lamps, and also other street lighting conversion fittings. He has lately completed, or has in hand, the following important contracts :—Beckenham, seven miles of streets; Caversham, seven miles of streets; West Hartlepool, tramway route and other streets; Lancaster and Maidstone, replacement of arc lamps; Tunbridge Wells, replacement of arc lamps; Battersea, replacement of 436 street arc lamps; Walker (Newcastle), 400 street lamps; Curragh Camp, Ireland; Imperial Paper Mills, Gravesend; L.B. & S.C. Rly., supply of all tungsten lamp fittings for new car-sheds and repair shops connected with the electrification of the London, Brighton & South Coast Railway.

APPOINTMENTS AND PERSONAL NOTES

Mr. C. W. Hill, General Manager of the Bournemouth Corporation Tramways, has tendered his resignation, having been appointed to an important post with an electrical trading company in London.

Mr. J. G. Lorrain, the patent expert, was married last week to Miss Dorothy Thwaites, daughter of C. Thwaites, M.Inst.C.E., of Sutton.

Mr. R. A. S. Duncan, Charge Shift Engineer at the Greenwich generating station, has resigned upon obtaining another appointment.

Parliamentary Intelligence.—The Winchester Corporation (Electric Supply) Bill and the Newcastle Corporation Bill were read a third time in the House of Commons last week.

The Brighton Corporation, which was recently refused a *locus standi* to oppose the Brighton, Hove & District Railless Traction Bill, except as regards protection to the Corporation electricity, gas, and water mains, have now withdrawn the whole of their opposition.

The Central London Railway Bill has been read a third time in the House of Lords.

Smoke Abatement.—A meeting of the Advisory Committee of the Manchester and Salford Smoke Abatement Exhibition was held in the Manchester Town Hall on Thursday last. Amongst those present were Councillor G. Howarth (Chairman of the Manchester Electricity Committee), and Mr. S. L. Pearce (Electrical Engineer to the Manchester Corporation). Councillors William Kay and W. Dagnall, and Mr. E. D. Simon (Secretary of the Smoke Abatement League of Great Britain) were elected to the Advisory Committee. Councillor Howarth promised on behalf of the Manchester Electricity Committee that electrical domestic appliances sold at the exhibition would be fixed and wired by the Corporation free of charge. It was proposed by Councillor Kay and seconded by Mr. S. L. Pearce, that a letter should be sent to the National Electrical Manufacturers' Association (Incorporated) with a view to obtaining their active support to the exhibition.

The Olympia Electrical Exhibition.—Arrangements have been made by the management for an elaborate display of cooking demonstrations in the galleries of the exhibition. For this purpose manufacturers who are exhibiting have had space granted to them without rental charge, and with a free supply of current, conditionally that they provide the demonstrations in question during the run of the exhibition. It may also be mentioned that one of the large firms of house furnishers and electrical contractors have already secured a large block of space in the galleries, where they are erecting a model electrical home. This, we understand, will be of a most elaborate description, and will be quite worthy of a great international exhibition. It is contemplated to install a garage, electrical laundry, electrical kitchens, country-house lighting, and a series of living-rooms, all equipped in such a manner as to show the advantages of electricity in the home.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night was £58 10s. to £59 (last week, £58 15s. to £59 5s.).

Bankruptcies.—C. F. Lindop, electrical engineer, 62 Dale Street, Liverpool, has been adjudicated bankrupt.

Liquidations.—The Bombay Hydro-Electric Syndicate, Ltd., is to be wound up voluntarily. Mr. F. J. Horne, 214 Gresham House, Old Broad Street, London, is liquidator. A meeting of creditors will be held at 208 Gresham House on July 24th. Claims on or before August 14th.

Griffiths' Electric Contractors, Ltd.—A company is being formed under the name of Griffiths' Electric Contractors, Ltd., to undertake the finance, design, construction, and operation of electrical works and schemes in all parts of the world, including electric railways, water-power and other transmission schemes, &c. Powerful interests, both in England and France, are represented, and the London Board of Management is to consist of J. Norton Griffiths, M.P. (President), E. P. Powles, R. D. McCarter, and J. Kerr Bock, the last two of whom will act as consulting engineers to the company; and the company will have the benefit of the experience of Messrs. Griffiths & Co., the well-known contractors, who are, amongst other work, at present carrying out the Chilian Longitudinal Railway. The company's activities will not include the manufacture of plant, nor will they be allied to any particular manufacturing firm. The London offices are at Griffiths House, 59A London Wall, E.C., and there are branch offices in East and West Canada, South America, Australia, New Zealand, South Africa, Spain, Turkey, &c.

Reductions in Price of Stannos Wires.—We are informed by Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster, S.W.), that, owing to increased manufacturing facilities and the reduced price of rubber, they have increased the discounts off the price of "Stannos" wire and fittings as from Monday, the 17th inst. Particulars will be supplied on application.

City & Guilds of London Institute.—In consequence of the rebuilding of Gresham College, the head offices of the City & Guilds of London Institute have been removed temporarily to 3 St. Helen's Place, London, E.C.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Edmundson's Electricity Corporation.—At the annual meeting last week it was stated that the new agreement with the Urban Electric Supply Co. provided for the carrying out by Edmundson's of all new construction work at cost price *plus* 10 per cent., and the financing of the Urban Co. to the extent of a further £100,000. The output of the Edmundson companies has increased during the past four years by nearly 2,000,000 units, and the profits by over £35,000, on an increased capital expenditure of approximately £200,000.

General Electric Co.—Mr. H. Hirst presided at the annual meeting on Monday, when the report and accounts given in our issue for July 6th were adopted. After expressing regret at the great loss which the company had sustained in the death of Mr. G. Byng, the Chairman commented on the large reserve fund, viz., £202,103, and the satisfactory working of the British General Electric Co. in South Africa, and of the Peel Conner Telephone Works. As a result, their investments, which stood at the same figure as a year ago, yielded £7,000 more. At present the works are fully occupied and extensions are being carried out.

Greenwood & Batley.—At the annual meeting last week it was stated that whilst the year's work had been unsatisfactory owing to a very poor first six months, the electrical and turbine department had turned out a fair amount of work. The Company have now acquired the complete control of the English De Laval Steam Turbine Company.

Bournemouth & Poole Electricity Supply Co.—Interim dividend on the ordinary shares at the rate of 5 per cent. per annum, less tax.

The Sales Managers' Association.—A meeting of this Association will be held on Thursday evening, July 20th, at 6.45 p.m., at the Holborn Restaurant. This will be the first of a series of discussions on selecting and engaging Salesmen, methods of training Salesmen, and Managing Salesmen. Any Business Manager or Sales Manager who desires to attend, or who desires further particulars as to the aims and scope of the Association, is invited to communicate with the Hon. Secretary, Mr. F. R. Jones, Audrey House, Ely Place, E.C. The object of the Association is to discuss at each meeting a topic so broad that every business man present, no matter what his business, will find that it touches at least one point in his work.

SUMMARY

A satisfactory statement as to the progress of the Company was made at the annual meeting of Marconi's Wireless Telegraph Co., Ltd., on Thursday. Arrangements are being made for the erection of stations in many parts of the world, and the Company look forward to developing the Imperial wireless scheme introduced by Sir Joseph Ward at the recent Imperial Conference. (Page 429.)

An article by Mr. W. G. Turner contains a number of practical hints regarding important details in the laying of mains on the solid system. (Page 423.)

Some particulars are given of the electrical undertakings in the Potteries district which are now being amalgamated under the new County Borough of Stoke-on-Trent. (Page 425.)

Several books are reviewed on page 426.

The Newcastle & District Electric Lighting Company has been fined for contravention of the Home Office electrical rules under the Factory Acts. The case arose out of the fatal accident to Mr. Middleton in April. (Page 427.)

Mr. Justice Swinfen Eady has refused to vary an order that the Electrical Co. is to deliver up, without the option of destruction, all "Sunshine" arc lamps and parts which are infringements of the Bremer patent. (Page 427.)

In the electric installation of Messrs. Swears & Wells' new drapery establishment in Regent-street, novel arrangements have been made for electric ironing. (Page 427.)

The Works Committee of the Holborn Council, having considered the report of the whole Council sitting as a Special Committee, recommend that the joint-tender of the Metropolitan Electric Supply Co. and the Gas Light & Coke Co. be accepted. (Page 427.)

An interesting Paper on "Electric Traction in Switzerland," devoted particularly to normal gauge main lines, was read by Mr. Huber Stockar at the Zurich meeting of the Institution of Mechanical Engineers this week.—Arrangements have been made for the conversion of the East London Railway to electric traction at an estimated cost of £65,000.—The City and South London Railway locomotives are to be remodelled with a view to greater speed.—The Court of Appeal has held that the purchase money for the Hartlepool tramways shall be paid to the Company.—Trolley omnibuses are being considered with a view to their installation at Edinburgh, Mirfield, Bingley, and Oldbury.—A number of other interesting notes on traction matters will be found on page 428.

Amongst the specifications published by the Patent Office on Thursday last was one by C. H. Redrup describing a magneto-ignition device. The automatic lowering of trolley poles to clear the overhead equipment when the pole is off the wire is covered by A. R. Christian, and Körting and Mathieson have protected a patent in connection with enclosed arc lamps. H. Hirst and C. H. Archer have introduced an improved electric heater, and G. Massip deals with an electric furnace. Opposition has been entered to the grant of a patent to F. Harrison relating to incandescent lamps. (Page 430.)

The L.C.C. have drawn the attention of the Islington Borough Council to the fact that they have no reserve fund, but that yet the Council is transferring sums to the relief of rates.—Action is being taken against the Islington Council for failing to instal five testing stations as requested by the L.C.C.—A proposal to use overhead wires in connection with street lighting at Attercliffe (Sheffield) has been rejected.—There was a loss of £768 upon the working of the Bristol Electricity undertaking last year. (Page 431.)

Generating plant, switchgear, transformers, meters, &c., are required at Penticton (B.C.); mains at Hammersmith; generating plant with Diesel engines at Farnham; storage battery at Pontypridd; cable at Rochdale; and electric lighting mains and switchgear

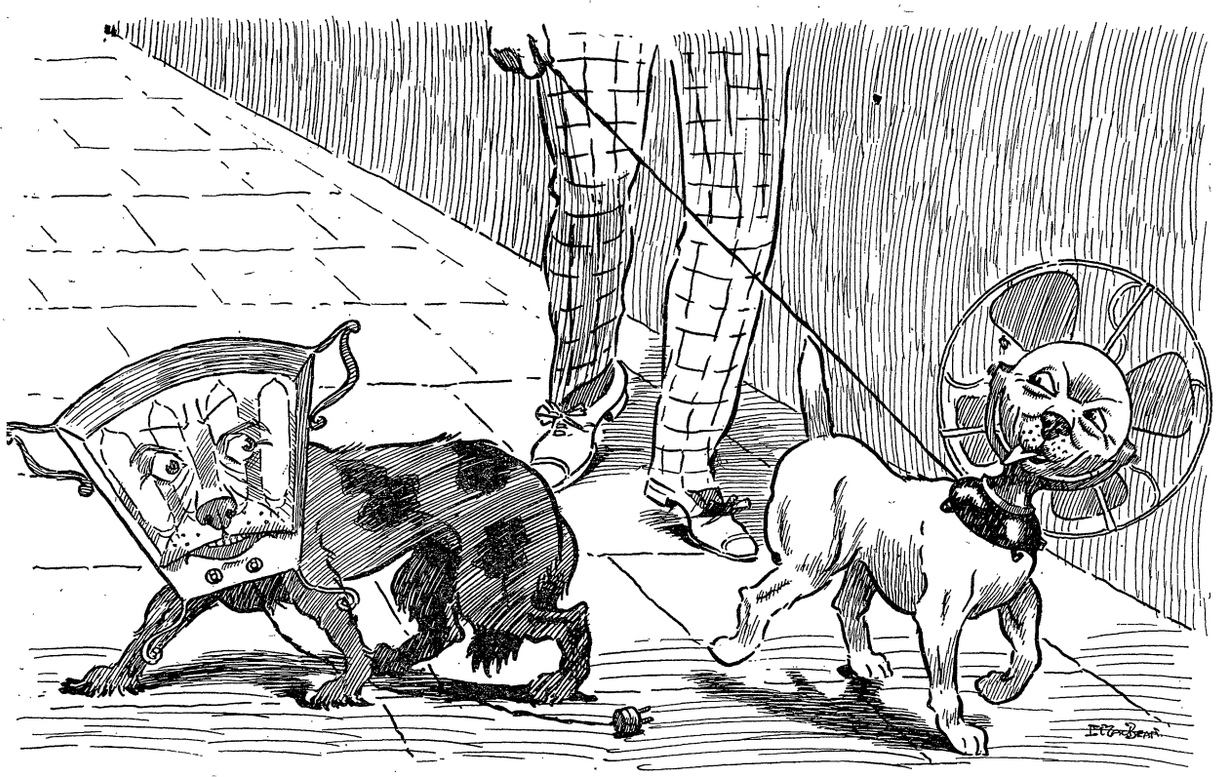
Hosted by Google

at Tonyrefail; the Swedish Postal Authorities require a large supply of metal filament lamps. (Page 431.)

DIVIDENDS are announced by a number of London Electric Supply Companies. Messrs. Crompton & Co. last year incurred a loss of £14,195. (Page 433.)

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The statement made at the annual meeting of Marconi's Wireless Telegraph Co., on Thursday, shows that there has been a material improvement in the position of the company. Mr. Marconi, who presided, said that a number of important contracts have been entered into for the erection of stations in Italy, Turkey, Greece, Spain, and the Canary Islands. The Italian station at Coltano, which will enable communication between Italy and North America is expected to be opened in the autumn, and the first of a series of coast stations extending from the Cocos Island to Hong Kong, Singapore, Malta, and Gibraltar will also shortly be opened. A working agreement has been entered into between the French Government and the Marconi Co. The Argentine Co. is to proceed with the erection of a long-distance station which will put South America into commercial wireless communication with Europe. Other long-distance stations will shortly be erected by the company in countries outside the British Empire. Further particulars are not yet available. During the early part of the year the company submitted to the Government a scheme to put all British possessions into wireless communication with each other, and applied for a concession for this purpose. This proposal, said Mr. Marconi, appears to have developed into the imperial wireless scheme introduced by Sir Joseph Ward at the recent Imperial Conference, but the company would be equally satisfied if they erected the stations on behalf of the Government.



A conference of municipal representatives in the London telephone area is to be held at the Guildhall in October. The Lord Mayor of London will preside, and the main object is to decide whether the Postmaster-General shall be asked to have a flat rate system of charging. It is also expected that the desirability of appointing an Advisory Board will be discussed.

It may be remembered that some little time back the Bell Telephone Co., of Antwerp, charged a number of its employees, who were leaving its employ, with stealing plans and information belonging to the company. The action failed, and the electrical engineers in question, who were imprisoned for some time, have now instituted proceedings for damages against the company.

A profit of £500 for the past year is shown by the Portsmouth municipal telephone accounts.

Telegraphic communication between Rome and Constantinople was down on the 17th inst. for a short while, and telegrams to Rabat, Casablanca, and specially Mogador, are subject to long delay. Telegrams for the latter place can only be accepted at sender's risk.—The Eastern Telegraph Co. suffered through a break in the Malta-Tripoli cable on the 18th inst., when also the Bagdad-Bassorah line ceased working. The Egyptian Administration state that telegrams for Uganda, &c., can be sent *via* Alexandria-Gondokoro with five hours' delay. It may prove of service while the Zanzibar-Mombasa cable is down. Telegrams between these two places are sent about five times per week by post, taking anything between twelve to twenty-four hours in transit.—On the 22nd inst. the Bathurst-Bissao cable was restored. The West India & Panama Telegraph Co. has been giving some attention to the West Indian cables to Puerto Rico.

Machine Tool and Engineering Association.—This association, which was formed in 1910 with the primary object of exercising control over the organisation of exhibitions, has made arrangements whereby one engineering exhibition will be held under its own auspices in 1912 instead of the two proposed for 1912 and 1913 respectively. The association is in favour of one exhibition in London every three years, and possibly one in the provinces alternately with those in London. The association is in touch with the Board of Trade as to engineering sections of foreign exhibitions, and is in a position generally to afford its members information regarding trade openings and conditions abroad. The following form the board of directors:—Chairman, Mr. J. T. Peddie (Vickers, Ltd.); Vice-Chairman, Mr. W. Deakin (H. W. Ward & Co.); Mr. J. W. S. Asquith (William Asquith, Ltd.), Mr. A. Drummond (Drummond Bros., Ltd.), Mr. E. M. Griffiths (C. W. Burton, Griffiths & Co.), Mr. A. Herbert (Alfred Herbert, Ltd.), Mr. W. D. Ford Smith (Smith & Coventry, Ltd.), Mr. Charles Wicksteed (Charles Wicksteed & Co., Ltd.). Communications should be addressed to the Secretary, Mr. H. G. Williams, 104 High Holborn, W.C.

Every dog has his day.

THE LAYING OF MAINS ON THE SOLID SYSTEM

By W. G. Turner.

A GREAT deal of trouble usually experienced on underground networks laid on the solid system is caused not so much by faulty construction and design of cable as by carelessness in laying, and a few points as to the precautions to be taken in this respect may be of interest. With the more extensive use of vulcanised bitumen cables the necessity for careful laying becomes a matter of the greatest importance, and a good and permanent job should always be made in the first instance, so that any relaying or even opening of the main may be rendered unnecessary in the future.

The careless laying of cables is often caused through work having to be rushed, generally in order to satisfy the hasty demands of some prospective consumer or by the late delivery of cable or other necessary materials. Another factor which is often the cause of defective laying and a contributory cause to the unfulfilment of sound workmanship is the necessity of deviation of cables owing to the presence of such obstacles as gas, water, or telephone pipes, drains, cellars, tramway posts, gas lamps, &c., in the line of route. A great mistake usually made is that the future requirements of a main are overlooked; and although the main may be sufficiently large to meet all immediate demands, it may be totally inadequate for the future. The necessity for careful initial laying cannot be too strongly emphasised with an eye to future requirements, as thereby the main is assisted in the event of an overload.

The hints and precautions outlined below, although referring particularly to rubber or bitumen insulated cables, apply generally to lead-covered and other forms of cable laid on this system.

In commencing work the trench should be cut sufficiently wide to allow the men ample room to work when laying the troughs and cables, otherwise there is a tendency for some of the subsoil to be swept into the trough by the men's clothes. A width of from 4 in. to 6 in. on each side of the trough is generally sufficient, and this enables a man to stand with one foot on each side of the trough. The usual depth of the cutting is from 1 ft. 6 in. to 2 ft. under pathways, and more under roadways, depending upon the nature of the road and whether tram-lines are present. A depth of 4 ft., however, is generally adopted in the latter case. A good labourer is able to dig about one cubic yard of trench in one hour in ordinary ground, and half this amount in hard, rocky ground. For the final filling in and ramming, 50 per cent. of the excavating costs is a good average figure. It is as well to sweep away the excavated material from the edge of the cutting for a distance of at least a foot on each side, so that it is not raked into the trench by the feet of the workmen, or blown in if the day be windy. If the bottom of the cutting is not sandy, it is necessary to riddle the soil on which to bed the troughs, and in any case it is advisable to excavate underneath the place where the spigot and socket of the troughs will lie, to make sure that they will have a firm bed.

The most general materials from which troughs are made are cast-iron, asphalt, earthenware, and wood, the latter either tarred or creosoted. Cast-iron makes a sound mechanical job, but is not used so much nowadays, when everything has to be done in the cheapest possible manner compatible with safety because of its heavy expense, and also from the fact that it is a conductor of electricity, and thus helps a path to earth for leakage currents. It also generally has to be bonded electrically throughout its whole length, although this precaution has been neglected on many systems.

Asphalt troughs are laid by a special process, and make a thoroughly sound job. They are of great service where it has been found necessary to utilise some old cable. The trough, which is manufactured from natural rock asphalt, is made continuous in laying by welded joints, and is protected on its outside by a thin steel casing. This casing is to prevent damage in transit, and after laying eventually rusts away. The cables are laid in the trough with asphalt separators between, and after filling in with compound in the usual manner, a cover is made by pouring hot asphalt concrete over the top of the trough, welding the whole into a solid homogeneous mass. This form of trough is not so expensive as cast-iron.

Earthenware and wood are the cheapest forms of troughing, each costing about the same, and have the advantage over iron in that they are both non-conductors; earthenware, however, has an advantage over wood in that it has an indefinite life, but it is more liable to be damaged by picks or through not being laid on a firm bed, or in ground where there may be a subsidence, as may be encountered in colliery districts.

The following table gives the relative prices per yard for the above troughs of standard sizes complete with covers.

Size.	Cast Iron	Asphalt.	Earthenware.	Wood.
3″ × 2″	2/0	1/7	-/9½	-/10½
6″ × 3″	3/6	2/7	1/-	1/1½

Cast-iron troughs can be from $\frac{3}{16}$ in. to $\frac{3}{8}$ in. thick, but not less than $\frac{3}{16}$ in., and should be coated with Dr. Angus Smith's composition. Earthenware troughing should be glazed all over, but some engineers prefer to leave it unglazed on the inside; as then the bitumen is enabled to get a firmer hold of the surface. Wood troughing should either be prepared with tar or creosoted. When tarred, the usual method is to boil the length of trough in Stockholm tar for at least two hours, ordinary painting or soaking not being sufficient. If creosoted, the only way is to impregnate the trough thoroughly with creosote under pressure or by the vacuum method. It should be specified that wood creosote is not used, but only the best, obtained by coal tar distillation. The former and also cheap creosote having an injurious effect on lead or iron, if the cables are protected in this manner, owing to the free acetic acid contained therein. Wood troughing lasts the longest time when laid in wet clay and the shortest in sand, the air being able to get to it in the latter case.

Cast-iron and earthenware troughs are usually made with spigot and socket joints. The former troughs can be made in various lengths, usually about 3-ft., and the latter in 2-ft. lengths. Asphalt troughs are generally about 4 ft. long, and wood about 9 ft. long. As stated previously, asphalt troughs are joined by a welding process; wood troughs, however, are joined by junction or saddle pieces, into which the ends of the troughs are placed. These saddles, besides preventing the ingress of moisture, also prevent the ends of the trough from sinking out of place and so straining the cables. With wood troughs it is best to make them with the bottoms the full width of the outside, *i.e.*, the sides nailed to the top face of the bottom of the trough, and the grain of all should run lengthways. Fig. 1 will make this quite clear.

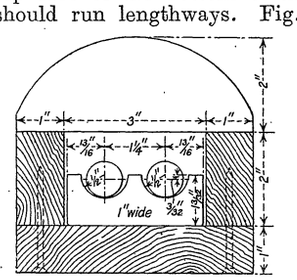

FIG. 1.—WOODEN TROUGH WITH DOME-SHAPED BRICK COVER.

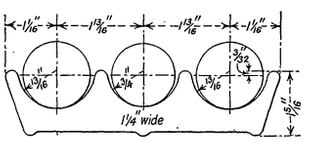

FIG. 2.—EARTHENWARE BRIDGE SUITABLE FOR 6 IN. BY 3 IN. TROUGH.

The wood should not be less than 1 in. thick for sides and bottoms of even the smallest troughs. The saddles are usually about 12 in. long, and the grain of the bottom should be at right angles to the length of the saddle, otherwise they are liable to crack when the trough-ends are placed in them should they be a tight fit.

Covers for cast-iron, wood, or earthenware troughs, if not of the same material as the troughs, which is not usual in these cases, can be either tiles or bricks, and the latter, made with a curved or what is generally known as a dome-shaped top, are the most satisfactory, as they will deflect picks in the event of the ground being opened in the future. They are also generally stamped "Electricity," which serves as a warning should they ever be uncovered. It is as well not to make these tiles very thick, as they become too heavy for easy handling. A dome-shaped tile is shown in Fig. 1, and is shown covering a 3 in. by 2 in. wood trough.

Bends are generally a source of trouble. For cast-iron and earthenware these are usually made in two standard shapes for the horizontal plane, *i.e.*, $\frac{1}{8}$ and $\frac{1}{4}$ bends, and these are again made either right or left handed. Also swan-neck bends are made for a rapid ascent or descent. With asphalt trough the bending process is very easy, as it is only necessary to detach the metal sheath of a special trough so arranged that this can be done, and by warming the trough it can be bent to any curve or shape desired. Wood trough is the most troublesome, as it necessitates the employment of a carpenter to shape it properly for curves and bends. The troughs should have their spigot ends dipped in hot compound before being

Hosted by Google

placed in position, as this makes them bed together better at the joints and prevents water entering them from below, due to rain or a wet cutting.

If the cable is of small sectional area, the bridges should be next placed in position. These are made of numerous insulating materials, the most usual being earthenware, wood, and asphalt. They are best when made of a waterproof as well as insulating material. Earthenware is undoubtedly the best material, as it conforms with these chief qualities required for a bridge. Wood bridges, if not thoroughly covered with compound, when placed in a damp position, will eventually absorb water, and so form a path to earth for stray currents. In any case, wood bridges first should be creosoted or boiled in tar, and when used should be kept in buckets on top of the pitch-boiler until wanted, and be dipped in hot compound before being placed in position. They should, however, never be used to support a lead-covered cable, as they are bound eventually to have an injurious effect on the lead due to the organic acids which are produced in the process of decay.

Asphalt is waterproof, and the advantage of it being non-hygroscopic entirely overcomes one of the troubles experienced with wood and improperly glazed earthenware bridges. It also partly melts on its outside surface when in contact with the hot compound used to fill the troughs, and so joins up solid in one homogeneous mass with the compound. The first opinion of many critics was that asphalt bridges would melt away entirely and allow the cable to sag down and touch the trough-bottom, but it has been practically demonstrated that only the surfaces of the bridges become plastic in the interval between pouring in and setting of the compound. These bridges, or generally asphalt separators, when used with asphalt troughs and covers, form a true solid system from every standpoint. An asphalt bridge of standard shape is shown in the trough in Fig. 1.

The radius of the curve of all bridges should be slightly more than that of the cable they have to support, so as to enable the compound to flow round the cable to the maximum possible amount. Fig. 2 shows an earthenware bridge of standard shape suitable for three cables and a 6 in. by 3 in. trough.

Bridges should be placed from 12 in. to 24 in. apart, much depending on the stiffness of the cable, but in the majority of cases a distance of about 15 in. is not exceeded. The dust and dirt are first brushed out of the troughs, and the position of the bridges is then marked on the bottom, a piece of stick being used as a gauge. It is best to prepare such a gauge beforehand, as otherwise if the work of placing the bridges is left to a labourer not possessing a trained eye, a distance of 12 in. or 15 in. often becomes 18 in. A patch of compound is next placed on each of the marks, and the bridges are fixed in these positions. After the trough has been cleared of dirt or other foreign matter, the cable is handed along and dropped into position, care being taken that it is free from kinks or bends, and that it rests properly on its bridges.

Should the cable be very heavy, say one of 1 sq. in. sectional area, the easiest way of handling it is to draw it along the trough on special temporary saddle pieces before the bridges are fixed. These saddle pieces are made of hard wood with rounded tops, in order to avoid damage to the cable, and are placed across the bottoms of the trough and held in by compound at distances of about 6 ft. apart. The advantage of drawing the cable along the trough in the manner described is that there is a great saving in the number of men required in handling the cable. When the cable is in the trough it is lifted up piece by piece and supported on stout pieces of wood laid across the top of the trough, the temporary saddle pieces are then knocked out, and bridges are placed in position, and work proceeded with as described previously.

The most important point to be considered in the laying of cable on the solid system is the filling up of the trough with compound. To get the compound free from blow-holes or air-bubbles, and also dirt, necessitates great care. The first operation is to coat the cables across the bridges, thus helping to keep them in their places. The whole trough is then filled up to one-third or one-half its depth with compound, the former being the best amount when the trough is large. The first application of compound should be hotter than is necessary for successive coats, as the cooling action of the troughs and cables will be very rapid. The compound, however, as it leaves the boiler, may be too hot, it generally being at a temperature of about 450° Fahr.; it will then have to be stirred and cooled by pouring into other buckets until it has fallen to a temperature of about 350° Fahr. The compound in the troughs is then allowed to cool, and at the same time a careful inspection is made to see that there are no air-bubbles under the cables or elsewhere in the trough. Any air-bubbles there may be should be burst with a stick. The trough is then filled up to two-thirds its depth, the same time for cooling being allowed to take place and inspection for air-bubbles, and it is finally filled up flush with the top, either two or three operations having been gone through, depending on the size of the trough. By this method the shrinkage is reduced to a minimum. The air-bubbles which may be present when the compound is drawn from the boiler may be removed by stirring it when in the "pouring-out bucket" with a stick; this also frees all other gas which may be present. Bubbles may also be caused by a shower of rain; therefore full buckets, if left to cool, should be covered up, and buckets standing empty be turned upside down. As each coat of compound is put on to the cables, the trough should be covered up during the time of cooling with a narrow waterproof sheet, supported at intervals by tiles or other means, so that the sheet does not touch the compound and thus adhere to it. This covering is necessary to prevent dust or other material getting into the trough, and also protects it in the event of a shower of rain. A last thin coat of fairly hot compound is applied to the top of the filled trough for fixing the tiles or other form of covers, and care is taken to push the compound in front of each tile as it is laid so as to form a good joint between the edges, and a coating on top of the joint.

Refined Trinidad bitumen is the best filling compound to use, but some engineers use a mixture of pitch and pitch oil, which has, after years of experience, been found to be quite satisfactory. It is also much cheaper than bitumen, but, of course, is not such a good insulator. The minimum distance between the outside of the cable and the trough should not be less than $\frac{1}{2}$ in. The gradual filling of the trough also gives the cable time to cool after each operation, which not only prevents buckling, as would occur if the trough was filled too rapidly, but also saves the consequent expansion in the length of the cable.

The process outlined above renders it possible to ascertain with certainty that the cable has not jumped off any of the bridges or become kinked so as to touch the bottom or sides of the trough. The ground is then filled in except at places of joints in cables, which latter should not be made for at least twenty-four hours after the cable has been laid. This gives plenty of time for the cable to cool and contract to its normal length. The section tests also should not be made until the cable and compound have thoroughly cooled.

A solid system of cables should never be laid in wet weather, and it is essential that the cable, trough, and bridges should be perfectly dry. All material ought, therefore, to be stored in a weatherproof place until immediately before it is required, and troughing when stacked should be inverted to protect the interior from damp. Bitumen-insulated cables should at all times be handled most carefully; in cold weather they are liable to crack if bent too acutely.

In the event of having to make the joints at once, the cable should be kept longer than necessary where it has to be jointed, say, from $\frac{3}{4}$ in. to 1 in. for each hundred yards, and no compound put into the trough for at least three yards on each side of the joint; then, if the cable is found to be a little too long after cooling, it can be shifted either sideways or up or down to take up the slack, or even a piece can be sawn off.

When laying mains round corners the radius should not be less than about 4 ft. 6 in. for a 0·5 sq. in. bitumen-insulated cable, 6 ft. for a 0·75 sq. in. cable, and 7 ft. for a 1 sq. in. cable. Precautions should also be taken when laying cables round bends to see that they are not laid too near the inside curve, as they will be drawn closer to the inside curve during the process of cooling; there is also always a danger of a like thing happening when the cable is heavy and is laid down a hill. The best plan in the event of a bend coming in a long length of cable is to avoid putting any compound into the bend for at least three yards on each side of it until the cable has had twenty-four hours for contraction, after which the troughs can be shifted to suit the length of cable available.

Sometimes for some unforeseen reason a main has to be laid in hot ground, *i.e.*, in the vicinity of buried pipes carrying hot fluids or under ash-heaps. It is necessary in such cases to surround the main with some non-conductive heat-resisting composition.

Before concluding, a few words about the means of disconnecting mains may be of interest. There are two general systems, viz., by means of underground boxes or by pillars. Pillars have a distinct advantage over underground boxes, but it is not always convenient to adopt them. In the first place, they are considerably cheaper; they also involve less disturbance to the ground; are more readily operated, and are much dryer than underground boxes.

THE ELECTRICITY UNDERTAKINGS IN THE POTTERIES

THE first Paper read at the Municipal Electrical Convention at Brighton referred to the effect of combination between the six different local authorities in the Potteries which has enabled a new scheme to be put forward for the supply to that district. For the benefit of our readers not acquainted with Staffordshire, we may say that this is not the Black Country—a name sometimes given to the chain-making and ironworking district in South Staffordshire. The

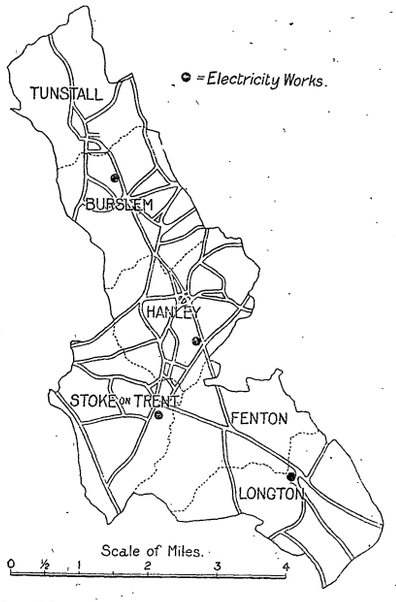

FIG. 1.—MAP OF POTTERIES, SHOWING POSITIONS OF GENERATING STATIONS.

Potteries lie almost equidistant from Crewe, Macclesfield, Stafford, and Derby in North Staffordshire, and between the main lines of the Midland and North Western Railways, in the valley of the River Trent.

The whole area has already been supplied more or less effectively with electricity from independent stations owned by the local authorities which controlled local administration under the old conditions. These works, it is claimed by the founders, were, and even still are, quite efficient and com-

petent to supply the needs of the several areas in which they were put down. But although the districts are contiguous, no attempt up to the present had been made to obtain the benefit of a combined undertaking.

A map of the district is given in Fig. 1, showing the positions of the generating stations. Particulars of the electrical undertakings of the constituents which have gone to make up the new county borough of Stoke-on-Trent are as follows:—The supply of Burslem, which was formerly a separate borough, was commenced in 1905, and the station contained plant aggregating 1,250 kw., and consisting of Howden-Dick, Kerr 100, 200 and 350 kw. sets and a Belliss-Siemens mixed-pressure 600 kw. turbo-alternator. The peak load is 746 kw., and a three-wire 2 × 220-volt distribution is given throughout Burslem, Tunstall, and Walstanton. The Hanley station is older, dating from 1894, and gives a single-phase supply. The generating plant is made up of Howden-Westinghouse and Ferranti steam alternators, aggregating 1,900 kw., and dealing with a peak load of 1,304 kw. The Longton station, started in 1901, is smaller, with 600-kw. plant capacity, meeting a peak load of 250 kw., and consisting of three Belliss-E.C.C. sets distribution in three-wire 2 × 230 volts. The remaining station at Stoke, which also supplies part of Fenton at 2 × 240 volts, is equipped with Willans-Dick, Kerr sets totalling 600 kw. Supply was commenced in 1904, and a peak of 624 kw. has been reached.

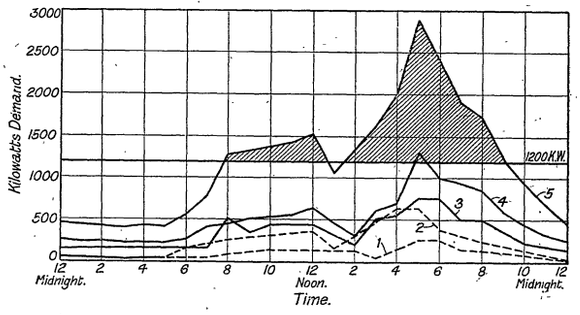

FIG. 3.—WINTER LOAD CURVES (1910).

1. Longton.
2. Stoke.
3. Burslem.
4. Hanley.
5. Total.

The total area is 11,154 acres, population 245,000, and rateable value £788,461. It has been estimated that the total horse-power of electric, steam, and gas plants engaged in the staple industry of the district, the manufacture of pottery and china, and in other minor industries, is 10,000 h.p., and of this approximately one-third is already electric. We are

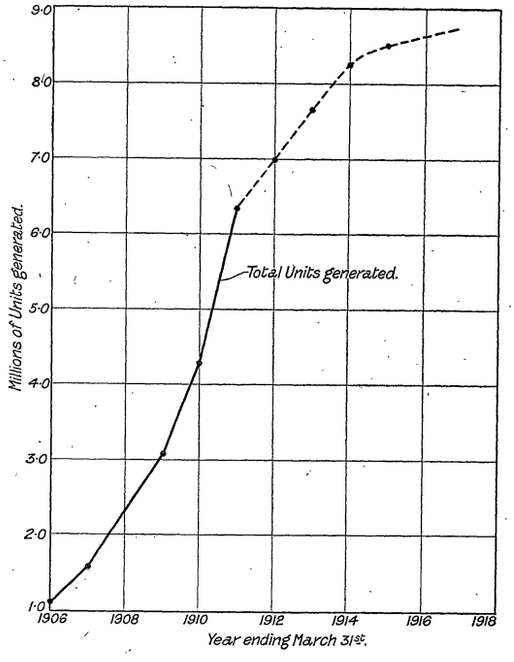

FIG. 4.—CURVE SHOWING INCREASE IN UNITS GENERATED PER ANNUM.

indebted for all these particulars to Mr. C. H. Yeaman, Chief Electrical Engineer to the County Borough of Stoke-on-Trent.

The remaining figures give some interesting curves showing the character and increase of the load. Summer and winter load curves are shown for the four stations separately, and as a total in Figs. 2 and 3 respectively, which are from curves prepared for Mr. J. F. C. Snell's evidence at the recent Local Government Board inquiry. Fig. 4 is also interesting, as it shows the increase in units generated for the last few years,

and the further estimated growth of the undertaking. The maximum loads each year since the undertakings commenced supply are shown in Fig. 5.

As has already been stated in Mr. Leese's Paper, the policy for the future is not to make additions to the small

plant in the existing stations, but to build and equip a new power station, as nearly as possible in the centre of the area of supply. This will be connected with the four existing stations by trunk mains, and will contain two 1,500 kw. turbo-alternators with the necessary equipment of boilers, switch-boards, &c. The D.C. plant at Burslem and Stoke and the A.C. single phase at the Hanley Works will be retained for peak loads so long as it is economical to do so.

REVIEWS OF BOOKS

A Handbook of Wireless Telegraphy, by Dr. J. Erskine-Murray. Third edition. 386 pp., 8¾ in. by 5¾ in., about 192 figures. (London: Crosby Lockwood & Son.) 10s. 6d. net; abroad 11s. 4d.

THE third edition of Dr. Murray's book on wireless telegraphy has followed soon after the second, but the rapid progress of the subject has necessitated considerable revision in the directions both of adding new matter and removing that which relates to paths other than those now leading to progress. The additions include interesting information as to recent developments of the Marconi system, but other modern systems, such as the Lepel, are also dealt with, and, indeed, the balance between the work of different pioneers is on the whole well kept. Although, as in former editions, the final chapters contain quantitative treatment of certain parts of the subject, this is perhaps hardly in the form required by the practical wireless telegraph engineer. The reader with only a general knowledge of the subject will find most stimulating reading to direct his thoughts to ways in which the fundamental phenomena are utilised in the different systems, but we would again suggest, as has been done in reviews of former editions, that, as a handbook for the actual designer, there is not quite enough to give a concrete idea of the actual dimensions of the apparatus employed.

The Propagation of Electric Currents in Telephone and Telegraph Conductors. By Prof. J. A. Fleming, F.R.S. 316 pp. 8¼ in. by 5⅞ in. 80 figures. (London: Constable & Co.) 8s. 6d. net; abroad, 9s. 2d.

THIS book is a reproduction of two courses of lectures recently given by the author. Although a good deal of mathematics, with a fair knowledge of the calculus, is required, the operations and processes have been simplified and rendered easy of application in practice. The opening chapter is a mathematical introduction, wherein the simple periodic currents are represented by complex quantities, and on account of the usefulness of hyperbolic functions for representing the flow of alternating currents, hyperbolic trigonometry is discussed, a table of these functions being given in the appendix. The chapter concludes with useful tables of hyperbolic functions of complex angles. Chapters II. and III. relate to the propagation of electromagnetic waves along wires and simple periodic currents in cables; and Chapter IV. deals with the principles of telephony, introducing the excellent work of Mr. Oliver Heaviside, also Prof. Pupin's application thereof to telephone cables, as well as investigations of Prof. Silvanus Thompson on submarine cables. The transmission of high and very low frequency currents comes next, followed by the electrical measurements and determination of cable constants dealt with at some length. In the next chapter, on cable calculations, useful tables and data are given. In conclusion, an illustrated description is given of the new Anglo-French telephone cable. The whole forms a very complete and comprehensive text-book.

Principles of Electrical Engineering. By H. Pender. 340 pp. 9½ in. by 6¼ in. 125 figures. (New York: McGraw Hill Book Co.) 17s. net; abroad, 17s. 9d.

THIS work is confined exclusively to the principles of electricity and magnetism and their applications in practice. It opens with the usual definitions of the fundamental and derived units, in which the quantities are measured. The next two chapters deal with the principles of the magnet and magnetic lines of force; electric currents in wires and their effects on the surrounding medium; electrical resistance, electromotive force, and the means of measuring them, and Kirchhoff's Laws are clearly defined and applied. We note that the magnetic field intensity is expressed in Gilberts per centimeter, and the unit of flux density is called the Gauss. Under the title of electromagnetism, the continuous current dynamo is introduced with the method of calculating the electromotive force induced in the armature, and expressions for magnetomotive force, reluctance, and inductance are deduced. Following this, electrostatics is fully and clearly explained, and then comes an important chapter on variable currents, in which the charge and discharge of the condenser are calculated. Alternating currents and the symbolic method of treating them is next dealt with, and finally, in connection with polyphase currents, the problem of the star and mesh connected combinations of the three-phase generator and load, and the two wattmeter method of measuring power applied to a balanced three-phase system are very well described. We do not like the abbreviation ln for natural log, nor do we think it necessary to use the prefix "ab," such as abampere, in the C.G.S. system of units. The use of the calculus throughout has, of course, considerably shortened the mathematics, which is unavoidable in this subject. This book contains much that is dealt with in a college course of electrical engineering, and should be well received by the student as well as the practical man.

Whittaker's Electrical Engineer's Pocket Book. Edited by K. Edgcumbe. Third edition. 597 pp. 6½ in. by 4 in. 181 figures. (London: Whittaker & Co.) 5s. net; abroad, 5s. 4d.

THE fact that the Electrical Pocket Book edited by Mr. K. Edgecumbe has already reached a third edition shows that the character of the information contained therein is such as is required in a work of this sort. The names of several well-known technical writers appear at the heads of some of the sections, but this does not prevent a homogeneity of treatment throughout. The work is principally devoted to the heavier branches of electrical engineering, as telegraphy and telephony are not dealt with. There is, however, a short chapter on electric clocks. A large proportion of the matter has been re-written in preparing the new edition, and the revision partakes more of the nature of a thorough bringing up to date of detail than the adding of new sections.

Associated Municipal Electrical Engineers (Greater London).—The Associated Municipal Electrical Engineers (Greater London) held their annual general meeting at the Institution of Electrical Engineers on July 5th, and the following executive officers were appointed for the session 1911-1912:—*President:* W. C. P. Tapper (Stepney). *Vice-Presidents:* F. A. Bond (Battersea), L. L. Robinson (Hackney), and A. H. Shaw (Ilford). *Hon Treasurer:* G. G. Bell (Hammersmith). *Hon. Auditors:* J. G. Bruce (Willesden) and E. Calvert (Finchley). *Hon. Secretary:* Norman Staniland (Hornsey). *Council:* S. W. Baynes (St. Pancras), A. J. Fuller (Fulham), P. E. Rycroft (Heston), J. H. Bowden (Poplar), F. Hill (Hammersmith), E. Sayer (Hampstead), H. H. Couzens (West Ham), W. Innes (Poplar), A. H. Seabrook (St. Marylebone), C. S. Davidson (Barnes), C. Newton Russell (Shoreditch), and W. C. Ullmann (East Ham).

Electric Lighting Provisional Orders.—The Board of Trade received 28 applications for electric lighting provisional orders in 1910, of which 11 were by local authorities, and 17 by companies or persons. In 19 cases the orders as applied for were granted; in two cases the promoters decided not to proceed with their applications, in one case the Board refused to grant the order, and in another dispensed with the consent of the local authority and granted the order, and in the remaining five cases, modified orders were granted. The Board have issued six certificates during the year, under Section 2 of the Electric Lighting Act of 1909, legalising the construction of generating stations upon land which had not been specified in an Act of Parliament, and under Section 6 of the same Act supply outside the area of the supply authority was authorised in 23 instances. The full report can be obtained from Messrs. Wyman & Sons, Fetter Lane, London, price 3d.

A SUPPLY COMPANY FINED UNDER THE FACTORY ACT

A CASE of some importance to those in charge of central station switchboards was heard at the Newcastle Police Court on Friday last, when the Newcastle and District Electric Lighting Co. were fined for neglecting to comply with certain of the Home Office regulations for the use of electricity in factories and workshops. The case arose out of the accident which occurred on April 6th last, at the switchboard of Close power station of the company, when Mr. W. Middleton, assistant station superintendent, received injuries from which he died.

The board in question is arranged for a 500 volt D.C. three-wire supply, with the neutral earthed, and with a battery and boosters. It appears that two men named Cox and Greenwood were at work on the board, and a spanner, with which a connection on the negative side was being tightened up, accidentally came in contact with a positive bar, and struck an arc by which the two men were somewhat burnt. This put 500 volts across the booster. The current was then broken, and a surge was produced which caused a flash over at a point on the board where there was about one inch between the positive and negative, but it would appear from the statements made in court that a further and more complete flash over, caused possibly by metallic dust left by the first arc, occurred later while Mr. Middleton was examining the connections. Mr. Middleton was badly burnt, and subsequently died from his injuries.

The actual charges were five in number. First, neglect to observe Regulation 14, in that the base conductors at the point where Mr. Middleton was injured were not placed so as to prevent danger from short circuit; and, secondly, that they were not so protected as to prevent danger. The third and fourth informations related to the cases of Cox and Greenwood respectively, and also alleged lack of proper protection. Lastly, the company were charged with general contravention of Regulation No. 1.

Mr. H. Mundahl appeared for the prosecution, and Mr. E. Meynell for the defence said he would plead guilty to the second charge, but not to the remainder. It was pointed out that Mr. Middleton was known to have a weak heart, and may have died from general shock, and the fact was elicited that before the accident the local factory inspector had never found fault with the board. The board had been subsequently tested by Prof. W. M. Thornton with 14,000 volts, without any flash over being produced.

No technical evidence was called, and while recognising that the neglect was not wilful, the Bench imposed a fine of £50 and costs on the second charge, and nominal fines of 20s. in respect of the third and fourth charges. The first and fifth indictments were withdrawn.

The accident was a very peculiar one, and difficult to foresee or reproduce. The board had given no trouble since it was installed in 1907, and had always been regarded as perfectly safe. It is only right to point out that as soon as any question of danger was raised, the company went considerably further than the requirements of the factory inspector, and put in new panels, doing away with the change over switches where the flash over occurred entirely. The severity of the judgment and summary way the case was dealt with may cause some consternation to owners of L.T. switchboards, as we are sure there must be many odd corners where conductors of opposite potential an inch or so apart are without insulating partitions.

THE BREMER FLAME ARC LAMP PATENT

AN interesting echo of the recent action by the British Westinghouse Co., Ltd., against the Electrical Co., Ltd., for infringement of the Bremer flame arc lamp patent was heard in Mr. Swinfen Eady's Chancery Court on Monday. As the result of the action in question (ELECTRICAL ENGINEERING, May 4th, page 235, and June 22nd, page 348), judgment was given to the effect that the Electrical Co.'s "Sunshine" arc lamp was an infringement of the Bremer specification, and an order was made for the delivery up of all lamps or parts of lamps in existence.

Before Mr. Justice Swinfen Eady on Monday, Mr. Bousfield, K.C., on behalf of the Electrical Co., argued that this order should be varied to give the Electrical Co. the option of having the lamps and parts of lamps destroyed in the presence of representatives of the British Westinghouse Co. He claimed that this was the usual interpretation of an order to deliver up, but that the British Westinghouse Co. took the opposite view. He also mentioned the fact that in the previous action by the British Westinghouse Co. against Mr. G. Braulik, lamps had been delivered up which the Westinghouse Co. had actually sold, and he argued that this was not the intention of the order, and he wished to prevent that happening in this case.

Mr. A. J. Walter, K.C., for the British Westinghouse Co., asked his lordship to maintain the terms of the order made at the time judgment was delivered, namely, that the goods should be delivered up.

Mr. Justice Swinfen Eady gave judgment in favour of the British Westinghouse Co., pointing out that the alternative asked for by the Electrical Co. was not suggested when judgment was delivered and the order made.

ELECTRICAL EQUIPMENT OF A LARGE DRAPERY ESTABLISHMENT

THE electrical equipment of Messrs. Swears & Wells, of Regent Street, whose enlarged premises are now nearing completion, has been carried out by Messrs. Rashleigh Phipps & Co. (147 Oxford Street, W.). Two separate services from the supply mains of the St. James & Pall Mall Electric Light Co. enter the building at the back and front respectively through Tucker switches, of the ironclad type, and fuses, and all connections here are finished off with a teak covering. The premises are wired throughout with Henley's 19/14 cable, which is drawn into heavy screwed steel earthed conduits with draw boxes throughout. The distribution boards are all provided with earth metal backings to the cases. All the tumbler switches are semi-sunk, and look much less cumbersome than the ordinary type. A feature of the building is the extensive provision made for electric ironing, which is always in great demand. For this purpose small teak benches 1 in. thick, insulated with uralite slabs ¾ in. thick, are erected at the wall on two or three floors. The electric irons are of the British Prometheus Co.'s manufacture, and are connected to plugs in the wall, each through a tumbler switch and a ruby lamp, which glows while the iron is in circuit, and acts as a warning to that effect. The large irons, made especially for tailoring work, take 3 amperes, and the smaller ones take 1·15 amperes. The window lighting consists entirely of 32-c.p. Osram lamps, placed in glass-lined metal troughings of Messrs. Rashleigh Phipps & Co.'s special design, arranged behind the flouncing at the top of the windows. The troughing is made in sections swivelled at the top, so that they can be tilted to any angle to produce the best effects for various methods of window-dressing. Power is supplied at 220 volts for the irons and the lifts, which were installed by Messrs. R. Waygood & Co., but the lighting circuits are entirely at 110 volts.

A very complete intercommunication telephone system, including 20 instruments in various departments, has been installed on the latest intercommunication system by the **Sterling Telephone & Electric Co., Ltd.**

STREET LIGHTING IN THE BORO' OF HOLBORN

THE much debated contract for the street lighting of the Borough of Holborn will again come up for consideration at the Council meeting to-morrow. The Works Committee having considered the report of the Council sitting as a special Committee (ELECTRICAL ENGINEERING, June 22nd, page 348), now express the opinion that the joint tender of the electric lighting and gas companies to give 425,000 c.p. at an annual cost of £7,645 is a favourable one to the Council. They point out that the capital cost of providing the new fittings, columns, lamps, &c., will amount to about £9,000, which sum will have to be provided by the Council, the fittings, &c., of course, remaining their property. This amount will be repaid over a period of ten years, making an addition of £900 per annum to the contract price. The proposal of the companies involves 20,000 more c.p. than is required by the specification, but this is brought about by the higher c.p. lamps required in certain thoroughfares in order to make them uniform with existing lamps in other parts of these thoroughfares which are in adjoining boroughs.

The Works Committee make the following recommendation that, "Subject to the consent of the London County Council being first obtained to the form and principle of the contract, the joint and several tenders of the Gas Light & Coke Co. and the Metropolitan Electric Supply Co., Ltd., dated 11th April, 1911, for lighting the streets of the Borough for ten years for the sum of £7,645 per annum, subject to the deletion of Clause 35 of the specification (ELECTRICAL ENGINEERING, June 15th, page 335) and the amendment of the schedule of lighting as proposed by them, be accepted, and that the seal of the Council be affixed to the necessary contract to be prepared by the Town Clerk."

ELECTRIC TRACTION NOTES

In ELECTRICAL ENGINEERING of May 18th (page 265) some notes were given of the intentions of the French Midi Railway as regards the adoption of electric traction, and particulars were given of one of the locomotives to be used. Another locomotive to be experimented with on the Villefranche section is described in *La Revue Electrique*. This had been built by Les Atelier de Construction électriques du Nord et de l'Est of Jeumont, and has a continuous rating of 1,200 b.h.p., or 1,500 h.p. on the one-hour rating. It will take current at 1,200 volts at 16⅔ cycles, single phase. Like the other, it is a ten-wheeled locomotive, with six driving wheels in the centre, but no coupling rods are used, as a separate 500-h.p. motor is provided for each driving axle. The motors are mounted rigidly on the chassis, and drive sleeves surrounding the driving axles through helical gearing. These sleeves are connected by spring couplings to the driving wheels, allowing considerable freedom of movement. The motors are of the compensated series type, weighing six tons, complete with gearing, and run at 450 r.p.m. They are fed from transformers in conjunction with induction regulators, and regenerative braking is arranged for. The locomotive is designed to start a train of 400 tons, and to attain a speed of 25 miles per hour with a 280-ton train, and 38 miles per hour with a 100-ton train.

For the supply of power for electric traction in the Hoosac Tunnel, in America, an account of which appeared in a recent issue of *Power*, an up-to-date generating plant has been installed by the Westinghouse Co. This consists of two 3,750-kw. turbines of the double flow type, which drive single-phase 25-cycle generators at 1,500 r.p.m., and supply current to the lines, which run from the station on flexible steel towers to switching stations at each end of the tunnel, at 11,000 volts. The auxiliary units comprise two 100-kw. direct-current exciters driven by an induction motor and turbine respectively, an air-compressor driven also by an induction motor, which supplies air at 50 cubic ft. per minute for cleaning purposes. The voltage is transformed down on the train, each locomotive being provided with a transformer, which is tapped so that any voltage can be obtained. The locomotives are each equipped with four 320-h.p. 300-volt single-phase motors bolted direct to the frames and connected to the driving wheels by gearing and a spring drive, and controlled by the multiple-unit system, so that it is possible for one controller to operate more than one locomotive. The locomotives for freight service have a maximum speed of 30 miles per hour, and those for passenger service are geared for a maximum speed of 50 miles per hour.

The most interesting Paper from an electrical engineering point of view of those read at the Zurich meeting of the Institution of Mechanical Engineers was that of Mr. E. Huber Stockar, of Zurich, on "Electric Traction in Switzerland." The author pointed out that in Switzerland, where railways are, on the whole, not making profits because of cost of construction, heavy grades, rather irregular traffic, short average distance of travel, high wages, low fares, and so on, the problem of railway electrification is in every case a problem mainly of general economics of railway operation, since the technical problem has admittedly been satisfactorily solved so far. Some statistics as to the Swiss railways in general were given in the form of tables, and it was mentioned that the percentage of normal gauge railways worked electrically had risen from 2·9 in 1909 to 5·4 at the present time. A description was then given of the Burgdorf-Thun line, which, it will be remembered, was the first normal gauge railway to be run on the three-phase system, although this form of traction has already been applied to a tramway system in Lugano and to certain narrow gauge and mountain lines. The trains were originally hauled by 30-ton two-axle locomotives, with two 150-h.p. motors, wound for one economical speed only, and provided with a mechanical change speed gear. The latest locomotives, however, are of the double bogie type, weighing 42 tons, and propelled by two 400 induction motors without slip-ring for variable voltage control, and giving four economical speeds by changing the effective number of poles. They were equipped by Messrs. Brown, Boveri & Co.; motor coaches, each equipped with four 60-h.p. motors, are also used. The Burgdorf-Thun railway was built for electric traction, but the first Swiss normal gauge steam railway to be converted was the Freiburg-Murten-Sus line, completed as far as Murten in 1903, and extended to Ins quite recently. This is the only example of a continuous-current normal gauge railway in the country, and makes use of a third rail at a pressure of 800 volts. The Paper then describes the traction arrangements in the Simplon Tunnel, which is entirely by three-phase locomotives, the most recent of which, by Messrs. Brown, Boveri & Co., have four driving axles driven by cranks and side-rods by two motors aggregating 1,700 h.p., with four economical speeds and variable voltage control. The first single-phase normal gauge railway in Switzerland was the Seebach-Wettingen experimental line, where tests have been made of various locomotives working with a contact line pressure of 15,000 volts 15 cycles. The locomotives were constructed by the Oerlikon and Siemens-Schuckert firms.

Another single-phase normal gauge line is the Seethalbahn, where motor cars each with four 100-h.p. motors are run from a 5,000-volt 25-cycle circuit. The Martigny-Orsières line, however, employs 8,000 volts at 15 cycles, this frequency conforming with the standard now accepted for future electrification. This line is interesting as employing the Deri motor, in which speed regulation is obtained by shifting the brushes. The Paper then describes the equipment for the Loetchberg tunnel. The Spiez-Frutigen line leading to the tunnel approaches is already run electrically on the now standard 15,000-volt 15-cycle single-phase system, first experimented with on the Seebach-Wettingen line. The rolling stock to be used for the tunnel comprise a 1,600-h.p. A.E.G. locomotive, a 2,000-h.p. Oerlikon locomotive, and three passenger motor cars of 450-900 h.p., each ordered jointly from the Siemens-Schuckert and Oerlikon companies. Single-phase current at 10,000 volts 15 cycles has been decided upon for the Rhätische Bahn, the new lines of which, in the Upper Engadine, are all to be worked electrically. Three 600-h.p. and eight 300-h.p. locomotives are already on order. These lines, although quite of the character of main lines, are of narrow gauge. Progress in electric traction has been facilitated in Switzerland by the Commission for the Study of Electrical Railway Working appointed by the Government, whose investigations led to the standardisation of system, voltage, and frequency, and who have prepared a complete scheme for the forthcoming electrification of the Gothard Railway.

On Friday, an Appeal Court, consisting of Lords Justices Vaughan-Williams, Fletcher-Moulton, and Buckley, disposed of the dispute between the West Hartlepool Corporation and the Hartlepool Electric Tramways Co., with regard to the purchase of the company's lines. We gave the facts of the case on page 353 of our issue for June 22nd. Briefly, they are that Messrs. Sellon & Ashby obtained the Hartlepool Tramways Order in 1895, and transferred it to the Hartlepool Tramways Co. This transfer, however, did not receive the sanction of the Board of Trade, but the company continued to work the lines until the period arrived when the Corporation were entitled to purchase. Arbitration proceedings took place a short time ago, and the sum of £12,963 was agreed upon as the price to be paid, but the Corporation raised the point that neither Messrs. Sellon & Ashby nor the Hartlepool Electric Tramways Co. were entitled in law to be paid. The matter was argued before Mr. Justice Bray, who held that Messrs. Sellon & Ashby still remained "promoters" under the Tramways Act, and that the Corporation must pay the purchase money to them, leaving it to these two gentlemen and the Tramways Company to make the necessary arrangements for giving the Corporation a good title to the tramways. The Appeal Court decided, however, that as the Board of Trade were fully cognisant of the position, as proved by certain documents, and had not objected, their consent had in fact been given, and that the company were in the position to give a good title to the tramways to the Corporation. They, therefore, upheld the decision of Mr. Justice Bray that the Corporation must pay somebody, but their decision has simplified the matter in holding that the Tramways Company can itself give a good title to the tramways.

The provision of trolley omnibus systems is under consideration in Mirfield, Bingley, and Oldbury. A deputation from the Dewsbury Council is to visit the installations at Leeds and Bradford.

Some further evidence was heard at Stalybridge last week concerning the cause of the tramway accident on Whit Monday. The witnesses consisted of the driver and conductor of a car coming in the opposite direction. The former stated that he saw the driver of the runaway car endeavour to apply first the hand brake and then the magnetic brake, but in neither case was the speed of the car checked. Col. Von Donop will report in due course.

In their annual report the directors of the Metropolitan Railway Co. state that the installation of automatic signalling between Willesden Green and Neasden has now been completed. The replacement of the existing turbo-generators at Neasden by machines of larger capacity and improved

Hosted by Google

economy is proceeding satisfactorily. The report also states that arrangements for the electrification of the East London Railway Co. are engaging the special attention of the lessee companies, and the work is expected to be put in hand shortly. Its completion will permit of the company's train service to New Cross being resumed.

A dividend at the rate of 5½ per cent. per annum for the June half-year is recommended by the Lanarkshire Tramways Co., carrying forward £7,073. Four additional cars will shortly be put into service.

The London, Tilbury & Southend Railway Bill was passed by a House of Lords Committee last week. The Bill gives the company powers to work the whole of their lines by electric traction, and authorises the raising of £750,000 new capital for the purpose of generating machinery and rolling stock.

The Llanelly electric tramway system was formally opened last week. The system is the property of the Llanelly & District Electric Lighting & Traction Co., Ltd.

In connection with the scheme mentioned in our last issue for the purchasing of the whole of the British Electric Traction Co.'s lines in Birmingham, the Tramways Committee recommend a large number of extensions.

The June half-year's report of the London, Brighton & South Coast Railway states that the cost of equipping the L.B. & S.C. Railway and Crystal Palace lines for electric traction, and providing rolling stock and repair shops, are the principal items of the capital expenditure of £449,715.

The concession for the extension of the subways in New York City has been awarded to the Brooklyn Rapid Transit Co. The estimated cost is about £45,000,000.

The Hastings Tramways Committee have refused to assent to a proposal by the Hastings Tramways Co. to substitute the overhead system for the Dolter surface contact system along the sea-front.

The Highways Committee of the L.C.C. recommend application being made to Parliament next session for seven new lines of tramways having an aggregate length of eleven miles of single track. The estimated cost of construction and equipment, including cables, cars, and a proportion of the cost of car-sheds and sub-stations, is £274,820, and the total net cost of street widenings £88,750.

Some details of the proposed conversion of the East London Railway to electric traction have at last been made public. At the half-yearly meeting on Tuesday, Lord Claud Hamilton stated that the estimated expenditure was £65,000, and it was hoped that the Great Eastern Railway Co. would incorporate clauses in one of its own Bills authorising the raising of this sum of money. The extra working expenses are put at £3,000 per annum, which the lessee companies are willing to bear. With regard to the interest upon the £65,000, which at 4 per cent. amounts to £2,600 per annum, the East London Co. will pay this after they have received the minimum rent of £30,000 per annum, and also the extra sum to which they are entitled when the gross receipts exceed £53,000 per annum. The District Railway Co. will supply the current from Lot's Road, and the Metropolitan Co. will supply the rolling stock.

At the City and South London half-yearly meeting, on Tuesday, it was stated that experiments are to be carried out with a view to so improving the existing locomotives that the time taken on each journey will be reduced by five or six minutes.

An Appeal Court, consisting of the Master of the Rolls and Lords Justices Farwell and Kennedy, decided on Monday (Lord Justice Farwell dissenting) that the Central London Railway Co. is not liable to pay land tax in respect of the portion of their tubes which are beneath certain streets in the City of London. It is agreed that land tax is not payable where the tubes are underneath houses.

The conversion to electric traction of the Vienna Stadttahn and the construction of a considerable length of new underground electric lines connected therewith, is being considered by the Vienna Traffic Commission. Probably a concession will be granted to a company to carry out the work, which will involve the expenditure of about five million pounds.

Parliamentary.—The East Kent Electric Power Bill was read a third time and passed in the House of Lords last week.

The Newcastle-upon-Tyne, the Chiswick, and St. Helens Corporations Bills were read a second time, and the Luton Corporation Bill a third time, in the House of Lords on Monday.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ONEWATT LAMPS.—Several new sizes of onewatt lamps are included in a new list just issued by Siemens Brothers' Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.). The range now comprises low voltage lamps in various sizes, from 9 to 14·5 c.p. for voltages from 20 to 50, a special 45 c.p. (55 watt) lamp for street and shop lighting, made for 100–130 and 200–250 volts, and the high candle-power lamps, which are now produced for 90, 180, 270, and 360 British candle-power. As is well known, the drawn tungsten filament of these lamps is wound in one length, and is supported by tantalum hooks, the elasticity of which greatly reduces risk of breakage.

A further pamphlet from Siemens Brothers' Dynamo Works deals particularly with the 200 watt "onewatt" lamp, pointing out its advantages for shop, hotel, and street lighting, and illustrating one or two designs of outside lantern specially suited for use with this size of lamp.

METAL FILAMENT LAMPS.—The Corona Lamp Works Co. (Ascham Street, N.W.), with which is incorporated the lamp business formerly carried on by Mr. S. Horvath, have issued a full list of their Corona lamps. This lamp was previously known as the "Mascot," and its special distinguishing feature is the method of supporting the filament, which in the higher voltage lamps is mounted on a double frame, giving, so to speak, two layers. Great flexibility and freedom from the effects of shock are also obtained by the use of a loose ring instead of a rigid hook through which the loops of the filament are threaded.

CRANE MOTORS.—A pamphlet relating to crane-rated motors is before us from the Union Electric Co. (Park Street, Southwark, S.E.). It deals with motors of the open protected, enclosed ventilated, and totally enclosed types, and comprises the rating of and the general specification of d.c. and three-phase motors, with a full list of dimensions in each case. Prices for the whole machine and spare parts are also given.

WIRES AND CABLES.—The Piggott Electrical Company (24 New Bridge Street, E.C.) have issued a leaflet containing the prices of cables of the 600 megohms grade, and illustrating their china cable connectors.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

METALLIC DIMMERS.—The Adams Manufacturing Co. (106 New Bond Street) have sent us two pamphlets dealing with stage lighting which is now an important branch in electrical engineering. One of the pamphlets compares the liquid and the metallic dimmers from the point of view of size, safety, construction, upkeep, and results, and the second deals with stage lighting in general, giving a full illustrated description of the company's metallic dimmer. In these days, when so much money is spent in scenic displays, the question of illumination is of the utmost importance. In order to render these effects as real as possible, it is necessary to be able to obtain any degree of brilliancy. When the carbon filament lamp was used, this was comparatively easy, but now that the metallic filament lamp is so extensively adopted, a much greater range of resistance is required than can be provided conveniently by a dimmer of the liquid type. It is largely for this purpose that the metallic dimmer has been developed. This is constructed on the unit principle, each consisting of a resistance divided up into a number of small steps for graduating the brilliancy of the light. They are worked by means of a lever actuating a rigid rod drive, and by an interlocking arrangement any combination of lamps can be worked. A more complete description of these dimmers appeared in an article on "Stage Lighting at the Little Theatre," where they are extensively used, in ELECTRICAL ENGINEERING of October 27th, 1910, page 680.

FANS.—Messrs. Matthews & Yates, Ltd. (84 Gray's Inn Road, W.C.), have sent us a leaflet of the cyclone fans, the special feature of which is the blade. This is of simple and open construction, and does not obstruct ventilation when the fan is at rest. The motors are supplied for constant and variable speeds, and can be enclosed or open protected. We understand that these fans have been installed in the Houses of Parliament, Buckingham Palace, the Natural History Museum, Birmingham University, and also to H.M. Office of Works, the Admiralty, and the various Post Offices throughout the country.

THE VULCAN REDUCING VALVE.—A leaflet, which has just been issued by W. Geipel & Co. (Vulcan Works, St. Thomas' Street, London, S.E.), describes their new reducing valve. This is attached to a piston, the weight of which keeps it on its seat. The piston is a loose fit, so that steam can pass into a space provided underneath. This space is connected through a pilot valve to the reduced pressure side by means of a passage. When the pilot valve, which is actuated by a steel diaphragm, is open, the steam escapes through the passage, and the valve is closed by the greater pressure on top of the piston, but when it is closed the pressure on each side of the piston is equal, and the valve is free to open. The diaphragm is controlled by a spring on one side, and the reduced pressure on the other. These are also made for medium pressure, high pressure, or superheat.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 20, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

15,134/10. **Magneto Ignition.** C. H. REDRUP. A magneto-ignition device for a multi-cylinder engine consists of a distributor rotatable with the cylinders, and carrying a series of contacts, in conjunction with a brush that travels round with the magneto armature at a different speed to the cylinders. The interruption of the primary circuit of the armature is effected by a make and break plunger co-operating with cam surfaces on the distributor. Three figures.

15,414/10. **Trolley Poles.** A. R. CHRISTIAN. A bridge, slideable on two connecting rods, and also on a central core on which is threaded a helical spring, is provided with pivoted pawls which engage with notches in the rods, and maintains the trolley pole in contact with the wire. Should the pole leave the wire, a stationary bridge with cams for disengaging the pawls from the notches allows the rod to slide through the bridge and release the spring, when the pole drops and clears all overhead equipment, until it is stopped by a buffer spring. Flexible connections are provided for restoring the pole to its running position, which draw the sliding bridge forward and free the pawls from the cams ready to engage the notches again. Nineteen figures.

22,777/10. **Electric Furnace.** G. MASSIP. An electric furnace, comprising an upper movable electrode, and a refractory and normally non-conducting hearth, which is heated to the point of conductivity by an electric current, which passes through metallic resistances embedded in the hearth, and which constitute the other electrode. Six figures.

24,238/10. **Electric Heater.** H. HIRST and C. H. ARCHER. The heating conductors are supported on a fireproof insulating support made of fireclay, porcelain, quartz, or asbestos, and provided with conveniently spaced holes for cottar pins, which are first placed over the conductors, and then either cemented into the holes, or allowed to project through them beyond the back support, and then opened out. Two figures.

15,619/10. **Electric Recorders.** A. LAMBOT. An automatic electric measuring and recording device, in which the transmitter carries a needle controlled by the measuring device, and periodically moves a loose needle controlled by one or more electromagnets, and makes or breaks the circuits. The receiver is provided with a resistance, which, when short circuited, reinforces the live current and operates the transmission device after the recording of each indication. A self-polarising selective relay is also used. Six figures.

15,789/10. **Arc Lamp Couplings.** J. E. F. C. RECHIN. An improved cup insulator for arc lamps, with concentric contact rings composed of two parts, arranged in such a way that two rings are provided in each of the cup parts, serving to establish the current, the upper cup part being fixed and the lower part movable, in a manner permitting easy access to the lamp and ensuring perfect contact between the two parts. Five figures.

19,182/10. **Electrical Switches.** THE ELECTRIC AND ORDNANCE ACCESSORIES CO., LTD., and N. COLLINS. An electric switch in which the contact arm and slotted bracket are provided with a series of coincident holes in which the balls are located, the balls being normally forced inwards by springs to engage with recesses in the controlling part of the handle, and also engage partly with the bracket and partly with the contact arm, which is locked in its "on" or "off" position until the handle causes the recesses to engage and force the balls against the springs to unlock the switch arm. Six figures.

28,724/10. **Electric Lighting.** FRANKENBURG & SONS and E. FLEMING. A method of supplying current to charge an accumulator for feeding a low-voltage circuit, consists of introducing a change-over switch into a high-voltage circuit, and connecting the accumulator to the terminals on the switch, so that the accumulator can be cut out when charged, but continues to feed the low-voltage circuit. One figure.

3,891/11. **Enclosed Arc Lamps.** KORTING and MATHIESON AKT.-GES. Relates to enclosed arc lamps, in which a depositing chamber is provided above the combustion chamber, and consists in cooling the gases flowing back from the former chamber to a low temperature, and at the same time keeping the globe surrounding the arc as hot as possible, by jacketing it with a second globe, so that the air, enclosed between the two, serves as a heat insulator. Two figures.

Opposition to Grant of Patent

10,869/10. **Incandescent Lamps.** J. HARRISON. Opposition has been entered to the grant of this patent. The specification describes a method of attaching metallic lamp filaments to the conducting wires by means of a paste containing phosphorous and powdered platinum.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: STEVENSON and WILLIAMS [Automatic raising and lowering of] 18,217/10; SCHMID [Self-regulating, for projection] 25,634/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: WOLFF [Automatic distributor for electricity] 29,810/10.

Dynamos, Motors, and Transformers: MILCH [Speed-regulation of induction motors] 22,717/10; SIEMENS BROS. DYNAMO WORKS, LTD., and KOETTGEN [Ventilation of machines] 8,392/11; SCHULZ and EVERYMANN [Homopolar dynamos] 2,369/11.

Electric Ignition: MAZELLIER [Electric sparking-plug] 3,859/11.

Heating and Cooking: VERITY'S, LTD. and PIPKIN [Electric heaters] 18,136/10; FIELD and FERRANTI, LTD. [Electric heaters] 26,836/10; SUMNER [Resistances] 5,521/11.

Switchgear, Fuses, and Fittings: HAMILTON and FERRANTI, LTD. [Time switches] 13,704/10; CROMPTON & Co., MACFARLANE, BURGE, and WILLIAMS [Control of electric driving systems] 29,727/10; SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens-Schuckertwerke Ges.*) [Non-interchangeable fuses] 10,113/11.

Telephony and Telegraphy: RAY [Guide-sheaves for ships' telegraphs] 28,320/10.

Traction: ASHWORTH [Trolley poles] 17,690/10; DUDGEON [Device for protecting the ears and trolley wire] 23,536/10; HULTMAN [Conduit manufacturing apparatus] 5,813/11; KNECHT [Railway-signalling devices] 6,166/11.

Miscellaneous: CEREBOTANI [Wireless-operated signalling] 16,360/10; BILLÉ [Conduits joints] 21,313/10; REISZ and STRAUSS [Relay for undulatory currents] 2,111/11; PRITCHETT [Electric accumulator boxes] 4,524/11; BRITISH THOMSON-HOUSTON Co. (General Electric Co.) [Manufacture of tungsten] 8,031/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution: GES. FÜR ELEKTROTECHNISCHE INDUSTRIE [Electric conductors] 5,569/11.

Electric Ignition: OFFICINE DI VILLAR PEROSA, AGNELLI & Co. [Sparking plug] 1,562/11.

Storage Batteries: SOC. DES ETABLISSEMENTS SAGE, BINE ET CIE. [Multitubular positive for electric batteries] 19,600/10.

Incandescent Lamps: SOC. DES ETABLISSEMENTS PAZ and SILVA [Sockets for fixing bulbs] 20,040/10.

Telephony: CLIMENT [Telephones] 29,685/10.

Expiring and Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. S. HATFIELD and F. M. LEWIS, 7,926/07; H. BEVIS and A. E. ANGOLD, 7,941A/07.

Dynamos, &c.: SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [Dynamos] 7,695/07.

Electrometallurgy, &c.: A. J. BOULT (*J. B. Du. Faur*) [Electrolysis] 7,698/07; S. O. COWPER COLES [Electric furnaces] 7,742/07; E. A. A. GRÖNWALL, A. R. LINDBLAD, and O. STALHANE [Electric furnaces] 7,791/07.

Incandescent Lamps: W. J. GREENWOOD, 7,444/05; R. T. SMITH and A. G. BEAVER [Lamps] 7,789/07; J. J. RAWLINGS and R. T. SMITH [Lamps] 8,151/07.

Switchgear, &c.: BRITISH THOMSON-HOUSTON Co. (*General Electric Co.*) [Motor control] 8,020/07; H. W. LEONARD [Controllers] 8,079/07; H. H. BERRY, E. SKINNER, and W. J. MARKHAM [Cut-outs] 8,138/07.

Telephony, &c.: G. ANGELINI [Telephones] 8,168/06; T. D. TAYLOR [Telegraphs] 7,663/07; P. CHRISTOF [Recording telephone signals] 8,095/07.

Traction: A. NEELEMANS [Railway points and signals] 8,020/02; S. R. THOMPSON [Electric tramways] 8,077/04; T. MCMORRAN [Electric tramways] 7,758/07.

Miscellaneous: R. P. JACKSON [Electromagnets] 7,491/06; J. B. D'HOMERGUE [Electric resistances] 7,711/07; R. WAYGOOD & Co. and D. BONE [Lifts] 7,737/07; W. G. T. GOODMAN and E. W. AUCKLAND [Electric conduits] 7,800/07; W. P. THOMPSON (*Ges. für Drathlose Telegraphie*) [Electric oscillations] 7,815/07; C. and F. C. NAUJOKS [Lifts] 7,883/07; J. and G. J. SUTTON and G. MUNDY [Fire alarms] 7,895/07; W. BLACKMOXL [Magnetic separators] 7,982/07; FELTEN and GUILLEAUME-LAHMEYERWERKE AKT.-GES. [Electromagnets] 15,009/07.

Hosted by Google

LOCAL NOTES

Bootle: *Electricity Accounts.*—After meeting capital charges and transferring £2,300 towards depreciation and renewals, a sum of £1,500 is handed over to relief of rates from the profits on the electricity undertaking last year.

Bristol: *Electric Lighting Accounts.*—After meeting capital charges, there is a deficiency for the past year of £768 16s. upon the working of the electricity undertaking. The balance in hand amounts to £4,041 15s., and against this is to be charged the deficiency for the year, and a number of other items not chargeable against revenue, but for which loans have not been obtained, leaving a balance of £2,628 to be carried forward. The number of 30-watt lamps connected with the mains increased from 521,124 to 551,991 during the year.

Edinburgh: *Electricity Surplus.*—There has been considerable controversy as to the best method of disposing of the profits upon the working of the electricity undertaking, the reserve fund having reached the limit allowed by statute. Last year there was a surplus of £8,000, and it is now proposed to hand this over to the College of Art Building Fund to complete the necessary sum required for that purpose.

London: *Hammersmith: Condition of Tramway Track.*—The Council have a deposit of £1,000 from the London United Tramways Co. in respect of maintenance of the company's tramways in that district. Complaints have been made as to the condition of the lines in Goldhawk Road, and the question of spending a portion of this deposit in repairing them has been referred to the Works Committee for report.

Advertising Electricity.—Having regard to the active methods pursued by the gas company, the Electricity Committee recommend that an annual sum of £300, which shall include the salary of the canvasser, shall be set aside for the purposes of general advertising in connection with the Electricity Department.

Islington: Testing Stations.—The London County Council are taking action against the Borough Council, calling upon them to show cause why they should not instal five testing stations for recording the pressure upon their electric supply system as provided for in their Electric Lighting Orders. The Council was called upon to instal these stations in July, 1907, but have since done nothing.

Reserve Fund.—In recommending sanction to a loan of £24,175 for extensions in connection with the electricity undertaking, the Finance Committee of the L.C.C. call attention to the absence of a reserve fund, and the fact that the Borough Council propose to transfer the estimated net surplus of £3,360 for 1910-11 to relief of rates. As a consequence, the Borough Council have decided to give consideration to the question of establishing a reserve fund.

Poplar: Showrooms.—The Electricity Department opened a showroom of electrical appliances at 121 East India Dock Road last week.

Maidstone: *Electricity Accounts.*—There was a deficit of £158 15s. upon the working of the electricity undertaking last year after meeting capital charges amounting to £5,976. The deficit is explained by a considerable increase in capital charges.

Portsmouth: *Electric Lighting Profits.*—The accounts of the electric lighting department for the past year show that the reserve fund has now reached the limit of 10 per cent. on the capital expenditure allowed by Parliament.

Sheffield: *Overhead Wires.*—A proposal to use overhead wires in connection with the proposed extension of street electric lighting to Attercliffe was negatived at the last meeting of the Council. Those councillors who were instrumental in bringing about this decision based their argument on danger, a rather surprising one, having in view the large mileage of overhead tramway wires which Sheffield possesses.

Electricity Extensions.—A report by Mr. S. E. Fedden dealing with the general position of electricity supply in Sheffield in connection with the proposed extensions at Neepsend has been referred back in order that the Finance Committee may consider it first. Incidentally, it may be mentioned that some of the councillors object to some rather outspoken remarks by Mr. Fedden as to the protracted proceedings in obtaining the approval of the various committees of the Council. One member suggested that the engineer should confine his reports to matters which come under his jurisdiction.

Swinton: *Death from Electric Shock.*—An assistant mains engineer of the Lancashire Electric Power Co., named Sidney Douglas, was investigating a fault in the high-tension plant at the Pendlebury sub-station on Saturday when he came into contact with the 10,000-volt mains, and received a fatal shock.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Canada.—According to the *Board of Trade Journal*, the Penticton (British Columbia) Council require two 100-k.v.a. three-phase 4,600-volt 900-r.p.m. alternators, with switchboards, transformers, meters, distribution and street lighting system. Tenders to Mr. F. H. Latimer, Consulting Engineer, Penticton, British Columbia, by August 10th. It will be noticed that this date is only of use to those having agents on the spot, as specification forms are to be obtained at the office of the *Canadian Engineer*, Toronto.

Farnham.—Tenders are invited, by August 16th, for two 90 k.w. Diesel engines and dynamos, exciters, cranes, &c.; also high tension switchboard. Consulting engineers, Messrs. Handcock and Dykes, 11, Victoria Street, S.W. Specifications, &c., from Farnham Gas and Electricity Co.

Glamorgan.—The Tonyrefail and Gilfach Goch Electric Lighting Company require tenders for the supply and erection of electric light mains, switchgear, and street lighting fittings. Applications to D. R. Morgan, 48, High Street, Tonyrefail.

Hartlepool.—The Local Government Board inquiry into the application of the Corporation for sanction to borrow £35,417 for a new electric power station was resumed last week. It will be remembered that the scheme is to erect plant at the works of the Seaton Carew Iron Works Co., in order to make use of the exhaust steam there. Mr. J. F. C. Snell is advising the Corporation, for whom Captain Sankey gave evidence. There is opposition to the scheme by the Cleveland & Durham Electric Power Co. and others, the point between the power company and the Corporation being that power can be purchased in bulk more cheaply than it will be generated under the new scheme. A provisional agreement has been entered into between the Iron Works Co. and the Corporation for the supply of 30,000 lbs. of steam per annum for thirty years. The Corporation guarantee to give the company a free supply of electrical energy up to a certain amount.

London: *Hammersmith.*—An extension of mains to Oilmill Lane at £162 12s. is recommended.

An additional transformer and accessories is required at an estimated cost of £131 9s.

Pontypridd.—A 1,700 ampere-hour storage battery with motor-driven booster, also switchgear, is required. Particulars from Borough Electrical Engineer, and tenders by August 1st.

Rawtenstall.—A Local Government Board enquiry will be held shortly with regard to a loan of £2,000 for street lighting.

Rochdale.—Tenders are invited, by August 2nd, for a twelve months' supply of paper insulated cable. Particulars from Borough Electrical Engineer.

WIRING

Ashford.—Considerable extensions to the South Eastern & Chatham Railway Co.'s locomotive works.

Bradford.—Re-building of Albion Dye Works. Architect, W. T. Holroyd, 55, Tyrrel Street.

Bridlington.—Alterations and additions to the Corn Exchange. Architect, J. Earnshaw, Carlton House.

Bristol.—Reconstruction of Royal Theatre.

Cardiff.—Drill hall for Territorial Forces Association. Architect, J. W. Roger, 14 High Street.

New buildings for National Museum of Wales.

Chadderton.—Town Hall and Public Offices in Middleton Road. Architects, Messrs. Taylor Simister, Oldham.

Hosted by Google

Dundee.—Church and hall in Blackness Avenue.

Edinburgh.—Schools at Fountainbridge and Viewforth. Architect, C. R. Carfrae, 3, Queen Street. Three-story tenement in Gorgie Road, for Hillside Printing Works.

Greenock.—Extensive alterations to W. Kirk.

Greenwich.—Extensions to Miller General Hospital.

Kendal.—Swimming bath, pavilion, and gymnasium for the Council.

London.—Melville Theatre, Shaftesbury Avenue.—Cinematograph theatre at Gaisford Street, Kentish Town.

Tenders are invited, by August 1st, for the installation of 250 lamps at the Great College Street Elementary School, N.W. Particulars from Chief Engineer to L.C.C.

Wakefield.—Extensions to workhouse infirmary.

Ystradgynlais.—Tenders are invited for the electric lighting of Cwmgiedd Chapel. Apply, Cwmgiedd House.

MISCELLANEOUS

Australia.—The Melbourne City Council require 530 A.C. meters, 495 D.C. meters, 133 maximum demand indicators. Particulars from Messrs. McIlwraith, McEacharn and Co., Billiter Square Buildings, London, E.C.

Portsmouth.—The Light Railways Commissioners have extended the time for construction of the Portsmouth and Hayling Island light electric railway. A transporter bridge will be constructed joining the island with Portsmouth and linking up the tramways on the Portsmouth system.

Sweden.—The Swedish Postal Authorities require a supply of 4,000 to 6,000 metal filament lamps, 16-50 c.p. 110-250 volts. Tenders by August 1st to "Generalpoststyrelsens Registratorskontor, Vasagatan," Stockholm.

TENDERS RECEIVED AND ACCEPTED

Dover.—The tenders of the Brush Electrical Engineering Co. for three car-bodies, trucks, and brakes at £303 each, and the British Thomson-Houston Co. for electrical equipments at £272 each, have been accepted.

Huddersfield.—The tenders of Messrs. Dick, Kerr & Co. and the United Car Co. for ten tramcars have been accepted.

London: *L.C.C.*—The following have been received for electric lighting at the Kennington Fire Station, and the Fire Brigade Committee recommend the acceptance of Messrs. Hawkins & Sons' offer:—A. Hawkins & Sons, £229; W. J. Fryer & Co., £248 18s.; G. E. Taylor & Co., £269 15s.; Tilley Bros., £269 15s.; Pinching & Walton, £287; John Bryden & Sons, £314.

The following tenders have been received for electric lighting at the Shadwell Fire Station, the tender of Messrs. Malcolm & Allan, Ltd., being recommended for acceptance:—Malcolm and Allan, Ltd., £202 15s.; Tilley Bros., £206 9s.; E. Newbald & Co., £236; G. Harland Bowden & Co., £280; Tredegar & Co., £280 4s.

The following tenders have been received for electric lighting at the Stoke Newington Fire Station, the tender of Messrs. W. J. Fryer & Co. being recommended:—W. J. Fryer & Co., £168 15s.; Foote & Milne, £176 17s.; E. Lawrance & Sons, £185; G. Weston & Sons, £185; Waring & Withers, £214 10s.; Lund Bros. & Co., £230.

Hammersmith.—The tender of Messrs. Nichols Bros., Gateshead, for the supply of a feed pump at £190 15s. is recommended for acceptance.

Tenders have been received from the Reason Manufacturing Co., Haydn Harrison & Co., Lucy & Co., Wardle Engineering Co., General Electric Co., W. Edgar, Pontifex & Co., and Falk, Stadelman & Co., for the supply of lanterns for side-street lighting. The tenders of Messrs. Lucy & Co. for the supply of brackets and switches at 8s. 10d. each, and of the General Electric Co. for hoods at 8s. 3d. each for street lighting, are recommended for acceptance.

Tenders have been received from Messrs. Venner & Co., Laing, Wharton & Co., Reid & Co., Engineering & Arc Lamps, Ltd., General Electric Co., and Ferranti, Ltd., for the supply of time switches for public electric lamps. In reporting upon the tenders, the Electricity Committee recommend that in view of the cost involved, viz., £1,085, no further action shall be taken in the matter at present.

London & North Western Railway.—Messrs. Wm. Geipel & Co. have again secured a contract for the annual supply of Henrion arc lamp carbons, open, enclosed, and flame type, amounting to nearly 1,150,000 carbons. This is the third year that they have secured this important contract.

Margate.—The Electric and Street Lighting Committee have accepted the tender of the Isle of Thanet Tramways & Lighting Co. for lighting the promenade and approaches with twenty-four 300-c.p. Osram lamps at a total cost of £101 10s. per annum. A tender was also sent in by the gas company, but the Council have preferred electric light.

Swansea.—The tender of the Electric and Ordnance Accessories Co. for a two years' supply of electric motors has been accepted.

The Lea Recorder Co. have recently received orders for their recorders for the following electric power stations:—Dublin, Aberdeen, Stretford, East Ham, Sheffield, Torquay, Cape Town, Walthamstow, Walsall, Eastbourne, Burnley, and Blackburn Municipalities, Dublin United Tramways Co., City & South London Railway, Midland Electric Corporation, County of London Electric Supply Co., and Melbourne Electric Supply Co.

APPOINTMENTS AND PERSONAL NOTES

A well-known central station engineer can thoroughly recommend a first-class Boiler House and Steam Plant Superintendent, whom we shall be glad to put in communication with any Supply Engineer seeking a reliable man for this position.

The Highways Committee of the London County Council received 149 applications for the position of Charge Engineer at the Greenwich power-house. Mr. R. E. Armstrong, at present in charge of the Philadelphia power station of the Newcastle Electric Supply Co., Ltd., is recommended for the post at a salary of £250 rising to £300 per annum.

There were 250 applications for the appointment of fourth Engineer-in-Charge at the Hammersmith Electricity Works, and the Electricity Committee recommend the appointment of Mr. H. Love, at present in the employ of the Great Western Railway Co.

The salary of Mr. H. Bartlett, the Exeter Tramways Manager, has been increased from £160 to £170 per annum.

The salary of Mr. J. W. Turner, Chief Assistant Electrical Engineer to the Huddersfield Corporation, has been increased from £185 to £200 per annum.

We are asked to state that Mr. Harry Guest is not now connected with the Reason Manufacturing Co.

Mr. H. B. Tilley, well-known as the Manchester manager of Messrs. Bruce Peebles, has just left this country for an extended business tour in Canada, on behalf of his firm. He will visit all places of importance in the Dominion, and expects to be away for fully a year.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. (last week, £58 15s. to £59 5s.).

Athletic Club.—Electrical Installations, Ltd. (27 Martin's Lane, Cannon Street, E.C.), have recently organised an athletic club for cricket, football, tennis, &c., and have taken grounds at Edmonton. The Secretary would be glad to hear from other firms in the allied trades with reference to arranging for matches.

Galsworthy, Ltd.—Considerable extensions have just been opened to Messrs. Galworthy's fittings show-rooms at 15 and 16 Newman Street, Oxford Street, which have been redecorated and re-arranged throughout, and contain an excellent selection of examples of fittings in every style.

Patents for Sale.—Two patents relating to electro-mechanical transmission systems of motor road vehicles. (See an advertisement on another page.)

The Benjamin Electric, Ltd.—The telephone number of this firm's new offices and show rooms, at 117, Victoria Street, is Victoria 1297.

Liquidations.—The Batley Electric Carbonising Co., Ltd., is to be wound up voluntarily. Mr. H. Appleyard, Prudential Buildings, Market Place, Dewsbury, is liquidator.

Hosted by Google

Bankruptcies.—W. H. Ridpath, electrical engineer, 20 Bath Street, Ilkestone, has been adjudicated bankrupt.

The first meeting of creditors will be held at 5 Victoria Buildings, London Road, Derby, on July 31st, at 11 a.m., and the public examination will take place at the Court House 20, St. Peter's Church, Derby, August 2nd, at 11 a.m.

The last day for receiving proofs in the bankruptcy of W. H. Illingworth, electrical engineer, 30 Pellon Lane, Halifax, is August 2nd, 1911. The trustee is Mr. W. Durrance, 12 Duke Street, Bradford.

The public examination of T. C. Francis, electrical engineer, 66 Liverpool Road, Stoke-on-Trent, took place last week. The liabilities amount to £513 and the assets to £11. The examination was adjourned.

Canadian Agents Wanted.—A London firm wishes to get into communication with Canadian importers of metal filament lamps and metal filaments for lamp-making, electrical accessories, and bell wiring. Further particulars from Board of Trade, 73 Basinghall Street, London, E.C.

A Toronto firm desire the representation of British manufacturers of electrical supplies.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Melbourne Electric Supply Co.—Resolutions have been passed authorising the raising of £100,000 additional capital.

Electric Construction Co.—The annual meeting was held in London on Thursday. Mr. W. S. B. McLaren, chairman, stated that this year had been commenced with a larger amount of work than in the previous twelve months, and that the directors viewed the future with confidence. The Board looked for a larger output of machinery for use in mines when the apprehensions as to the use of electricity in mines were removed, as there was every reason to believe would be the case before long.

Crompton & Co.—After making the usual provision for depreciation, the accounts for the year to March 31st show a loss of £14,195 10s., bringing the debit balance to £48,272.

Electric and General Investment Co.—A scheme for the reconstruction of this company will be laid before the shareholders at the meeting to-day.

Companies Struck off Register.—The names of the Macclesfield Electric Light and Power Co., and the Phœnix Electric Heating Co., Ltd., will be struck off the register of joint stock companies within three months, unless cause is shown to the contrary.

Vickers.—Interim dividend for the June half-year of 2½ per cent. on the preferred stock, and 1s. per share on the ordinary shares.

Dividends of London Supply Companies.—Interim dividends for the June half-year at the rate of 10 per cent. per annum are recommended on the ordinary shares of the St. James and Pall Mall Electric Supply Co., and 4 per cent. by the Chelsea Electricity Supply Co., and the County of London Electric Supply Co.

NOTICE.

READERS OF "ELECTRICAL ENGINEERING" who do not have their copies posted to them direct from the Publishers are particularly requested to communicate with us, if they do not obtain the paper regularly and punctually. We are desirous that ALL readers should have their "Electrical Engineering" at the earliest moment that it is possible to get a copy to their locality, and upon receiving any complaints, we will take steps to ensure a prompt supply.

SUMMARY

Our monthly supplement on Electrical Engineering in Mines is included in this issue. It opens with an illustrated description of the electrical equipment of the Sneyd Colliery, Burslem, and contains an account of an electrical mining power scheme in the north of France. An illustrated description is given of a new mining telephone, and an abstract of a Paper read recently on high tension mining switchgear. Notes on various matters concerning electricity in mines are also included.

The question of the rating of telephone property after the State acquire the National Telephone Co.'s undertaking, is causing some uneasiness in local circles. A new submarine cable is to be laid between New Zealand and Australia. Some successful wireless experiments from an aeroplane have been carried out in France. (Page 438.)

A letter from Mr. C. Beaver comments on a number of points raised in Mr. W. G. Turner's article last week, on the laying of mains on the solid system. (Page 437.)

Some notes on the variation of flame photometric standards with atmospheric conditions, &c., are given in a Paper by Messrs. W. J. A. Butterfield, J. S. Haldane, and A. P. Trotter, read at the Zürich meeting of the International Photometric Commission. (Page 437.)

The Holborn Council have finally decided to accept the joint tender of the Electric Lighting and Gas Companies for street lighting. (Page 437.)

The Thomas petrol electric system has been applied in a modified form to a railway coach for the Central South African Railways. The Board of the British Electric Traction Co. have prepared a scheme for the rearrangement of the company's capital. The Aberdare and Rotherham Comporation Bills, which provide for the installation of trolley omnibuses, have been passed. There was a loss of £1,110 upon the working of the Great Northern & City Railway Co. for the June half-year. A scheme for the electrification of the Melbourne suburban railways is to be prepared. There was a profit of £232,727 upon the L.C.C. tramways last year after meeting capital charges. (Page 439.)

Amongst the specifications published by the Patent Office on Thursday last was one by H. M. Dudgeon for the protection of the ears and trolley wire on overhead systems. A self-regulating arc lamp, in which both carbons are adjusted by a solenoid, is covered by A. Schmidt. Siemens Brothers' Dynamo Works and C. A. B. D. Koettgen deal with the ventilation of machinery, and the same firm have protected a system of non-interchangeable fuses. Opposition has been entered to the grant of a patent for an insulating material to A. R. Muller and the R. M. D. Syndicate, Ltd. (Page 438.)

A Sub-Committee has been formed to consider the formation of an independent electricity meter testing department at Manchester.—A new scheme of electric supply is nearly completed at Walsall.—There was a net balance of £12,089 upon the working of the Marylebone electricity undertaking last year. Bonuses to the officials amounted to £788.—Stoke Newington Council propose to terminate their agreement with the North Metropolitan Electric Power Supply Co.—A deputation from the Glasgow tramway power house is to visit the works of various makers of turbo-generators. (Page 440.)

Hosted by Google

The Finance Committee of the L.C.C. recommend considerable loans, for electrical extensions, to a number of London Borough Councils.—Bolton Corporation are to apply for £20,000 and Belfast for £40,000.—Loans have been sanctioned at Loughborough, £2,200, and Haslingden, £8,188.—A 5,000-kw. generator and other plant is required at West Ham; generating plant at Whalley Asylum; a high-tension feeder at Stoke-on-Trent, and an induced draught fan at Warrington. (Page 441.)

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

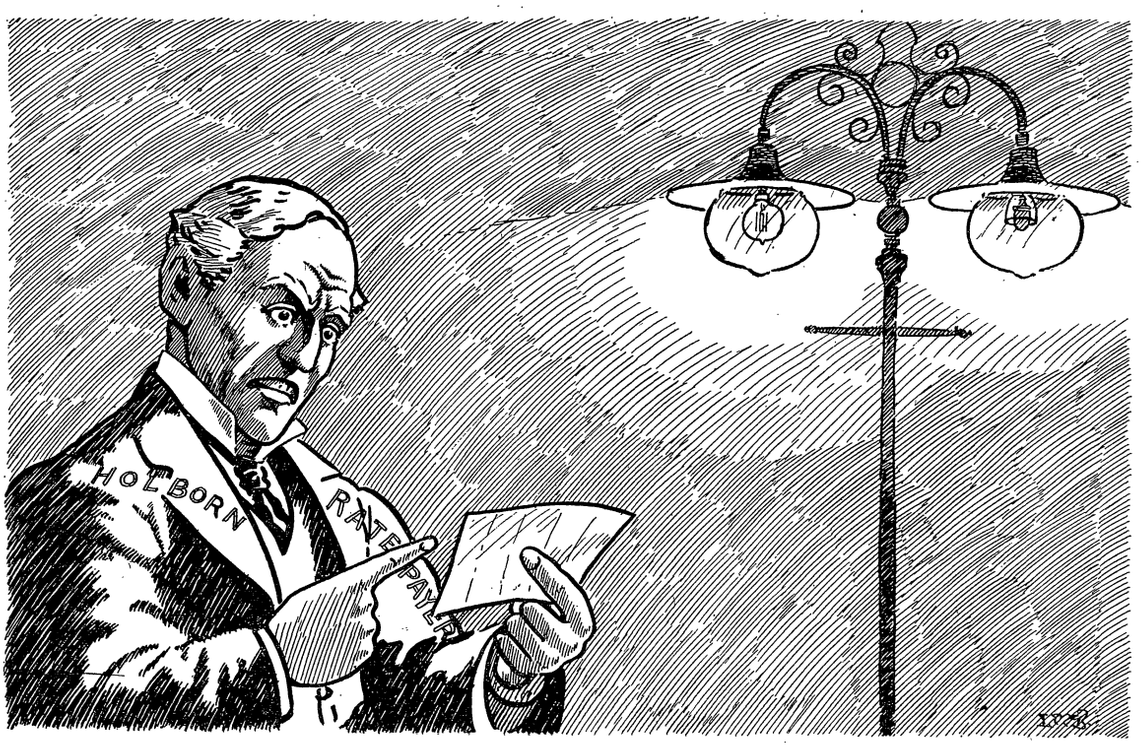
It is stated that the Dundee Town Council are proposing to urge the Government to make provision in the Telephone Transfer Bill with regard to the rating of telephone property in local areas after the transfer of the National Telephone Co.'s business to the State. In Dundee the valuation of the National Telephone Co.'s property is £5,682, but Crown property is exempt from rating, and it is this matter which is exercising some uneasiness in various local quarters.

At the half-yearly meeting of the National Telephone Co. on Thursday, Mr. George Franklin stated that during the past six months more than £200,000 had been expended on constructional work, the Board being assured that all capital now being spent would produce an added sum when the system was taken over by the State. It was anticipated, he said, that by the end of the present year the inventory of the plant would be completed, and that it would then be possible, if necessary, to obtain the decision of the arbitrators as to the price to be paid. Reference was made to the decision of the Post Office to take over practically all the company's plant subject to its valuation later. With regard to the staff, the Board felt that the Postmaster-General had met them in a fair, full, and frank manner, and that the company had now no cause for complaint. He hoped that the same spirit would be applied to the principal officers and others whose claims were now under consideration.

In addition to installing some 700 miles of telephone lines between a number of important centres in the interior of Italy, provision has been made in the Budget for the establishment of the following international lines:—Rome-Milan-Simplon, Turin-Milan, and Genoa-Milan, for communication with Germany; Milan-Swiss Frontier (Chiasso) and Milan-Swiss Frontier-Simplon for direct communication with Bale and Zurich.

The Pacific Cable (Extensions) Bill, which has just been published, authorises the laying of a submarine cable between Australia and New Zealand, and any other extensions that may be agreed between the contributing Governments.

A wireless telegraph station has been established at Fez, in Morocco. Experiments are being carried on with a view to establishing communication with Paris.



A successful experiment with wireless transmission from an aeroplane was carried out on Saturday in France, when two engineer officers sent a message from a biplane flying at about 31 miles from Paris, which was received at the Eiffel Tower station. Thence it was delivered to the Minister of War. The apparatus on the aeroplane weighed about 46 lbs.

The Bristol Corporation Docks Committee have been in correspondence with the Postmaster-General with a view to having a wireless telegraph station erected at Avonmouth. The Secretary of the General Post Office has written, however, stating that it is the intention to establish wireless telegraph stations at Land's End and Fishguard, and these stations, it is considered, will be sufficient without it being necessary to erect an additional station at Avonmouth.

Mr. Remnant asked the First Lord of the Admiralty in the House of Commons on Monday whether wireless telegraphists in the Navy were being prohibited from purchasing their discharges in the ordinary way. Mr. McKenna said that this was not so, although any such application was carefully scrutinised. With the growing requirements of wireless telegraphy in the Fleet, it was desirable that the expansion of this new branch of the service should not be checked more than was necessary.

There are now 141 private owners of overhead wires in the City of London, in addition to 26 companies. The National Telephone Co. has 735,136 spans, compared with 733,956 last year.

In connection with telegraphs there is little to report this week. Communication has been restored with Casablanca, Mogador, and Rabat, while the Cayenne-Salinas cable of the Compagnie Française des Cables Télégraphiques was once more interrupted on July 29th, and this breakdown is likely to last some time, judging by past experience. The line between Rome and Constantinople was down on July 31st.

THE DISSATISFIED CONSUMER—"My street lighting bill raised."
[The Holborn Borough Council has finally accepted the combined tender of the Gas and Electric Lighting Co.s for street lighting at £7,645 per annum. The Electric Lighting Co.s had previously offered to do the work for £6,602.] (*With apologies to a well-known poster.*)

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

ELECTRICAL EQUIPMENT OF THE SNEYD COLLIERY, BURSLEM

TWENTY years ago the owners of the Sneyd Colliery, Burslem, laid down a small lighting set to light their offices. Eight years later they put down a 50-kw. three-phase Westinghouse engine generator set for power purposes, operating two haulage systems (a 20-h.p. main and tail and a 20-h.p. endless rope) and a 30-h.p. pump. This was something in the nature of an innovation, being one of the very earliest applications of the three-phase system to collieries in this country, but it proved so successful that the Company decided to convert all the haulages in their mines, and for this purpose built their present power station. The plant next installed consisted of two 250-kw. Howden high-speed engine sets, running at 375 r.p.m. direct coupled to three-phase 25-cycle 440-volt alternators, with exciters separately driven by small steam sets, plenty of space being left for extensions.

In its two years of service this plant showed so many economies and advantages that it was further enlarged by the installation of a 500-kw. turbo-alternator set. The turbine is of the Rateau type, run on exhaust steam from the winding engines, with a thermo-accumulator interposed, and drives a British Westinghouse three-phase 25-cycle 440/500-volt turbo-type alternator, with coupled exciter, the set running at 1,500 r.p.m. Steam is supplied to the engine sets by three Babcock & Wilcox and six Lancashire boilers working at 120 lbs. and 90 lbs. pressure respectively, the Babcock & Wilcox grates being designed to burn the fine slack from the screening plant.

The switchboard is mounted on a platform at one end of the station, and comprises three generator and four feeder panels, fitted with the usual meters, overload circuit-breakers, &c., the rheostats for voltage regulation being placed at the back of the board and operated from pillars in front. The supply is led to the various motors installed on the surface and to the top of the pit shafts by underground cables, and thence down the pit to sub-stations.

There are three pits, known as No. 2, No. 3, and No. 4, the electrical machinery in No. 2 pit comprising eleven motors, totalling about 380 h.p., all engaged either in haulage or pumping work. The main haulage to the pit-bottom is a single drum set, capable of dealing with six tubs per wind, each tub carrying approximately 12 cwt. of coal. These are hauled up a gradient of 1 in 3 for a distance of 160 yards, the motive power being furnished by 100-h.p. 440-volt Westinghouse slip-ring motor, running at 475 r.p.m., driving by ropes to the haulage pulley, which transmits the power through a friction clutch and helical gearing to the drum, the haulage ropes being ¾ in. steel wire. The control for this unit is effected by means of an oil-immersed reversible controller. There are also the following haulage gears in this pit :—One 75-h.p. single-drum gear drawing nine waggons up an incline of 1 in 4½; one 75-h.p. endless-rope plant; and three 20-h.p. single-drum haulage sets. These are semi-portable, the gears, motor, controller, and resistance all being fixed in the same bed-plate. The sump at the pit-bottom is dealt with by two three-throw pumps, each having a lift of 750 ft., driven by a 50-h.p. squirrel-cage motor running at 710 r.p.m. through an 8-in. canvas belt, one being kept as a spare whilst the other is in use. One of these sets is shown in Fig. 1. Three small pumps, each driven by a 3-h.p. motor, act as an auxiliary plant.

The distribution switchgear supplying these motors is situated at the pit-bottom, and current is led by three single-

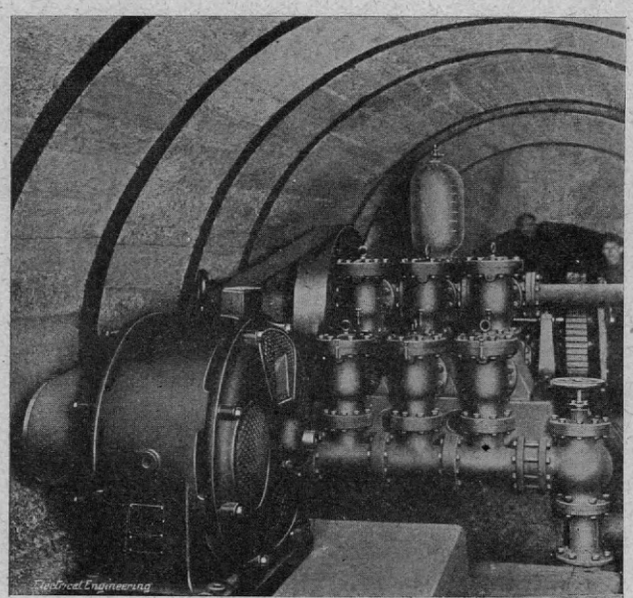

FIG. 1.—30-H.P. WESTINGHOUSE MOTOR DRIVING 3-THROW SCOTT & MOUNTAIN PUMP.

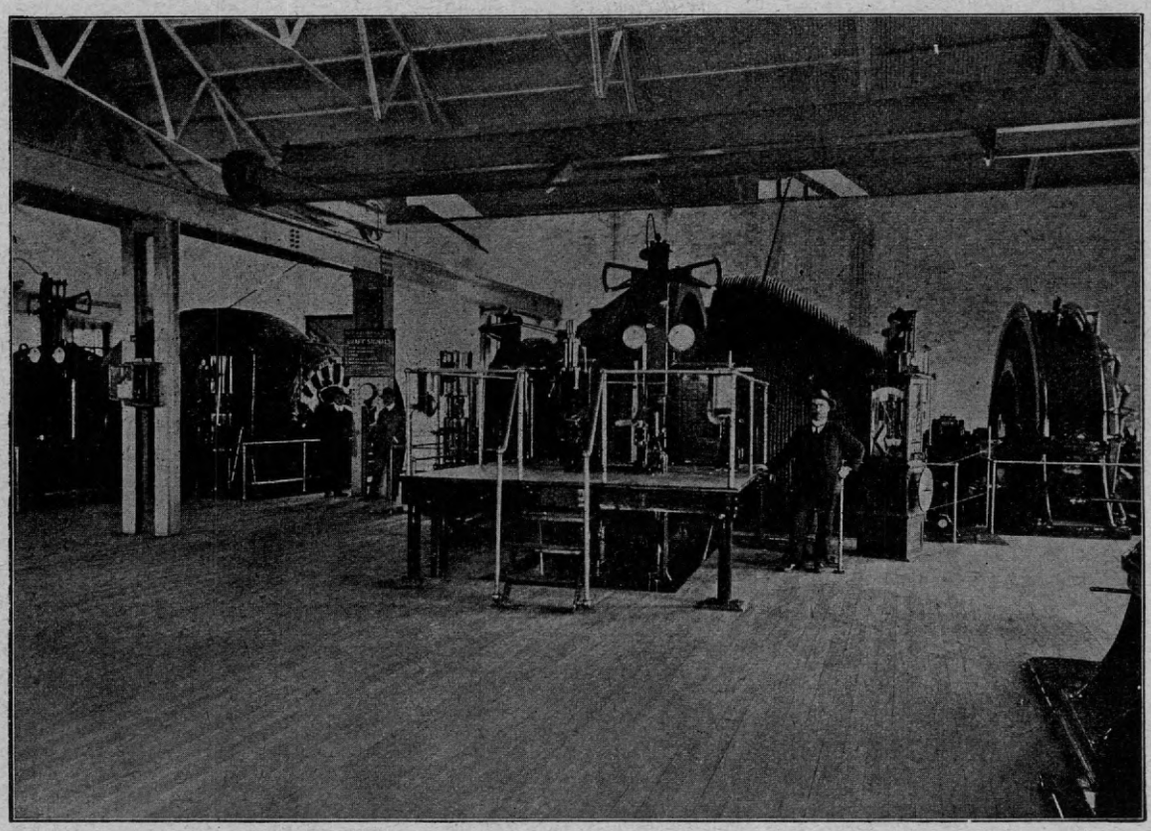
core cables to busbars at the back of the distribution board. The feeder switches are of the totally enclosed, automatic, oil-immersed type, specially designed for mining work, the necessary meters being fitted within the casing of the switch. The gear is mounted on two iron pillars, and forms a complete dust-proof, water-proof, and, more important still in colliery work, gas-tight, iron-clad distribution board, from which the current is led to the various motors by feeders made up of three-core armoured cables.

In No. 3 pit six motors are installed, the aggregate h.p. amounting to 333. A three-throw ram pump, having a duty of 200 gallons per minute against a head of 1,200 ft., is driven by means of ropes from a 100-h.p. slip-ring motor. A Riedler pump to which a motor of 75 h.p. is attached is provided as a stand-by. Two other pumps act as auxiliaries, viz., a centrifugal pump driven by a 5-h.p. motor, and a small portable three-throw ram pump connected by gearing to a 3-h.p. motor. There are two single drum-haulage gears drawing waggons up inclines of 1 in 3 and 1 in 4½ respectively, and both operated by 75-h.p. slip-ring motors.



In No. 4 pit there are two types of haulage, namely, main and tail and endless rope, which differ from the single-drum

Hosted by Google

type employed in No. 2 and No. 3. The single drum, as its name implies, consists of a single drum winding a single rope, and, therefore, the gradient must be steep enough to allow the tubs to draw the rope back by gravity; in the main and tail type, however, the main rope hauls the full tubs, and the tail rope takes back the empties. In No. 4 pit there are two of these haulages, both driven by 75-h.p. motors, each capable of dealing with 30 trucks at an average speed of five miles per hour. In the endless-rope type of haulage the rope is passed two or three times round a "C" pulley, and then round a guide wheel at each end of the road, the tubs being affixed to the rope by clips. It will be seen that to allow of the use of this type the road must be wide enough to allow two tubs to pass each other at any point on the route. In this particular case, illustrated in Fig. 2, a 20-h.p. squirrel-cage Westinghouse motor drives the haulage pulley by ropes, thence by pinion and spur wheel to the "C" pulley. The switchgear operating the motor consists of a totally enclosed oil switch, similar to those used on the distributing board, and an oil-immersed controller. All the haulages in the mine are fitted with strong brakes of the band type. There are also two single-drum haulages in this pit, driven by 20-h.p. slip-ring Westinghouse motors, and controlled by tramway-type controllers dealing with four tubs on a 1 in 4½ gradient. Two 5-h.p. squirrel-cage motors are used to operate creepers,

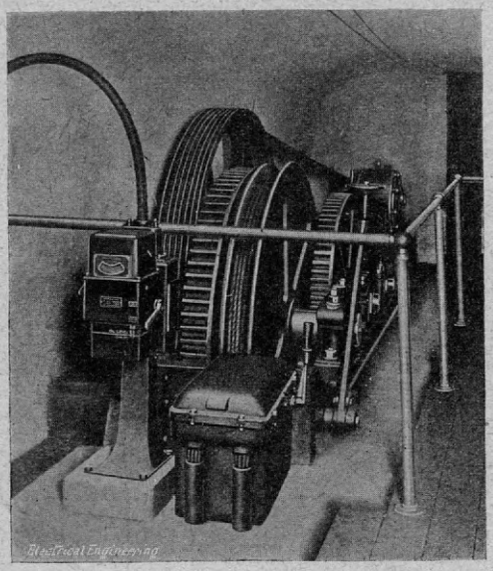

FIG. 2.—20-H.P. WESTINGHOUSE MOTOR DRIVING ENDLESS ROPE HAULAGE GEAR.

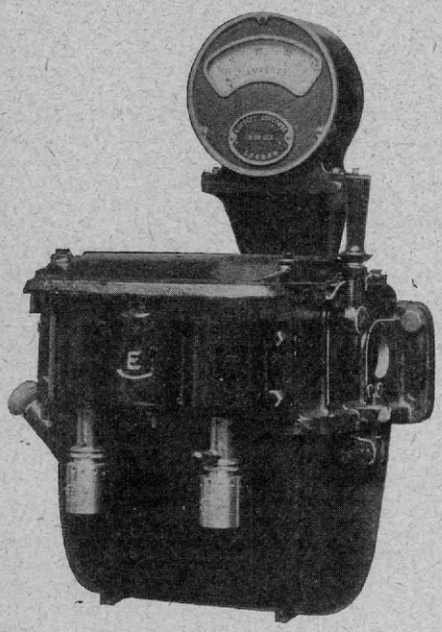
one for raising loaded tubs, and the other empty tubs, both working at the pit-bottom. One motor of 50 h.p. drives by means of a belt a two-stage air compressor, the air being used for percussive drills, and two small haulage winches.

Hydraulic rams are used to push the full tubs into the cage, and at the same time push the empties off, a three-throw pump driven by a 10-h.p. motor supplying the water pressure. This is a most useful device, and saves a great amount of time and labour in getting the coal to the surface. The total h.p. of the ten motors working in this pit is 300. The cages are of the four-deck type, capable of carrying eight tubs of coal per wind, and are operated by 2,000-h.p. steam winding engines working at 90 lbs. steam pressure.

On arriving at the surface electricity is again requisitioned to convey the coal to the screens, and also in the actual operation of screening. At the pit-brow there is a 20-h.p. motor driving a creeper by pinion and spur wheel, which is capable of pulling the loaded waggons up the incline to the screen, into which the coal is tipped by power-driven tipplers. The screens are large rectangular sieves, placed on a slant, and shaken by eccentrics, the latter being driven by a 150-h.p. motor. As the coal drops through the screens it is conveyed on belts to the chutes, the dirt being picked out by boys, and carried away by a small conveyor belt, known as the dirt belt. There are altogether five 5-h.p. Westinghouse motors operating these belts, and a 10-h.p. motor controlling the hoisting gear for raising the jib ends of the belt, and so minimising the breakage of coal falling from the belts. An interesting feature of the screens is the installation of Westinghouse-Cooper Hewitt mercury-vapour lamps, the light from which is admirably suited for coal picking. A fan driven by a 20-h.p. motor extracts most of the dust and delivers it in a "Maxaner" apparatus, when it is mixed with water and allowed to settle, the sediment being afterwards dried and burnt in the boiler fires.

In the fitting shops a 3-h.p. squirrel-cage Westinghouse motor is doing splendid work, driving line shafting from which three lathes, a radial drill and drilling machines, and a 6 ft. by 2 ft. planer are operated; whilst in the next shed a 20-h.p. motor drives a 4 ft. circular saw. Electric motors are also used to operate the blacksmith's shop and the crane, the latter being worked by two motors, a 20-h.p. British Westinghouse slip-ring motor for hoistiing, and a 6-h.p. 110-volt D.C. motor for slewing the crane. There are at present 53 motors installed, totalling 1,440 h.p., varying in size from a small 3-h.p. pump motor to a 150-h.p. motor driving the screens, all at work saving time, labour, and, therefore, money for the Company.

We have to express our indebtedness to Mr. J. Gregory, the Manager of the Sneyd Collieries, Ltd., Burslem, for permission to publish the foregoing interesting details, and to the British Westinghouse Co. for the photographs from which the illustrations are reproduced.



Electric Safety Lamps.—At an inquest on Saturday at Bryncethin, on two men who lost their lives owing to an escape of gas, it transpired that electric safety lamps were in use at the time. Colonel Pearson, inspector of mines, adopted the view that electric lamps were not "safety" lamps within the meaning of the Act, although, when questioned, he admitted that had ordinary safety lamps been in use there would have been more likelihood of explosion. The jury found that the deceased had died through suffocation, but added that if they had been using safety lamps the deaths would not have occurred.

A Primary Battery Lamp.—In the proceedings of the South Wales Institute of Engineers, an electric safety lamp for miners is described, in a Paper read by Mr. A. Leighton Stevens. This compares favourably with some of the requirements set down in connection with the prize of £1,000 which has been offered. (See ELECTRICAL ENGINEERING of June 1st, 1911, Supp. XLI.) Its main feature is that it is worked by a primary battery. This consists of a carefully packed glass pot and a carbon cylinder, arranged in an aluminium case. The liquid in the cylinder is prevented from spilling by means of a rubber plug, which seals the cylinder, and at the same time holds the zinc. There are no switching arrangements, the amount of fluid being so arranged that inverting the battery puts it out of operation. The lamp, which weighs about 3¼ lbs., will give a full light for eight hours, at a cost of a little more than 1d. per unit, and the life of the bulb would be about 800 hours.

The Home Office Rules.—We referred in a recent issue to the announcement by the Home Office that an arbitrator had been appointed to consider objections to the new electrical mining order. The following is the text of the circular in question, which is signed by Sir Henry Cunynghame, Permanent Assistant Under Secretary: "I am directed by the Secretary of State to say that he has received a number of objections from owners of mines under the Coal Mines Regulation Acts to the new special rules relating to the installation and use of electricity which have been proposed to them. It has consequently been necessary for the inspector of mines in charge of each district to appoint an arbitrator in the matter, in pursuance of the provisions of Section 47 of the Coal Mines Regulation Act, 1887, and each of the inspectors has accordingly appointed Mr. James Swinburne, of Victoria Street, London, S.W., as arbitrator in the matter of objections to the rules received in respect of mines in his district. The Secretary of State trusts that it may be possible to settle the matter without arbitration, but as objection has been formally made to the rules, it is necessary, under the Act, that an arbitrator should be appointed."

The Coal Mines Bill.—When the new Mines Bill was under consideration of the Standing Committee of the House of Commons, of which Mr. E. Wason is Chairman, on July 19th, discussion was resumed on Clause 20, which seeks to limit the use of electricity in mines. The amendment proposed by Mr. S. Walsh that electricity should not be used in any part of a mine where safety lamps are in use, was rejected by 26 votes to 13, and Sir A. Markham then moved to add the following words to the clause:—"If in any place of a mine, or part of a ventilating district of a mine, the amount of inflammable gas in the air current exceeds one-half per cent. or upwards, the use of electricity shall at once be discontinued in such place or part of such ventilating district where the inflammable gas exists till the air current is clear of the same, or shall not exceed one-half per cent." The amendment was opposed by Mr. Hunter, who said that not only would electricity be then prohibited at the place where safety lamps were used, but also in mines where naked lamps were used. The presence of a half per cent. of gas was not necessarily dangerous. The amendment was, however, carried by 15 votes to 12. A new sub-section proposed by Mr. Hunter was also agreed to, reading as follows: "When any question under this section is to be settled by arbitration, the owner, pending the settlement of the question, shall comply with the requirements of the inspector, subject to an appeal to the chief inspector."

AN ELECTRICAL MINING POWER SCHEME IN THE NORTH OF FRANCE

A PAPER by M. Besson recently published in the *Bulletin* of the Société Internationale des Electriciens, describes the electrical equipment of a group of mines at Lens, in the north of France, which is a fine example of the utilisation of waste power from both coke oven gas and exhaust steam, and of electric power supply on a large scale. The electrical energy produced is used for ventilation, pumping, coal screening, and workshop driving and lighting, and in the case of two of the newest pits for main shaft winding. In addition to this, surplus power is sold to a neighbouring power company (Compagnie électrique du Nord), to whose 15,000- and 45,000-volt transmission lines the colliery station is connected through a step-up sub-station.

There are, in addition to the coke oven gas and exhaust steam plants referred to below, four high-pressure steam generating stations at different points about the group of mines. Three of these adjoin the riverside chemical works at Vendin-le-Vieil, some distance from Lens, and one is at pit No. 3, the other side of Lens. The first three contain generating sets supplied with steam from boilers fired by coke oven gas, with a few coal-fired boilers in case of shortage of gas. One of these contains a slow-speed horizontal engine driving an 800 k.v.a. flywheel alternator installed in 1902, and a 1,250 k.v.a. Brown, Boveri-Parsons type turbo-alternator manufactured by the Compagnie Electromécanique du Bourget, exhausting into a Westinghouse-Leblanc condenser, and running at 3,000 r.p.m. The second station, dating also from 1902, contains three 850-kw. sets driven by Corliss type engines. The third station was only recently completed and contains only turbo-generators. These are three in number, also of the Brown, Boveri-Parsons pattern, each for 1,750 kw. running at 1,500 r.p.m. The boilers at this station, which are of the Belleville water-tube type, are arranged to be fired either by coke oven gas or by coal burned in "Underfeed" automatic stokers. The equipment is thoroughly up to date, with economiser and superheaters, and a steam consumption at full load of 17·9 lbs. of steam per kw. hour is obtained. The generating plant referred to above at pit No. 3 is only of very small size, consisting of one 180-kw. Brown-Boveri turbo set, taking steam from boilers supplying the winding engines, &c.

Passing now to the gas-driven stations, we have one (at pit No. 8) containing a single 360-kw. alternator direct driven by an engine with two double-acting tandem cylinders taking the waste gas from a battery of coke ovens. The other gas-engine station by the riverside is much larger, and is designed for three 800-kw. sets and two 1,600-kw. The first three engines, which are of the Augsburg-Nurnberg type, with two tandem double-acting cylinders each, are already in place. The large sets will be similar, with two lines of cylinders. The engines have cylinders 34 ins. diameter by about 42 ins. stroke, and run at 107 r.p.m.; each carries a 25-ton flywheel and drives a Westinghouse alternator. There are four exhaust steam turbo-generator installations (at pits Nos. 5, 8, 13, and 11), the last of which is not yet completed. That at pit No. 5 is solely an exhaust steam plant, but in the other three, mixed pressure turbines are used. All these equipments are provided with Rateau heat accumulators of varying sizes, designed to keep the steam pressure reasonably constant during a stoppage of the steam winding engines of 50 seconds. In the case of pit No. 5 provision is made, in case of long stops of the winding engine, for admitting live steam to the turbine through a reducing valve, but in the other three cases true mixed pressure turbines are employed, in which separate wheels are provided for the high-pressure steam. Westinghouse-Leblanc condensers are used in all these installations; condensing water in one case is taken from a canal, but in the other three instances cooling towers are employed. The turbo-alternator at No. 5 pit is of 550-k.v.a. capacity, and was made by Sautter Harlé and Co., of Paris. The steam consumption obtained has been 37·5 lbs. per kw. hour on full load with steam at 15·7 lbs. per sq. in. absolute, and 1·4 lbs. per sq. in. back pressure. At pit No. 8 a 1,000-kw. Curtiss vertical shaft mixed pressure turbo-generator by the French Thomson-Houston Co. is installed, taking exhaust steam from two winding engines, two air compressors, two fans, and the coal washing and screening plant. At full load with high-pressure steam alone the consumption is 22·8 lbs. per kw. hour, and with low-pressure steam alone, 36·9 lbs. per kw. hour. The set at pit No. 13 was supplied by the Société d'exploitation des Appareils Rateau; the turbine was manufactured by Messrs. Brosse et Fouché, of Nantes, and drives a 550-kw. Brown-Boveri alternator, and a similar set of 630-kw. is being erected at pit No. 11. The current from these generators, which have been put down from time to time at convenient points, and all generate at 5,000 volts three-phase 50 cycles, is distributed by a network of underground cables aggregating some 56·3 miles, running all through the group of mines. This network springs from a principal distributing station near the river, to which the feeders from the four generating stations in its immediate neighbourhood are taken. The other stations are connected up to the main network at convenient points. In the riverside district some 3,900 kw. is utilised, and the next largest receiving point is pit No. 15, where plant is being installed that will absorb 1,300 kw., and will include two electric winders, two large ventilating fans, a pair of turbo air compressors, and a number of motors for general purposes.

The winders were equipped by the French Thomson-Houston Co. Both employ Koepe pulleys, driven in one case by a pair of direct coupled motors, one on either side, and in the other case by a single motor. These winding motors are for continuous current, and are supplied with current from Ilgner equalising sets with 18-ton flywheels. The motor of each flywheel set absorbs about 270 kw. continuously, and by the aid of the flywheel, peaks at 434 kw. are supplied to the winding motors, which work at voltages varying up to 300. The load is 4·4 tons including cage, the shaft is 2,300 ft. deep, and a maximum rope speed of 1,970 ft. per min. is attained. The ventilating fans are driven by 225 h.p. motors direct off the 5,000-volt three-phase circuit. Electrically driven ventilating fans have also been installed at five other pits, where electric power is also used for pumping, driving the washing and screening plant, and general workshops. The total plant capacity of the generating plant now at work is 18,220 kw., and as the aggregate motor connections only amount to 11,520 kw., there is a fair margin of power available for supply to the Compagnie électrique du Nord.

Electrical Mining Accidents.—A coroner's jury at Trimdon Grange on July 5th returned a verdict that a screensman named M. Vickers met his death on June 26th by electric shock through coming in contact with a pipe containing a cable. The medical evidence was to the effect that it was impossible to say whether current had passed through the man's body. He had a diseased heart, and the actual cause of death was cardiac failure.

A coal cutter accident, in which a man was killed by the starting of the cutter before he was ready, occurred at Emley last month. It appears that when the trailing cable plug was inserted in the switchbox eighty yards away, the cutter started owing to the switch on the machine having been accidentally left on or knocked on.

An electrician named R. Craggs received a fatal shock on July 8th while examining a switch pillar at Swalwell Colliery, owing, probably, to the switch cover having become live. Although he had rubber gloves with him, he had only one on at the time. The pressure was 440 volt alternating.

MINING TELEPHONES

THE accompanying illustration shows one of a special series of magneto and battery call telephones particularly suited for mines, steel works, and use on board ship, which Messrs. Haslam & Schontheil, Ltd. (11, Windsor Place, Cardiff), are putting on the market. The particular instrument depicted is a magneto instrument, and is shown with the cover removed. The cases are of cast-iron, fully water-

MINING MAGNETO CALL TELEPHONE, WITH COVER REMOVED.

tight, and the transmitter and receiver are so connected by flexible tubes to aluminium mouth- and ear-pieces that they only require one hand for use. There is an automatic switch, so that there is no need to hold down a speaking key as in ordinary hand combination sets, and there are no exposed cords to break or wear. Loud and clear speaking is obtained, and there should be considerable field for apparatus of this type.

HIGH TENSION MINING SWITCHGEAR

A PAPER on this subject by Mr. F. B. Clark was read last month before the South Staffordshire and Warwickshire Institute of Mining Engineers. The author emphasised the advantage of oil-immersed switches for all underground work, even for low pressure, and the necessity for making them capable of dealing with the full short-circuit current which can arise in the particular circuit. Overload trips should be used in preference to fuses, especially underground. Where the neutral point is insulated, it is sufficient to have these on two phases, but otherwise there must be used one on each phase.

Speaking of motor starters, he recommended the use of squirrel-cage motors wherever possible started by the auto-transformer or the star-delta method. Where slip-ring motors must be employed, liquid starters were often used, but for frequent starting and stopping, as in main and tail haulage, metallic starters were preferable. The resistances should be well protected, and in wet and very dusty places oil-immersed resistances were preferable. For underground use controllers should be oil-immersed, even for circuits of low pressure, and the horizontal type, with the drum fixed to the cover, was preferable to the vertical type, as the latter, when oil-immersed, did not lend itself so readily to inspection.

On large systems automatic leakage protective devices were advisable as well as overload trips, and the Merz-Price system had given good results. Although these leakage protective devices undoubtedly prevented severe arcing, it had not been proved that any of them would prevent arcing altogether, quick as their action might be when a high-tension cable suddenly developed a fault. It might therefore be argued that protective devices would not inevitably prevent the ignition of gas should it be present where a cable is damaged; but, by preventing severe arcing, they lessened to a certain extent the risk of ignition of either gas or coal dust.

Generally speaking, underground switchgear should be compact and simple, with a minimum of instruments, absolute protection being more desirable than immediate accessibility. It should be interlocked, so that no part can be got at unless "dead." It is not desirable to enclose more space than is absolutely necessary, but ample clearance between the internal parts and earthed outer casing should be provided. In order to make the gear more compact, makers have on the whole erred on the side of too little clearance.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during July.

July 6th.—Monthly supplement on Electrical Engineering in Mines, containing an article on Prof. Redmayne's report on the Hulton colliery disaster, and some notes on electric power in the Kent colliery works.

July 13th.—Illustrated description of the large new power-house of the Newcastle-upon-Tyne Electric Supply Co. Details of a new automatic voltage regulator.

July 20th.—Report of a Paper on magnetic separator for the concentration of tin ores. Description of an automatic clutch for use with alternating current motors.

July 27th.—A practical article on the laying of mains on the solid system.

Electric Haulage Gears.—We have received from Messrs. H. Mackay and Co. (4 Southampton Row, W.C.), who are now sole selling agents of the Falcon Iron Works, Ltd., Oldham, some particulars of electric and other haulage gears manufactured by the latter firm. The electric-driven gears include a standard single-drum haulage made in sizes from 5 to 500 h.p., and suitable for either surface work or underground work. It is built upon a strong steel girder framework requiring little or no foundation. The first motion gearing is machine-cut, with a raw hide pinion and cast-iron spur-wheel. The second motion gear is machine-moulded. The drum is fitted with claw clutch and very powerful foot brake. Rope-driven endless rope haulages are also listed.

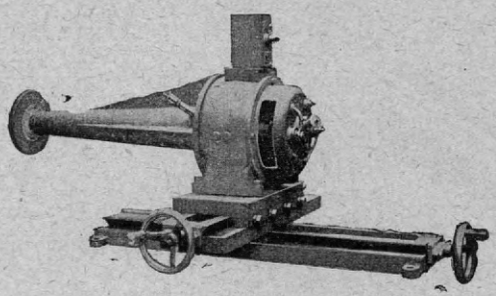
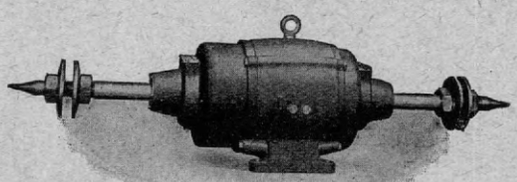
"Witton=Kramer"

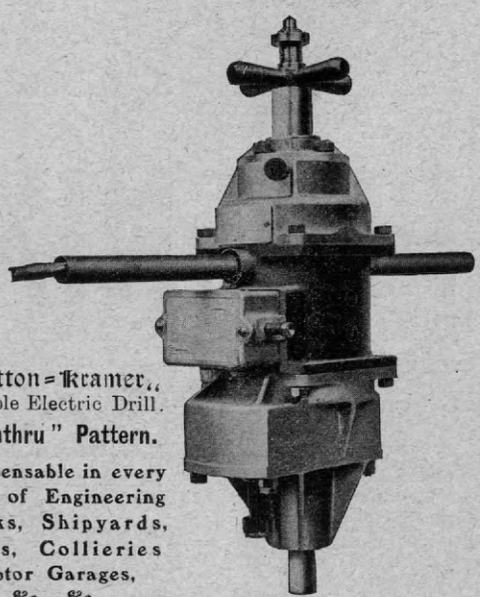


PORTABLE ELECTRIC TOOLS

COMPRISING GRINDING EQUIPMENTS, POLISHING MACHINES, DRILLING AND TAPPING OUTFITS, TUBE CLEANING EQUIPMENTS, MAGNETIC DRILLING PILLARS, FLEXIBLE SHAFTS, &c., &c.



"Witton=Kramer" Transportable Drilling Equipment, consisting of Trunnion Type Motor, flexible Shaft and Drill Head.



Every part is of extra solid construction for heavy duty.

"Witton=Kramer" Electric Grinders.
Long Snout Pattern.
An excellent Tool for internal grinding of cylinders, ruing up commutators of large machines, &c.

"Witton=Kramer" Electric Polishers.
"Double Spindle" Type.
Designed for heavy and continuous work.
Large Spindle diameter and extra long bearing.
Unequalled for quality, price and construction.

"Witton=Kramer"
Portable Electric Drill.
"Runthru" Pattern.
Indispensable in every class of Engineering Works, Shipyards, Mines, Collieries Motor Garages, &c., &c.

Highly recommended for breakdown-repair work and outside erection work.

CORRESPONDENCE

THE LAYING OF MAINS ON THE SOLID SYSTEM.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The article by Mr. W. G. Turner in your issue of the 27th inst., is excellent both as regards scope and detail, and I should like to be allowed to supplement it with a few brief remarks on the subject of materials.

With regard to the troughs, cast-iron has been largely used in this country for E.H.T. cables, because of its "earth shield" facilities. The bolting together of the sections, and the clipping down of the cable to iron bridges in the trough, constitute all the bonding that is required in connection with it. In tropical countries it is also said to shield the cables from lightning effects. Incidentally, it also shields the cables from electrolytic effects arising from external sources. These features, together with the mechanical soundness pointed out by Mr. Turner, probably render it the most permanent method. There are, however, few jobs which justify the expense entailed by its use.

Asphalt troughs properly jointed and filled are ideal as regards the permanency of the materials and the protection afforded to the cables. They have given excellent results in all climates. In a discussion on Mr. C. Vernier's Paper at the Institution in London, Mr. F. J. C. Snell and Mr. Roger Smith spoke very highly of the Howard asphalt troughing, the former as to its efficiency in protecting cables under sub-tropical conditions, and the latter as to electrical tests between cable sheaths and earth, the values obtained being, it was stated, quite sufficient to prevent electrolysis.

Unlikely as it may appear at first sight to those unfamiliar with the Howard asphalt troughing system, it has been conclusively proved that as regards heat dissipation this system is very considerably superior to either the earthenware or wood troughing systems. Ordinarily, these more usual solid systems constitute the worst methods of laying from this point of view, whereas the Howard system is closely comparable with the best system for heat dissipation, *i.e.*, armoured cable laid direct in the ground. The asphalt is non-absorbent, and there is therefore no chance of a general leakage through it from cable sheaths in course of time, as there is in the case of wood and the grade of earthenware usually used for troughing.

The well-known instances of cable failures at wood bridges in wood troughing have had exact parallels in the case of earthenware troughs in which the bridges are moulded on the inner surface of the trough. Generally speaking, it should be remembered that porous earthenware can no more be protected from the percolation of moisture by capillarity by a thin glazing, than fibrous material such as wood can be prevented from absorbing water by tarring, creosoting, or compounding. Asphalt bridges have come to the rescue of these two forms of troughing, and should, in my opinion, be invariably used in conjunction with them. The criticisms as to their softening under the heat of the compound and the mechanical pressure of the cables referred to by Mr. Turner, are, as he also states, quite erroneous. Such criticisms have been made in ignorance of the physical properties of the material, which, although softened by heat, does not liquefy, or even lose its shape, unless mechanical pressure is applied considerably in excess of anything met with in cable-laying conditions. Porcelain bridges which are quite non-absorbent are now easily obtainable. They should preferably be unglazed and finished with a matt surface to assist the adhesion of the trough compound. It is good practice to expel surface moisture, and form a prepared surface by immersing them in the hot trough compound before placing them in the trough.

With regard to trough-filling compound, I quite agree with Mr. Turner that refined Trinidad bitumen is the best material for the purpose, and would point out that this is especially so where cables in the trough are liable to become heated through overload, because for a given temperature rise pitch mixtures are much more liable to flow. In this connection, it is well to remember that the solid system of laying, so far as wood and earthenware troughs are concerned, is the worst system as regards dissipation of heat. For ordinary conditions of load, such as obtain with lighting feeders, pitch compounds are very satisfactory. The usual abstract statements as to "weathering" effects on pitch as compared with refined Trinidad bitumen do not apply, because the practical comparison is not between surfaces but between solid masses.

In conclusion, I would emphasise Mr. Turner's remarks as to the necessity for dry and clean conditions in all solid systems of cable laying.

C. BEAVER.

Trafford Park, Manchester.
July 31st, 1911.

PHOTOMETRIC FLAME STANDARDS

A PAPER by Messrs. W. J. A. Butterfield, J. S. Haldane, and A. P. Trotter, read at the meeting of the International Photometric Commission at Zürich, in July, contained a record of a research on the corrections for the effects of atmospheric conditions on Photometric flame standards. The effects of the pressure, degree of humidity and vitiation of the atmosphere on the Harcourt pentane and Hefner amyl-acetate lamps were investigated by the aid of a steel chamber, sufficiently commodious to accommodate two observers (placed at the disposal of the authors by the Lister Institute of Preventive Medicine), in which any variation of conditions could be made and recorded. The lamps were placed below a hood directly connected with the outlet airway. A small metal filament lamp fed by accumulators and considerably underrun to obtain a suitable colour, was at first used as a standard, but subsequently a Fleming-Ediswan carbon standard was used. The methods employed and the results are detailed in the Paper. The principal results may be summarised as follows:—The curve connecting air pressure and correction factor is for the Harcourt lamp nearly a straight line for the range of 700 to 850 mm., and shows that within these limits the light increases or decreases by 1 per cent., with an increase or decrease respectively in pressure of 12·5 mm., or that a variation of 10 mm. in pressure is attended by a variation in the same sense of 0·8 per cent. in the light afforded by the lamp. The curve for the Hefner lamp is likewise nearly a straight line for the range of 700 to 850 mm., and shows that within these limits the light increases or decreases by 1 per cent. with an increase or decrease respectively in pressure of 25 mm., or that a variation of 10 mm. in pressure is attended by a variation in the same sense of 0·4 per cent. in the light afforded by the lamp. Sets of observations on the Harcourt lamp showed that a change in the temperature *per se* of the air from 8° C. to over 20° C. had no definite effect on the light afforded, but the light of both the Harcourt and Hefner lamps decreases by 1 per cent. for an increase of 0·16 per cent. in the aqueous vapour in the air, so that an increase of 1 per cent. in the aqueous vapour in the air is attended by a decrease of 6·25 per cent. in the light of the lamps. It was also found that 1 per cent. decrease in the light of the Harcourt lamp was caused when approximately 0·035 per cent. of carbon dioxide was present in the air, and in the light of the Hefner lamp with 0·045 per cent.

STREET LIGHTING IN THE BORO' OF HOLBORN

AT the meeting of the Holborn Borough Council on Wednesday last week, the report of the Works Committee recommending the Council to adopt the joint tender of the Electric Light and Gas Companies for street lighting at an annual cost of £7,645 (ELECTRICAL ENGINEERING, July 27th, page 427), was agreed to without the recommendation being put to the vote. The only speaker on the report was Alderman Green, whose argument seemed to be that the 425,000 c.p. provided for in the agreement was excessive for the needs of the Borough, and he incidentally complained that the Works Committee in their last consideration of the matter had treated it in a somewhat cursory manner, "as if they had had enough of it," to which remark several councillors added, "Hear, hear." Thus the Holborn street lighting problem is at last disposed of, although the ratepayers have the doubtful satisfaction of having to pay the £7,645 per annum for the combined scheme of electric and gas lighting against £6,602, for which the electric lighting company offered to carry out the work.

Crystal Palace School of Engineering.—The annual ceremony of the award of certificates was held yesterday, Sir Almeric W. Fitzroy, Clerk of the Privy Council, in the chair.

University College.—In the Faculty of Engineering at University College, London, an Entrance Scholarship of the value of 120 guineas, instituted by a Fellow of the College, will be competed for in September next. Candidates must have passed the University of London Matriculation, or an examination accepted in lieu thereof. The post-graduate courses for next session will include a course by Mr. F. Bacon on "The Photomicrographic Study of Metals"; a course by Mr. A. R. Low on "The Design and Calculation of Aeroplanes"; a course by Mr. W. J. Goudie on "Steam Turbines"; and a course by Mr. H. P. Philpot on "Some Modern Methods in the Design of Structures."

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 27, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

23,536/10. **Protection of Trolley Wire and Ears.** H. M. DUDGEON. To reduce the rapid wear of the ears and trolley wire due to arcing, the contact area between the conductor and collector is increased by suspending a supplementary conductor of flexible wire or strip in bow-shape fashion alongside the ear, so that contact is made between it and the collector in addition to the original contact with the trolley wire. The supplementary conductor is held in position by clips fixed on the wire near the ears. Three figures.

25,634/10. **Arc Lamps.** A. SCHMIDT. A self-regulating arc lamp, in which both carbons are adjusted by a solenoid. An arm, pin-jointed to a toothed lever, is connected to the solenoid, and by means of a spring joining the lever and core, the lever is pressed against a toothed wheel attached to a grooved roller. A chain, passing round this roller, is connected to the carbons, which are drawn apart. When the solenoid core is at its bottom position, the toothed lever is released and the carbons fall together. Two figures.

26,836/10. **Electric Heaters.** M. B. FIELD and FERRANTI, LTD. This invention relates to an electrical heater with a slotted hot plate, and a resistance winding, insulated therefrom, for generating heat in contact with the plate. Two figures.

4,524/11. **Accumulator Boxes.** G. E. B. PRITCHETT (*Pritchett's and Gold, Ltd.*). In the author's patent 15,425/10, which was abstracted in ELECTRICAL ENGINEERING of April 27th, 1911, page 226, instead of having a deep space between the plate and the top of the box, he supplies a second plate, which forms the lid of the box, and the space is much reduced. Two figures.

8,392/11. **Ventilation of Machinery.** SIEMENS BROTHERS DYNAMO WORKS, LTD., and C. A. B. D. KOETTGEN. In a dynamo of the turbo type, an arrangement for ventilation consists of the combination of three fans on the rotor for forcing air through the stator air ducts, drawing air through the rotor air ducts, and also through the air gap. A partition within the dynamo separates the air discharged from the stator ducts from that discharged from the rotor ducts and the air gap. One figure.

10,113/11. **Non-Interchangeable Fuses.** SIEMENS BROTHERS DYNAMO WORKS, LTD. To avoid using low-voltage screw plugs in high-voltage sockets, the depth of the fuse socket, and the length of the screw plug, are altered. In this way, sockets of considerable depth with long screw plugs can be used for high voltages, and of less depth with shorter screw plugs for low voltages, the graduation for consecutive voltages being at least equal to the length of the screw-threaded part of the screw plug. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Dynamos, Motors, and Transformers: ROSENBERG and PECK [Braking induction motors] 17,010/10; ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Control systems for electric motors] 17,107/10; BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Systems of motor control] 177/11; ALLGEMEINE ELEKTRICITÄTS-GES. [Systems of motor control] 12,921/11.

Electric Ignition: ANDERSON [Manufacture of spark plugs] 18,295/10; SMITH and MUIRHEAD & Co. [Ignition apparatus] 18,794/10.

Electrometallurgy and Electrochemistry: RUTHENBURG [Extraction of antimony from ores] 28,030/10; SOCIÉTÉ ANONYME ELECTROMETALLURGIQUE (*Procédés Paul Girod*) [Method of supplying electric furnaces with three-phase currents] 13,731/11.

Heating and Cooking: CUNNINGTON [Electrical heating apparatus] 21,848/10.

Incandescent Lamps: WILSON, 1,251/11.

Instruments and Meters: COMPAGNIE POUR LA FABRICATION DES COMPTEURS ET MATERIEL D'USINES À GAZ [Electricity motor-meters] 30,297/10.

Switchgear, Fuses, and Fittings: JOHNSON and LOXLEY & Co. [Electrical ceiling-roses, junction boxes and fuses] 14,042/10; KALLMANN [Electric safety fuses] 16,258/10; PRESSER, and GES. FÜR ELEKTROTECHNISCHE INDUSTRIE [Automatic regulators for electric circuits] 22,198/10; WESTINGHOUSE BRAKE CO. (*Taylor*) [Electric relay apparatus] 28,588/10; HATHORNE, DAVEY & Co. and TOWLER [Control gear for electric driven pumps] 8,890/11.

Telephony and Telegraghy: GRAHAM [Water-tight telephonic apparatus] 2,501/11; SIEMENS BROS. & Co. (*Siemens and Halske Akt.-Ges.*) [Automatic telephone instruments] 10,341/11.

Traction: SAMAIA [Conduits and ploughs] 24,489/10; COMPAGNIE DE SIGNAUX ELECTRIQUES POUR CHEMINS DE FER [Warning apparatus on railways] 3,978/11; SIEMENS BROS. & Co. and SCOURFIELD [Automatic signal control] 8,511/11.

Miscellaneous: CRAWFORD and SCOTT [Means for driving tools electrically] 13,716/10; HOLDEN [Electric clocks] 14,126/10; VICKERS, SONS & MAXIM, LTD., and WILLIAMSON [Rotating commutators] 22,507/10; READING [Centrifugal fans] 1,326/11; KELLY [Metallic railway ties] 2,994/10; CARDWELL [Mechanism for transmitting electric impulses] 3,086/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: GEBR. SIEMENS & Co. [Electrodes for] 13,817/11; GENERAL COMPOSING CO. GES. [Arc lights] 15,474/11; GES. FÜR MASCHINEN- UND METALL-INDUSTRIE M.B.H., 15,730/11.

Switchgear, &c.: BERDON [Electric-current controlling device] 15,149/11.

Telephony, &c.: TELEPHON APPARAT FABRIK E. ZWIETUSCH & Co. GES. [Automatic telephone sending mechanism] 15,569/11.

Miscellaneous: NEU [Feeding low-voltage lamps on a high-voltage circuit] 10,965/11; ELEKTROCHEMISCHE WERKE-GES. and ROTHE [Production of disc-like flaming arcs] 13,335/11; REBSAMEN [Electric sewing-machines] 15,690/11; SCHWAGER [Pocket-lamps] 15,818/11.

Opposition to Grant of Patent

11,908/10. **Insulating Material.** A. R. MULLER and the R. M. D. SYNDICATE, LTD. Opposition has been entered to the grant of this patent, which relates to an improved insulating material, comprising a mixture of asbestos and tar, consisting of two parts of asbestos to one of tar, compressed to the required shape, and heated to a temperature of 400° to 500° C.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

18,259 of August 5th, 1897. **Traffic Control.** F. W. WEBB, G. EDWARDS, and A. M. THOMSON. In the electrical control of traffic on single lines of railway in which staffs are used, the removal of one of them renders the instrument inoperative until it has been returned or inserted in the instrument at the other end of the section. This patent provides a number of staffs for despatching several trains if required, and the electrical arrangements for working the instruments are also used for transmitting telephonic messages.

18,337 of August 6th, 1897. **Electrical Cut-outs.** H. HIRST. This patent provides means for enclosing the fusible wire or strip in an isolating box, so that when the fuse is blown, the vapour is prevented from causing an arc between the terminals.

18,556 of August 10th, 1897. **Lightning Arresters.** THE BRITISH THOMSON-HOUSTON CO. (*E. M. Hewlett, America*). A lightning arrester for protecting electrical apparatus comprises the combination of arcing electrodes, a non-inductive resistance in circuit with one of them, and a blow-out magnet with its coil ends connected to the resistance at points between which there is a difference of potential, these being suitably enclosed in a box of insulating material.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Transformers] 8,539/06; SIEMENS BROS. & Co. and F. TURNER [Transmission] 8,367/07.

Dynamos, &c.: BRITISH THOMSON-HOUSTON (*General Electric Co.*) [Dynamos] 7,919/05; H. J. MCMAHON [Dynamos] 7,891/06; BRITISH THOMSON-HOUSTON CO. and W. F PAWSON [Dynamos] 8,286/07.

Electrometallurgy, &c.: S. Z. DE FERRANTI [Furnaces] 8,255/07; H. PAWECK [Electrolysis] 8,562/07.

Incandescent Lamps: R. J. B. M. DAMSEAUX, 8,240/07.

Switchgear, &c.: L. NEU [Electric Protective Systems] 9,026/06; P. S. BROOK and J. A. HIRST [Switches] 8,504/07; C. SCHMIDT [Switches] 8,706/07; C. T. J. OPPERMANN [Controllers] 8,742/07.

Telephony, &c.: W. BENICKE and H. WESTERBECK [Typewriters, Telegraphs, &c.] 8,575/04; C. BRUNNSCHWEILER [Telephones] 8,611/07.

Traction: B. GRAHAM [Electric railway points and switches] 8,206/07; N. KESSLER and G. JELICH [Crossing gates and barriers] 8,471A/07; S. STONE and L. W. MIGOTTI [Traction control] 8,623/07 and 8,623A/07.

Miscellaneous: C. NEUMANN [Fans] 7,729/05 and 7,730/05; BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) [Electric relays] 8,936/06; BRITISH THOMSON-HOUSTON (*General Electric Co.*) [Electric lighting] 8,388/07; N. KESSLER and G. JELICH [Electric bells] 8,471/07.

ELECTRIC TRACTION NOTES

The petrol electric transmission system, designed by Mr. J. G. P. Thomas, and known as the Thomas transmission, which is applied to road vehicles, was described in some detail in ELECTRICAL ENGINEERING, May 4th, page 236, has also been applied in a slightly modified form to a railway coach which is being supplied to the Central South African Railways. The vehicle has been constructed by Leyland Motors, Ltd., in conjunction with the United Electric Car Co., of Preston. The engine, which is of the six-cylinder vertical pattern, rated at 120 h.p., is situated in the centre of the car, and drives, as before, the cage of the planetary gear. The smaller sun-pinion is connected to one of the electrical machines, while the larger one is geared to one of the axles of one bogie, there being also a coupling whereby the sleeve carrying the armature of the motor can be coupled to the same shaft. The other electric machine, instead of being mounted on the back end of the propeller shaft as in the road vehicles, is geared to the driving axle of the other bogie. The general principle of the sharing of the transmission of power by the electrical and mechanical shafts is in no way altered. A battery is provided which can propel the vehicle a short distance in case of emergency, and is used for starting up the engine. The weight of the car, which is 37 ft. over all and accommodates 42 passengers, is 21·25 tons, and of this 7 tons is accounted for by the power equipment, the engine alone weighing 35 cwt. A draw bar pull of 1¾ tons has been obtained. The car can attain a maximum speed of 50 m.p.h., and is capable of reaching 30 m.p.h. in 30 seconds after starting on the level. It is guaranteed to maintain this speed up gradients of 1 in 25.

The net revenue of the Great Northern & City Railway Co. for the June half-year was insufficient to meet the fixed charges by £1,110 12s. This sum, as usual, has been provided from outside sources. The number of passengers carried during the half-year showed an improvement of nearly half a million.

It is announced that the London Brighton & South Coast Railway Co. have decided to extend their electric lines from Balham to Croydon *via* South Norwood.

The directors of the Liverpool Overhead Railway Co. recommend a dividend at the rate of 1 per cent. per annum on the ordinary shares for the June half-year, carrying forward £4,665.

The half-yearly accounts of the Central London Railway Co. show a balance available for distribution of £76,878, against £85,079 in the corresponding period of last year. After meeting the preference interest the directors recommend a dividend at the rate of 3 per cent. per annum on the undivided ordinary stock, and 4 per cent. per annum on the preferred ordinary stock, carrying forward £36,538. The number of passengers carried during the half-year decreased by 658,609, a result which is attributed to the large increase of motor-omnibus competition and the poor attendance at the Shepherd's Bush Exhibition. Against this a material saving has been effected in the working expenses. Arrangements have been made with the contractors for the Liverpool Street extension, whereby the work will be expedited six months.

According to a *Standard* cable from Melbourne, the Hon. W. A. Watt, the Acting Premier, has promised to submit to Parliament a definite scheme for the conversion to electric traction of the Melbourne suburban lines. A few years ago Mr. C. H. Merz was specially engaged by the Victorian Government to investigate the problem of converting the Melbourne railways to electric traction. His proposals to do so, however, were not adopted, but the matter has since continued a much debated one in view of the need for acceleration in the train service between the centre of Melbourne and the suburbs.

The Bill of the Aberdare Urban District Council for the construction of electric tramways was passed last week by a House of Commons Committee. It includes powers to run trolley omnibuses.

The Birmingham Corporation have passed a resolution to purchase the lines of the British Electric Traction Co. in their district at a cost of £151,500. The Tramway Committee's recommendation to apply to Parliament for powers to considerably extend the tramways has been deferred for further consideration in October.

After meeting all charges, the accounts of the Aberdeen Tramways Department for the year to March 31st show a net profit of £17,459, which has been carried to renewal fund, bringing this latter up to £67,402. The net profit in the previous twelve months was £14,654. The use of meters on the tramcars has been extremely beneficial.

Mr. R. Elliott Cooper has been appointed by the Board of Trade to act as arbitrator in connection with the purchase by the L.C.C. of the small portion of the London United Tramway Co.'s undertaking which is in the County of London.

An interim dividend at the rate of 4 per cent. per annum for the June half-year is recommended on the ordinary shares of the Bristol Tramways & Carriage Co.

The accounts of the L.C.C. Tramways for the year to March 31st, 1911, show that there are 126⅓ miles of electric tramways, and 17⅓ miles of horse lines. The total capital expenditure amounts to £11,618,837, and allowing for repayments, the net debt is £9,465,499. There was a surplus on the working for the year of £895,048, which is reduced to £232,727 after providing for capital charges and other payments. From this balance the sum of £129,229 is taken for renewals, bringing this fund to £527,264. The balance on the year's working is £103,498. The working expenses per mile increased from 6·42d. to 6·48d. for the electric lines, and the receipts were 11d. per car mile, against 11·21d. for the previous year, which latter decrease is due to the opening of routes in less populated districts.

A dividend at the rate of 1 per cent. per annum is recommended on the ordinary shares of the London Electric Rly. Co. for the June half-year, placing £7,500 to renewals, and carrying forward £14,500. The full dividend on the 4 per cent. guaranteed stock of the District Rly. Co. for the past six months is recommended, and 4½ per cent. on the first preference stock. Renewals fund is credited with £10,000, and the carry forward is £14,200.

The Paris City authorities have sanctioned a loan of £9,600,000 for completing the Metropolitan Railway.

A House of Lords Committee have passed the Rotherham Corporation Bill, which provides for various tramway extensions, and also the installation of trolley omnibuses.

A scheme for the rearrangement, and not reduction, of the capital of the British Electric Traction Co. has been prepared by the Board. Under the scheme, the preference shareholders obtain an advantage in priority of capital, and waive part of their rights to future distribution of profits. The ordinary shareholders have their prospect of dividend improved, and waive part of their right as to capital. The nominal capital of £4,000,000, divided into £2,000,000 preference and £2,000,000 ordinary, will be divided into £500,000 first preference shares, £500,000 second preference shares, £2,000,000 preference ordinary shares, and £1,000,000 deferred ordinary shares, all of £1 each.

According to the *Journal des Transports* (Paris), considerable progress is being made with the conversion to electric traction of the Mont Cenis line from Modane to Bardonèche, which will increase the carrying capacity and ameliorate the conditions in the Mont Cenis tunnel. Energy will be obtained from the municipal generating station at Chiomonte, where 3,500 kw. will be available at 50,000 volts 50 cycles. The main feeders will follow the course of the railway between Bardonèche and Bussoleno on poles suitable also for carrying the contact line, when this section is converted; special types of glass and porcelain insulators will be employed. At Bardonèche a sub-station will convert the supply to 3,500 volts 16 cycles. The locomotives will be required to haul a 300-ton train up a 3 per cent. gradient at 31 miles per hour, and two such trains will be on the 9½-mile section between Bardonèche and Modane at once.

Another section of the German State railways which is to be converted to electric traction is a group of lines in Silesia, near the frontier of Bohemia, including a line 76 miles in length, from Lauban to Königszelt, and certain branch lines aggregating about 90 miles. Much of this is almost of the nature as a mountain railway, with heavy gradients and sharp curves. The lines will work with a contact-line pressure of 10,000 volts single-phase 15 cycles, which is now the standard for the German main lines. Two types of locomotives will be used, one for passenger traffic capable of speeds up to 68·5 miles per hour, and the other for goods traffic, similar to those described in ELECTRICAL ENGINEERING, July 20th, page 414, for the Dessau-Bitterfeld section. These will be capable of speeds up to 40 miles per hour. For very heavy trains two can be used in tandem.

It is anticipated that considerable increase in traffic and speed, combined with reduction in cost, will follow the adoption of electric traction on the St. Gothard line. The scheme under consideration involves taking power from three stations at Retom, Göschenen, and Amsteg respectively.

A company is being formed for the construction of an electric railway between Jumilla and Cieza, in Spain.

CATALOGUES AND PAMPHLETS RECEIVED

ARC LAMPS.—A pamphlet from the Globe Electric Co., Ltd. (11 Farringdon Avenue, E.C.) gives notice of further improvements in the "Multax" flame lamp. By an improved method of enclosure the burning hours have been increased by 25 per cent., with a corresponding reduction in carbon and trimming costs, while at the same time the outer globe is kept free of deposit. The lamps can now be provided with a special light distribution reflector.

BRUSH HOLDERS.—Another pamphlet from the Globe Electric Co. deals with the "Supra" brush holder and carbon brushes. This well-known brush holder consists of two independent cast steel parts, one being tightly fixed on the spindle by means of a split ring and tommy screw, the other being allowed free movement round same. To the end of the fixed portion, remote from the spindle, is attached a spiral spring, the downward pull of which is exerted on the moving arm of the holder carrying the brush, resulting in the latter being pressed evenly against the commutator. The brush is carried by two jaws, one of which is cast solid on the main arm, and the other is formed by a freely moving arm, which is held in tension by means of a spring.

HEATING AND COOKING APPARATUS.—The London Electrical Trading Co. (21 Broad Street House, E.C.) send us a list of Bastian patent "Quartzalite" heating and cooking appliances, the principal features of which have been described in Electrical Engineering from time to time. Various patterns of heaters for rooms and offices, toasters, ovens, hot plates, kettles, and water-heaters and irons, are dealt with, including those with the latest pattern of insertion heater.

GOVERNORS AND GOVERNING GEAR.—An interesting catalogue on governors and governing gear has just been issued by W. Hartnell & Co. (Volt Works, Leeds). The Hartnell automatic expansion regulator and various vertical types of governor are illustrated and described, and much valuable information is contained in notes on the governing of engines.

ELECTRIC BELLS AND ACCESSORIES.—We have received from Messrs. G. Braulik (8 Lambeth Hill, Queen Victoria Street, E.C.) a copy of the new edition of Section B of their catalogue. It is divided into five sub-sections, with numerous illustrations and details of bells, buzzers, and relays; indicators; pushes, alarm-contacts and switches; testing instruments, batteries, and line materials, etc., and diagrams of connections for bell and indicator circuits. Separate leaflets are also enclosed relating to fans and small motors, the Eclipse metallic filament lamp, the Eclipse flame arc lamp, and electric auto thermal flashers. This very complete bell list will be sent to all contractors who apply for a copy.

THE "SVP" MOTOR.—A short account of this continuous-current motor appears in a pamphlet from the Electric Construction Co., Ltd. (Dashwood House, 9 New Broad Street, London, E.C.). The principal feature is its vertical commutator, the advantages of which reduce the cost of production, allow of easy access to the brushes, do away with the danger of high bars, require practically no bedding of the brushes, and the overall length of the motor is reduced. Each of the two brushes is held against the commutator by a small spiral spring, adjustable by means of a milled-head vulcanite screw. The temperature rise after a six hours' run does not exceed 70° F., and the overload capacity is 25 per cent. for two hours, and 50 per cent. momentarily. The following outputs are at present offered: ¾, 1, and 1½ B.H.P. at 1,000, 1,400, and 2,000 R.P.M. respectively.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

FLAME ARC LAMPS.—The Union Electric Co., Ltd. (Park Street, Southwark, S.E.), have issued a new complete list of "Excello" arc lamps, introducing the latest form of inner dioptric globe, which is composed of a number of prism rings of different angles to divert the rays and produce the most suitable distribution of light. From the surface illumination curves of lamps placed about 60 yards apart and at a suitable height for street lighting, it is seen that the minimum illumination is almost doubled, whilst the maximum illumination compares more closely with the minimum, when the dioptric globe is used. Various designs of reflectors and covers are illustrated, and among the accessories we find adjustable choking coils and line resistances, transformers, automatic cut-outs, and compensating resistances for D.C. lamps, safety coils, and arc lamp winches. A full list of dimensions appears at the end, and a new feature which is being adopted by the firm consists in cutting the right-hand edge of their catalogues for index purposes.

ALUMINIUM.—Two leaflets are to hand, illustrating the use of aluminium for battery and feeder connections, from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.).

HEATING AND COOKING APPARATUS.—An illustrated catalogue from the Phœnix Electric Heating Co. (17 Morwell Street, Tottenham Court Road, W.C.) contains electric heating and cooking apparatus of every description, including hot cupboards, grills, hot plates, electric irons, utensils and urns for the kitchen; kettles and water jugs for the table; besides radiators, curling-iron heaters, towel rails, immersion heaters, coffee roasters, hot-water tanks, and many other articles, all of which are of British manufacture.

LOCAL NOTES

Baildon: *Electric Lighting.*—The Council has intimated its intention of opposing an application for an electric lighting Provisional Order by the Wharfedale Electric Light and Power Syndicate.

Braunton: *Electric Lighting.*—The final arrangements for the formation of the Braunton Electric Lighting and Power Co. have now been made. It is anticipated that there will be no difficulty in raising the necessary capital locally, and that the plant will be installed within three months from the commencement of erection. Messrs. Crompton & Co. are concerned in the project.

Bristol: *Electricity Accounts.*—In dealing with these accounts in our last issue, we stated that there was a deficiency last year of £768 16s. after meeting capital charges. Closer investigation of the accounts, however, reveals that whilst this in itself is more than a sound position, the result for the past year given above was arrived at after setting aside about £3,000 to the renewals fund. The Bristol auditors do not approve of declaring a net profit until after money has been placed to the reserve fund, a policy which is not in accordance with other people's ideas.

Edgware: *Electric Light.*—An agreement has been signed with the North Metropolitan Electric Power Co. for lighting the Edgware main road by electricity.

Glasgow: *New Turbo-Generators.*—A deputation in connection with the Tramways Department, including the Tramways Manager and the Tramways Electrical Engineer, has been appointed to visit the works of various makers of turbo-generators in England and on the Continent. The object is to make full inquiries before the Tramways Committee make a recommendation with regard to the new turbo-generators which are to be installed at Pinkston Power Station.

Honiton: *Electric Supply.*—The Council have decided to enter into an agreement with Dr. Purves, of Exeter, to install an electric supply plant.

India: *Electric Power Supply.*—The water power scheme of the Tata Hydro Electric Supply Co. is in an advanced state of construction, and the directors have decided to invite applications from prospective consumers.

London: *City of London: Street Lighting.*—At the present time there are 463 street electric lamps in the City of London compared with 447 last year. This number includes 32 centrally-hung lamps; there are 424 open type arc lamps and 90 flame arc lamps.

St. Marylebone: Electricity Accounts.—After meeting interest and repayment of loans, which amounted to no less than £113,789, there was a net balance of £12,089 upon the working of the electricity undertaking last year. Out of this sundry items of capital expenditure amounting to £2,166 have been met, in addition to the full cost of motors, &c., on hire, amounting to £1,192, and a further sum of £1,183 in respect of sundry improvements and minor additions to plant. After meeting these and the bonuses payable to officials, £788, there remains an unappropriated balance of £6,712. The total expenses on the Sales and Publicity Department for the year were £19,171, whilst the amount received from the sale and hiring of apparatus, &c., was £16,959. In their report the Committee emphasised the fact that a great deal of the work of this section is unremunerative to itself, but is considerably beneficial to the undertaking as a whole. The cost per unit sold amounted to 0·901d., including publicity expenditure, against 0·961d. in the previous year and 1·19d. in 1908-9. Whilst the expenditure for the past twelve months increased by 7½ per cent., the output was increased by 14½ per cent.

Hosted by Google

Stoke Newington: Electric Lighting.—It is proposed that the Council shall give the necessary six months' notice to the North Metropolitan Electric Power Supply Co. to terminate the agreement for bulk supply. The matter is to be discussed in September.

Oldham: *Hiring of Motors.*—The Electricity Committee have met a deputation from the Electrical Section of the Oldham Chamber of Trade with regard to the hiring out of motors. The Chamber had made the charge that the Committee were infringing the law in hiring out motors, but it was pointed out that the Corporation themselves do not own any motors so hired, but that arrangements were made with two firms of makers. The Committee claimed the moral right to work in this manner, as none of the electrical contractors in the town have been prepared to hire, although they are willing to sell motors. The Committee offered to meet the Chamber of Trade by dropping the arrangements they have at present if the electrical contractors in the town take up the hiring of motors.

Maidstone: *Supply Outside Area.*—The Corporation have decided to apply to the Board of Trade for sanction to supply certain premises outside the area.

Manchester: *Testing Electricity Meters.*—The Justices Committee, which has charge of the Gas Meter Testing Department of the Corporation, have issued a special report in which it is recommended that the testing of electricity meters shall also be placed in their hands. This Committee is in a similar position to the Electrical Department of the London County Council, in that it is not in direct connection with the Gas Department, and the argument is that the testing of electricity meters should also be carried out by an independent authority of this character. At the meeting of the Council on Monday it was decided to appoint a sub-committee to consider the question.

Swansea: *Electric Lighting Profits.*—The Corporation, after a lengthy discussion, have adopted the recommendation of the Tramways and Lighting Committee to transfer the profits on the electric lighting undertaking, viz., £8,062, to the reserve fund.

Wakefield: *Electricity Accounts.*—There was a loss of £213 upon the Corporation's electricity undertaking last year, compared with £802 in the previous twelve months.

Walsall: *New Supply Scheme.*—The large scheme of extensions inaugurated by A. S. Barnard before he was unfortunately compelled to go away for his health, and which has been carried on by Mr. Ashton Bremner, who is acting for Mr. Barnard, is nearing completion.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Austria-Hungary.—According to the *Board of Trade Journal*, the Budapest municipal authorities invite tenders by September 30th for a 10,000-kw. power plant. Particulars from "Dr. János Buzáth, IV. Városhaz utcza 16, II. 1," Budapest.

Belfast.—Application is to be made for sanction to a loan of £40,000 for additional electrical plant and mains.

Blackburn.—Firms desirous of an opportunity to tender for the installation of electricity generating plant at the Whalley Asylum, near Blackburn, should send their names and addresses to the Clerk to the Committee of Visitors, County Offices, Preston, not later than August 7th.

Bolton.—The Electricity Committee recommend application for a loan of £20,000 for electric mains extensions.

Cleethorpes.—The Local Government Board have written to the Council in reference to the recent inquiry concerning a loan of £4,000 for electric light purposes. At that inquiry it was suggested that the scheme put forward could be considerably improved, and the Local Government Board now desire particulars of this new scheme. Mr. C. S. Vesey-Brown, the Council's Consulting Engineer, has been asked to forward the amended estimates.

Guisborough.—The Council have received a petition signed by some 400 residents in favour of electric lighting of the streets.

Haslingden.—The Local Government Board have sanctioned a loan of £8,188, as follows: £6,238 for mains; £850 for sub-station equipment; £350 for services; £250 for meters; £500 for the purchase of motors for hire.

London: *L.C.C.*—Electric charging apparatus is to be erected at four fire stations in connection with the motor escape vans which will shortly be in use, at an estimated cost of £200.

Hampstead.—The Finance Committee of the L.C.C. recommend a loan of £7,550 for mains, transformers, house services, &c.

Islington.—A loan of £5,500 for mains, transformers, house services, &c., is recommended by the Finance Committee of the L.C.C.

Marylebone.—The Finance Committee of the L.C.C. recommend loans of £1,500 for mains, £3,500 for house services, and £2,650 for battery cells.

Poplar.—Sanction to loans amounting to £34,995 for new generating plant is recommended by the Finance Committee of the L.C.C.

Woolwich.—The Finance Committee of the L.C.C. recommend a loan of £4,841 for electrical plant and mains.

Loughborough.—The Local Government Board have sanctioned a loan of £2,200 in connection with the electricity undertaking.

Reigate.—A Local Government Board inquiry was held on Tuesday concerning an application for sanction to borrow £8,400 for the electricity undertaking. The scheme includes the installation of Diesel engines.

Sweden.—The *Board of Trade Journal* states that the Danvik Hospital authorities require an electric power plant. Tenders will be received at the "Kungl Direktionen for Danviks Hospital," Stockholm, up to August 15th.

Stoke-on-Trent.—A new high-tension feeder, at an estimated cost of £425, is to be laid to Howard Place.

Warrington.—The Electricity and Tramways Committee invite tenders by August 9th for a motor-driven induced draught fan.

West Ham.—Tenders are invited for water-tube boilers, coal handling and discharging plant, a 5,000-kw. turbo-alternator and condensing plant, river service pipe-work, 750-kw. converter, and centrifugal pumps. (See an advertisement on another page.)

Worthing.—A Local Government Board inquiry was held last week concerning a loan of £4,950 for new plant and mains. Diesel engines are to be installed.

WIRING

Aberdeen.—Tenders are invited by August 14th for electric lighting on the property of the City District and Lunacy Board.

Birmingham.—New tramway depôt in Whitmore Street for the Corporation.

Dublin.—Additions to Richmond Hospital. Architect, C. H. Ashworth, 12 & 13 William Street, Dublin.

Glasgow.—Alterations to premises of Scotch Automobile Club.—Block of buildings at north-east corner of Gallowgate.—Shops and hall at corner of Pollokshaws Road.

London.—New town hall for the Hampstead Council.

Newport.—Additions to infirmary buildings.

Radcliffe.—Extension to County Hospital. Builders, Wooldridge & Simpson, Oxford.

Swansea.—Additions to hospital.—Eighteen houses in Pantygwydr Road. J. B. Jenkins.—Additions to Salem Chapel, Neath Road.

Walsall.—Catholic School in Glebe Street.

York.—The Board of Guardians are seeking information as to the cost of electric lighting at the workhouse.

MISCELLANEOUS

South Africa.—In his report for 1910 the Postmaster-General of South Rhodesia recommends the installation of two new copper telegraph wires from Salisbury to Bulawayo, and thence to the border of the Cape Province, at an estimated cost of £20,000. He also recommends the introduction of the metallic circuit system at Bulawayo.

Sweden.—The *Board of Trade Journal* states that the Danvik Hospital authorities require a telephone system, and also an electric lift. Tenders to "Kungl, Direktionen for Danviks Hospital," Stockholm.

Hosted by Google

TENDERS RECEIVED AND ACCEPTED

Belfast.—The tender of the Rees Roturbo Manufacturing Co., Ltd., has been accepted for a circulating water-pump, and that of the Worthington Pump Co. for a motor-driven air-pump.

Burnley.—The contract for the electrical lighting at Victoria Hospital Extension has been secured by Mr. R. B. Beattie, electrician, of St. James' Street, Burnley.

Copenhagen.—Messrs. W. Geipel & Co. have secured a contract for 68 Geipel steam traps for the new Copenhagen hospital.

Derby.—The following tenders have been accepted:—Cables, Messrs. W. Rickard, £914; transformers, British Electric Transformer Co., £696 10s.; sub-station switchgear, Messrs. Reyrolle, £342.

London: *L.C.C.*—The following tenders have been received for the electric lighting of the North Kensington Fire Station:—E. Lawrence & Son, £157; G. Weston & Sons, £160; Malcolm & Allan, £168 10s.; E. Newbold & Co., £194; Tredegar & Co., £221. The first-named is recommended for acceptance.

Six electrically-driven motor escape vans are to be supplied by the Cedes Electric Traction, Ltd., at £5,291 18s.

The tender of Messrs. John Mowlem & Co. for the tramway and paving works in connection with the reconstruction of the track from Finsbury Park to Manor House, and from Green Lanes to Southgate Road, for the conduit system, at £71,993 is recommended for acceptance.

Luton.—The tender of the Hudson Economiser Co., Ltd., at £637 10s., has been accepted for a cooling tower of 125,000 lbs. per hour capacity, and that of Messrs. Hayward Tyler & Co., at £120, for a motor-driven feed pump.

Stoke-on-Trent.—The Electricity Committee recommend the acceptance of the Stirling Boiler Co.'s tender for three boilers at £5,040.

Mexborough.—The following tenders have been accepted:—Arc lamps, British Westinghouse Co.; brackets, Reason Manufacturing Co.; switch panels, Dorman & Smith.

York.—The tender of Messrs. Callender's Cable Construction Co. at £2,640 has been accepted for the supply of cables in connection with the supply of electricity to Messrs. Rowntree's works.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. (last week, £58 15s. to £59 5s.).

The General Electric Co.—This company's Dublin branch has removed to more commodious premises at 13 Trinity street, the new telephone number being 3300 Dublin.

Plant for Sale.—The Mount Kenneth Ironworks, Dock Road, Limerick, are for sale. (See an advertisement on another page.)

Holidays.—Siemens Brothers Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department), inform us that their Dalston offices and stores will be closed from August 7th to August 12th, but a small staff will be in attendance to deal with urgent matters.

Armorduct Outing.—The sixth annual outing of the head office staff, branch managers and agents of the Armorduct Manufacturing Co., took place on Saturday. A party of over fifty journeyed by river to Staines, and had a very enjoyable time.

Bankruptcies.—The discharge of G. M. Sellick, manufacturer of electrical accessories, 464 Romford Road, Forest Gate, E., has been suspended for two years as from June, 1913.

The last day for receiving proofs in the bankruptcy of J. D. Carlmark, electrical engineer, 402 High Street, West Bromwich, is August 12th. The trustee is A. S. Cully, 191 Corporation Street, Birmingham.

APPOINTMENTS AND PERSONAL NOTES

An Assistant to the Wireless Telegraph Expert on H.M.S. *Vernon*, Portsmouth, is required. (See an advertisement on another page.)

The Bournemouth Corporation require a chief assistant and electrical engineer in the Tramways Department, at a salary of £300, rising to £400, per annum.

The salary of Mr. W. H. Cooke, chief electrical engineer to the Luton Corporation, is to be increased from £400 to £450 per annum, and that of Mr. H. A. Kell, his chief assistant, from £140 to £165 per annum.

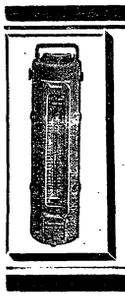
Mr. P. A. Spalding, of Galway, has been appointed Resident Electrical Engineer by the Dundalk Urban District Council.

The salary of Mr. G. Dearle, Assistant Mains Superintendent at the Derby Electricity Works, is to be increased from £120 to 130 per annum.

A switchboard attendant is required for the Kilmarnock Council's lighting and traction station. (See an advertisement on another page.)

Dr. M. Kloss, who is well known as one of Messrs. Siemens Brothers Dynamo Works chief designers, has been appointed Professor of Electrical Engineering at the Technical University, Berlin—Charlottenburg.

Mr. I. Bulfin, at present Chief Assistant and Electrical Engineer in the Bournemouth Tramways Department, has been appointed General Manager of the tramways, in succession to Mr. C. W. Hill, at a salary of £500, rising to £700, per annum.



A Chief Assistant Electrical Engineer is required at the Batley Electricity Works. Salary, £130 per annum. Applications to Town Clerk by August 9th.

Parliamentary Intelligence.—The Metropolitan Electric Tramways Bill and the Belfast Bill were read a third time, and passed in the House of Lords on Thursday.

The East Kent Electric Power Bill was read a second time in the House of Commons on Monday.

Electricity in Textile Mills.—We understand that the Institution of Electrical Engineers and the Textile Institute have appointed a joint committee, consisting of twenty-eight members drawn in equal numbers from either institution, to consider the application of electricity in textile mills. Mr. T. Roberts, of Darwen, has been appointed chairman, and Mr. S. L. Pearce, City Electrical Engineer, Manchester, vice-chairman. The following is the full list of members of the committee:—Representatives of Institution of Electrical Engineers: J. F. C. Snell (Messrs. Preece, Cardew & Snell); R. K. Morcom (Messrs. Bellis and Morcom); C. D. Taite (Lancashire Electric Power Co.); S. J. Watson (Borough Electrical Engineer, Bury); H. Wilson (Messrs. Miller, Wilson, & Pegg); Professor Schwartz (Manchester); S. L. Pearce (City Electrical Engineer, Manchester); J. S. Peck (British Westinghouse Co.); H. Dickenson (City Electrical Engineer, Leeds); A. B. Mountain (Borough Electrical Engineer, Huddersfield); W. B. Woodhouse (Yorkshire Electric Power Co., Thornhill, Dewsbury); W. M. Rogerson (Borough Electrical Engineer, Halifax); Dr. Pohl (Phœnix Dynamo Co.); and J. Schofield (Borough Electrical Engineer, Shipley). Representatives of Textile Institute: Messrs. J. R. Denison (Messrs. Denison, Preusner, & Co.), Bradford; B. Palin Dobson (Messrs. Dobson & Barlow), Bolton; E. P. Fry, Shipley, Yorkshire; Oscar Hall (Messrs. Robert Hall & Sons), Bury; Frederick Leeves (Messrs. Platt Bros. & Co.), Oldham; Frederick Lye (Messrs. John Bright & Bros.), Rochdale; F. Nasmith (Messrs. Nasmith & Barraclough), Manchester; W. J. Orr (Messrs. Orr & Sons), Castleton; Thomas Roberts (Messrs. Whipp Brothers & Co.), Darwen; Fletcher Robinson, Manchester; George B. Storie, Rochdale; F. W. Whittaker (Messrs. Whittaker & Pendlebury), Bradford; and T. Rowland Wollaston, Manchester. In addition to taking evidence, the committee will carry out experiments, the results of which will be embodied in their final report.

Fatal Accident.—An inquest was held into the death of H. R. Fisher from shock at Rugby on Tuesday last. The deceased was employed in the Testing Department of the British Thomson-Houston Co.'s works, and was engaged in preparing for testing a motor-generator. Only a preliminary test was to be made, which would not require the use of the bus-bars. It was also understood that connections were to be made as far as possible for the load test, which would require 2,100 volts, and the same connections were to be used as had been used for a turbo-generator test. It was known that the turbo-generator was to be again temporarily connected, and before giving instructions to connect up the cables ready for the load test, it was ascertained that the bus-bars were dead. It appears, though it is unknown how it happened, that the bus-bars were alive when the machine was switched in, and the deceased, who was underneath, got the full pressure, and was killed instantly. The jury returned a verdict of accidental death.

SUMMARY

An article criticising the general inactivity of the Electrical Contractors' Association in all matters except the opposition to municipal wiring appears on page 444.

Our monthly article on New Electrical Supplies and Accessories contains the description of a complete line of knife switches; some new weather-proof lanterns and screens for interior fitting are described, and illustrated particulars are given of a new re-fillable cartridge fuse; other novelties dealt with include motor-starters and a form of fan which can be fixed in chimney shafts and large pipes. (Page 445.)

We give some details of two reliable types of time switches. (Page 446.)

Several books relating to electrical engineering and allied subjects are reviewed on page 447.

Many interesting details are to be found in the scheme adopted for the erection of the overhead equipment of the Dessau-Bitterfeld section of the Prussian State Railway system. (Page 448.)

The French Government are establishing three wireless stations for the purpose of giving distinctive signals by which ships can identify their position in case of fog.—The Hull Municipal telephone system has given a profit of £1,168. (Page 449.)

The electric lighting and traction scheme at Llanelly has recently been inaugurated; some details of the undertaking are given on page 449.

A Board of Trade inquiry was held last week into the circumstances attending a fatal explosion caused by water-hammer at the Bow Road works of the Charing Cross, West End, & City Electricity Supply Corporation on October 31st. (Page 449.)

Among the specifications published by the Patent Office on Thursday last was one by F. Holden, relating to electric clocks, and another by M. Kallmann describes an electric safety fuse. J. C. Anderson has protected a method of manufacturing sparking plugs. The attachment of commutators is dealt with by Vickers, Sons and Maxim, and A. D. Williamson. A patent has been granted in spite of opposition to P. Marino, in connection with separators for primary batteries. The desired amendments to two patents by Brown, Boveri & Co., Ltd., describing textile machinery, have been allowed. (Page 450.)

An interesting Paper on Rack-Railway Locomotives, including particulars of those worked electrically, was read at the Zurich meeting of the Institution of Mechanical Engineers.—The reports of the various railways in this country upon which electric traction is used show a general improvement in traffic receipts.—Considerable success has attended the opening of the newly electrified lines of the London, Brighton & South Coast Railway. (Page 451.)

Profits on the year's work are reported at St. Pancras (£12,203); Halifax (£4,366); Hull (£8,347);

Hosted by Google

Ilford (£1,400). The Marylebone Council has decided that wiring of installations under the three years' hire system shall be sublet to contractors. A reduction in the price of supply for lighting has been made at Llandudno. (Page 452.)

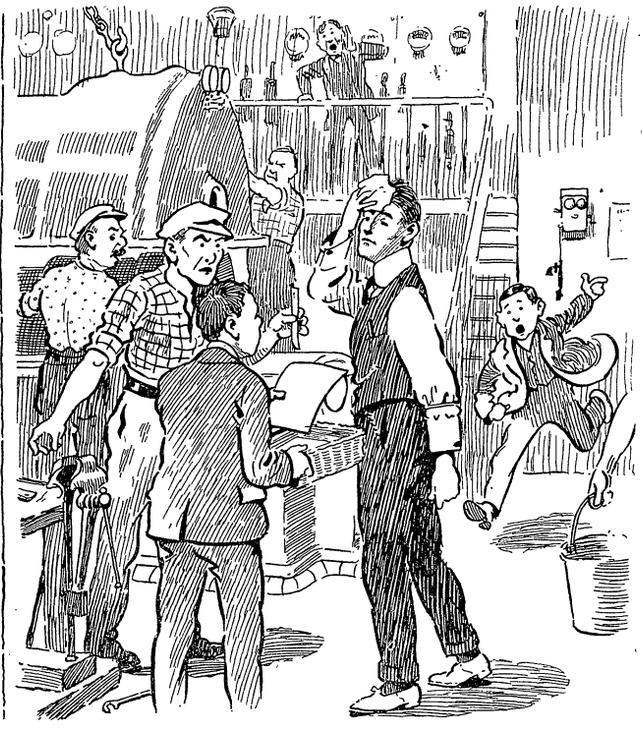
Application is to be made to the Local Government Board for loans at Bacup (£1,250), Southwark (£4,456), and Wednesbury (£238). Inquiries have been held into applications at Birmingham (£934), Wimbledon (£7,459), and Worthing (£4,950). Loans have been sanctioned at Burnley (£8,552), and Wrexham. A rotary converter and switchgear is required at Wolverhampton. (Page 453.)

Dissatisfaction is being expressed by the shareholders of the Welsbach Light Co., and an inquiry is asked for. The report of the Yorkshire Electric Power Co. records a steady growth in the receipts. (Page 454.)

THE ELECTRICAL CONTRACTORS' ASSOCIATION

ALTHOUGH seventy new members have joined the Electrical Contractors' Association during the past year, it appears that the membership of this body does not yet exceed 400, and this can only represent a small fraction of the total number of men engaged in electric light and power wiring all over the country. This is not because the Association is too "exclusive"; in fact, it errs rather in the opposite direction, and admits any electrical contractor, so that membership is not necessarily a mark of high status. The reason of the comparatively small membership, we are convinced, is that the whole aims and objects of the Association are subordinated to, and overshadowed by "the great struggle," to use the words of the Association's own journal, *The Electrical Contractor*. Those who are not taking a direct personal interest in the controversy with regard to municipal wiring have very little inducement to join, yet the number of installations wired by firms who are not members of the Association must be a hundred times as great as the number wired by municipal workmen.

The remedy for this state of affairs is obvious. The Association must make up its mind to pursue a more general policy; it must hold regular meetings at which matters relating to the practice of electric wiring should be discussed, and not merely questions of business, organisation, and opposition to municipal trading. Consulting engineers who specialise in wiring work, and also manufacturers of supplies and accessories, should be invited to take part in the discussions, and the technical press should be encouraged to report the meetings, instead of being excluded from them. In spite of the seventy new members, it is not inconceivable that the roll of the Association has not greatly increased when resignations and the natural falling out of members who are too indifferent either to resign or to pay their subscriptions, are taken account of, and if more life is not infused into the Association it is bound to die a natural death. As it is, we doubt whether the Institution of Electrical Engineers and the Engineering Standards Committee would continue to place delegates of the Association on some of their committees if they knew that for many years past there has been no general meeting of members of the Association to discuss technical matters.



The Electrical Contractors' Association is capable of doing useful work, and we trust that a change of policy may be inaugurated which will make it really representative of the branch of the industry whose name it bears.

Parliamentary Intelligence.—The London County Council (Tramways and Improvements) Bill was read a third time, and passed, in the House of Lords, on Wednesday last week.

Obituary.—We regret to report that Mr. C. W. Pearson, of Messrs. Pearson Bros., electrical engineers, Nottingham, who had been suffering from overwork, threw himself from a train last Monday and died of his injuries.

The Chief.

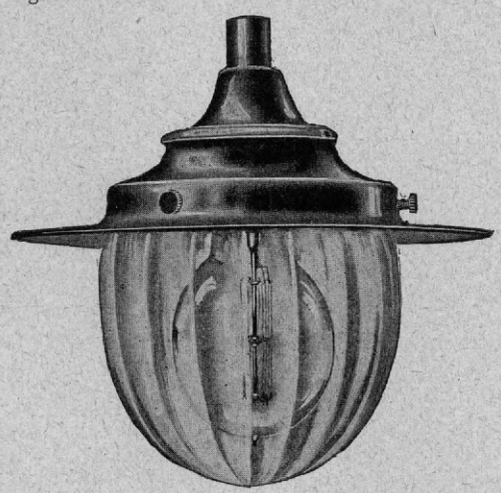
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Switches, Fittings and Accessories.

The General Electric Co., Ltd., has recently put on the market a complete line of chopper-type switches, which are manufactured at the Witton Works. These are made and stocked in thirteen sizes from 30 to 3,000 amps., and can be be made up to a 10,000 amps. capacity at short notice.

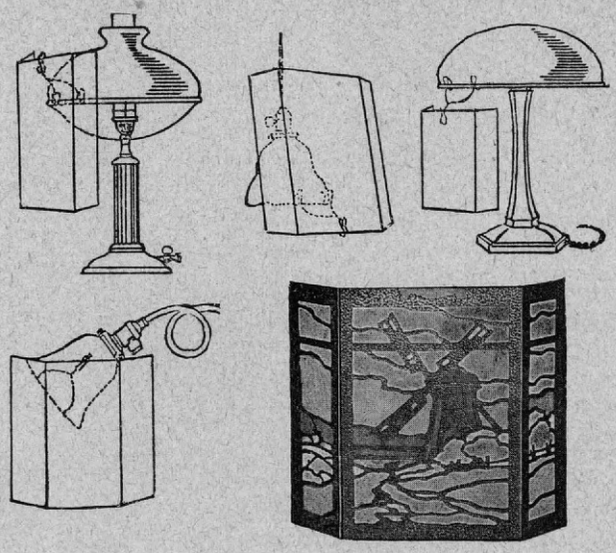
The same general design has been carried through the whole range, and the appearance of the switches of different capacities is therefore quite similar.



The current density exceeds nowhere 1,000 amps. per sq. in. sectional area for high-conductivity copper, and 60 amps. per sq. inch surface area in the contact clips. They are amply rated with regard to surface density, and therefore keep particularly cool on heavy overloads. The general design can be seen from the illustrations. The

G.E.C. Knife Switches.

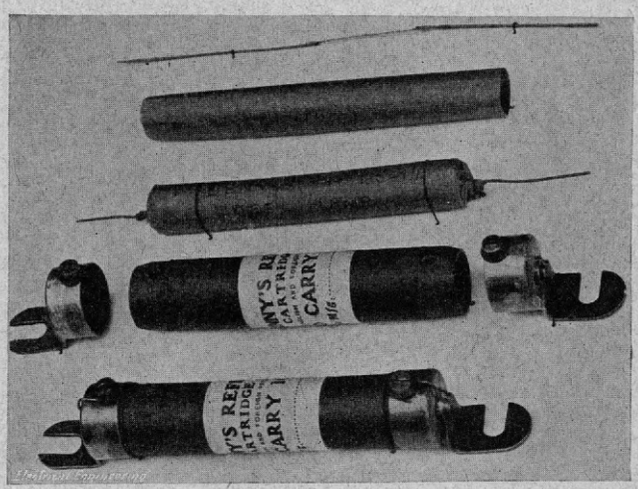
flipper blades, which cause the quick break, are fitted with a steel stamping where they are hinged, and the main blade is bushed with a steel bush for the hinge pin, making the actual wearing parts very strong. At the handle end, the main blades are provided with solid square steel blocks, in which the handle is screwed. To hold the blade in the "off" position in change-over switches, or where there should be no room to swing the switch right over, shaped steel springs are provided, which are fixed to the side of the hinge contact and act on the rounded end of the flipper blade pivot pin. The switches are stocked "single," "double," and "triple" pole for front and back connections. A larger number of poles can be made up on short notice. The switches are jig made, and all parts are interchangeable. The finish is copper and black.



Siemens Brothers Dynamo Works, Ltd. (Incandescent Lamps and Fittings Department, Tyssen Street, Dalston), have brought out several new weather-proof fittings for using

"Bradford" Lantern for 1,200 watt Lamp.
(Siemens Bros. Dynamo Works.)

"Onewatt" lamps to the best advantage for exterior lighting. We illustrate here their "Bradford" design of zinc lantern, complete with special fluted clear globe and white enamelled reflector, suitable for one 200-watt lamp. Other lanterns suitable either for one 200-watt lamp or a group of four 55-watt lamps are also supplied.



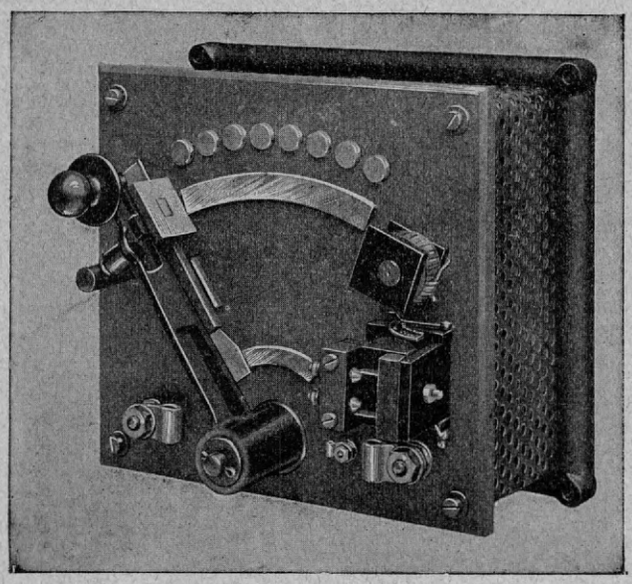
Simplex Conduits, Ltd., have issued a new list of their well-known "Spookie" shades, for which they are now sole selling agents in Great Britain, Europe, the British Empire, and the

"Spookie" Screens.
(Simplex Conduits, Ltd.)

Argentine. Several new designs of candle, pendant, table-lamp and other shades are included, as well as a novelty in the shape of "Spookie" screens, which may be clipped on to any standard pendant or bracket in the manner shown in the accompanying illustration.

A novel form of refillable cartridge fuse has recently been devised by Mr. C. W. Denny (39 Oakley Crescent, Chelsea), which we are able to illustrate. The unique feature about this fuse being that the refills, which are made up in paper or asbestos tubes, are accurately calibrated and packed, making the operation of refilling as simple as possible, and also main-

Denny Refillable Cartridge Fuse.



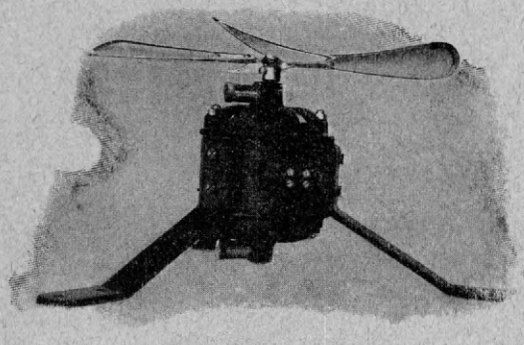
taining the maximum degree of accuracy. Refills for various capacities and voltages can be supplied, neatly packed in cardboard boxes, for a very small cost. The refills, which are practically paper cartridge fuses, are an easy fit into the outer fuse-case proper, and can also be made to fit porcelain-handle type fuses.

A new "preliminary" list of electric light fittings from Simplex Conduits, Ltd., contains illustrations of designs in the Adam, Georgian, Dutch, and Modern styles, as well as some specially designed for Holophane glassware. This list is to be followed by a further and much more comprehensive catalogue in a few weeks' time.

Hosted by Google

Miscellaneous.

We illustrate here one of the latest patterns of open-type lever-pattern motor starters of Messrs. A. Reyrolle & Co., Ltd., fitted with no-voltage and overload resistances, which, together with others of the protected type, are dealt with

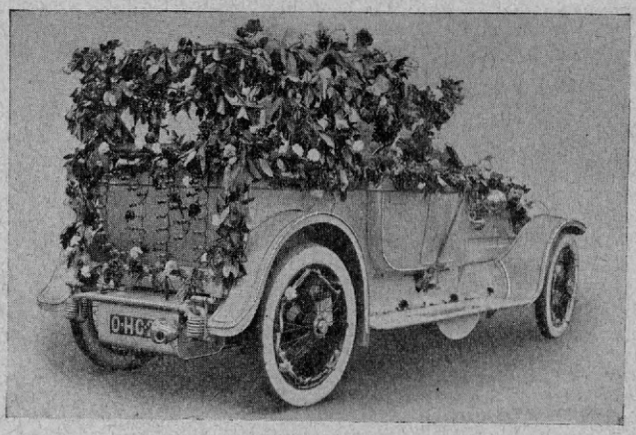


Lever Pattern Open Type Starter, with "Current Growing" Resistance.

(A. Reyrolle & Co.)

in a new pamphlet just issued, which gives a remarkably large range of sizes. These starters are provided with the firm's patent "current-growing" resistance, which in effect acts as an electricity valve, and, owing to improved manufacturing facilities, considerable reductions in price are noticeable.

The accompanying illustration shows the Simplex shaft fan. It is fitted with three substantial cast legs to enable it to be fixed in chimney shafts and large pipes. No speed regulation is provided, but a rheostat can be used if desired. Full particulars of other fans and small motors made by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), include the desk type with swivel and trunnion movements



Simplex Shaft Fan.

and three-speed regulation controlled by handle in base, and a type for ship work of the fixed and trunnion pattern. These two types are fitted with brass blades and guards, but the porthole fan has flat blades. Automatic shutters, made with aluminium vanes to open automatically or by hand, are supplied for use with the porthole fan. They can all be driven by D.C. series-wound or single-phase commutator motors, or by motors of the single and three-phase induction types.

Electric Companies.—According to an article on company registrations in 1911 in the *Investors' Guardian and Joint Stock Companies' Review*, the total capital of companies connected with the electrical industry registered in the first half of this year amounted to only £509,145, as compared with £2,016,320 and £1,522,507 for the first halves of 1909 and 1910 respectively.

OSRAM LAMPS FOR CAR DECORATION

THE accompanying illustration, which has been sent us by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), represents a Daimler car belonging to Mr. G. F. Heath, of Birmingham, which has attracted considerable interest in the Midlands on account of its elaborate scheme of decorative illumination, the entire effect being produced

by means of 400 Osram lamps. A number of Osrams were affixed to the wheels of the car, and, revolving with them, greatly added to the effect. Such a test speaks well for the strength of the Osram filament, and if they will stand the jolts and jars to which the wheels are subjected on rough roads, they are certainly qualified to stand the wear and tear of ordinary everyday use.

TIME SWITCHES

MESSRS. W. GEIPEL & CO. (Vulcan Works, 72A St. Thomas Street, London, S.E.) have recently developed new designs in this kind of switch. Of the two types made, the "Arbiter" type is arranged for switching on by hand and switching off automatically.

These are made in two sizes, the larger size containing an oil-immersed contact quick break switch with sparking tips, operating handle, and a 35-day clock; whilst the smaller size has a quick break knife switch and a 16-day clock.

The adjustable timing system consists of a rotating dial engraved with the hours, six to six, on either half, and a number of movable discs arranged behind the dial can be set to the restricted period of time required. A roller lever rests on the periphery of the discs, which are provided with projections, so that when the time for switching off arrives the roller is lifted on to the higher periphery, and the circuit is automatically broken. No current can then be obtained until the lever is allowed to fall on to the lower periphery.

The "Opus" type is arranged to switch on as well as off automatically and the timing mechanism is similar to the "Arbiter" type, except that the discs have triangular projections with only one periphery. The small size of this type has a quick make and break knife switch and a 16-day clock, and is arranged to operate two or more circuits as additional functions. The dial system of this size consists of an outer stationary disc divided into minutes, and an inner revolving disc divided into hours, which rotates once every twenty-four hours. Four adjustable pointers are placed over the revolving disc for setting the times of switching "on" and "off." These switches have proved very reliable in every-day use, and we understand that the Manchester Corporation have a large number in use, their last repeat order being for 30 of the "Arbiter" type.

Electric Irons.—We have received from the Armorduct Manufacturing Co., Ltd. (Farringdon Avenue, E.C.), a leaflet dealing with "Armorduct-Therma" electric irons. These are made in several varieties, including heavy tailoring irons, heavy laundry irons, domestic and light laundry irons, with consumptions from 275 to 600 watts, and varying from 4 to 21 lbs. in weight. A useful 4 lb. domestic 275 watt iron can be obtained as cheap as 12s. 6d. complete. In order to demonstrate the durability of the apparatus, samples were sent to various supply engineers, who have reported on the tests they have made. In one case, an iron was kept for one month in circuit continuously without detriment, and other tests were carried out with equal success over continuous periods of 1,000 hours, 5,000 hours, and five weeks.

REVIEWS OF BOOKS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

The Ventilation of Electrical Machinery. By W. H. F. Murdoch. 79 pp. 7¼ ins. by 4⅝ ins. 30 figures. (London: Whittaker & Co.) Price 3s. net; abroad, 3s. 2d.

More is known by the average designer of electrical machinery of the data for calculating the losses which will take place in a particular machine than about the capability of the machine to get rid of the heat due to these losses, whereas the latter is really the governing feature in determining the size and cost of the machine. The matter is of growing importance with the high speeds and large outputs now called for, and the author is sanguine enough to look forward to the time when by application of artificial local cooling, the cost of large generators may be reduced to one-half or even to one-third of the present cost per kilowatt. The effect of increasing the output above the normal on the efficiency of a generator, and the effect of speed on temperature, is first discussed, and it is shown that continuous overloads are not as disastrous to the efficiency as is generally supposed. The general laws of heating and cooling are introduced with admirable clearness, and the ventilating action of an armature receives as excellent treatment. Data are worked out as to the cooling effect of fans and oil and water circulation; and various methods of cooling in use are described. The author uses a fair amount of mathematics throughout to deduce his quantitative data, but not more than should be at the fingers' ends of the designer, to whom the book will be welcome.

The Elements of Telephony. By A. Crotch. 90 pp. 7½ in. by 4⅝ in. 51 figures. (London: E. & F. N. Spon.) 1s. 6d. net; by post, 1s. 7½d.

In the ninety pages of this book the reader is given a good general idea of the working of a telephone and telephone exchange, and of the functions of the auxiliary apparatus. The descriptive and explanatory matter is, however, not entirely free from those defects which are almost inseparable from a book dedicated both to the layman and to "those who have some slight acquaintance with the subject."

Mathematics for the Practical Man. By G. Howe. 143 pp. 7½ in. by 5¼ in. 42 figures. (London: Constable & Co.) 5s. net; abroad, 5s. 3½d.

We have here a preparatory course in mathematics, such as it is necessary for the student to grasp thoroughly before he can take up any further studies in the principles of engineering. As mentioned in the preface, it starts at the beginning of the subject, assuming no knowledge beyond that of arithmetic. The feature of the book is that it is a master in itself; the author has attempted to explain the various steps and stages in very simple fashion, and in as short a way as possible. The first nine chapters deal with the fundamentals of algebra, and take the student up to quadratic equations and variation, but this last chapter is rather brief. More important still is the chapter on trigonometry, which, though short, is sufficient at any rate to stimulate interest. In the description of logarithms, we note that in the case of the negative characteristic, the minus sign is put before the whole expression, as log. $0{\cdot}00386 = -3{\cdot}586587$, instead of over the figure, thus, $\bar{3}{\cdot}586587$. The use of logarithms in solving difficult expressions is well brought home to the student. The final chapters deal briefly with the elementary principles of co-ordinate geometry and the calculus. The usual tables of logs. and natural sines, cosines, and tangents appear at the end of the book, but we find no answers to encourage the student to work out for himself the many problems set in the different chapters.

Electricity in Locomotion. By A. G. Whyte. 143 pp. 6½ by 4⅛ in. 18 figures. (Cambridge: University Press.) 1s. net., by post 1s. 2d.

This is one of series of manuals on various subjects connected with science and literature addressed to the general reader, and therefore not highly technical. Mr. Whyte gives a good idea of the general position of electricity in traction matters, and is particularly clear in his exposition of the effects of the Tramways Act of 1870, and other considerations of a non-engineering nature, which proved such a serious handicap to the tramway undertakings of the country, such as the high cost of obtaining powers, the exorbitant demands of local authorities, and the reckless cutting of fares which has taken place. He looks to the trolley omnibus to infuse some new life into electric traction on roads, and gives a few suggestive notes on electric automobiles, petrol-electric vehicles, and electrical marine propulsion, as well as main and suburban railway problems. The whole is easy reading, but we do not like accelerations expressed in "inches per second per second," nor is the description of the position of the gyroscopes in the Brennan monorail car quite correct.

The Compulsory Working of Letters Patent. By F. W. Beney. 15 pp. 8½ in. by 5½ in. (London: W. Clowes & Sons.) 3d.; by post, 3½d.

This little pamphlet is a repetition of the author's views upon the compulsory working clauses of the Patents Act of 1907, which were published in the *Empire Review*, in January last. It is written in a strongly "Imperialistic" tone. The author deprecates the policy of revoking patents for non-working, in connection with which he quotes the support of the Patent Agents' Institute and other bodies expert in patent matters, and urges the retention only of the portion of the Act relating to compulsory licences. He would, however, attach no working conditions to any patent granted to an Imperial citizen, but would apply the principle of compulsory licences to foreign patentees residing in a State that is willing to grant us a reciprocal advantage.

Steam Turbines. By J. W. Roe. 143 pp. 9¼ in. by 6¼ in. 77 figures. (New York: McGraw-Hill Book Co.) 8s. 6d. net; abroad, 8s. 11d.

The author of this book on the steam turbine steers a middle course between elaborate treatises for the skilled designer and so-called practical handbooks for those in charge of turbines, and sets out with the two-fold purpose of providing, first, a text-book suited to a short course on steam turbines in engineering schools and colleges, and secondly a book for the engineer on the principles and the general design of turbines, without going into refined treatment of the more difficult problems entering into their design. A nice balance is maintained between theory and practice, and the utility of the book is enhanced by frequent references to larger works and the collection of problems at the end of each section.

Hydro-Electric Practice. By H. A. E. C. von Schon. 383 pp. 9¾ in. by 7½ in. 140 figures. Second edition. (London: J. B. Lippincott Co.) 25s. net; abroad 26s. 2d.

The revision which this edition has undergone relates chiefly to the hydraulic part of the book, which, as we pointed out in a review of the first edition (Electrical Engineering, Vol. V., page 535, June 16th, 1909) constitutes the major, and also the best-written, portion of the book. That the book has been appreciated at any rate in America is shown by its having reached a second edition so soon, but, as we said in our original review, while we might recommend the book to the electrical engineer wishing to widen his knowledge of hydraulic matters, we would not put it in the hands of a hydraulic engineer wishing to become acquainted with the principles of electrical engineering.

Whittaker's Arithmetic of Electrical Engineering. 166 pp. 7¼ in. by 5 in. 11 figures. Second edition. (London: Whittaker & Co.) 1s. net; abroad, 1s. 2½d.

This little book is intended to aid the student who wishes to apply his theoretical knowledge to practical problems. In each chapter, formulæ are deduced representing the various laws, and problems, based on these, are fully worked out. There are 300 examples supplied for the student to work out for himself, and these include a good selection taken from the City and Guilds of London Institute examinations, besides a large number taken from the Board of Education examinations. Answers to all the questions are given at the end of the book.

Practical Dynamo and Motor Management. 48 pp. 7¼ in. by 6½ in. 21 figures. (London: S. Rentell & Co.) 6d. net; abroad 7d.

A number of useful and really practical hints on the management of dynamos and motors, as well as the diagnosis and remedy of faults, are given in this convenient sixpennyworth. Both continuous- and alternating-current machines are dealt with. A considerable amount of space is devoted to commutators, but, in the treatment recommended, insufficient distinction is drawn between turning and grinding of commutators.

NEW PUBLICATIONS

"The Design of Static Transformers. By H. M. Hobart. 174 pp. 8¾ in. by 5¾ in. 101 figures. (London: Constable & Co.) 6s. net; abroad, 6s. 5d.

"Shop Management." By F. W. Taylor. 207 pp. 8¾ by 5¾ ins. Four figures. (London: Harper and Bros.) 5s. net; abroad, 5s. 6d.

OVERHEAD EQUIPMENT ON THE PRUSSIAN STATE RAILWAYS

In Electrical Engineering of July 20th, 1911, page 414, the electric locomotives for the Dessau-Bitterfeld section of the Prussian State railway system were described, and we now give particulars of the overhead equipment for the same line, which was carried out by the Allgemeine-Elektricitäts Ges. The live wire is suspended on the catenary system from a galvanised steel rope of 42 sq. mm. section, and containing seven separate wires. These are supported from iron girders, which are U-shape for ordinary spans, but are held by tie-rods or made with struts for longer spans. The whole system is divided into sections of one kilometre each, and in the centre of each the line is rigidly fixed, whilst at the ends it is stretched by automatic tightening devices. This arrangement is one of the features of the installation, and produces a uniform tension throughout. In addition to the rope cable and the live wire, it consists of a span wire connected at each point of suspension of the steel rope, and is arranged to expand in opposition to the latter, so that all sag due to expansion is taken up. The construction is as follows:—The two ends of the two tightening sections are led a short distance past one another, and connected to weights. The tension due to these is evenly divided between the three wires and kept constant by connecting their ends to a lever with unequal arms. The lever carries a pulley, over which a cord passes for holding the weights, and a loose pulley is also provided, so that a quadruple ratio is obtained, and the necessary tension produced with a minimum weight. The weights are of cast-iron, and run in guides mounted below the mast. At the girders the steel rope lies loosely on a double cone-shaped insulator, and passes underneath in a loop, and is held 2½ in. from the girder by a special stranded wire support. The span wire is also looped in this way, and is connected to the rope cable by clamps placed at the end of the wire support, and two disc insulators are also fixed on each side of the clamps. The live wire is fixed at the sides by stays of steel tubing, on which contact-wire clamps are mounted, so that it can slide and hold the live wire fast. At the other end the tubing is fixed to the mast by a joint, and can turn in a vertical direction. At this point the whole system is double insulated from earth by connecting a bell and a grooved insulator in series. In order to ensure uniform wear of the bow collectors, the live wire is erected zigzag, thus allowing each point of suspension to deviate about 1 ft. 8 in. from the centre of the track, and in order to allow the wire to rise slightly, under pressure from the bow, without bending the suspension wires. The latter are provided underneath with a loop, which permits a vertical movement of the wire of about 2 in. The suspension wires are of galvanised steel wire of 3 mm. diameter, and the contact-wire clamps of pressed brass. They grip the grooves in the live wire with two jaws, and are fixed to the suspension wire by a slotted holder. The track sections are divided, so that parts can be switched out without cutting off the whole line. At these section divisions horn switches are mounted on the masts, to which two contact wires are connected. These are operated by a winch at the foot of the mast; they have double insulation, and, when required, are opened to cut the sections behind them out of circuit. The two main lines are separated from each other electrically, but a switch is provided in each section, which, in case of breakdown, is closed, and connects all the sections behind with the other line. Another feature of the system consists of the safety arrangements provided on the loading track. The contact lines are specially isolated and earthed under ordinary working conditions, and can only be switched in after warning signals have been given. These signals, supplied with current from a small auxiliary transformer, are automatically operated from the contact live switch, which is actuated by a crank mechanism, with two contact devices connected to a bell and a lamp circuit. For the first thirty seconds after operating the crank the switch does not work, but the bell rings and the lamps light up, and remain alight as long as the loading track is under pressure.

The equipment of the locomotive shed at Bitterfeld is also interesting, the full pressure of 10,000 volts being used inside. A switch is provided on the roof for each contact wire, which cannot be switched in before the warning signal has been given. This signal is similar to the one already described, but instead of the lamps a transparent sign is suspended over each track. When the operating device has been released, the switches spring back to the off position and earth the wires to the shed. The pressure for the shed is supplied by a novel arrangement in connection with the overhead equipment of the turn-table, which is fed from the main line. An angle iron ring is suspended directly over the centre of the turn-table, and in its inner circle a number of slots are provided, corresponding to the number of tracks in the sheds. These slots are gripped by the anchoring clamps for each line. The whole system is supplied by turbo-alternators of an output of 3,750 k.v.a., the alternator generating a single-phase current at 3,000 volts and 15 cycles. This is transformed and transmitted to sub-stations at 60,000 volts, where it is again reduced to a working pressure of 10,000 volts. We are indebted for the above particulars to the *A.E.G. Zeitung*.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ALUMINIUM.—Two leaflets from the British Aluminium Co. (109, Queen Victoria Street, London, E.C.) illustrate aluminium in its standard forms, and its use for bus-bar and switchboard connections.

CONDENSER TUBE PROTECTOR.—An apparatus, known as the Harris-Anderson condenser tube protector, for the prevention of pitting and corrosion of the tubes, is the subject of a pamphlet received from the Harris Patent Feed Water Filter (1910), Ltd. (82, Victoria Street, S.W.). This apparatus is extensively used on numerous steamships, amongst which are the Cunard Co.'s, Bibby and Son, Williamsons, Ltd.; also by the Corporations of Dundee, Dublin, Belfast, Devonport, and Partick electricity works. Large repeat orders have been received from the A.E.G., Berlin, and Bibby & Son, Liverpool.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

PULLEY-BLOCKS AND CRANES.—The Derome Standard Pulley-Block and Crane Manufacturing Co. (78, Southwark Street, London, S.E.) have issued a booklet describing and illustrating their lifting appliances, including various standard types of pulley-blocks, with or without chain drive, and overhead travelling cranes, besides electric runaways, which enable one ton to be moved about at 300 ft. per minute. We understand that any pulley-block with the required length of chain, will be sent out on approval, free of all charges, and at the firm's own risk, on the receipt of a post-card with the necessary particulars.

INDUCTION MOTORS.—A pamphlet, dealing with alternating current induction motors for three-phase and single-phase 50-cycle circuits, has been sent to us by T. W. Broadbent, Ltd. (Victoria Works, East Parade, Huddersfield). A special feature of these motors is the robustness of their construction, both electrically and mechanically. The stators are wound with "asbestin" insulated wire, and the insulating materials are such as to withstand high temperatures without injury. The rotor conductors are expanded at the ends to fit the short-circuiting rings, which are very massive, of low resistance, and offer a large cooling surface. The machines are of high frequency and power factor, and have a small percentage slip. They will work at 25 per cent. overload for one hour without injury.

University College, London.—We have received a copy of the prospectus for the forthcoming session of the Faculty of Engineering of University College (Gower Street, London, W.C.). Students can either take a degree course leading to the London B.Sc. in engineering, or a diploma course for which a certificate is given. Both courses are of three years' duration, and students desiring to commence either next session should communicate with the Provost of the College not later than September 20th. Specialisation in electrical engineering is possible in the second and third years. Special courses can be arranged for those who have received partial training elsewhere, and there are exceptional facilities for post-graduate and research work. Prof. J. D. Cormack is Professor of Mechanical Engineering, and special lectures are given in this division by Mr. A. H. Barker on heating and ventilating. The Electrical Engineering Department is under Prof. J. A. Fleming (Pender Professor of Electrical Engineering); Mr. W. C. Clinton is Assistant Professor; and lectures in electrical design are given by Mr. E. Kilburn Scott. The laboratories are very completely equipped. Municipal engineering is dealt with by Prof. Osbert Chadwick. Engineering students have also opportunities to study in other departments, such as those of geology, mathematics, physics, applied mathematics, and chemistry. A considerable number of scholarships are open to those taking engineering subjects, including an entrance scholarship of the value of 120 guineas, application forms for which must be obtained before September 5th.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The French Ministry of Public Works has decided upon the establishment of three wireless stations for the express purpose of giving signals by which ships provided with directive receiving apparatus, such as the Bellini and Tosi "wireless compass" (see ELECTRICAL ENGINEERING, Vol. VI., July 28th, 1910, page 491), can ascertain their position in time of fog. The first will be at Créach d'Ouessant, where every six seconds the Morse letter O will be given out in a manner which will produce in a receiving telephone a note corresponding to 522 vibrations per second. At the second station, at l'Ile de Sein, the note will be higher, 783 per second, and the letter S will be repeated; while the third signal, from the *Le Havre* lightship, about seven miles from Cape La Hève, will employ a wave-length of 24 metres and repeat the letter H with the same note as the first mentioned.

For some time the French Government have sent out regular time-signals at 11 o'clock in the morning from the Eiffel Tower. This is now made of still more use to mariners by being followed by a series of meteorological signals, reporting the height of the barometer and the direction and force of the wind and the roughness of the sea according to a certain code at the following stations:—Reykjavik (Iceland), Valentia (Ireland), Ouessant (France), La Coruna (Spain), Horta (Azores), and St. Pierre et Miquelon (Newfoundland).

As a result of the successful experiments in direct telephony over the new Channel cable between Paris and towns as far north as Aberdeen, a list of towns is to be published shortly with which telephonic communication will be available with France.

In answer to a question in the House of Commons last week, the Postmaster-General stated that at the present time he was unable to give the cost of the two automatic telephone exchanges which are to be erected at Epsom and Caterham Valley. The chief object of the experiment was to ascertain the working expenditure.

The National Chamber of Trade have addressed a further communication to the Postmaster-General, urging the appointment of a committee of inquiry into the work and management of the telephone system of the country.

The accounts of the Hull Municipal telephone system show a surplus of £1,168 on the past year's working.

Telegraphic communication between Rome and Constantinople was restored on the 2nd inst., and on the 4th inst., the cable between Guam and Manila was in working order again. It was only reasonable to expect that the Hayti revolution should have brought interferences with land lines in its train. Communication with Jeremie, Aux Cayes, and Jacmel is down, and telegrams are being sent south to places in Hayti by mail. The El Arich route failed beyond Gaza on the 6th inst., but was repaired on the following day. Owing to pressure of work, the exchange of telegraphic correspondence with Morocco is subject to delay, and telegrams can only be accepted subject to this condition.

LLANELLY ELECTRICITY WORKS

THE inauguration of the undertaking of the Llanelly & District Electric Lighting & Traction Co., Ltd., was on July 13th, when a luncheon was given by the contractors, Messrs. Balfour, Beatty & Co., Ltd. The Lighting Order was originally granted in 1891 to the Llanelly Urban District Council, but remained in abeyance for several years. In 1908, however, it was transferred to the Company, and an agreement was entered into with the Urban Council whereby the street lighting was to be converted from gas to electricity within a period of two years. The conversion of some existing tramway lines from horse to electric traction has also been carried out by the contractors, and an additional five miles of track constructed (making in all about 6¼ miles of track) under the Llanelly & District Light Railways Order, 1907, as amended in 1910.

The light and power system adopted is direct current, 500 volts, three-wire, the majority of power consumers being across the 500, and the lighting across the 250-volt sides. The power station is situated close to the North Dock, from which the circulating water for condensation purposes is obtained. Work was commenced on it in July, 1910, and the supply was started on the first day of this year. In addition to laying cables, the contractors had to convert over 530 gas lamps to incandescent electric lamps, and to erect 40 Crompton-Blondel flame arc lamps. Each incandescent standard has one 50-c.p. metallic filament lamp, and the arc lamps, in addition to the 1,500-c.p. flame arc, are provided with two incandescent lamps for all-night lighting.

The generating plant consists of two Belliss engines, one coupled to a 300- and a 150-kw. generator by the Rees Roturbo Co., and the other to a 500- and a 150-kw. generator of the same make. One condenser, supplied by Messrs. Cole, Marchent & Morley, is placed midway between the two engines. Steam is supplied from two Babcock & Wilcox water-tube boilers, with super-heaters. The condensed water is taken through a Paterson combined feed water purifier and heater, and is delivered to the boilers by a Weir feed pump, with a Worthington pump as a standby. A 1,000-ampere-hour battery, by the Chloride Electrical Storage Co., along with an automatic Entz booster, is provided, and the switchgear is arranged so that the battery and booster can be put on either to the lighting and power or traction loads. The balancer was supplied by the Rees Roturbo Manufacturing Co., and the switchgear by the British Thomson-Houston Co., Ltd.

The cables are laid throughout on the solid system in earthenware troughs, and this portion of the work was supplied and carried out by Callenders Cable & Construction Co.

The tramways actually constructed total about 6¼ miles of route, and included the conversion of one mile of horse lines.

Work was commenced in March of this year, and the first section, consisting of some 4½ miles of track, was inspected by the Board of Trade and opened for traffic on June 16th. The remaining section (that to Pwll, about 1¾ miles) has now been constructed, and was inspected by the Board of Trade on August 1st. The track and overhead equipment do not call for special remark. Ten cars have been supplied by the British Thomson-Houston Co., with bodies being built by the United Electric Car Co., Preston. A new car-shed has been built capable of accommodating twenty cars. The whole of the lighting and traction system was designed by Messrs. Balfour, Beatty Co., Ltd., 22A College Hill, Cannon Street, London, E.C., who were also the contractors.

SERIOUS EXPLOSION AT AN ELECTRICITY WORKS DUE TO WATER HAMMER

ON Wednesday last week, a Board of Trade enquiry was held with regard to a fatal steam pipe explosion which occurred at the Bow Road Works of the Charing Cross, West End, and City Electricity Supply Company, on October 31st last year. Mr. A. A. Hudson, K.C., and Mr. J. Fullerton Bell conducted the enquiry on behalf of the Board of Trade, and it lasted until Saturday.

It appears that some alterations were being made, involved by the substitution of steam-driven for electrically-driven exciters, and two stop valves were taken into use which had previously been used at the company's Lambeth Works. Last September the valves were stripped entirely and examined by Mr. E. Coates, station superintendent, and Mr. J. W. Kingston, the works foreman, and they were found to be generally in good working order, except that it was deemed necessary to fit one of the valves with a new spindle. This was done, and the alterations in connection with steam supply to the exciters were made in October, and everything was connected up ready for steam to be admitted into the new range on October 31st. The boiler-house foreman received directions from Mr. J. W. Kingston as to what was to be done, but in carrying them out it appears that proper precautions had not been taken for the drainage of the pipes, and also that by the omission to open one of the valves, only part of the system was placed under steam, so that water hammer was produced which caused the explosion. Both the valves in question were fractured, two men—the works foreman and one other man—were killed, and three were injured. Mr. H. W. Kingston, the company's engineer-in-chief, and Mr. Ernest Coates, the station superintendent, both gave evidence at the enquiry. The Board of Trade inspectors held that sufficient consideration had not been given to the possibility of mistakes being made by the men who actually let live steam into the new range, and that the station superintendent himself ought to have been present at the time this was done.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published August 3, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

14,126/10. **Electric Clocks.** F. Holden. An electric clock in which the pendulum or balance wheel carries a pivoted contact, which, by the motion of the pendulum, periodically engages a fixed contact and closes the electric circuit. The moving and fixed contacts are magnetised, so that when nearly touching a magnetic attraction takes place of sufficient strength to prevent a rebound. One figure.

16,258/10. **Electric Safety Fuses.** M. Kallmann. An electric safety fuse, comprising a main fuse, which normally carries most of the current, and an auxiliary fuse with a high temperature coefficient and a very high resistance. This is placed in parallel and arranged to break after the main fuse has blown. Means are also provided for protecting the auxiliary fuse when the main fuse blows.

17,010/10. **Braking Induction Motors.** E. Rosenberg and J. S. Peck. In the braking of induction motors, where the motor is disconnected from the alternating current supply and one of the windings is supplied with direct current, means are provided for a resistance, placed in circuit with the other winding, to be varied automatically by a device which operates in accordance with the motor speed as a generator, or with the frequency or voltage of the current generated by the secondary member of the motor. Six figures.

18,295/10. **Sparking Plugs.** J. C. Anderson. The manufacture of sparking plugs, in which the shell is heated and confined within a mould. A heated electrode is located in the shell, into which molten glass is poured, and finally compressed and welded to the metallic members of the plug. Four figures.

22,507/10. **Rotating Commutators.** Vickers, Sons & Maxim and A. D. Williamson. This invention relates to the attachment of commutators, and consists of a series of segmental pieces constituting a ring with a cylindrical inner face and a conical outer surface, also a collar surrounding the ring and having a conical inner surface to correspond to the outer surface of the ring, and means are provided for moving the collar axially on the ring to insert an inward pressure. Six figures.

28,588/10. **Electric Relay Apparatus.** The Westinghouse Brake Co., Ltd. A relay comprising a rectangular core of magnetisable material with two opposite pole pieces projecting inwardly. The remaining sides of the rectangle are connected by a bar passing between the pole pieces and the movable part of the relay, constituting a short-circuited coil, which moves in the space between the poles and the bar, and these are provided with windings supplied by an alternating current. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Booker, Ogilvy-Webb, and Reinecke, 9,191/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Campbell and Shaw [Transmission of electric signals] 3,422/11.

Dynamos, Motors, and Transformers: Klein [A.C. and D.C. machines] 16,763/10; Sumpter [Control of reversing variable speed motor] 17,222/10; Watkins [Carbon grinding device for] 17,236/10; James [Driving variable speed machines] 17,247/10; Rogler [Motor for driving blowers, &c.] 21,235/10; Railing and Bartlett [Commutator cooling] 9,201/11.

Electric Ignition: Raggett, Maclean and Murray [Ignition systems] 20,531/10; Anderson [Sparking plugs] 29,489/10.

Electrometallurgy and Electrochemistry: Harden and Electric Furnaces & Smelters, Ltd. [Production of metals] 21,206/10; Stassano [Electric furnace] 8,901/11.

Heating and Cooking: Frosali and Visconti [Heating apparatus] 10,767/11.

Incandescent Lamps: Eisner [Manufacture of filaments for] 17,469/10; Bacci, 27,240/10.

Instruments and Meters: Arno [A.C. power measurement] 9,580/10; Stroude and Josephs [Thermo-electric temperature apparatus] 1,100/11; Weston [Measuring instruments] 5,267/11; Siemens Bros. & Co. (*Siemens and Halske Akt.-Ges.*) [Instruments, dynamometer type] 13,707/11.

Switchgear, Fuses, and Fittings: Lichtenfeld [Switch devices] 16,904/10; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Motor starting devices] 17,166/10; Tucker [Switches] 20,900/10.

Telephony and Telegraphy: Judd and Hardie [Telegraph relays] 17,523/10; White [Intercommunication system] 22,239/10; Perotti [Transmitting and registering verbal messages device] 24,347/10; Goldschmidt [Method for receiving electric waves in] 8,387/11.

Traction: Siemens Bros. & Co. (*Siemens and Halske Akt.-Ges.*) [Railway signalling apparatus] 5,596/11.

Miscellaneous: Bonhomme [Wireless signalling] 17,172/10; Venner [Resistance for heating apparatus] 17,684/10; Murphy [Electric oscillations and H.T. discharges] 29,802/10; Frisby [Electric current detectors] 7,569/11; Schattner [Rheostats] 7,736/11; Crook [Selective electric signalling] 8,283/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Incandescent Lamp: Schaller, 16,195/11.

Miscellaneous: Pörscke and Achenbach [Electrodes for secondary cells] 10,264/11.

Opposition to Grant of Patents

30,602/09. **Separators for Primary Batteries, &c.** P. Marino. This patent has been granted in spite of opposition. It deals with the construction of separators for primary batteries and secondary cells by a process of treating the fibrous material for use as separators.

Amendments

19,626/06. **Textile Machinery.** Brown, Boveri & Co., Ltd. The amendments to this specification referred to in Electrical Engineering, of March 23rd, 1911, page 156, have been allowed. The patent covers improvements in electrically-driven ring spinning machines.

7,612/08. **Textile Machinery.**—Brown, Boveri & Co., Ltd. The Comptroller has allowed the amendments to this patent. We gave particulars of them in Electrical Engineering, of March 23rd, 1911, page 156. The specification deals with electrically-driven ring spinning machines.

1,805/10. **Sterilisation of Liquids.** V. Henri, A. Helbronner, and Max von Recklinghausen. As a result of the extended investigation under section 8 of the Patents Act, a disclaiming note has been inserted in this specification, which relates to apparatus for sterilising liquids by means of ultra violet rays.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

18,644 of August 11th, 1897. **Wireless Telegraphy.** Oliver J. Lodge and A. Muirhead. This invention deals with systems of telegraphing by Hertzian waves, and provides means for greater certainty of action, and for increasing the distance of transmission.

18,868 of August 14th, 1897. **Linotype Machines.** W. S. Scudder. Describes the manufacture of matrix-bars having intaglio characters formed in metal, which is electrolytically deposited in recesses in the edges of the bars.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: M. Meirowsky [Electric insulation] 9,325/02; W. J. Davy [Electric distribution] 8,951/07; A. G. Inrig [Insulating material] 9,094/07.

Electrometallurgy, &c.: P. Hubert [Electroplating] 8,679/03; G. Gin [Reduction of ores] 8,221/05.

Incandescent Lamps: J. Davis, 8,903/07; T. Elliott [Supporter for], 9,345/07.

Instruments, &c.: G. Hookham and S. H. Holden [Motor meter], 8,984/07; B. North and R. Pohl [Electrolytic meters], 9,337/07.

Switchgear, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Controllers], 9,112/06; M. W. W. Mackie [Switches], 9,191/06; E. Schattner [Switches], 8,842/07; K. Hahn [Vapour Electric Apparatus], 8,874/07; E. T. Bumpstead and H. C. Glover [Switches], 8,913/07; F. Decker [Engine stop-gear], 9,109/07.

Telephony, &c.: J. H. Parsons [Telephone Systems], 8,881/07; Amalgamated Radio-Telegraph Co. (*H. Rosenthal*) [Wireless Telegraphy], 9,028/07 and 9,051/07.

Miscellaneous: British Thomson-Houston Co. and F. Holden [Coin freed apparatus], 9,135/02; T. Twynam [Utilising slag], 9,073/07; M. Möller [Electric clocks], 9,240/07; H. C. L. Holden and G. K. B. Elphingstone [Electric lighting systems], 9,294/07; A. Coates and H. W. Hacket [Governor valve operation], 9,338/07; F. Diehl and A. F. Becker [Electric fans], 23,756/07.

ELECTRIC TRACTION NOTES

As the result of a conference, the Leeds tramway strike was settled late on Thursday last, and traffic was resumed on Friday. The men's working hours have been reduced from 60 to 54 per week, and a compromise has been arrived at with regard to spread-over terms, &c.

At the meeting of the London, Brighton & South Coast Railway last Wednesday, reference was made to the increasing success of the electrified lines, which showed conclusively that electric traction on a railway could more than hold its own in competition with electric trams. The electrical services between Victoria and the Crystal Palace had only been running since May 12th, but the result was equally satisfactory. At the end of this year, when it is hoped similar services will be established between London Bridge and the Crystal Palace, the attainment of even better results is expected. The additional receipts derived from the electrical services represented nearly 30 per cent. of the total increase of passenger receipts.

At the general meeting of the Central London Railway, Mr. H. F. Parshall, Chairman, announced that considerable progress had been made with the new system of ventilation by ozonised air. The plant is already in operation at the Bank station, and it was hoped that the equipment of all the other stations would be completed by September. Four hundred thousand cubic feet of air per hour will be pumped in at each station, containing ozone in the proportion of one part in 10,000,000. Considerable progress has been made with the Liverpool Street extension.

According to the report of the London Electric Railways Co., the gross receipts on revenue account showed an increase of £27,193 compared with the corresponding half of last year. The working expenses increased by £7,699. After providing for interest and rents, and reserving £7,500 for contingencies and renewals, there remains a balance of £124,156. The directors recommend that a dividend at the rate of 4 per cent. per annum be declared on the 4 per cent. preferred stock and that a dividend at the rate of 1 per cent. per annum be declared on the ordinary shares, leaving a balance of £14,516 to be carried forward.

The half-yearly report of the Metropolitan District Railway records an increase of 9·25 per cent. in the passenger receipts and 4·60 per cent. and 6·92 per cent. in the train mileage and car mileage respectively, as compared with the corresponding previous half-year.

An increase of 27,961 miles run by electric trains on the Great Western Railway as compared with the previous corresponding half-year is recorded in the report.

The cost of electric train working on the North Eastern Railway for the half-year ended June 30th, 1911, was £16,168 (as compared with £15,978 for the previous corresponding half-year). Of this, £12,331 is the cost of energy purchased. The total car miles run by electric traction had increased from 1,836,048 to 1,892,439 for the same periods. The passenger train miles were 597,953, and the goods train miles 2,537.

The report of the Liverpool Overhead Railway records an increase of traffic receipts of £1,968; 5 and 1 per cent. dividends are recommended on the preference and ordinary shares respectively, with £4,665 carried forward.

The Tyneside Tramways and Tramroads Co. report a surplus of receipts over expenses of £4,288, which, after deduction of interest, &c., and including last year's balance, gives £989 available for distribution. Dividends of 5 per cent. on the preference and 1½ per cent. on the ordinary shares are recommended, and £1,000 is to be carried to reserve. The traffic receipts show an increase of £882.

After meeting capital charges amounting to nearly £20,000 and £760 legal expenses, there was a loss of £115 on last year's working of the Birkenhead tramway undertaking. The rates will have to be drawn on in addition to the extent of £1,000, which is the annual contribution to renewals fund. £7,050 has been contributed to relief of rates from the Stockport tramway undertaking.

An interim dividend at the rate of 4 per cent. per annum has been declared by the Bristol Tramways & Carriage Co.

The Brighton, Hove & District Railless Traction Bill has been approved by the Select Committee of the House of Commons. The scheme proposed involves the running of an accumulator omnibus as far as the boundary of Brighton. The battery, weighing a ton and a quarter, would then be removed, and the car run to Rottingdean by the railless trolley system. On the return journey the battery would be replaced. The work is to be completed within two years.

It is stated that trolley omnibuses will be employed on the new lines from Moor Side to Grain's Bar, Oldham. The estimated cost has been given at £1,500 per mile.

Trolley omnibuses are under consideration in Munich, and a Commission has been appointed to report on the matter.

The report of the Commission on railway electrification in Switzerland is stated to contain estimates showing that the conversion of the St. Gotthard line to the single-phase system with 15,000 volts 15 cycles, will entail 8 per cent. less capital expenditure than if it were carried out on the third rail continuous-current system. The cost of the conversion is estimated at £2,700,000, and a 10 per cent. reduction in working costs is anticipated.

The adoption of electric traction is under consideration on various local lines in the neighbourhood of Cologne and Bonn. The scheme would involve an expenditure of nearly 1½ millions.

A concession has been granted for the construction of an electric railway from Piazza Venezia, in the middle of Rome, to the seashore at Ostia, about 18 miles.

The paper on rack-railway locomotives of the Swiss mountain railways, by Messrs. T. Weber and Abt (Winterthur), read at the Zürich meeting of the Institution of Mechanical Engineers, contained, in addition to particulars of steam locomotives, a few notes on electric rack locomotives. Electric traction was first applied to a rack-railway on the Gornergrat line, opened in 1898, where locomotives, each driven by two 9 h.p. three-phase motors, are employed, giving a maximum tractive force of 5·9 tons and a speed of 4·3 m.p.h.; regenerative as well as mechanical braking is employed. Similar locomotives are in use on the Jungfrau railway. The first Swiss rack-railways to be worked by continuous currents are stated to be the Aigle-Leysin and Bex-Gryon-Villars lines, opened in 1900 and 1901 respectively. In these locomotives a friction disc-coupling to reduce shocks was first employed between the motor and the gearing. Three-phase motors are employed on the Brunnen Morschach line, and the mechanical arrangements include a safety grip on the rack.

The Wengernalp Railway commenced to use electric driving in June, 1909, and now has ten locomotives of 300 h.p. each. These are generally of the same construction as those of Gornergrat and Jungfrau, but are built for 80 cm. (2 ft. 7½ ins.) gauge. They have an equalisation of pressure on the rack-wheels arranged by means of balancing levers, as well as a system of automatic interlocking which prevents the automatic brakes from being put in action when the train is going uphill. Each locomotive is provided with two-series continuous-current motors, each of 150 h.p., this full power being capable of continuous use. The motors make 750 r.p.m., and they are worked in series by bow contracts at 1,500 to 1,800 volts. Electric braking is used when running down hill.

The Stanstad Engelberg line, opened in 1898, is partly rack and partly adhesion, and employs three-phase current at 750 volts. Each locomotive has two 150 h.p. motors, and special arrangements permit of the carrying and rack axles being connected by coupling-rods. This is also done on the locomotives of the Martigny-Chatelard line, opened in 1904, which, however, are driven by continuous current. In addition to the locomotives there are on the Martigny-Chatelard line also nine motor-carriages, each of which rests on two four-wheel bogies. Each bogie has two motors of 80 to 100 h.p., which, by means of spur-wheel gearing an intermediate shaft, transmit the power on the rack as well as on the adhesion-axles. This rigid connection between adhesion and rack-wheels is not recommended by the authors of the paper, but up to date the system has worked without any interruption.

On the Monthey-Champery line, opened in 1906, motor coaches are used on which the bogies each have one adhesion and one rack-wheel driving motor, each independent of the other, allow varying gradients to be worked in the most efficient manner by the rolling stock. The adhesion-axles are driven by the adhesion motor and connected by coupling-rods. The rack-wheel motor works by means of double spur gear on a rack driving-wheel mounted loose on one of the adhesion-axles. The locomotives on the Montreux-Glion line are also arranged so that they can run either only by adhesion or by the rack gear only. The two rack driving-axles are each connected to the neighbouring adhesion-axles and carry a loose rack brake-wheel. The rack-wheels are always in motion as they are coupled up through double spur-wheel gearing to the motors. For running on the adhesion part

Hosted by Google

of the line, a friction-clutch coupling keyed on to the intermediate shaft transmits the power from this by spur-wheel gearing and connecting-rods to the adhesion-axles.

The Blonay-les-Pleiades and the Altstätten-Gais railway lines are intended to be brought into service during the present summer. The first works with mixed locomotives similar to those on the Montreux-Glion line, the second line has six-wheeled motor carriages having bogies similar to the Monthey-Champery type. Switzerland has a total of 120 steam locomotives as well as forty-five electric locomotives, and motor coaches arranged for working with rack gear. The total length of the rack-railways is 87 miles.

According to the *Electric Railway Journal*, all the cable lines of the United Railroads of San Francisco are now electrically driven. The speed of the cables has been increased about 3 per cent., and owing to the constant speed of the motor, a much more uniform speed is obtained than with the steam engine, which could not be controlled within less than 5 per cent.

A slight collision occurred last Friday on the electrically-driven wire-rope railway up Great Orme's Head, Llandudno, owing to one of the cars missing the points at a passing-place. The cars were going slowly at the time, and only a few persons were slightly injured.

LOCAL NOTES

Blackpool: *Municipal Wiring.*—The deputation at the M.E.A. Convention has reported:—"We do not advocate the Corporation doing the actual wiring work, but if the Corporation had the powers it would enable the Electricity Supply Department to obtain much new business in the hiring out of motors, &c., and thus increase the output and sale of electricity. When the Corporation do obtain powers, the Electricity Department will, in all cases, invite tenders for local contractors for carrying out the actual wiring, and thus no injustice will result to the wiring contractors."

Burton-on-Trent: *Electricity Showrooms.*—As the result of attending the Brighton Convention of the I.M.E.A., Councillor King has recommended the Council to open electricity showrooms.

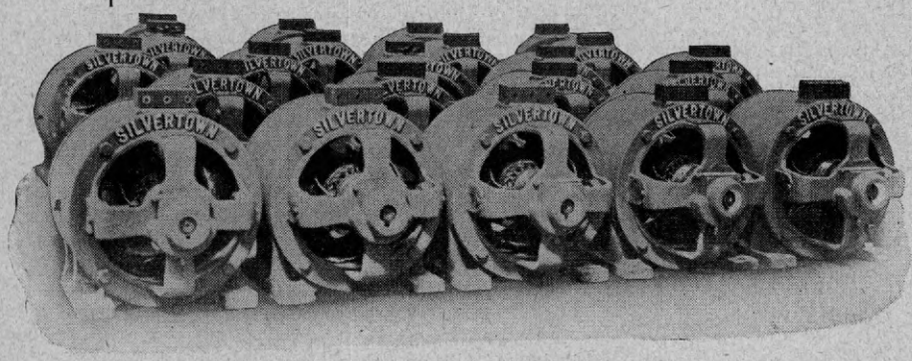
Canada: *New Water Power Plant.*—It is anticipated that the Winnipeg water power generating station at Point du Bois will be in operation on August 15th.

Dover: *Electricity Undertaking.*—A recommendation of the Electricity Committee that the salaries of several officials of the Electricity Department should be raised has been rejected by the Council.

Greenock: *Electricity Accounts.*—A profit of over £5,000 is reported on the electricity undertaking, after payment of all capital charges, &c. The corresponding profit for the previous year was £3,427.

Guisborough: *Electricity Supply.*—As a result of a petition asking for a scheme for electric supply, a Committee has been formed to report on the question.

Halifax: *Electricity Accounts.*—The profit for the year has amounted to £4,366, as compared with £1,883 for the previous year.



Hull: *Electricity Accounts.*—After payment of capital charges, a net profit of £8,347 remains for the year out of a gross profit of £32,746. This is slightly in excess of the amount for the previous year.

Ilford: *Electricity Accounts.*—A final balance of £1,400 on the last year's working has been carried to reserve and depreciation account.

Llandudno: *Reduced Tariff.*—The recommendation of the Electricity Committee that the price of electricity for lighting be reduced from 5d. per unit to 4½d. has been approved by the Council.

London: *Marylebone.*—A suggestion of the Electricity Committee to the effect that wiring of installations under the three

SILVERTOWN

Part of an order for Silvertown "Z 10" Motors.

"Z" Type
MOTORS
1—1½ B.H.P.

are guaranteed to develop their rated outputs, and will stand heavy overloads.

These Motors are strongly constructed, and can always be relied upon to give satisfactory service.

COMPETITIVE PRICES. Full Particulars on Application.

The
India Rubber, Gutta Percha & Telegraph Works Co., Ltd.

Head Offices: 106, Cannon Street, London, E.C. Works: Silvertown, London, E.

Hosted by Google

years' hire system should be sublet entirely to contractors, has been approved by the Council.

St. Pancras: Electricity Profits.—There was a net profit of £13,203 upon the electricity undertaking last year after meeting capital charges.

Morley: *Electricity Accounts.*—The final result of the year's working has been a deficit of £530, against that of £793 for the previous year.

Nelson: *Supply of Brierfield.*—At Nelson Town Council, on August 3rd, the Chairman reported that the Board of Trade had decided to make an Order authorising the supply of electricity in bulk to Brierfield, subject to a provision that such supply should not be used for traction purposes in connection with tramways worked by the Burnley Corporation.

Newcastle: *Supply of Walker and Newburn.*—An agreement has been arrived at whereby the supply of electricity to Walker will no longer be taken from the Newcastle Electric Supply Co. but will be given by the Corporation. The supply of Newburn is to be given by the Newcastle District Electric Lighting Company, at 0·55d. per unit.

Newport (Mon.): *Electricity Undertaking.*—Two members of the Electricity and Tramways Committee have resigned as a protest to alleged bad management of the undertaking generally, especially as regards to the condition of the tramway track and cars.

Northallerton: *Street Lighting.*—The tender of the Northallerton Electric Power Co. for street lighting for five years has been accepted.

Stockport: *Electricity Accounts.*—A gross profit on the year's working of £10,235 has been made, out of which £3,539 has been contributed in relief of rates.

Yarmouth: *Interruption of Supply.*—Supply was interrupted for about half an hour on Monday evening, and some inconvenience was caused at hotels, places of entertainment, &c.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bacup.—It has been decided to ask for sanction to borrow £1,250 for electricity purposes.

Belfast.—It has been decided to make application to the Local Government Board for a loan of £40,000 for plant extensions and mains.

Biddulph.—A scheme has been laid before the Council for electric lighting of the village with overhead distribution.

Birmingham.—A Local Government inquiry was held last week into a loan of £934 for the purchase of a site for extensions to the Summer Lane station. It is proposed to instal two new 5,000-kw. sets.

Bispham.—The Local Government Board has sanctioned a loan of £10,800 for extensions.

Britonferry.—Application is to be made to the Local Government Board for a loan of £1,200.

Burnley.—The Local Government Board has sanctioned the borrowing of £8,552 for extensions at the electricity works.

Epsom.—The Electrical Engineer has recommended the expenditure of £3,500 on extensions, including a Diesel engine. An expert is to be appointed to advise in the matter.

London: *Southwark.*—A loan of £4,456 is to be applied for, for extensions, including new battery room, machinery mains, house services, and meters.

Melrose.—The Electric Supply Corporation have been granted consent to the erection of overhead wires for supply to a number of districts outside the town.

It has practically been decided to erect a power station to supply electricity to St. Boswells, Newtown, and Bowden.

Wath.—The Yorkshire Electric Power Co. has placed a scheme of electric supply before the Council.

Wednesbury.—Application is to be made to the Local Government Board for a loan of £238 for small mains extensions.

Wimbledon.—A Local Government Board inquiry was held last week concerning a loan of £7,459 in connection with the extension of electric supply into the Maldens and Coombe district.

Wolverhampton.—A 400-kw. rotary converter and switchgear is to be purchased at an estimated cost of £1,500.

Worthing.—A Local Government Board inquiry has been held regarding an application for a loan of £4,950 for extensions at the electricity works. It is proposed to put down two 125-kw. sets driven by Diesel engines.

Wrexham.—The Local Government Board have sanctioned loans for the following purposes:—Traction battery (£437), meters (£140), extensions to feed pumps, forced draught furnace, automatic expansion gear to one engine (£450), street lighting (£500), extension to condensers (£80), electrical instruments and sundries (£50), machine tools (£220), erecting and fitting out stores and offices (£350), coal elevator (£300), switchboard (£260), reversible booster (£150), switchboard (£100).

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Aberdeen.—Cinematograph theatre.

Aberytswyth.—Additions to Council school.

Belfast.—New schools. Architect, W. J. Fennell, 2 Wellington Place, Belfast.

Birmingham.—Tramway depôt at Hockley. A. Rowse, King's Court, Colmore Row.

Bradford.—Residence for Medical Officer at City Hospital.

Brighton.—Receiving homes and infirmary. J. W. Hawker, 3 North Street.—New Presbyterian Church. E. Proctor, 83 St. Paul's Churchyard.

Doncaster.—New lecture hall and school.

Dover.—Infants' school. Borough Surveyor.

Eccles.—Public baths in Cromwell Road. Architects, Brameld & Smith, 4 Cannon Street, Manchester.

Gillingham.—Royal Naval and Marine Orphanage.

Hampstead.—New police station.

Ilkestone.—New schools.

Irvinestown (Co. Fermanagh).—A lighting scheme for the Parish Church is under consideration.

London.—Erection of Deptford Central Library.

Nottingham.—Veterans' and Union Jack Club, Carlton Road. Architect, A. Marshall, King Street.

Oswestry.—Infirmary, &c.

Sussex.—The East Sussex County Hall and Courts are to be wired for electric lighting.

MISCELLANEOUS

London.—Tenders are required by August 18th for a three years' supply of electrical accessories by H.M. Office of Works.

Portsmouth.—The Traffic Committee of the Tramway Committee recommend a number of tramway extensions at a total estimated cost of £31,500.

Rishton.—The directors of the Victoria Mill, Rishton, have decided to work their machinery by electricity. This will be the first mill in the district to adopt this method. There will be a separate motor for each loom.

St. Helens.—The London & North Western Railway have been in treaty with the Corporation regarding a supply of electricity for power purposes to their Earlstown Waggon Works.

TENDERS RECEIVED AND ACCEPTED

Blackburn.—The tender of McPhail & Simpson, Ltd., for a superheater and fittings, has been accepted.

Dundalk.—The following tenders, amounting in all to £16,186, have been accepted:—Oil engines and generators, Messrs. Mirrlees, Bickerton & Day, Ltd., Hazel Grove, Stockport; main, Messrs. Siemens Bros. & Co., Ltd.; switchboard, &c., Messrs. Brook, Hurst & Co.; battery (Tudor Accumulator Co.'s plates), the Sandycroft Foundry Co.; booster, British Westinghouse Co., Ltd.

Luton.—The tenders of the Hudson Economiser, Ltd., for a cooling tower (£637), and of Messrs. Hayward, Tyler & Co. for an electrically-driven feed pump (£120), have been accepted.

Shanghai.—An order has been placed by the Municipal Commissioners with the General Electric Co. for 1,700 Osram lamps from 100 to 400 c.p.

Wednesbury.—The tenders of the Tudor Accumulator Co., Messrs. Johnson & Phillips, and H. J. Smith, relating to extensions of the electricity works, have been accepted.

Hosted by Google

APPOINTMENTS AND PERSONAL NOTES

Mr. T. A. Edison arrived at Fishguard on Monday. According to the *Times*, he is spending a two months' holiday in England.

Mr. Hugh M'Lean, Electrician, Great North of Scotland Railway Locomotive Works at Inverurie, has been appointed by the Chloride Electrical Storage, Co., Ltd., as their representative in the Argentine.

The salary of Mr. W. H. Cook, Electrical Engineer, Luton, has been raised from £400 to £450 per annum, and that of the Chief Assistant, Mr. H. A. Kell, from £140 to £165.

Applications are invited for the position of entire control of a factory in the Midlands employing a thousand hands. (See advertisement on another page.)

Applications are invited for the posts of Junior Drawing Office Assistant and Assistant Junior Demonstrator at the Northampton Polytechnic. (See an advertisement on another page.)

Mr. P. Spalding, formerly Engineer to the Galway Electric Lighting Co., has been appointed Electrical Engineer to the District Council of Dundalk at a salary of £250 per annum.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5, Philpot-lane, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. (last week the same).

Bankruptcies.—As the result of creditors' meetings in the bankruptcy of Messrs. J. G. Childs & Co., Ltd., electrical engineers, Willesden Green, London, the liquidation of this firm has been left in the hands of the Official Receiver. The company was registered in 1907 with a capital of £20,000, and has involved losses each year since. The accounts showed assets valued at £3,410, which are entirely absorbed in a debenture of £5,000. The unsecured liabilities amount to £20,640.

The Official Receiver's statement of the bankruptcy of W. H. Ridpath, electrical engineer, Ilkestone, shows assets amounting to £140, and a deficiency of £1,210.

The public examination of C. F. Lindop, electrical engineer, 62 Dale Street, Liverpool, took place last week. The debtor appears to have formed his business into a limited company in a somewhat irregular manner, and as further information was required, the examination was adjourned until September 18th.

An Old Electric Light Installation.—An electric lighting plant that is interesting on account of historical features rather than its efficiency is that of the South Foreland Lighthouse on the cliffs between Dover and St. Margaret's Bay. At the present time only the "high" lighthouse is in use, as the "low" lighthouse, lower down on the cliff, was put out of service some years ago, when the fixed light of its partner was converted into a revolving light. The light is given by a single vertical carbon open arc lamp, with clockwork feed and fluted carbons about seven inches in length, which have to be renewed several times in one night. For this purpose, two separate lamps are employed, arranged so one can be slipped into place when the other is withdrawn for carboning. Alternating current, at a high frequency, is supplied, and the lamp takes about 60 amperes. The power station is about 100 yards distant, and contains steam-driven alternators of the old Holmes magneto pattern, with rows of inwardly-pointing permanent horseshoe magnets between the poles, between which pass the coils of the revolving armature. Two such alternators are used in series on the arc lamp, and they are coupled together and driven by an elaborate arrangement of countershafts, fast and loose pulleys, &c., from a single cylinder horizontal engine. A duplicate plant was used for the low lighthouse, and is now retained as a standby. The engines have each their own condenser, with the air pump worked off the tail-rod, and steam is supplied at 35 lbs. per square inch, from a pair of Cornish pattern boilers. The alternators have been running for over forty years, and are still in excellent condition. The magnets are, however, remagnetised every few years. Of switchboard, properly speaking, there is none, but the circuits are connected up to links on a wooden board. The plant is an interesting example of practice in the pioneering days.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Welsbach Light.—At the statutory meeting of the new Welsbach Co., last week, a number of shareholders expressed their dissatisfaction with the method of the reconstruction of the company, and stated their intention of asking the Board of Trade to hold an inquiry into the conduct of the business prior to the constitution of the new board. Objection was also taken to the presence of Major Pringle, of the Board of Trade, on the board. The general meeting will be held in December.

Kensington & Knightsbridge Electric Supply Co.—An interim dividend, at the rate of 8 per cent. per annum, is declared upon the ordinary shares for the June half year.

Brompton & Kensington Electricity Supply Co.—An interim dividend, of 9 per cent., is declared upon the ordinary shares for the June half year.

Charing Cross, West End, & City Electricity Co.—An interim dividend, at the rate of 5 per cent. per annum, is declared upon the ordinary shares of the West End undertaking.

Metropolitan Electric Supply Co.—An interim dividend, at the rate of 4 per cent. per annum, has been declared.

Westminster Supply Corporation.—An interim dividend at the rate of 10 per cent., for the half year ended June 30th, is announced.

Mather & Platt.—An interim dividend at the rate of 10 per cent. per annum is declared on the ordinary shares for the half year ended June 30th.

Yorkshire Electric Power Co.—The net profit for the half-year ended June 30th, after deduction of mortgage interest, was £4,137, as against £2,622 and £1,069 for the two preceding corresponding half-years. A dividend at the rate of 6 per cent. on the amount paid up on the cumulative preference shares is recommended, with £12,476 11s. 1d. carried forward.

French Westinghouse Co.—There was a loss of about £6,500 on the working for 1910, which the report attributes to the poor financial return made by the electrical department. Mention is also made of a poor year by the Italian Westinghouse in consequence of the Italian Government interrupting the execution of its programme of street railway electrification.

Llanelly Electric Lighting & Traction Co.—A prospectus has been issued inviting applications for £50,000 5 per cent. debentures at par.

Lamp Lowering Gear.—We have received from the London Electric Firm (George Street, Croydon) a collection of illustrations of the various forms of lowering gear for arc lamps and metal filament lanterns, in which they specialise. With regard to the latter application, it may not appear warrantable, at first sight, to fit such gear, seeing that the lamps only require attention for cleaning and for replacing defective or worn-out lamps, say, once a month; yet a simple calculation of the cost of such attention, with its expenditure of time and labour in wheeling the costly and cumbrous tower waggon, shows that the quite moderate cost justifies the installation of such gear; whilst in cases where it is already installed for arcs, it can be used without any alteration whatever, except in cases of two (or more) circuit clusters, and in these cases the cost of alterations are quite trifling. The contact-suspension device is of the firm's well-known postive acting weight relieving type, and the winch of their equally well-known self-sustaining pattern, without ratchets, pawls, springs, or triggers.

SUMMARY

Some grievances have been placed before the Postmaster-General by a deputation of telegraph and telephone employees. (Page 465.)

The main power supply to the exhibition at Turin is effected by a special generating station containing coal- and oil-fired boilers, reciprocating steam-engines and turbines, as well as oil engines of several makes. (Page 457.)

Judgment has been obtained in favour of Osram Lamp Works, Ltd., in an action brought by them against the British Tungsten Lamp Co., Ltd., for infringement of certain metal filament lamp patents. (Page 457.)

A paper read recently in America describes some researches into the electrolytic corrosion of reinforced concrete. (Page 457.)

A work by Mr. H. M. Hobart on transformers is reviewed on page 488.

Notes on arrangements for the forthcoming session at some of the leading technical colleges are given under the heading of University and Technical College Announcements. (Page 458.)

Mr. Dugald C. Jackson, in his presidential address to the American Institute of Electrical Engineers, dealt with the duty of the electrical engineer to the public and to his nation. He defined in broad terms the professional spirit which should actuate the engineer, and pointed out that they must necessarily deal with the commercial and economic problems associated with the industries which they dominate. (Page 459.)

Some new conduit fittings and a new form of screwdriver are described in short articles on page 460.

A short article warns mains engineers of the possible effect of the heat spell upon their networks, and recommends systematic testing immediately wet weather sets in. (Page 461.)

The fire at the Carlton Hotel, London, last week has been erroneously attributed by a daily paper to the fusing of electric wires. (Page 461.)

A letter from a contractor in the North of England agrees with our remarks last week as to the inactivity of the Electrical Contractors' Association. (Page 461.)

The present situation of the manufacture of steel in the electric furnace is reviewed in a short article on page 461.

Among the specifications published by the Patent Office last week was one covering a machine for grinding the contact surface of carbon brushes by A. Watkins. A new form of switching device, consisting of strips of sheet metal laid on the floor, is described by S. Lichtenfeld. F. Eisner introduces a new binding medium for the manufacture of tungsten filaments, and R. F. Venner has patented an electric heater in which the heating coils are immersed in mercury. A specification by R. Bacci describes an incandescent lamp which is capable of being dismantled for renewing the parts. The desired amendments to a patent by

Hosted by Google

H. T. Hansen relating to block signalling systems have been allowed. (Page 462.)

Under the heading of electric traction notes is given a *résumé* of the labour situation in the electric traction industry. £18,750 has been contributed to relief of rates by the Salford Corporation tramways. The introduction of trolley omnibuses in Dundee has been definitely decided upon. Other notes in this column include particulars of the purchase, by the Birmingham Corporation, of tramway lines in the neighbourhood formerly worked by companies. (Page 463.)

In a paper read before the American Institute of Electrical Engineers on the transmission system of the Colorado Power Co. some interesting points in the construction of the line to meet the severe weather conditions are given. (Page 464.)

In a short article on the electrical equipment of the rolling stock on the Schöneberg-Berlin Underground Railway, an ingenious scheme for running a train out of the car-shed without using the third rail is described. (Page 464.)

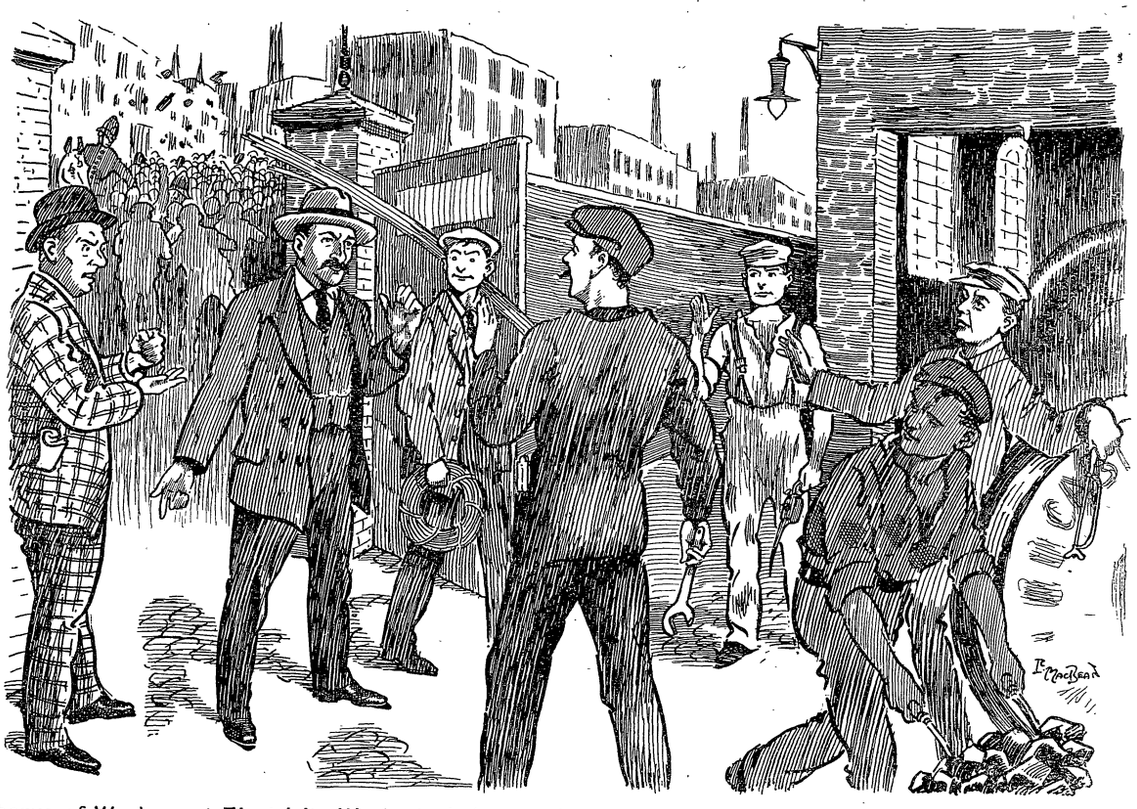
A surplus of £6,680 is recorded on the working of the Glasgow Electricity Department. The Aldrington Electricity Works reports a deficit of £207 for the year. The price of street lighting is to be reduced in Islington, and a surplus of £1,000 is to be added to the rates. The Electricity Committee at Newport (Mon.) have been directed by the Town Council to report further on the administration of the undertaking. A large power station in Italy, which supplies the greater part of Turin, has been destroyed by fire, but this does not affect the exhibition. (Page 465.)

The Local Government Board have now sanctioned a further loan of £50,000 for extensions at Dublin. Loans amounting to £2,350 are to be applied for at Hereford, and a Local Government Board enquiry has been held at Wimbledon (£7,459). (Page 465.)

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Mr. E. Crabb has been appointed Second Secretary to the Post Office in succession to Sir A. F. King, who has been made Secretary, and in view of the approaching telephone transfer, and in order to secure co-ordination of the Telegraph and Telephone Departments, the Postmaster-General has established a post of Third Secretary with supervision over those Departments. Mr. A. M. Ogilvie, hitherto Assistant Secretary in charge of the Telephone Department, has been appointed to the new post.

On Monday last, the Postmaster-General received a deputation from the Postal Telegraph Clerks' Association urging a number of grievances in the administration of the telegraph and telephone services. In event of an unsatisfactory reply a mass meeting is to be convened.



On Friday last, when the House of Commons was in Committee on the Telephone Transfer Bill, Mr. Peto moved the insertion of words to make it clear that a portion of the £4,000,000 should be devoted to the development of the telephonic system "in rural as well as in urban areas." Capt. Norton maintained that there was no object in inserting these words, because the clause would carry out the object which the hon. member had in view. The amendment was negatived.

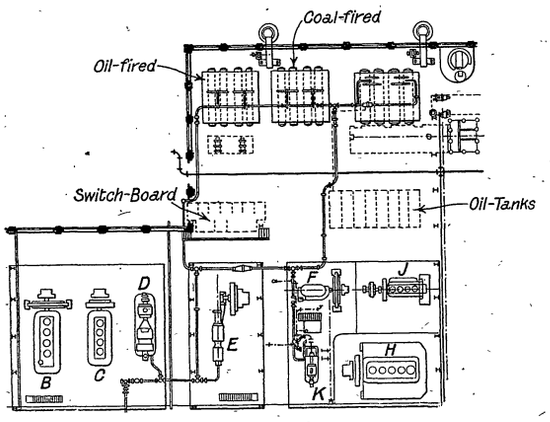
A powerful wireless telegraph installation is being installed at the new London Opera House in Kingsway, by which passengers on Atlantic liners and others will be able to book seats in advance.

A private wireless service is in use between the Wanamaker Stores in New York and Philadelphia. It is stated that by its use a considerable sum is saved which was formerly spent in telephone charges.

It is stated that the German Government has established a wireless telegraph station on one of the Spanish islands about 84 miles from Teneriffe at an important strategic point.

The only item of interest in the world of telegraphic failures and repairs is that of a breakdown of the lines of the Indo-European Telegraph Company on the 9th and 10th inst. between Tiflis and Tauris.

Chorus of Workers at Electricity Works to Labour agitator: No, we will not join you. We are satisfied with our conditions and our interests are common with those of our employers.



Hosted by Google

ELECTRICITY AT THE TURIN EXHIBITION

ELECTRIC power for the needs of the Turin Exhibition is supplied from a special generating station forming one end of the gallery of "machinery in motion" in the western part of the exhibition, and with a plant capacity of some 10,000 h.p., as compared with 900 h.p. for the Turin Exhibition of 1884 and 1,250 h.p. in 1898. A plan of the station is given in the accompanying figure.

The first section of the boiler plant consists of two Babcock-Wilcox water-tube boilers of 16,000 sq. ft. heating surface, producing steam superheated to 600° F. at a pressure of 185 lbs. per sq. in. The boilers supply a 1,200 kw. turbo-alternator and a 500 h.p. vertical engine, set by Swiderski, of Leipzig. There is also a complete power equipment by Franco Tosi, of Legnano, comprising the following items:—Two batteries of boilers of 19,500 sq. ft. total heating surface for a steam pressure of 185 lbs. per sq. in., one coal fired and the other oil fired; a tandem compound 600–800 h.p. engine, running at 125 r.p.m.; a 5,000 kw. steam turbine, running at 1,500 r.p.m.; a four-cycle heavy oil engine of 600 h.p., running at 150 r.p.m., and a 1,000 h.p. two-cycle heavy oil engine for the same speed. A 1,000 h.p. Diesel engine of Sülzer Bros. manufacture is also installed, as well as a 400 h.p. Diesel engine, made by the Italian Langen & Wolf Co.

These various engines are coupled to the generators detailed below:—One 5,000 kw. turbo-alternator coupled to the Tosi turbine, and one continuous-current machine for the Diesel engine, by the Langen & Wolf Co.; two Brown Boveri machines for the Tosi heavy oil engines, a Brown Boveri alternator driven by the 1,200 h.p. Swiderski turbine, and alternators by the Societa Nazionale delle Officine di Tanigliano, driven by the 1,000 h.p. Diesel Sülzer, the 600 h.p. Tosi, and

PLAN OF POWER STATION.

B	1000 h.p.	Tosi oil engine.
C	600 h.p.	,, ,, ,,
D	4500 h.p.	,, steam turbine.
E	600 h.p.	,, horizontal engine.
F	500 h.p.	Swiderski vertical engine.
H	1000 h.p.	Sülzer-Diesel engine.
J	450 h.p	Langen & Wolf Diesel engine.
K	1200 h.p	Swiderski steam turbine.

the 500 h.p. Swiderski engines. An electrically-driven forced-draught plant on the Prat system is provided.

All the alternators generate at 6,400 volts, 50 cycles, three-phase and four main feeders leave the central switchboard for various sections of the exhibition where transforming sub-stations are situated. The main switchboard is also connected up to the 6,400 volt mains of the municipal supply of Turin, which can be utilised as a standby. In addition to the main power station, separate generating plant is provided for the Swiss and British sections respectively, the latter of which is driven by suction gas engines of the Campbell Gas Engine Co.

Current is transformed down to 500 volts for the motor circuits, and the arc lamps, which are arranged in groups of six in series, and to 220 and 125 volts for other purposes, including the incandescent lighting. Considerable care has been exercised in the supervision of the wiring all over the exhibition, and an insulation resistance on the basis of 1,000 ohms per volt is said to have been specified. Very complete fire-protection arrangements have been made, both from the point of view of fire alarms and water supply. Some of the fountains and ornamental cascades are supplied from electrically-driven pumps, that in the British section being fed by a centrifugal pump driven by a 180 h.p. three-phase motor. Numerous small generating plants are, of course, scattered over the sections, as, for example, a model small hotel plant driven by a 4 h.p. petrol engine and utilising accumulators forming part of the exhibit of the Italian Touring Club. Electrical driving is also used very largely for every purpose throughout the exhibition.

Electrical interest is, however, largely concentrated in the Palace of Electricity, where French exhibits are particularly prominent, including two Delaunez-Belleville boilers destined for the Saint-Denis station, Paris, and a 6,400/100,000 volt step-up transformer on the stand of Messrs. Vedovelli & Priestley, connected to a short 100,000-volt transmission line to another part of the exhibition, partly overhead and partly through a cable. A popular display to demonstrate the "marvels of electricity" has been arranged in this section by Professor Arno, and popular experimental lectures are also given on the principal applications of electricity. The most interesting electrical engineering exhibits in the British section are the generating plant driven by a Campbell suction gas plant already mentioned, and a fine display of electrically-driven textile machinery. The area of the whole section amounts to 10,000 sq. ft. For the above particulars we are indebted to *Le Génie Civil* (Paris).

METAL FILAMENT LAMP PATENTS

IN an action brought in the Chancery Division of the High Court of Justice by the Osram Lamp Works, Ltd., against the British Tungsten Lamp Co., Ltd., and another for infringement of Letters Patent, an Order was by consent made on the 26th day of July, 1911, whereby it was (among other things) ordered that the defendants, their servants, agents, and workmen be restrained during the continuance of certain Letters Patent from importing into and from making, selling, offering for sale, supplying, and using in this realm any illuminating bodies or electric lamps containing illuminating bodies made according to or in manner described and claimed in the specification of such letters patent or according to or in manner only colourably differing therefrom, and generally from infringing the rights of the plaintiffs under the said letters patent. And that the defendants do pay to the plaintiffs the sum agreed for damages sustained by the plaintiffs or to be sustained by reason of the infringement of the said letters patent by the defendants by the manufacture and sale prior to the date thereof of lamps and filaments and the sale of the lamps then in stock, or by reason of the user of such lamps and filaments. And that the defendants do pay to the plaintiffs their costs of the said action to be taxed by the taxing master.

THE ELECTROLYTIC CORROSION OF REINFORCED CONCRETE

A PAPER by Messrs. C. E. Magnusson and G. H. Smith, read at the annual convention of the American Institute of Electrical Engineers, contains an account of a research on the corrosion of reinforced concrete by stray currents, the results of which may be summarised as follows: Concrete and cement, when dry, are good insulators and show a specific resistance of about 1,000 megohms per cubic centimeter. Their conductivity depends upon the porosity of the material and the nature of the solution in the pores, a solution of aqueous sodium chloride making them fairly good conductors of electricity. With the liquid in the porous spaces as the conductor, the current flowing through the concrete probably follows the ordinary laws of electrolysis. A current of low density passing through cement or concrete does not effect their compressive strength.

The observed data showed that in cases where the samples thus soaked failed due to corrosion, the corrosion of the iron, caused by the current, precedes the crack in the concrete; that the increase in volume, when the iron changes into an oxide or a salt, is the direct cause of the failure of the concrete. A remedy was found for this by covering the iron bar with two coats of various commercial paints and letting them dry before making up the blocks. With an electrolyte of salt water, there was no evidence of corrosion in three tests lasting from 125 to 250 days, made with samples treated in this way.

REVIEW

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

The Design of Static Transformers. By H. M. Hobart. 174 pp. 3¾ in. by 5¾ in. 101 figures. (London: Constable & Co.) 6s. net; abroad, 6s. 5d.

It is not often that a text-book of design has so interesting and readable an introduction as that in which the author here sketches his personal connection with the pioneering days, when the principles underlying the transformer were being gradually threshed out, and the interest stimulated by this presentation of the way in which the problems occurred will be a help to the study of the ways in which they have been overcome. In the body of the work Mr. Hobart follows the subject through with his customary clearness and logical sequence, assisting his text with numerous curves, diagrams, &c. The section on heating of transformers is particularly valuable. The author confines himself entirely to real practical design, and refers the reader to other works for the academic study of transformer theory. We notice that the practice of using the comma instead of decimal point, which had been abandoned in some of the author's most recently published books, has been reverted to, but the reiteration of the protest against this which we have made in reviewing other of Mr. Hobart's works does not interfere with our appreciation of the general merits of this publication.

UNIVERSITY AND TECHNICAL COLLEGE ANNOUNCEMENTS

An advanced course of instruction on "The Systematic Design and Manufacture of Dynamo Electric Machinery" is to be given at the City and Guilds Engineering College, Exhibition Road, South Kensington (Imperial College of Science and Technology), during the forthcoming session. The course will be somewhat of a new departure, and is intended to prepare men to take up positions as designers in electrical works. It will deal with present-day problems in design, construction, and testing, in a thoroughly practical manner. The lecturer will be Mr. W. E. Robson (late Chief Designer and Assistant Manager, British Eletcric Plant Co., Alloa, N.B., formerly Chief Draughtsman in the Electric Manufacturing Department of Armstrong, Whitworth & Co.'s, Elswick; and Deputy Chief Draughtsman at the Brush Electrical Engineering Company's Works, Loughborough). The lectures, about forty-five in number, will be delivered during the first half of the session (October to February), and the practical work will commence in October and continue throughout the session. Ratings, frame sizes, windings, &c., for complete lines of machines will be considered in detail, as well as works organisation required for systematic manufacture and for developments. In addition to lectures, practice in designing, estimating, and drawing office work will be given, and advanced laboratory work relating to the limiting conditions existing in modern machines. An experienced designer and draughtsman, specially engaged for the purpose, will devote his whole time to the drawing office work in connection with the course. Application for admission to the whole course, or parts thereof, to be made by letter to the Dean, City and Guilds (Engineering) College, Exhibition Road, London, S.W.

The ordinary courses at the college in Civil and Mechanical Engineering are under Prof. W. E. Dalby, and Prof. T. Mather has charge of those in Electrical Engineering. They are divided into Diploma Courses for the Associateship of the Institute in the branch of engineering selected, special or partial courses for students who can engage in research work or omit part of the regular course, and advanced specialised courses for post graduate and other duly qualified students. Courses are also conducted in railway engineering, structural engineering, and the design and construction of electrical machinery.

As stated in Electrical Engineering, August 10th, p. 448, those desiring to commence courses in engineering at University College, London (Gower Street, W.C.) should communicate with the Provost before September 20th, and should send a full statement of their previous training. Students can either take a degree course leading to the London B.Sc. in engineering, or a diploma course for which a certificate is given. Both courses are of three years' duration. Specialisation in electrical engineering is possible in the second and third years. Special courses can be arranged for those who have received partial training elsewhere, and there are exceptional facilities for post-graduate and research work. An Entrance Scholarship, value 120 guineas, will be competed for in September next.

The full day courses in mechanical and electrical engineering at the Northampton Polytechnic Institute (St. John's Street, E.C.) will commence on October 2nd. The courses give a thorough groundwork in general engineering, and in electrical engineering, specialisation can be effected later in the directions of heavy electrical engineering or telegraphy and telephony, including wireless. Three entrance examinations are offered at the entrance examination on Sept. 27th and 28th. The courses include two summer periods of about six months in commercial workshops, and extend over four years altogether.

The session at the Borough Polytechnic Institute commences on September 25th. The course in electrotechnics, under D. J. Henderson, occupies four years, devoted respectively to general principles, technical applications (including electrical design, continuous current work—instruments, testing dynamos and motors—and alternating current work—principle and theory, measurements, alternators, motors, transformers, single and polyphase work). A three years' course in electric wiremen's work is given, and there are also elementary and advanced courses in electrical design and workshop drawing.

Complete three years' courses leading to a diploma or to a University degree in Electrical Engineering are held in the daytime at the South-Western Polytechnic Institute (Manresa Road, Chelsea, S.W.), and a four years' evening course is also held.

The 1911–1912 Session of the Engineering Department of the University of Birmingham, the electrical section of which is under Prof. Gisbert Kapp, commences on October 2nd. The full courses extend over four years, and students who enter after Matriculation and pass successfully the examinations at the end of each year will be entitled to the degree of Bachelor of Science in the branch of engineering to which they devote themselves.

The next session of the Engineering Department of the University of Edinburgh opens on October 10th. The Preliminary or Entrance Examination is held in September. The University provides complete Courses in Civil, Mechanical, and Electrical Engineering, qualifying for the degree of B.Sc. in Engineering, and extending over a period of three years.

The engineering instruction provided at University College, Nottingham, includes courses of instruction for the London University B.Sc. Degree Examinations in Civil, Mechanical, and Electrical Engineering, and for College and other Diplomas in Engineering and Mining. The Session begins October 2nd.

The next session in the departments of electrical, civil, mechanical and mining engineering, fuel and metallurgy, &c., at the University of Leeds will commence on October 3rd, on which day the entrance examination will be held.

A two years' course of instruction in electrical measurement and practical electricity will be commenced at the University College of North Wales, Bangor, under Prof. E. Taylor Jones and Mr. W. E. Williams in October.

Manchester Smoke Abatement Exhibition.—It is anticipated that a feature of the Smoke Abatement Exhibition to be held in Manchester from November 10th to 25th will be a display of electrical heating and cooking appliances. The demand for space has been made all the more keen by the concessions made to the electrical firms who are showing by the Corporation Electricity Department.

London Generating Stations and the Strikes.—It is announced that most of the London generating stations, including those supplying traction systems, have a sufficient supply of coal on hand to meet eventualities in view of strike troubles.

Electrical Fatality.—A caulker named F. H. F. Best met his death at Smith's Dock, Middlesbrough, last Friday in a somewhat remarkable way. While walking along a jetty he dropped some white lead which he was carrying into an open conduit containing electric mains, and in inserting his hand through the slot in the conduit came in contact with a live conductor and received a fatal shock.

ELECTRICAL ENGINEERS AND THE PUBLIC

MR. DUGALD C. JACKSON, the new President of the American Institute of Electrical Engineers, delivered his inaugural address on June 27th. Members of the Institute, he said, are pleased to refer to electrical engineering as a Profession, and to the Institute itself as a Professional Society. The word profession "implies professed attainments in special knowledge, as distinguished from mere skill; a practical dealing with affairs, as distinguished from mere study or investigation; and an application of such knowledge to uses for others, as a vocation, as distinguished from its pursuit for one's own purposes." This sets the professional man in a position which demands from him an attitude of service and of leadership. His duties must be performed with a touch of disinterested spirit in addition to the vocational spirit of earning his livelihood. Such men have a duty to the public; and in the performance of that duty they must exert their influence on that thought and practice of the day which affects the welfare and progress of the nation.

It may be retorted, Mr. Jackson continued, that questions relating to the welfare and progress of the nation are matters of economics and sociology, and not of engineering. The affirmation contained in this retort I will admit, but the negation I deny. The theory of modern economics is built up under the influences produced by the introduction of steam power, with its potent agencies comprised in the steam railroad, ocean navigation, and the use of steam power in industrial operations. These agencies are the creatures of engineers, and the further developments of economic theory are largely dependent on those industrial changes which are continually produced by the inventive activities of the great body of engineers. When I speak of industrial operations or industrial conditions, it must be understood that I include among industrial affairs the great means for transportation and intercommunication which are comprised in railways, telegraphs, and telephones, in addition to the manufacture and distribution of products which involve the application of mechanical power, and the manufacture, accompanied by distribution by pipe or wire, of the media for providing illumination and power. The engineers have precipitated these affairs on the world by their inventions; these affairs are in a large measure the support of the engineering profession; and it is the duty of engineers to do their share in moulding their various economic creatures so that the creatures may reach the greatest practicable usefulness to society.

It may again be retorted that the tenets which I am advocating will lead engineers out of a professional spirit and into "commercialism." The word "commercialism" strictly means the characteristics of business or commercial life, but custom has made it applicable to any undue predominance of commercial ideas in a nation or community, and it has thereby come to infer a willingness to establish the strife for money in a position of precedence over reason and righteousness.

It has been alleged that learning loses of its dignity by becoming fashionable. It has also been alleged that learning loses of its dignity by becoming useful. Of the latter, at least, experience has proved the contrary—happily for engineers who are proud of their profession, for engineering is necessarily an embodiment of the useful application of knowledge and learning. Engineering, relating, as it does, to the application of the powers of nature to useful purposes, must necessarily bring its followers into intimate contact with commercial affairs in an age when, as in ours, the industries dominate commerce, and the abatement of war has reduced the importance of military engineering. A true engineer is a devoted follower after truth. He differs diametrically from the devotees of pure "commercialism," who are strictly opportunists. He also differs from pure idealists, who are often notable for refusing to accept any advance unless it wholly meets their personal ideals. The spirit of the engineer rejoices in obtaining any move toward the truth, but is always seeking farther advance.

Those who accept even in part the usual evolutionary doctrines which are summed up by Herbert Spencer in his view that progress occurs by successive differentiations and integrations producing development from the homogeneous to definite, coherent heterogeneity, will assent to the proposition that the modern giant corporation follows in the wake of the one-man business and the simple partnership in response to an inextinguishable natural law. The progress of corporation development cannot be prevented. We must, therefore, adjust our mental attitude to dealing properly with the situation; and in making the adjustment we must return to the old and approved recognition that a misdeed is a personal thing, and remember that responsibility for it cannot be shifted from the personality of the man in responsibility to an impersonal aggregation entitled a corporation which he manages. But if we must establish personal answerability to the public, we must also establish fair and generous dealing by the public.

The building up of a great industrial nation in an honourable state of civilisation is subject to many hazards—an error may cause injury to the structure that takes years or even decades to eradicate. The forward route is untested, and real progress can be made only by judiciously combining teachings from the records of yesterday with experience of to-day to make a working theory for to-morrow. It has been suggested that a theorist should be defined as a man who thinks he may learn to swim by sitting on the bank and watching a frog. The definition is as inaccurate as defining a black object as an object without colour. Theory, as the word is used by engineers, means a working hypothesis founded on all known facts and experience, which may be used to guide progress beyond the margin of past experience. Every successful, progressive man is a constant user of theory in this proper sense of the term. Theory is not antagonistic to practice, but is founded on experience, and is a guide to progress. Custom should be followed only when it has reason to support it. In the juncture now before us we must utilise the best theories of the corporation relations and the rights of persons and property, and cautiously extend our practices accordingly. No body of men is better equipped for this sound and scientific procedure than a body of professional engineers for the reason that this procedure is in accordance with the every-day steps of their business life. Moreover, the engineers of experience are well adapted to grapple with the mighty problems of a new age, for the reason that an efficient engineer must associate audacity and sobriety in his spirit.

Some people seem to believe that all public service corporation men are either wicked or are liars or thieves. This has as little foundation in fact as a belief that all men in Spain carry mandolins or that Spanish women always wear mantillas. It is necessary for all men trained in straight thinking to combat such folly and to cry out for fair dealing, one with the other, as between the public service corporations and the public which they are established to serve. No engineer does his duty who does not stand with fidelity for equally square treatment *for* as *by* these corporations. These corporations are not here as vampires on society, but are here to serve the needs of the people in a reasonable and business-like way; and their proper objects cannot be accomplished unless they are treated with reason and established in confidence. They obtain their income from serving the public, and they cannot give generous service unless they are granted generous opportunities. A scrupulously frank and honest dealing with the public by the companies should be insisted on, but the public must be taught the importance of dealing on its part with an equally scrupulous fairness and a well-balanced generosity. It is here that I say lies a duty of electrical engineers to the public. It is to give of their time and brain to establish convincingly the facts which the public do not understand in regard to the business of the public service companies, to indicate the means for rightly treating these new influences which we and our fellow engineers have been creating by our works, and to aid in establishing measures which will favour and sustain mutual confidence and fair dealing between them and the public.

The "UNITYPE" INDICATOR

NEW, PRACTICAL, INEXPENSIVE.

Each movement a complete unit. Contained in black metal case. Can be mounted in any number or design.

THE STERLING TELEPHONE AND ELECTRIC CO., LTD. 200, UPPER THAMES STREET LONDON, E.C.

CONDUITS AND FITTINGS

A PARTICULARLY complete new catalogue of conduit material, fittings, &c., has just been issued by the Armorduct Manufacturing Co., Ltd. (Farringdon Avenue, E.C.). Among the contents to which attention may be drawn specially are the Armorduct patent universal "knock-out box" illustrated in the accompanying figure. This avoids the use of separate patterns of one-, two-, and three-way boxes. Shoulders are provided on each side, which are stop-tapped, so that any one can be used as in inlet by simply knocking out the "film" or diaphragm, which closes the hole. A number of sizes are supplied, and the standard box has a heavy cast-iron cover. The company also list a series of oblong junction boxes with various styles and positions of

Fig. 1.—Universal "Knock-out" Junction Box.

outlets, which should prove very useful, and in connection with these have got out a special design of porcelain interior arranged so that the conductors do not anywhere cross each other on live parts of opposite polarity. Floor inspection boxes with oak or brass covers are also made. Attention may also be drawn to a series of 10 ampere switch and plug fittings for various classes of work, and an interesting novelty is an adjustable fittings box for sunk work, which can be set so that the interior fittings are parallel to the wall surface, even when the box is out of true in the plaster. The list concludes with a copious assortment of distribution boards and water-tight fittings.

A FRICTION DRIVE SCREW-DRIVER

A NEW form of screw-driver has been brought out by the Benjamin Electric, Ltd. (1A Rosebery Avenue, E.C.), to meet the demand for a moderate-priced tool combining the advantages of both the ordinary and the ratchet screw-drivers without the disadvantages of the latter. The friction drive is the feature of the tool. The frictional surfaces between the cap and the handle engage with the ordinary pressure used in driving the screw. The spring in the handle releases the friction when the pressure is relieved on the reverse movement, at the same time maintaining a constant pressure on the screw, thus holding the blade firmly in the slot while returning the hand. The free swivel connection between the cap and the handle enables it to be driven very rapidly by the simple operation of the thumb and fingers. It is very useful for all one-hand work, especially in difficult places. The rotating cap always moves with the hand, and therefore does not rub the skin. It is always ready to drive screws in either direction without any adjustment, and there are no ratchet teeth to get out of order. The blade is made of crucible steel, and the handle is of black insulating material moulded to the blade, and fluted to insure a firm grip and prevent rolling.

OSRAM-LAMPS

THE STRENGTH OF METAL FILAMENTS

THE accompanying illustration has been reproduced from an untouched photograph taken of a lamp sent to the General Electric Co. (67 Queen Victoria Street) by Rawlings & Co., of 303 High Street, Lee, Kent. This lamp has recently withstood a test such as does not fall to the lot of many. For some considerable time past it has been burning in a private garage in Kent, and on Thursday last it had the misfortune to be struck by the rear part of a car backing into the garage. It is of interest to record that the only damage done to the lamp was the indentation of the cap shown in the illustration, the filament after the collision being found absolutely intact.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ALUMINIUM.—The British Aluminium Company (109 Queen Victoria Street, London, E.C.) have sent us two leaflets illustrating aluminium transmission lines erected at Aldershot for the British Government, at Klondyke, and on the sea-coast.

TECHNICAL BOOKS.—We have received from H. K. Lewis (136 Gower Street, W.C.) catalogues of new books and editions which have been added recently to his medical and scientific consulting library, which includes works on electrical engineering and allied subjects.

MOTORS.—We have received a small folder from the Union Electric Co. (Park Street, Southwark, London, S.E.), giving prices of their standard direct-current motors. This is arranged in compact form, and of a size suitable for the card case. On the outside a useful table of fuse wires is given.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

A DOMESTIC MOTOR EQUIPMENT.—An outfit for electrically driving sewing machines has been designed by Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster, S.W.). The equipment includes a D.C. motor, a foot-control switch, two lengths of flexible cord with plug adaptors for connecting to the supply and switch. The 1-16 h.p. motor stands on two metal rails fixed to the table by a special clamp. It can be fitted to all kinds of treadle machines without alteration, and the machine can be converted again to treadle drive in a few seconds. The speed of the machine is varied by means of the foot-control switch, so that the operator's hands are free.

"UNION" INTERPOLE MACHINES.—A list of direct-current interpole machines has been sent to us by the Union Electric Co. (Park Street, Southwark, London, S.E.). These are listed in a large range of sizes, and can be supplied with various mechanical protections to suit different purposes. In addition, all dimensions, with and without slide rails, are given.

SHADES AND LAMPHOLDERS.—New cards from Simplex Conduits, Ltd., deal respectively with lampholders of English manufacture and "Spookie" shades.

Parliamentary Intelligence.—The East Kent Electric Power Bill has been read a third time in the House of Commons. The Bill promoted by the Rhondda Council for the supply of electricity for power and lighting purposes in the districts of Treherbert, Treordry, Pentre, Ystrad, Tonypandy, Penygraig, Trealaw, Porth, Ynyshin, Tylorstown, and Ferndale has been ordered to be reported for third reading.

"Bottled Sunshine."—According to the *Daily Express*, a bogus company in America has been obtaining money from investors on a scheme for generating electricity from sunshine. An arrangement of mirrors was placed on the roof of a house, and wires were provided by which the energy was taken to "bottles" for storage. Incandescent lamps were claimed to be lighted by the apparatus, but were really fed by a hidden battery. The promoters have been arrested.

EFFECT OF THE HEAT SPELL UPON CABLE NETWORKS

THOSE in charge of electricity undertakings and distributing networks should not be lulled into a false sense of security by the absence of faults and general leakage on their mains during the long season of hot and dry weather, which is probably now drawing to a close. On the contrary, the unusual conditions of temperature and dryness which have been experienced in this country during the past six weeks or so may eventually in many cases have a very adverse effect upon the cable networks. The heat has penetrated deep into the ground, the cables will have undergone expansion, and the surrounding soil contraction and cracking, due to the expulsion of moisture; unusual strains will have been placed upon the cables and their connections, especially at the points at which they are led into service-boxes, &c., and even solid systems may not have been exempt from the effects of the continuous high temperature.

As soon as the rain sets in, faults and leakages will begin to develop, just as they do soon after thaw and rain follow a long period of frost. As is the case with the large majority of cable faults, however, the result will not be immediate breakdown where small breaks and crevices have occurred in the lead-covering of the cables or at the points of entry to junction-boxes. Frequently such faults can be detected by testing long before they have become sufficiently serious to develop into serious earths or short circuits.
